In his last report, Prof. Callendar carried the work up to a pressure of 1,000 lb./sq. in., and observations have since been made up to nearly 2,000 lb. Fig. 7 shows the difference between the observed total heat of steam and that given in Callendar's tables, the latter value being the greater. Prof. Callendar has suggested that the discrepancy may be due to the lag which takes place in his experimental apparatus as the steam is rapidly heated in the superheater. It is questionable whether the actual conditions met with in the operation of power plant are not identical with those of Prof. Callendar's experiments. In all probability such modification in the estimates of thermal efficiency as may be necessary when the experimental work has been completed will probably be of such a nature as to slightly decrease the gains to be expected from increased pressure.

The numbers indicate absolute pressure, lb./sq. in.

Fig. 7.

In order to arrive at the effect on thermal efficiency of the use of regenerative feed heating, several pressures from 200 lb. to 2,000 lb./sq. in. were chosen, and an investigation made from which a series of curves of the type shown in fig. 8 were deduced for turbines designed for 600 lb. working. It was assumed that the total temperature rise was equally divided between the feed heaters, that the feed water leaving any heater reached a temperature 10 deg. F. less than the temperature of the steam supplied to that heater, that the mechanical efficiency of the turbine was 98 per cent., and that the radiation coefficient was 1.05. The full-line curves hold for boiler plant having an economiser, but no air heater; and those in dotted lines apply to a boiler plant fitted with both an economiser and an air heater, the latter being so proportioned that as the temperature of the gases leaving the econo-

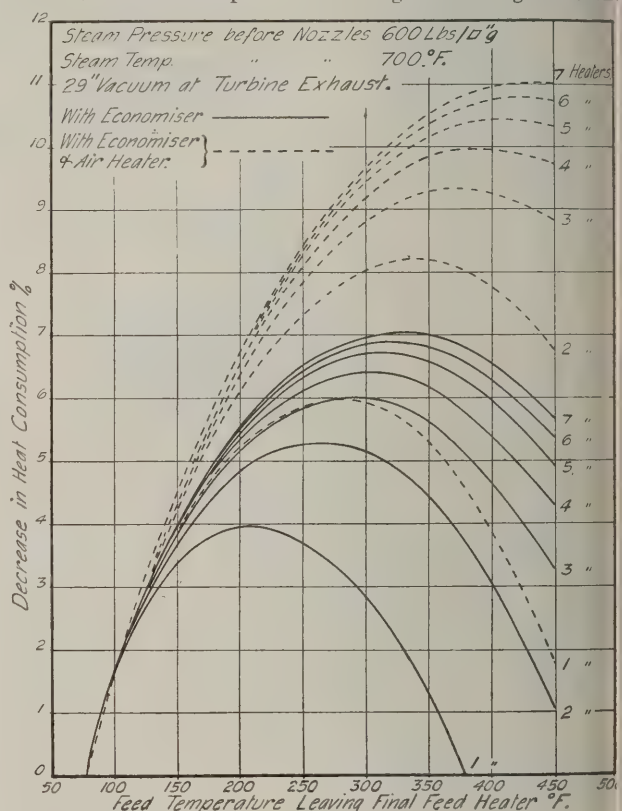

Fig. 8.

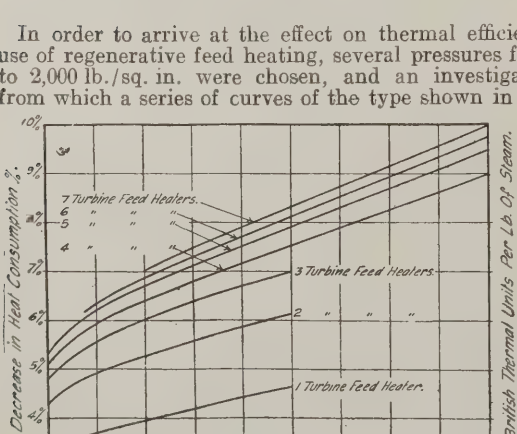

Fig. 9.

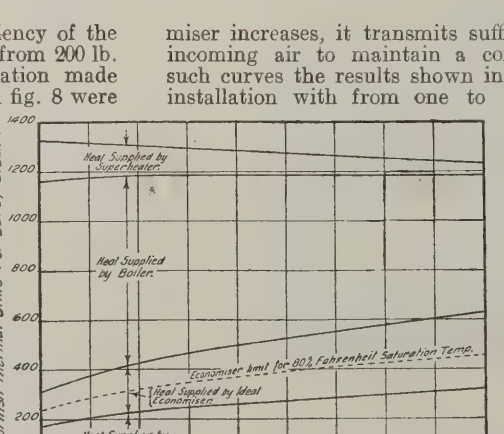

Fig. 10.

700 deg. F., 29-in. vac.

In order to arrive at the effect on thermal efficiency of the use of regenerative feed heating, several pressures from 200 lb. to 2,000 lb./sq. in. were chosen, and an investigation made from which a series of curves of the type shown in fig. 8 were deduced for turbines designed for 600 lb. working. It was assumed that the total temperature rise was equally divided between the feed heaters, that the feed water leaving any heater reached a temperature 10 deg. F. less than the temperature of the steam supplied to that heater, that the mechanical efficiency of the turbine was 98 per cent., and that the radiation coefficient was 1.05. The full-line curves hold for boiler plant having an economiser, but no air heater; and those in dotted lines apply to a boiler plant fitted with both an economiser and an air heater, the latter being so proportioned that as the temperature of the gases leaving the econo-miser increases, it transmits sufficient additional heat to the incoming air to maintain a constant chimney loss. From such curves the results shown in fig. 9 were obtained for a installation with from one to seven feed heaters and a economiser, but no a heaters. The decrease i heat consumption is co tinuous with increasin pressure, but the rate increase is most rapid f the first increase in pre sure. The number of fe heaters chosen for furth consideration, *i.e.*, four, perhaps more than usually adopted at presen A constant number of fe heaters has been chosen spite of the rather small gain in efficiency at low pressures resulting fro the addition of the four heater, because its incl sion is equally justifie when the increasing co with increasing pressure of incorporating such a feed heat into the system is taken into account. In fig. 10 the quanti of heat supplied per lb. of steam from each main source plotted for a system employing four feed heaters but no a heater.

If the temperature of the water leaving the economiser is limited to 80 per cent. of the saturated steam temperature, the maximum quantity of heat supplied is given by the intercept between the dotted line and that giving the heat supplied by the turbine feed heaters. The line corresponding to the "ideal economiser" shows the limiting economiser input if the water can be raised to boiling temperature.

Figs. 11 and 12 show the corresponding curves for a system in which the boilers are equipped with both economisers and air heaters. The addition of the air heater increases the improvement in heat consumption resulting from regenerative feed heating at approximately 50 per cent. The distribution of the heat input to the steam, fig. 12, emphasises the decreased range of usefulness of the economiser. If the limitation

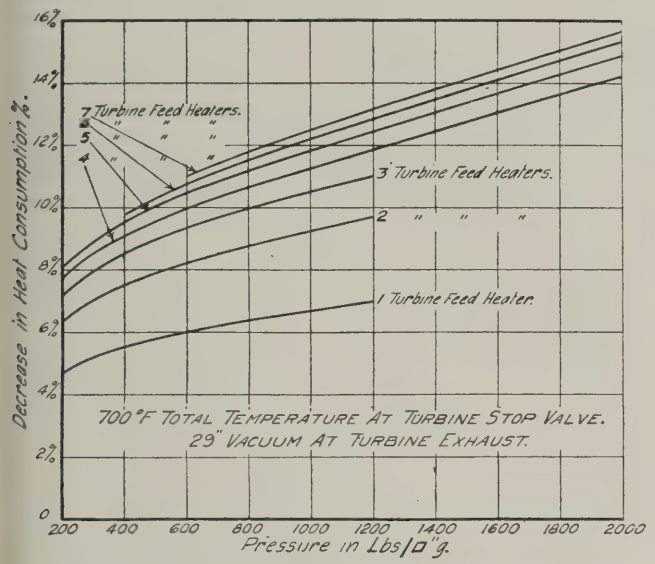

Fig. 11.

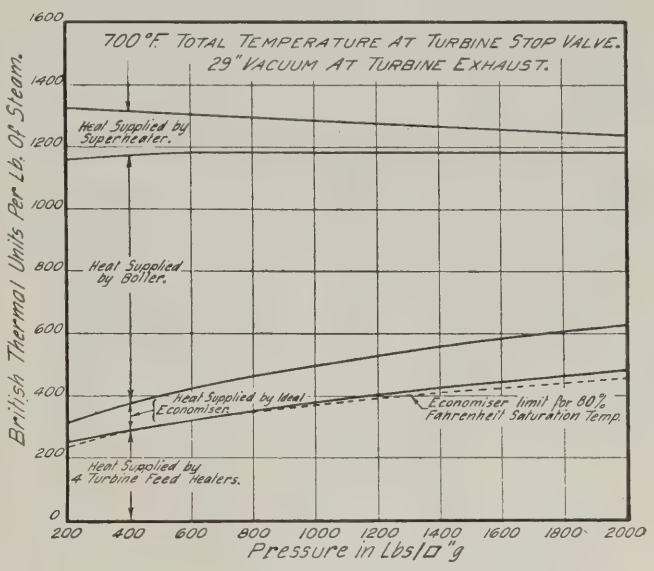

Fig. 12.

of the maximum temperature of water leaving the economiser is still imposed, its range of usefulness practically disappears, but if water can be heated up to the saturation temperature, an important sphere of usefulness is still available to it; as otherwise the amount of heat to be absorbed in the air heater may prove to result in too high an air temperature for comfortable working.

The heat dissipation per pound of steam for an installation incorporating four feed heaters, economisers and air heaters is shown in fig. 13. These figures relate to a pound of steam and not to the steam required per kW generated. Consequently the diminishing proportion shown of heat converted into work is not indicative of decreasing efficiency, because the heat supplied to the steam per kW by the fuel is itself continuously decreasing, as has been shown in fig. 3. When feed heating

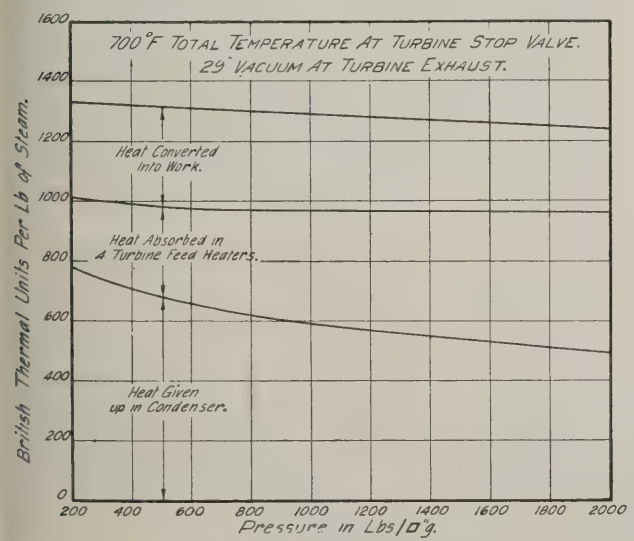

Fig. 13.

is carried out to the extent indicated, the proportions of the steam passages in different parts of the machine are very materially modified. Relatively to a turbine designed without feed heating, the steam quantity entering the first stages has to be very considerably increased to compensate for lost work capacity of the steam diverted to the various heaters. The areas through the blading in the early stages must therefore be increased on this account. The fact that a large proportion of the total steam is diverted to feed heaters naturally results in the blade areas in the final stage of the machine being substantially reduced.

Fig. 14 shows for various initial pressures how the blade proportion of turbines designed for four stage feed heating should compare with those of turbines designed without feed heating. Consider the blading areas of a 20,000-kW turbine designed for an initial pressure of 1,200 lb./sq. in. with four feed heaters. Then, compared with one designed without feed heaters, it will be built up as follows:—The first ¼ will have blading appropriate to 25,000 kW, the next ¼ appropriate to 22,500 kW, and the next ¼ to 20,000 kW: the following ¼ will have blading appropriate to 18,000 kW, and the final ¼ to 16,000 kW.

The magnitude of the difference is such that it is obvious that the conditions of steam flow in a turbine having blading proportioned on the basis that the feed heaters are in operation will be profoundly modified when it is operated with the feed heaters out of commission, and *vice-versa*. As such modifications in the steam flow conditions would result in some loss of efficiency, the turbine should be designed for the internal conditions holding when the feed heaters are in operation. Estimates of steam consumption with the feed heaters out of commission must be given with reserve.

When considering the influence of resuperheating on thermal efficiency, a change in the total temperature of from 700 to 750 deg. F. was made. This involved the use of plant designed for 800 deg. F. In addition to the assumptions common to the former investigations, a pressure loss in the resuperheater and its connections of 5 per cent. was postulated, but no allowance was made for loss due to radiation to and from the resuperheater. Fig. 15 shows the way in which this affected the thermal efficiency at different pressures. The chain dotted curves were obtained by making a wetness correction at the

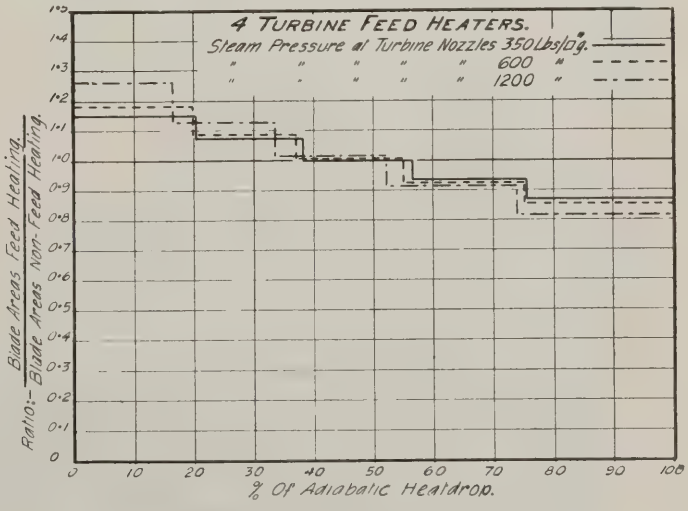

Fig. 14.

rate of 1 per cent. loss in efficiency for 1 per cent. mean wetness in the stage concerned. The variation of the proportion of the complete expansion which should precede admission to the resuperheater is depicted in the upper portion of fig. 16, while in the lower part the maximum gain in thermal efficiency resulting from resuperheating is shown. The gain in thermal efficiency resulting from resuperheating, if the full wetness correction is made, is more than one-third greater at 2,000 than at 200 lb./sq. in. The gain at the higher pressure is only one-quarter of that at the lower pressure if this correction is omitted. While many tests have shown that the

usual rate of correction for wetness gives results in conformity with experience with normal h.p. condensing turbines, such experience as has been accumulated on resuperheating installations to date indicates results not in conformity with the predictions on this basis. Judging by the results at present available, the gain due to resuperheating does not exceed the mean estimated on the two bases under discussion. The dotted line shows the locus of this mean.

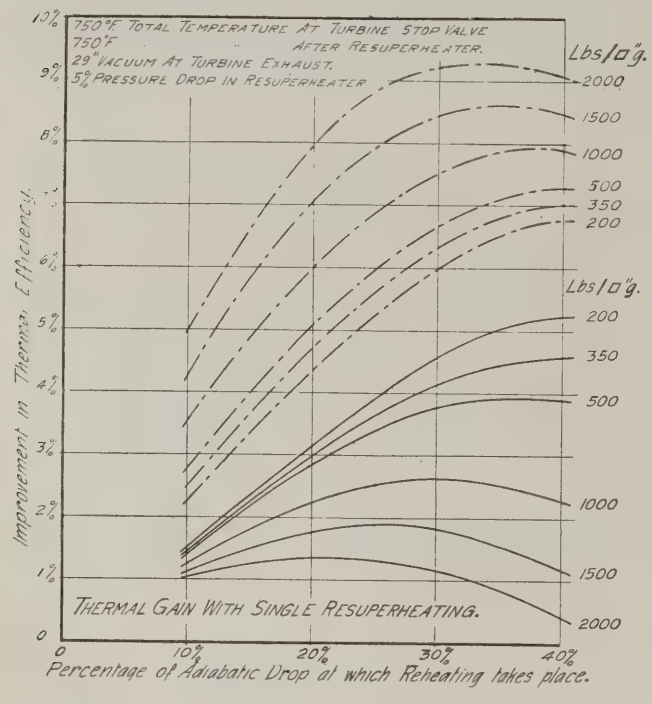

Fig. 15.

There is still a possibility that the resort to resuperheating may be imperative if high pressures are adopted. With the conditions assumed, but without resuperheating, the quantity of water present in the steam in the lower stages of expansion increases very rapidly with the initial pressure. With an initial pressure of 200 lb./sq. in. the fraction of the original steam which is water on leaving the last row of blades is 9.5 per cent.; at 600 lb. this rises to 15.25 per cent., and at 1,200 lb. reaches 20.3 per cent. In a turbine loaded at 40,000 kW, with steam at 1,200 lb./sq. in. initial pressure—assuming that the conditions are stabilised from stage to stage—over 33 tons of water per hour are passed through the last blade. It

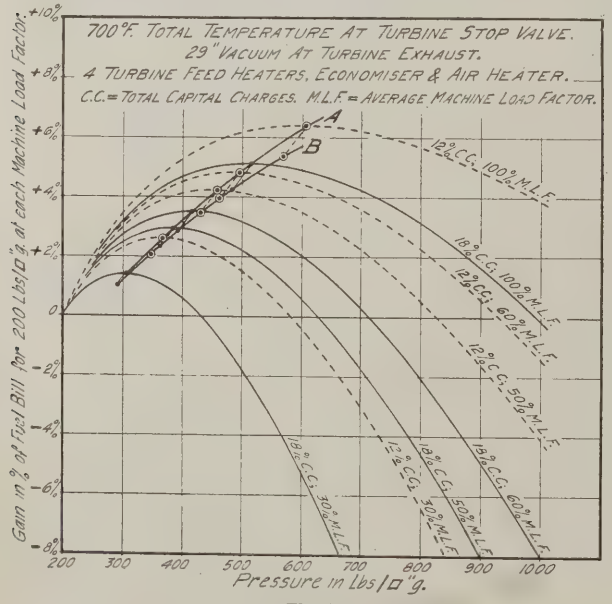

Fig. 17.

has still to be proved by experience whether at pressures as high as 500 lb./sq. in. the erosion which may result from such conditions will set a term to the useful life of the blading shorter than that usual with more moderate conditions.

Consideration must be given to the financial advantages likely to result from its adoption. Statistics were carefully compiled co-ordinating cost of plant with the variations resulting from increased pressure in the type of plant herein dealt with. The average mean temperature difference in the four feed heaters is 1.92 times that in the condenser for the 200-lb. installation, the figure rising to 2.46 at 1,000 lb. The mean cost of feed-heater surface per square foot in the latter case is 2.5 times that of the condenser surface.

While the total kW cost of the condenser plant decreases with the initial pressure, that of the feed heaters increases so that the combined cost at first decreases slightly, then takes an upward trend. The cost of the turbines themselves continuously increases with pressure, so does the combined cost of

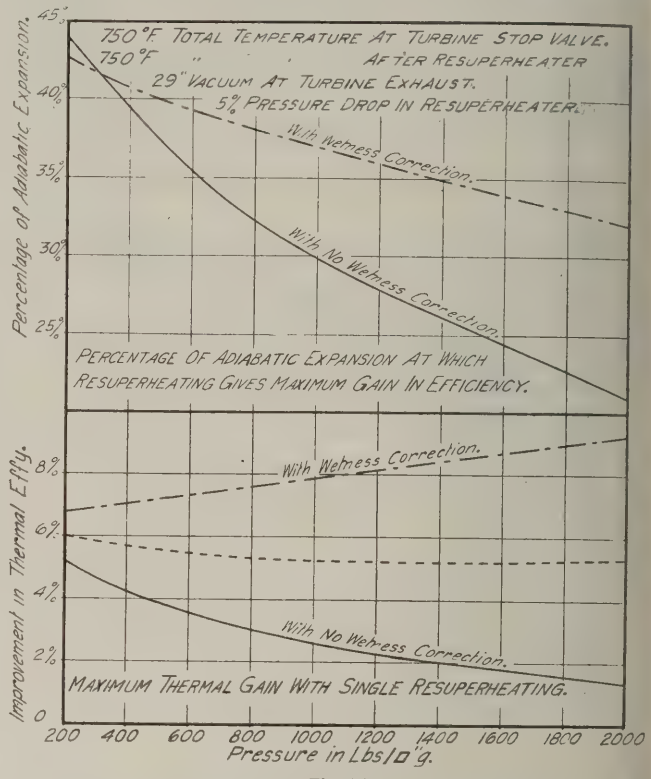

Fig. 16

the boilers, economisers and preheaters. On the other hand, the cost of the boiler house decreases. The total increased capital cost per kW installed at economic rating was found to be not less than that given in the following :—

Table III.

Pressure — lb./sq. in. g. ...	200	300	400	500	600	700	800	900	1,00
Increased cost per kW. ...	£0	0·158	0·353	0·600	0·884	1·211	1·579	1·990	2·44

The costs above 800 lb./sq. in. were obtained by extrapolation.

In order to assess the annual value of the fuel savings, coal was valued at 15s. per 11,500 B.th.u., and the turbine thermodynamic efficiency at 200 lb./sq. in. g. was taken as 80 per cent. The generator and boiler efficiencies are assumed to be 96 per cent. and 84 per cent., respectively, at economic load. From this basis fig. 17 was obtained, showing the saving expressed as a percentage of the fuel bill at certain constant load factors and for two specified rates of capital charges. The

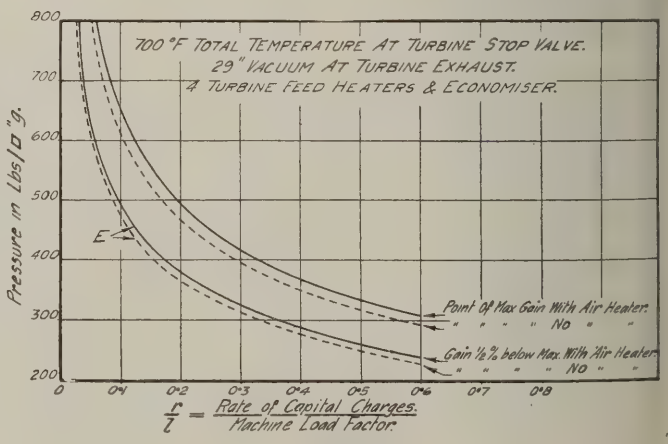

Fig. 18.

12 per cent. rate can be considered as made up of 5 per cent. rate of interest, 5 per cent. depreciation, and 2 per cent. maintenance. With the 18 per cent. rate these charges would probably be 6 per cent., 7 per cent., and 5 per cent., respectively. In any one year the machine load factor is necessarily less than the station load factor.

The locus of the maximum points shown by curve A was checked by arriving at the expressions which corresponded with the ascertained capital cost per kW installed, and the annual fuel saving, thus obtaining the net saving, and differentiating.

The expressions were found to be as follows:—
Net saving in pounds sterling per annum=

$$l\{0{\cdot}610 - [189{\cdot}(p + 110)]\} - r[(2{\cdot}11/10^6)p^2 + (5{\cdot}22/10^4)p - 0{\cdot}1888] = lF - rC.$$

Where l=machine load factor,
p=pressure adopted in lb./sq. in. g.,
r=rate of capital charges,
F=annual kW value of fuel saved at 100 per cent. load factor, and
C=additional capital cost per kW.

The curves in fig. 18 co-ordinate the pressures corresponding to maximum return on additional investment with the ratio r/l. The net annual gains for other costs of fuel can be obtained by making use of the relation that the gain is constant if the price of fuel multiplied by the load factor is constant. Thus, the curve in fig. 17 relating to coal at 15s. per 11,500 B.th.u. and 100 per cent. load factor holds also for coal at 30s. per 11,500 B.th.u. if the load factor is 50 per cent Curve A gives the locus of the maxima for installations which include an air heater and economiser, whereas curve B gives the corresponding points if the air heater is omitted. From fig. 17 it will be found that the pressures at which the maximum return is possible vary with the load factors as follows:—

TABLE IV.

	Rate of capital charges.	Load factor 100%	60%	50%	30%
With air heater ...	12%	606	495	459	367
Without air heater	12%	575	466	433	350
With air heater ...	18%	516	417	385	306
Without air heater	18%	477	396	366	293

Special Motor-Generators.

Recent Developments by Messrs. Bull Motors, Ltd., in the production of High-Frequency Machines.

PROGRESS in wireless telegraphy and telephony has made some very exacting demands upon the technical resources of those firms which have been courageous enough to keep pace with the times by developing the special generating plant that is continually being called for by radio

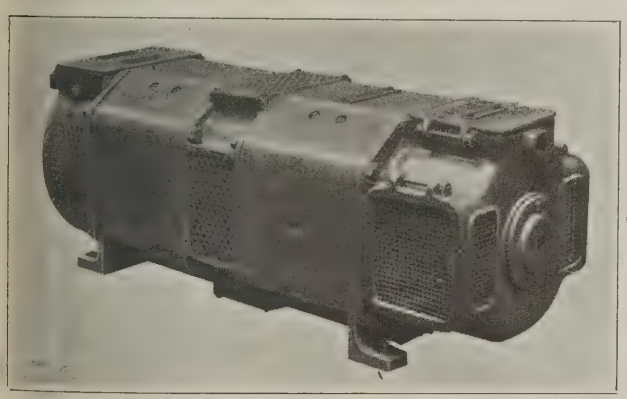

Fig. 1.—Ship's Motor-Generator.

engineers. Included among such firms are Messrs. Bull Motors, Ltd., from whom we have received the following particulars concerning special plant which they have produced.

Fig. 1 shows one of a number of special motor-generators which have been supplied for ship's wireless sets. One section of the double armature, fig. 3, carries the motor winding and also an auxiliary generator winding for supplying 275 W at 25 V for filament heating. The other or generator armature is wound so as to give 0.5 A at 2,400 V d.c., and is fitted with a special h.p. commutator of maximum possible diameter. The set revolves at 3,000 r.p.m., and the h.p. end, which is claimed to be as sparkless as any high-class industrial motor, has been subjected to a flash test of 5,000 V a.c. to earth. Similar tests are in construction for 3,000 volts d.c.

Fig. 2 shows a special 1,000-cycle, single-phase, 110-V, 500-W alternator, having 32 poles, coupled to a d.c. motor revolving at 3,750 r.p.m., the inherent voltage regulation of the alternator from no load to full load being 8 per cent. at 0.8 power factor—a satisfactory achievement when one considers the intricate problems involved in designing a.c. plant for frequencies of the order given. In spite of the high frequency, the overall efficiency at full load is claimed to be 52.1 per cent. The alternator is designed with a rotating field system and an unexpected difficulty was encountered due to the very high windage loss. This was greatly reduced, however, by suitably modifying the outline of the rotor, with a resulting increase of 8 per cent. in efficiency. Very careful attention is given to the design of the rotor poles in this type of machine, as with so many poles in a small diameter flux leakage is a serious matter, and the least departure from correct design may so increase the leakage as to prevent the alternator

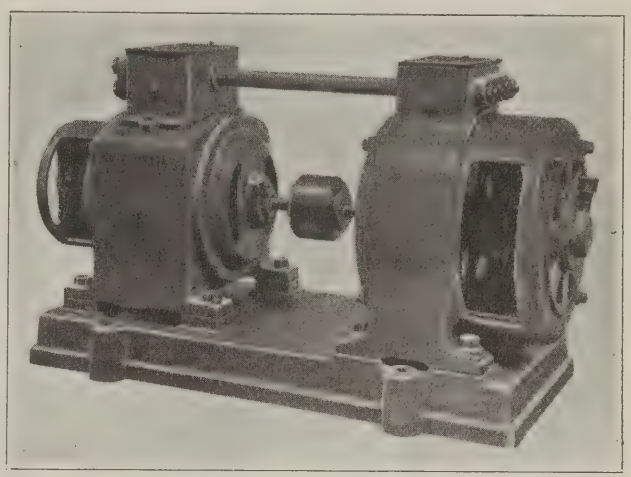

Fig. 2.—1,000-cycle Alternator.

developing its full designed voltage, in spite of the fact that the stator flux density has to be extremely low in order to avoid excessive iron losses.

In the design of the former sets every effort was made to eliminate commutator ripple, and in the latest models this is claimed to have been fully achieved. Similar "Bull" motor generators are in use for heating the filaments of high-power wireless transmission valves.

Legal.

Shocks from an Electric Drill.

AT Haslingden recently, Messrs. F. S. Scott, Laneside Foundry, were ordered to pay costs for a breach of the Workshops Act. The proceedings arose from an accident at the firm's works when two men received serious shocks whilst using a portable electric drill. The Factory Inspector said that the energy was obtained from an ordinary lampholder. A flexible wire was used whereas there should have been a heavy c.t.s. cable, and metallic connector. Cotton-coated flexible cable and ordinary connectors were used, and the shocks were due to the insulation being bared by a connector. Defendants had now adopted proper connectors and cable.

Electric Light Plant Dispute.

BEFORE Mr. Justice Tomlin, in the Chancery Division, on April 27th, Mr. R. W. P. Dawson, engineer, claimed an injunction restraining the Effingham Estates Co., Ltd., from trespassing in rooms which he said had been leased to him, an order on them to block up the entrance which they had made, and also to remove the electric light plant, and damages for loss alleged to have been sustained by his being unable to use the space occupied by the plant.

Mr. ALEXANDER GRANT, K.C. for the plaintiff, said that the defendants suggested originally that he had agreed to buy the

plant. It was true that each party appointed a valuer to fix a price, but they could not agree, and there was no sale. Neither the plaintiff nor the defendants wanted the plant. What the plaintiff complained of was that the defendants were using the plant for their own premises. When he told them that they must take it away they broke into the rooms and worked it for themselves.

His Lordship considered the case a trivial one, and after lengthy negotiations, following this hint, the parties came to a settlement. His Lordship said he would make an order staying the proceedings on the terms agreed with liberty to mention it to him at any time when a formal minute had been drawn up and signed.

Automatic Telephone Mfg. Co.'s Patent Application.

Mr. Justice Tomlin, in the Chancery Division, on April 29th, heard the application of the Automatic Telephone Mfg. Co., Ltd., Liverpool, for the extension of three patents relating to automatic telephony, because the war had deprived it of the benefit it would otherwise have obtained from them.

Giving judgment, his Lordship said that before the war broke out the company received orders from the Postmaster-General to install its "Director" system in many towns, but during the war it was compelled to refuse to undertake other orders because it was engaged in making munitions. The application, he said, was opposed by persons interested in an American system called the "panel" system. They said that the delay caused by the war was really an advantage to the applicants because it had enabled them to develop their system in such a manner as to compete successfully with the "panel" system. If he had had to decide which system obtained the most advantage from the war he would have said it was the "panel" system, because being an American system it could be worked in countries not affected by the war. He granted the applicants an extension of the patents up to January 18th, 1931.

Fraudulent Conversion Charge.

At the Guildhall on April 28th, Elie Stacey Charlier, company promoter, was again before Ald. Sir Harold Moore upon a charge of the fraudulent conversion of funds entrusted to him in respect of the formation of a Canadian electric railway company. Sir Frederick Mills, chairman of the Ebbw Vale Steel, Iron & Coal Co., whose name was said to have been used by the prisoner, gave evidence that, after investigation, he decided to have nothing to do with Charlier. The accused pleaded "Not guilty" and reserved his defence. He was committed for trial, bail of £250 being allowed.

Correspondence.

Correspondents should forward their communications* as early as possible.** ***No letter can be published unless we have the writer's name and address in our possession.

Hiding the Light.

Is the advantage of electricity for power purposes being brought to the notice of potential customers with sufficient energy? A brief investigation in a large town boasting an up-to-date system has revealed the following:—

A brattice cloth works was working both day and night shifts for the greater part of the year. Artificial light was supplied by two fairly large inverted gas fittings, the mantles of which were in a sad state of disrepair. Inquiries elicited the fact that, owing to draught, mantles were a costly item. The mills were driven by a steam engine of about 12 horse power supplied with steam at about 50 lb. pressure from a large and poorly lagged boiler. It is true a certain amount of steam was used for heating the drying rolls, though there does not appear to be any reason why this could not be done, and probably with more efficiency, electrically. The clay wash was thrown on by hand, a process that would be improved by the use of a small motor-driven pump. I was informed that the electric mains passed these works.

At a dry dock, the pumps, capable of dealing with the total contents of the dock in four hours, were steam driven. Should the dock be in use for but a short time, as during the painting or surveying of a vessel, the boilers are kept banked. At other times the fires are allowed to die out. The engines are non-condensing and will probably take in the region of 30 lb. of steam per h.p.-hour.

At a fuel works a self-contained power house of about 1,000-kW capacity has been installed.

A considerable amount of traffic takes place over about three miles of canal. The Canal Company will not tolerate self-propelling barges, its objection being that the wash disturbs the banks. The barges are, therefore, horse-drawn, though there appears to be no reason why a battery tractor could not be used with charging stations at the loading and discharging termini.

Many other smaller fields were met with, such as bakehouses, garages with plant, cabinet makers, saw mills, &c. These are not able to meet the cost of changing from gas or oil to electricity, and it is to be hoped that at an early date undertakings will hire out motors in such cases. Bakehouses, in particular, would provide a load when the distributing system is otherwise lightly loaded, especially were electric ovens used.

April 26th, 1927. **Electrician.**

A Domestic Load Diagram.

On page 630 of your issue of to-day, Mr. Ross's diagram of a domestic load for 24 hours, if my reading is correct, appears to total (hatched *areas*):—

	kWh.
Radiators	32.8
Water storage	17.0
Cooking	14.8
"Other" uses	14.4
Baths	4.0
Clothes washing	1.0

One day's consumption 84 kWh. Load factor 28 per cent.

The left-hand margin is divided into 13 numbered equal spaces with no unit named. Are the above *areas* kelvins?

Do you agree that if the unit is named and the size of home defined, it will materially add to the value of the diagram?

London, *April 22nd*, 1927. **Theodore Stevens.**

[The ordinates are, of course, graduated in terms of kilowatts; the areas, therefore, are kilowatt-hours.—Eds. Elec. Rev.]

Electric Water Heating.

Mr. Meares's article of the 22nd inst., and letter of the 29th inst., draw attention to a state of affairs much neglected by those who are presumed to have the industry at heart, and he is to be thanked for so doing.

As the load curve in my article is based on several years' practical experience gained in my own home, and in other homes similarly conditioned, Mr. Meares may safely take it as quite representative of its purpose. His suggested auto-switched water tank is the one solution of what may conceivably become a source of trouble as domestic load develops. That industrial load will undoubtedly take second place, as American experience is showing clearly to-day, and one fine day little communities of 10,000-20,000 homes or more will switch on 13,000-30,000 kW for the morning meal as against half that amount for the mid-day and evening meals. True, the period of high load is short. But it must be taken care of by the sub-station at least, and unless the domestic load curve is flattened appreciably by some such arrangement as Mr. Meares suggests, considerable capital is likely to be used increasing the power price needlessly.

On the other hand, presuming the point to be taken care of, even in the most residential localities, the road to cheap power is barred by the present high capital cost of the very means to obtain the end. I don't doubt for a moment that Mr. Meares's switch *could* be made at a reasonable price, but what of the water tanks? For tanks to meet all household needs the modest price of £10 to £25 must be paid. Where does the money go to in the production of such tanks? Even an ordinary household boiler can be converted for little more than the cost of an immersion heater plus some slag wool.

The lowest possible capital outlay is essential, and it is gratifying to note Mr. Sharp's broad hint at immediate favourable developments. The industry is on the verge of doing great work, and that with quite satisfactory remuneration, but will selfish profits override the willing horse and thwart the backer?

Manchester, *April 30th*, 1927. **Eric G. Ross.**

Cheap Electricity.

I should like to endorse a sentence in the letter of Mr R. B. Matthews in your last issue, wherein he emphasises "the great difficulty there is in refuting the arguments put forward in favour of the small independent plant." The word "small" must not be given too narrow a significance in this connection. Indeed, there are many special instances where the larger the size of the independent plant the more difficult it is to refute the arguments in its favour. It must be remembered that the difference between the steam consumption per kelvin of a well-loaded 2,000-kVA steam turbine and one of 10,000 kVA is not very great for equal steam pressure and temperature, and this difference is usually much less than that portion of the cost per kelvin which is due to distribution.

Thus, in general, if a consumer has a load factor considerably higher than the average load factor of the local generating station, and if his plant is large enough to warrant the use of a turbo-generator exceeding about 1,500 kVA, the commercial advantage is very often in favour of the private plant. But this does not settle the question completely: there are considerations other than the purely commercial, which become more evident as experience of local supply increases. The owner of a works requiring electric power often realises that it is better for him not to divide his energies between his own proper business and the problems incidental to the

roduction of power. Although no accountant could put the alue of this concentration into a profit-and-loss account, yet s effect is not the less real on that score.

William Cramp.

The University, Birmingham.
May 2nd, 1927.

The Salaries of Engineers.

The article in your issue of the 22nd inst. by "P.B.E." once gain calls attention to the inadequate remuneration of 90 er cent. of electrical engineers. A short time ago a friend ought my advice with reference to making his son an elec-rical engineer. He was under the impression that if he nd his family made the necessary sacrifices to enable his n to take a diploma or degree in electrical engineering, the tter's future on an adequately remunerated basis would be ssured. I therefore felt it my duty—whilst not desiring discourage his son from entering the electrical profession—place the facts, so well brought out in the above article, efore him. I also considered it was my duty to tell him hat many friends of mine who are themselves engineers ave avoided putting their sons into the engineering pro-ession. This state of things is, of course, deplorable, and hould be remedied. It is no doubt largely brought about hrough the ignorance of parents as to the real conditions n the engineering world, and to the great desire of boys—nany of whom have exceptional ability—to take up engineer-ng. With the same ability most of these boys would probably ave done better to have followed some other vocation, which vould have called for less sacrifice on the part of the parents nd would have placed them in better positions to bring up nd educate their own families in due course.

I make this contribution to the discussion because the re-nuneration and financial position of so many hard-working nd able electrical engineers call for the attention of the eaders of the profession and industry, on whom the respon-ibility for rectifying the present position should largely devolve.

Ernest T. Williams.

London, *April 30th*, 1927.

A Commutation Problem.

The writer is at a loss for an explanation of the cause of trouble with some small dynamos supplied by a fairly well-known firm, and could not think of a better place to seek it than your columns (with your permission).

The machines are 10 amps., 30 volts, at 2,400 revs., and the trouble has been that, while they all ran apparently perfectly when new, or for some time after re-turning of commutators, in a few weeks they were sparking slightly, and this increased cumulatively until in three months the commutators would be black and scored, and would require turning up. Nothing in the way of changing brushes, adjusting the rocker, or cutting down micas has cured this, and the makers, on having an armature sent up, only turned up the commutator and sent it back.

Now, the armature winding is 432 conductors of 18 gauge, divided into 12 double coils, there being 12 slots ($\frac{3}{8}$ in. wide) and 24 commutator bars. Armature diameter is $3\frac{1}{4}$ in., length 3 in. The magnetic and electrical loading data come out at about 20,000 lines per square inch in the gap, and 230 ampere-turns per inch of armature periphery, respectively, and this does not seem to be an abnormal design.

The writer's theory is that there are not enough slots, and, assuming the 18 wires in each double-coil assembly to be roughly evenly distributed in the half slot, the conductors are, at the best, on the average $7\frac{1}{2}$ degrees from the correct neutral position when undergoing commutation, and this is enough to prevent sparkless running for any length of time. Slots are open and have parallel sides.

If this problem is not too trifling for insertion, an opinion from one or more of your many expert readers would be greatly valued.

A. O. Griffiths.

24,677. "Time-lag mechanism for electric relays." O. Janzen. October 5th, 1925. (259,253.)

26,456. "Electrodes for electric accumulators and a process for their production." P. Hagspihl. February 13th, 1926. (265,918.)

1927.

2,759. "Electric lamps." British Thomson-Houston Co., Ltd. January 30th, 1926. (265,237.)

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from April 27th :—

Supronic. No. 476,822. Class 5. Wire made of a copper-nickel alloy.—L.P.S. Electrical Co., Ltd., Avenue Road, Acton, W.3.

Semper Idem (lettering and design). No. 464,283. Class 8. Electric batteries and parts thereof.—Atlas Carbon and Battery Co., Ltd., 56, Southwark Bridge Road, S.E.1.

Spioscope. No. 478,415. Class 8. Optical apparatus and instruments.—Television, Ltd., Motograph House, St. Martin's Lane, W.C.2.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ABERDEEN.—Infirmary (£257,000); Dr. Kelly, architect.

ANDOVER.—Elementary school; Hampshire Education Committee.

ARGENTINA (Buenos Aires).—New Federal sanitary service (30,750,000 pesos) for the Government.

BEDFORD.—Millwrights' stores, Queen's Engineering Works; W. H. Allen, Sons & Co., Ltd.

BEXHILL.—Houses, Terminus Road, Mill View, and Collington Avenue; J. H. Lye, Chepbourne Road. Houses, Barnhorn Lane; Matthews & Co.

BIRMINGHAM.—Baptist Church Hall, Brook Lane, Billesley; trustees. Schools and assembly hall, Lyttleton Road, Stechford; trustees.

BRADFORD.—First portion of new infirmary scheme (£75,000, total scheme, £500,000); secretary, Board of Governors, Royal Infirmary.

BRIERLEY HILL.—Warehouse, Chapel Street, Pensnett, for Gill & Weaver, wholesale grocers (several thousand pounds).

BRIGHTON.—Factory, South Road; A. Darling & Sons, Ltd. 32 houses, Barnett Road; Hayward (Brighton), Ltd. Alterations, Abbots Hotel, Regency Square; C. E. Martin. Adaptation of Continental Hotel for municipal offices; borough engineer.

BURSLEM.—Electric furnaces, Furlong Tile Works; T. A. Simpson & Co., Ltd.

CANTERBURY.—Practical instruction school, for the borough E.C.; P. H. Warwick, city surveyor.

CHADDERTON.—Secondary school; Lancashire Education Committee.

CHELMSFORD.—50 flats, Boarded Barn estate; borough engineer. Warehouse, Victoria Road; Denham & Archer.

CRAYFORD (Kent).—Houses (71), Slades Green, for the U.D.C.; Clarke & Leahy, Ltd., builders.

DEWSBURY.—Church and Presbytery, at Moorthorpe; Holton & Fox, Corporation Street.

ELLESMERE PORT (Cheshire).—Church, Grace Road (£3,000); Slater Bros., builders.

FALKIRK.—Garage (£1,900); M. Millar, Woodside Garage.

GLASGOW.—Extensions at Knightswood Hospital for Corporation Public Health Department; medical officer. Cinema, &c., Byres Road, for Botanic Gardens Picture House, Ltd.; the secretary. Hall at Tallcross, for Salvation Army; officer commanding. 1,000 houses for Corporation; Balshagray Building Co. 1,000 houses, for Corporation; John McDonald (Contractors), Ltd. Electrical installation, Garscube Home; medical officer.

GRAVESEND.—School, Ordnance Road, for the borough E.C.; education architect.

GRAYS.—Extensions, Stifford Long Lane Hospital, for Orsett Joint Hospital Board; C. M. Shiner, architect, "The Barn," Dell Road.

GUILDFORD.—Assize Courts, Stoke Park; borough engineer.

HAMPSHIRE.—Mental colony, Portsmouth, Bournemouth, and Southampton Corporations.

HIGH WYCOMBE.—Factory extensions, Totteridge Road, for W. S. Toms, Ltd. Additions to chair factory, Richardson Street, for Smith & Co. Printing works extensions, High Street, for Bucks Free Press, Ltd.

IRISH FREE STATE (Queenstown).—Electric lighting at warehouse for the Pilotage Committee of the Cork Harbour Board.

IRLAM.—Central school, Lancashire Education Committee.

KINGSMEAD.—Hospital accommodation, residential school; Herts. Medical Officer.

LEAMINGTON.—Showroom, Russell Street; Midland Autocar Co. Additions, pump room filter house, for U.D.C.; R. P. Gathercole.

LEICESTER.—Mental institution, Birstall; city engineer.

LITCHURCH (Derby).—Church (£5,500), for the Wesleyan trustees; secretary.

LITTLE THURROCK (Essex).—Block of 22 shops, Purfleet-Tilbury Road, for F. C. Stark.

LLANBISTER.—School, for Radnorshire E.C.; T. W. Wishlade, county surveyor, Llandrindod Wells.

LLANDUDNO.—Suggested town hall extension; U.D.C., surveyor.

LONDON (Bow, E.).—Salvation Army Hall, Kerbey Street; Oswald Archer.

(Poplar, E.).—Additions, Dockland Settlement, East Ferry Road; J. Greenwood, Ltd.

(E.C.).—Building, 49-52, Houndsditch; Stone & Drew. Subway and vaults; Bankside Finance and Industries, Ltd.

(Finchley, N.).—Roman Catholic school; Catholic trustees. Canteen, Woodberry Grove; Metropolitan Electric Tramway, Ltd.

(Battersea, S.W.).—Adaptation of rooms at Central Library as museum; borough engineer. Synagogue, rear of 104, Bolingbroke Grove; D. Pierson.

(Hammersmith, S.W.).—Electric light and heating installation, Western ambulance station; chief engineer, Metropolitan Asylums Board.

MAIDENHEAD.—Adaptation of Crauford College as mental hospital; Middlesex C.C.

MANSFIELD.—Houses (113), Ravensdale estate, for the T.C.; R. Moore, builder, Stockwell Gate.

NEWCHURCH.—Elementary school, Lancashire Education Committee.

NORTHAMPTON.—Factory extension, St. James' Street; Wareings, Ltd.

PADIHAM.—Adaptation of West Bank House as clinic; Lancashire Education Committee.

PAIGNTON (Preston).—Lecture hall; Bridgman & Bridgman, the Palace Avenue, architects.

POCKLINGTON (East Yorkshire).—Assembly hall (to seat 500) for Pocklington School; Crickner & Foxley, architects, 1, Lincoln's Inn Fields, London, W.C.2.

PORTSLADE.—'Bus garage, Victoria Road; Southdown Motor Services, Ltd.

PORTSMOUTH.—Bank, High Street, Cosham; Lloyd's Bank, Ltd. Boiler house, Eldon Street, for Portsmouth United Breweries; Gallaways, Ltd. Factory, off Target Road; Hays Waterproof Glue Co., Ltd. Alterations and additions, 109-115, Commercial Road: Lloyd's Bank, Ltd. Drainage scheme at Cosham (£68,000); city engineer.

PRESTWICH.—Salvage and disposal scheme; U.D.C. surveyor. Shops and houses for Messrs. J. & W. Leach and Sons, Bury New Road; W. F. Pinfold, surveyor.

ST. ANDREWS.—Residence hall for men students for St. Andrews University Court; the principal.

SOUTHAMPTON.—Proposed theatre, Commercial Road, for Moss Empires, Ltd., London.

STAFFORD.—New St. John's Church; Rev. Frank W. Jones, vicar.

STIFFORD (Essex).—Alterations and additions, Ford Place, for Col. R. M. Laurie. Development of estate, Nutberry, for residences, for Col. F. H. D. C. Whitmore.

STIRLING.—Police court and offices (£11,750), for the T.C.; burgh surveyor.

STOKE-ON-TRENT.—Extensions, nurses' quarters at hospital; city engineer. Electrical installation, Saw Mills, Copeland Street; F. G. Chambers & Co., Shelton Wharf.

STOWE (Bucks).—Chapel, Stowe School (£40,000); Sir Robert Lorimer, architect.

SWADLINCOTE.—School, Newhall, for Derbyshire E.C.; H. W. Skinner, clerk, County Offices, Derby.

THAMES HAVEN (Essex).—Power station, for the London and Thames Haven Oil Wharves, Ltd.

TROWBRIDGE.—Bank, Fore Street, for the Westminster Bank, Ltd.

TYNEMOUTH.—73 houses, Ogle Terrace; 15 blocks of maisonettes, Balkwell; borough engineer. Smallpox hospital; borough engineer.

WALSALL.—Additional 40 houses, Rushall, for the R.D.C.; surveyor.

WARRINGTON.—School, Bewsey, for the borough E.C.; director of education.

WEM.—School, and extensions to Grammar School, for Salop E.C.; director of education, Shrewsbury.

WEST LOTHIAN.—Central school at Bo'ness; clerk, Education Authority, Bathgate.

YORK.—Church and school, Fulford Road; Christian Scientist Community.

The

Electrical Review

VOL. C. MAY 13, 1927. No. 2,581.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

London's Electricity Supply.

WE recently abstracted the report of the London County Council on electricity supply in the London and Home Counties Electricity District, and complimented the Council on the issue of these annual reports, which now comes to an end. No doubt the Joint Electricity Authority will take up the task, and keep us equally well informed as to the progress and development of the electricity supply industry in this area, which embraces one-fifth of the population of Great Britain.

By the two Acts of 1925 and the Electricity District Order of 1925 the supply of electricity was entrusted to the Joint Electricity Authority, which supervises 89 undertakings forming three groups, namely, a group of four companies; a group of ten companies (styled the London Power Company, which now owns or leases all the generating stations of the ten companies and supplies them with electricity in bulk); and the remainder of the companies and all the local authority undertakers, numbering 75 in all. The two company groups have a large measure of freedom to conduct their own affairs, but the undertakings in the third category come directly under the control of the J.E.A., which is preparing to erect a large power station at Chiswick for bulk supply.

In the hands of so many authorities, the supply has taken almost as many forms, varying from place to place in frequency and voltage, as well as in kind; worse still, perhaps, is the chaos of prices and tariffs which prevails. In view of the differences between the methods of charging, the only safe comparison must be based on the average revenue received per kilowatt-hour. For private lighting, power, and heat the average revenue of local authorities in the District in 1924-25 was 2.23d.; within the County the average was 2.12d., and outside its boundaries 2.40d. The figures for the companies were nearly a penny more—that is, 40 per cent. higher; their average revenue was 3.16d. (intra-London 3.14d., extra-London 3.24d.). Of the local authorities, the lowest was at Gravesend, 1.44d.; West Ham came next with 1.53d., then Woolwich, 1.57d., and Poplar and Erith, 1.62d. The highest in the County was Southwark, 3.57d., and Stoke Newington was also over 3d.; outside the County, Reigate, Epsom and

Maidenhead top the list with average receipts from 5.74 to 5.31d. Of the companies, West Kent has the best record with 1.8d., followed by Uxbridge with 1.96d., and by the North Metropolitan with 2.28d.—all outside the County. The highest company revenue was also extra-London—9.43d. at Caterham (Urban Electric Supply)—with Edmundson's at Dorking a good second, 8.78d. Ascot District Gas and Electricity Co. and the Urban Co. at Weybridge and Walton scored 7.79d. and 7.70d. respectively. Within the County, Brompton and Kensington, Notting Hill and Chelsea—all pioneer companies—head the list with 4.91d. to 4.88d.; no other company undertaking makes a worse showing than 4d., or a better one than 2.42d. (South Metropolitan). The London Electric Supply Corporation's figures include the supply to the Southern Railway and are not comparable with the others.

Although additional returns for the company undertakings are given for 1925 in an appendix, they are not sufficiently complete to allow of a similar analysis, but West Kent again takes the honours with 1.35d., closely followed by Uxbridge and North Metropolitan as before.

The three London companies with capital expenditure over three millions sterling—the City of London, County of London, and the Metropolitan—were also the three with the largest total revenue, and the largest profits. The City Company, charging an average of 3.32d. per kWh for private supply, paid £223,402 interest and dividends, and transferred £166,704 to reserve; the County Company, receiving 3.48d., distributed £355,772 and put no less than £491,316 to reserve; the Metropolitan received 3.94d. per kWh, distributed £199,676, and put £206,250 to reserve. On the basis of "capital called up" in 1924, these companies respectively disposed of 17.15, 20.8, and 15 per cent. in the form of dividends, interest, and reserve funds. The larger the reserves, capitalised under the Acts of 1925, the worse for the consumers of the future; and those reserves have been provided by the consumers of the past.

Compared with the low prices charged by most of the local authority undertakers, the company figures make a bad showing; they illustrate the contrast between private profit and public service, and suggest that after all there was some justification for the claim that public-service monopolies should be in public hands. We hope that under the new *régime*, which is intended to ensure the supply of electricity at the cheapest possible rates, the spirit of service will prevail and that the public interest will be the ruling consideration.

The Salaries of Engineers.

That it is the hope of reward that sweetens labour is a principle which lies at the very foundation of public and private service, whether the desired reward be fame, fortune, or the consciousness of duty done. With the first and last of these considerations we are not here concerned, though both are powerful incentives to work and have exercised immense influence on the development of civilisation—we wish rather to comment on the financial aspect of the subject, in the light of the correspondence which has been in progress in our columns during the past two months.

The profession of engineering has an inherent fascination for a large proportion of our race, and electrical engineering in particular possesses attractions which have drawn into its ranks a greater number of recruits than is justified by its requirements; throughout the past 30 years the profession has been overmanned, and complaints have been uttered by those who felt that their merits had not received just recognition. Unfortunately it is only too true that the standard of remuneration of electrical engineers in general has been, and is, far below the scale obtaining in other professions which can be entered with less arduous and lengthy training and entail no greater responsibilities, and whilst we look forward hopefully to a bright future, it is impossible to ignore the existing situation.

Various proposals have been put forward with a view to finding a remedy. The efforts of the Electrical Power Engineers' Association have met with a considerable measure of success; not only have its members in electricity supply undertakings secured a recognised schedule of salaries, but also it has gained the respect and confidence of the employers' side of the industry, and has been able to improve the lot of its members in private employ. The Society of Technical Engineers, which is not in a position to adopt the methods of the E.P.E.A., has promoted a Bill for the Registration of Engineers, with a view apparently to restricting the area from which posts can be filled. The bogy of Socialism has been invoked to frighten employers, and the policy of educating employers and the public has been advocated. The Institution of Electrical Engineers has been repeatedly charged with indifference to the interests of its junior members, and urged to take official action in the matter; but this, we know, is impossible, as the Charter of the Institution specifically debars the Council from concerning itself with questions of wages and salaries, and, as the President pointed out at the annual general meeting last week, even the Appointments Register has to be conducted unofficially, quite independently, by a voluntary committee in order to comply with the law. It is useless, therefore, to appeal to the Institution as a body, but the fact does not absolve its members from a measure of responsibility with regard to their fellows, and we welcome the suggestion of Mr. E. T. Williams that the leaders of the profession should interest themselves in the question.

In this, as in many other social matters, education is the soundest means to secure reform. The first step is to bring it home to the public that engineers are not adequately rewarded for their labours; the next, to induce employers to recognise their responsibilities and to remove the reproach under which they lie.

The Central Scotland Scheme.

The publication of the scheme which the Electricity Commissioners have forwarded to the Central Electricity Board, marks the commencement of the operations of that body, which came into office on the first of this month. An outline of the scheme is given on a later page, from which it will be seen that practically the whole of the industrial area of Scotland is embraced within its scope; the Board could hardly wish for a more favourable field in which to put its principles to the test, as the district includes collieries, engineering and shipbuilding, and manufacturing industries in abundance, whilst it is compact, so that long-distance transmission of electricity will not be required, and densely populated centres are numerous, so that the main lines can be tapped with profit. During the next seven years the Board will spend over five millions sterling, of which the greater part will be devoted to the standardisation of frequency, and the owners of selected stations will spend £850,000—a total of six millions, as against about 3.3 millions that would have had to be spent on the basis of individual development in the absence of the scheme; and in ten years' time the area will have an abundant supply of electricity from eight capital stations interconnected by ring mains. Let us hope that the supply will also be cheap; the Commissioners estimate that in the first four years—*i.e.*, 1930-34—there will be a saving of £894,000. On the other hand, at the end of that period the capital charges on the transmission system, up to then suspended, will be brought into account and the Commissioners anticipate a deficit in 1933-34 and later years, which is to be met by a uniform average charge of 0.0475d. per kWh supplied by the Board from the commencement.

A mass of estimates and data has been published by the Board, which will be studied with interest by all concerned with electricity supply.

Publicity for Supply Undertakings.

Simple Language and Plain Statements Essential.

By EDWARD E. HAMAR (Shropshire, Worcestershire and Staffordshire Electric Power Co.)

As one interested in the publicity side of a supply undertaking which distributes power in large industrial and rural areas, I feel that I can offer a few suggestions as to what is a good business-getting style of advertising.

Engineers are too much inclined to take things for granted, that is, they expect the consumer or prospective consumer to know almost as much about the business as they do themselves. The public are certainly becoming more educated in the uses, but not the technicalities, of electricity; therefore only the uses, with the cost of operation, should be spoken of.

It is astonishing how many people who would welcome a supply do not even know how to obtain it. In order to appeal to the public, all advertising literature, whether explaining a particular appliance or the cost of operation, must be in very simple language. The leaflet or booklet may be a work of art in appearance, but if in its pages there appear numerous calculations with such words as volts, amperes, watts, &c., in most instances it will not be understood, and instead of the leaflet being put on one side for reading at leisure, it will be committed to the fire or waste-paper basket.

The periodical circulation of leaflets of seasonal character, commencing with one dealing with "Our Service and How to Obtain It," leads to a marked influx of new and additional business. This initial pamphlet should commence with a simple and brief outline of the generating side of the business, followed by distribution and a simple explanation of how the costs of an electricity supply undertaking are made up, and concluding with detailed information of what to do to obtain a supply and a few of the most important uses to which electricity can be applied. The circulation of such a pamphlet should be followed by a personal call from a canvasser, who should be the type of man who has been educated to talk in a language which is intelligible to the lay mind, that is, simple and non-technical. Seasonal literature, which can be enclosed with the quarterly accounts, should take the form of attractive leaflets giving illustrations of the different electrical appliances, with an explanation and the cost of operation.

It is very pleasing to note that contributions to the non-technical Press generally on electrical service are improving, but in reading between the lines of many of the articles there is still a certain lack of confidence in electrical appliances. This lack of confidence can be largely accounted for by the fact that it is only during recent years that perfection has been attained in certain apparatus. Electricity has developed so rapidly within a short period that many are inclined to think of appliances as they were some few years ago, and not as they are to-day. Quite recently I read an article, excellent in many respects, on electric cooking, and some of the smaller electric domestic labour-saving appliances. Unfortunately, however, it mentioned the great care and attention that was called for, in addition to which a large amount of stress was laid on the fragility of these appliances. I agree that electrical appliances have to be handled with a certain degree of care, but no more care is necessary than would be called for if other methods offered the same convenience and were of an equally portable character.

There is also the question of cost of operation which, in most instances, is dealt with on the lines that electricity is exceedingly expensive if particular attention is not given to control of heat and the like, and that electrical appliances should be handled by the housewife and not the maid, otherwise a very heavy account may be expected at the end of the quarter. Now, such conditions apply to other methods, such as coal, oil or gas, but there is always a very pronounced emphasis upon the cost of electricity. This is in all probability due to the fact that the advance in the knowledge of the writers has not kept pace with the progress of electrical apparatus. Such statements, which are made with no intended malice towards our business, are very harmful to both the manufacturer and supply undertaking. I feel that each of us in our own publicity can do much towards regaining the confidence of the public, for with the perfection of electrical appliances we are now in a position, based on practical experience, to give true facts regarding both reliability and cost of operation.

My comments so far have chiefly dealt with prospective business. Now for a few words regarding the existing consumer, for the loading-up of existing services is as essential as new business. I find from experience that the forerunner of any campaign for obtaining additional loading of service connections should be in the form of a booklet, which could be entitled "Our Service, and What it Will Do." The booklet should be illustrated, with a concise explanation of the appliances, how to use them, and the cost of operation. This can be followed up a few days later by the call of a canvasser, and in many instances it will be found that the booklet has already obtained the desired interest in some appliance or other, and all that remains to complete a sale, or the hire of apparatus, is a few further details. There always appears to be a certain degree of objection to canvassers, for many are inclined to think of a canvasser as one who only considers commission, with no regard to the truth of his statements. Suitable publicity preceding the call will, however, make all the difference in the attitude of the prospective purchaser, and also make it easier for the canvasser.

A further tried suggestion is a house-to-house inventory of all electrical appliances in use or discarded. It is surprising how much apparatus has been put on one side owing to small defects, and apart from this, the information obtained will be found exceedingly useful for other purposes. Here we come to the point as to whether a reasonable allowance could not be made for the old discarded appliances towards replacing them with more modern types. This, in my opinion, is a business proposition, for apart from the resultant increased revenue by again having the apparatus in commission, the confidence of the consumer in electrical appliances is retained. It is really nothing more than a service to which the consumer is entitled and if we wish to see the hoped-for development in the domestic side of our business, service has got to be given.

The Electrical Development Association is now issuing some very attractive publicity matter both in the form of leaflets and posters, and I should like to see a larger display of the latter on the hoardings of towns and villages throughout the country. Good posters leave that lasting impression which in publicity is the goal for which we strive.

Internally-Heated Furnaces.

A recent development in the total enclosure of the heating elements of resistance furnaces by means of specially shaped bricks which are built up to form the furnace lining, providing adequate support and uniform heating.

OF the varied problems encountered by the designer of large internally-heated electric furnaces, that of ascertaining the most effective method of installing the heating elements is by no means the easiest to solve. Numerous forms of construction have been tried both in this country and abroad, differing in type no less than in the difficulties presented by their employment: for instance, the use of knobs of porcelain, or other material, fixed to the walls and roof of the furnace chamber, on which the nickel-chrome wire or strip heating element was wound, led to early failures, the failure of the knobs being in some instances due to heat and in others to mechanical damage; cast nickel-chrome grids have also been employed, but this form of heating element does not satisfactorily permit of floor heating and possesses other disadvantages.

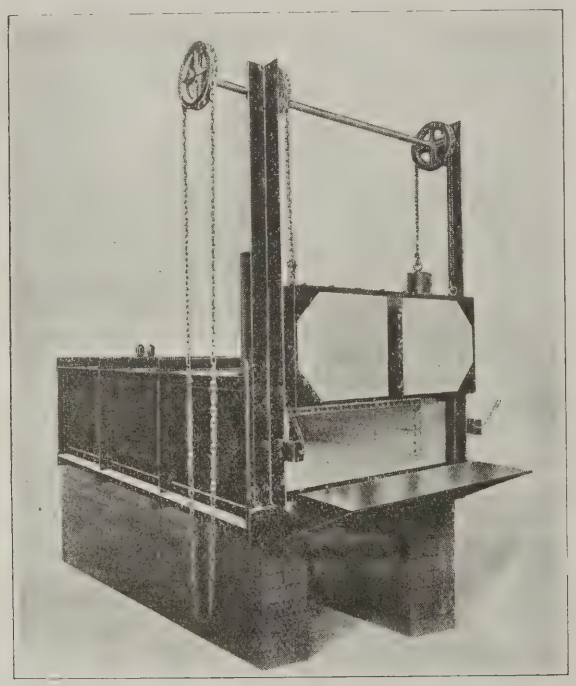

Fig. 2.—A Muffle Furnace, 36 kW at 440 Volts.

The designing of large types of electric furnaces to meet the requirements of manufacturers so far as uniform heating is concerned and, at the same time, guard the heaters and their supports from mechanical damage has been no easy matter. It must be borne in mind that furnaces of large capacity must be of rugged construction to withstand rough usage and the very heavy abrasive wear occasioned by the continuous introduction of heavy articles and their removal from the chamber; this fact led to the decision that heating units in such furnaces should be entirely enclosed, and it was also considered advisable that the bricks forming the lining, and certain other parts of the furnace, should be free to expand and contract during the period when they were being heated and while they were cooling. As the result of the above-stated conclusions, the form

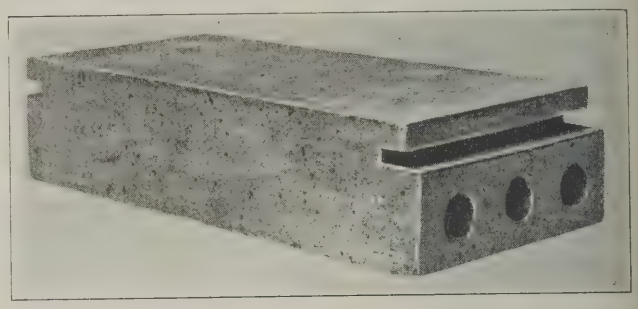

Fig. 1.—Furnace Lining Brick.

of brick construction depicted by the accompanying illustrations has been designed by Automatic and Electric Furnaces, Ltd. The type of brick used in Wild-Barfield internally-heated furnaces is, as shown in fig. 1, pierced with longitudinal holes, so that when the bricks are built up to form a chamber the holes in each adjacent brick coincide to form tunnels through which special spiral heating elements, or rods, can be freely drawn, thus allowing uniform heating conditions throughout the entire chamber; the wire spirals or rods, being entirely enclosed in separate tunnels, are prevented from coming into contact with any material being heated in the furnace, and an arrangement of bus-bars at the far end allows of the linking-up of the various units to meet the requirements of one-, two-, or three-phase supply. Fig. 2 shows a rectangular muffle furnace having a heating chamber 56 in. by 28 in. by 8 in., the input being 36 kW at a pressure of 440 volts on a three-phase supply circuit.

One great advantage of this type of electric furnace construction is the ease with which the heating units can be divided to suit various conditions of supply. In this particular case there are 18 spiralled coils to each phase, the arrangement being six coils in series and three in parallel per phase. The maximum working temperature in the chamber is 1,000 deg. C., and the control is automatically accomplished by means of

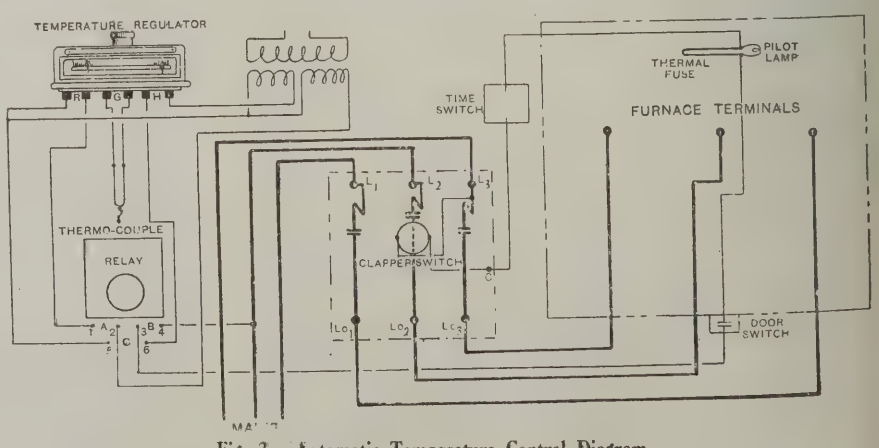

Fig. 3.—Automatic Temperature Control Diagram.

a combined Cambridge regulator and clapper switch. Fig. 3 shows the circuits, and it will be noted that in

the local energising circuit is a patented thermal fuse, which enters the heating chamber and is connected in series with the relay, time switch, door switch, and the energising coil of the clapper switch; it will be seen that the complete circuit may be broken at four different points. The thermal fuse is shunted by a red pilot lamp, so that, in the event of overheating, the red lamp will light immediately the fuse melts. The door switch is automatic in action, *i.e.*, when the door of the furnace is open, the main heating circuit is broken, so that there can be no possibility of shock to the operator; when the door is closed, the circuit is once more made. The time switch is (1) for the purpose of early morning switching on before the works open, so that the furnace is hot when the operatives arrive, and (2) for night operation when the furnace is timed to come into operation after the works are closed, the heating charge being controlled by the automatic temperature control mechanism.

Fig. 4 shows two large Wild-Barfield hot plates, each measuring 6 ft. square, to operate on a 200-volt, 2-phase supply circuit; they have been constructed for a special purpose, uniform heating and simplicity of temperature control being essential; the loading of each plate is 25 kilowatts, and they operate at a temperature of 780 deg. C. It will be noticed that the bricks in which the heating spirals are laid, unlike the furnace bricks shown in fig. 1, have open grooves, so that the heating elements in this case are actually exposed. Many internally-heated electric furnaces are in operation both in this country and abroad, their use not being confined to the heat-treatment of steel, but being equally important in the annealing of non-ferrous metals, glass, &c. In addition, special furnaces of this construction are designed to suit various industrial requirements.

Wireless Telegraph Communication.

A review of the present position of maritime safety services, commercial communication, and point-to-point telegraphy in view of the proposed modified requirements and regulations to be discussed at the International Conference to be held in the United States next Autumn.

By Lieut.-Col. CHETWODE CRAWLEY, M.I.E.E.

(*Continued from page 676.*)

(III) Point-to-Point Wireless Services.

THERE were practically no commercial point-to-point wireless services in operation when the last International Conference was held in 1912, so that the whole field of point-to-point communication will be virgin soil for the International Conference to be held this autumn at Washington.

It is likely that spark waves will be prohibited for international point-to-point communications, owing to their causing such wide bands of interference, but in any case there are now no important point-to-point stations using spark transmission. Rules to regulate the allowable widths of wave bands will no doubt be formulated, and the question whether wireless telephone services should be confined to certain definite wave bands will be considered.

Wave-lengths.—Attempts were made just after the war to formulate some broad principles for regulating the wave-lengths to be used for long range communications. One attractive suggestion was to divide the world into geographical zones so that the receiving stations in any given zone would all be receiving from distant stations waves which, though close together, would not cause mutual interference as the signals would all be of much about the same strength and could be easily sorted out, whereas the strong signals transmitted from stations in that zone, though not differing much in wavelength from one another, would be well separated in wavelength from the signals being received from the distant stations and could thus be eliminated in the receiving circuits. No definite scheme however was adopted, and the network of international wireless communications which has since grown up has been regulated, successfully on the whole, by a policy of compromise and common sense. It is unlikely now that any attempt will be made to allocate wavelengths on geographical or national bases.

There are only about 100 long waves available for the use of high-power stations, so that it would be extremely difficult to arrange for any great expansion of long-wave working, but fortunately the newly discovered possibility of using short waves for long distances has eased the situation

Theoretically there are some 3,500 waves under 100 metres available for long-range work, but it must be remembered that the advent of wireless telephony on short waves for long ranges will before long absorb a great number of waves which would otherwise be available for telegraphic purposes. There are, too, the difficulties that all short waves are not equally suitable for all distances, that short waves which are suitable for certain communications at one period of the day or night are not necessarily suitable at another, and that waves which are suitable at one season of the year may not be so suitable at another. The theoretical

number of available waves, therefore, may be much reduced in practice.

History however will no doubt be repeated, and new avenues for advance will be opened up as in the past. The assumption of the existence in the upper atmosphere of a Heaviside layer which is to some extent conductive due to the presence of free electrons may perhaps, again come to the rescue by allowing advantage to be taken of the skip distance effect of short waves so that waves may be made to skip areas where they would otherwise cause interference. But this solution presents great difficulties as the skip effect is very variable, and a more practical line of advance seems to be presented by the development of beam signalling so as to admit of interference being reduced by confining the greater part of the transmission to definite paths.

It is often said that in this country we are slow starters, which makes it all the more satisfactory to realise that in the utilisation of short-wave beams for great distances we are actually first in the field with our Empire scheme of beam stations. The beam stations for transmission to Canada and South Africa are situated at Bodmin, and for Australia and India at Grimsby, with receiving stations at Bridgwater and Skegness respectively. The wireless valve transmitters are operated by high-speed apparatus in the G.P.O., London, and the wireless signals received are relayed from the receiving stations to the recording machines which are placed alongside the keying apparatus. The Canadian and Australian services are in satisfactory operation, and the others will be ready shortly. These stations, which were erected by the Marconi Company, are to be operated by the Post Office, and in addition the Marconi Company now has a beam service in operation to South America.

In the Empire at the beginning of the year we had working or under construction eight long-range short-wave stations, including the beams, as compared with two in the United States, one in Italy, one in Germany, and one in the Argentine, and we had nine smaller ones, compared with nineteen throughout the rest of the world.

The advantages of using short waves, compared with long waves, are that for long ranges the possible number of stations in operation is enormously increased; as explained above, the power required for operation is much less than that required for long waves, thus greatly reducing capital cost and running expenses; interference from atmospherics is much less, and the signalling speeds obtainable are much greater. The only disadvantage is that, at present, communication by short waves is not nearly so reliable as by long waves due to fading and similar phenomena which are so far little understood and for which remedies have still to be found.

As regards high-power stations using long waves, we cannot boast of numbers as we have only 5 in the whole Empire, compared with 15 in the United States, 9 in France, and 18 in the rest of the world. But on the other hand, it is satisfactory to note that, with the co-operation of the United States, we have inaugurated the first long-range telephone service, the London-New York circuit, and that we have at Rugby the most powerful all-round station in the world.

Operation.—Three systems are used for long-wave transmission over great distances, valves, arcs, and alternators, and we have an example of each in this country.

The Post Office station at Rugby uses valve transmission on an 18,740-metre wave. It broadcasts Government communiqués to ships and stations all over the world free of charge, transmits commercial traffic to ships in any part of the world at an inclusive charge of 1s. 6d. a word, and, in conjunction with a receiving station, is used simultaneously for the transatlantic telephone service on a wave between 5,000 and 6,000 metres from 1.30 p.m. to 7 p.m. daily except Sundays at a charge of from £15 to £17 8s. for three minutes' conversation. For telegraphy, the Rugby station is operated, as are all the Post Office point-to-point stations, over land lines from the G.P.O., London, and for wireless telephony it is operated by the sender's voice over a trunk line from London, the received messages from New York being relayed to London from the wireless receiving station at Wroughton. A new receiving station for this service is being completed at Cupar. A medium-power long-wave set and a short-wave valve set are also being installed at the Rugby station for point-to-point services.

The Post Office arc station at Oxford uses waves of 12,350 metres and 8,750 metres, and transmits commercial traffic to Cairo and Press messages to Halifax. There is, too, a short-wave set at the Oxford station, which is used to supplement the long-wave transmission.

The similar Post Office arc station at Cairo, which will shortly be turned over to the Marconi Company, transmits on an 11,000-metre wave to Oxford, Germany, France, Italy, and Basra, and broadcasts meteorological messages on behalf of the Egyptian Government.

The Marconi Company operates a high-power alternator station at Carnarvon for the transmission of traffic and Press messages to America on waves of 14,200 metres and 9,400 metres. A high-power valve transmitter is also installed at this station as an alternative.

The Post Office operates medium-power long-wave valve stations at Northolt and Stonehaven for transmission to Italy, Cezcho-Slovakia, Hungary, Russia, Poland, Esthonia, and Danzig, and, in case of cable interruptions, to Germany, Norway and Iceland.

All messages received are relayed to the G.P.O., London, from the Post Office receiving station at St. Albans, with the exception of messages from the beam stations, which relay from their special receiving stations.

The Marconi Company operates a group of medium-power long-wave valve stations at Ongar for transmission to France, Spain, Portugal, Sweden, Austria, Jugo-Slavia, Switzerland, and Russia. The company is also free to open services with various other European countries and with countries outside Europe, but all stations for communication with the Empire will be operated by the Post Office.

All the Marconi Company's transmitters are operated from its office at Radio House in London, to which the received messages are relayed from its wireless receiving station at Brentwood.

The Marconi Company also conducts a telephotographic service which is available for the transmission of pictures, printed matter, &c., between London and New York. There is no television service yet in commercial operation.

As a rule the sending apparatus at point-to-point stations is operated by Wheatstone transmitters, and the speed of signalling in the case of the long-wave stations is from 50 to 100 words a minute, and from 100 to 200 words a minute in the case of the short-wave stations. The received messages are normally recorded in Morse code by Wheatstone or undulator instruments, or as printed letters by Creed apparatus. The latter arrangement saves writing up the messages, but is not so suitable as the former ones when receiving conditions are unsatisfactory.

The rates for radiotelegrams are as a rule the same as for cables and land lines, and where no route is specified by the sender the Post Office selects the route according to circumstances at the time of transmission. When the rates differ, the wireless rates are the lower, as in the case of the Australian beam service and the service to Egypt. The rates for the beam services to South Africa and India have not yet been announced.

The broadcasting services can hardly be considered as commercial point-to-point services, but it is interesting to note the number of stations now in operation. In North America there are about 800 (700 in the United States), in Europe 170, in South America 40, in Oceania 30, in Asia 20, in Africa 10, making a total of about 1,070 stations throughout the world.

The Measurement of Sheath Losses in Cables.

The accurate determination of sheath losses in single-core cables is of great importance in connection with the transmission of energy at very high pressures, but has presented great difficulties. The author describes a simple, quick, and accurate bridge method of measurement.

By R. A. BROCKBANK, B.Sc.

CONSIDERABLE attention has been directed recently by cable manufacturers to the determination of sheath losses in cables, in view of the possibility of employing single-core armoured cables for very-high-voltage transmission. The subject has formed the basis of several theoretical studies, but several assumptions have to be made about which the various authors are not in entire agreement, so that it becomes necessary to correlate any differences between experimental data and calculated results in order that the losses may be predetermined with fair accuracy from the physical characteristics of any cable.

Up to the present the published results appear to have been obtained almost exclusively by the use of the electromagnetic wattmeter. This instrument, whilst offering apparently a simple solution to the problem, suffers, even in skilled hands, from many disadvantages, the most serious being:—

(i). Corrections due to the phase angles of the two coils.

(ii). Very low sensitivity with small currents and relatively short lengths.

(iii). Necessity for an absolutely constant voltage supply; the loss varies as the square of the voltage.

(iv). Necessary arrangements for giving various current ranges.

(v). Accurate calibration of voltmeters and ammeters in conjunction with their leads.

(vi). Interpolated resistance readings between each wattmeter reading due to the change in resistance caused by the large currents.

The following method of measuring sheath losses was evolved in the E.H.T. Research Laboratories of Messrs. Standard Telephones and Cables, Ltd., for a special line of research requiring the highest sensitivity, where the electromagnetic wattmeter had to be abandoned owing to its insensitivity and inaccuracy.

The schematic diagram is shown in fig. 1 and consists essentially of a superimposed a.c. and d.c. bridge. The cable (z_1) is connected in series with a standard resistance R_3 of the order of 0.01 ohm. The other side of the bridge consists of two 10,000-ohm decade resistance boxes in series, R_4 being shunted with a 2-mfd. variable mica condenser (C_4). By means of the switch S_1 a d.c. galvanometer or a.c. vibration galvanometer can be thrown across the junction joints of the arms R_1 R_3 and R_2 R_4. The bridge is supplied by a low-voltage loading transformer, and provision is made for balancing the bridge on d.c. by switches S_2 S_3, which admit a 4-volt battery into the circuit. S_2 is a heavy-current-carrying-capacity switch (500 amps). S_4 opens the a.c. supply. The current through the cable is determined by measuring the voltage drop across R_3.

Consider the case when the bridge is in balance on alternating current. Then the impedance of arm (4) $= R_4/(1 + jw\ C_4 R_4)$.

Thus in the balance condition $z_1 \times R_4/(1 + jw\ C_4\ R_4) = R_2\ R_3$, whence $z_1 = R_2\ R_3/R_4 + j\ (w\ C_4\ R_2\ R_3)$
and the phase angle of the cable
$z_1 = \tan^{-1} w\ C_4\ R_2\ R_3 \times R_4/R_2\ R_3 = \tan^{-1}\ w\ C_4\ R_4$.

Therefore $R_2\ R_3/R_4$ will be the equivalent resistance of the cable which multiplied by (current)^2 will give the cable loss.

The bridge is balanced by keeping R_3 and R_4 constant and varying R_2 and C_4; the absolute value of C_4 is not required, unless a knowledge of the phase angle or inductance of the cable is desired.

The d.c. copper resistance of the cable is obtained by switching in the d.c. galvanometer and including the battery in place of the alternating current. R_2 is adjusted for balance.

The sequence of readings to obtain the various losses is as follows:—

(i) Put the bridge on d.c. and adjust R_2 to a value R_o for balance.

(ii) Put the bridge on a.c. with the lead open-circuited. Adjust R_2 and C_4 for balance. Let the value of R_2 be R_a.

(iii) Bridge on a.c. with lead bonded. Adjust R_2 and C_4 for balance. Let this value of R_2 be R_b.

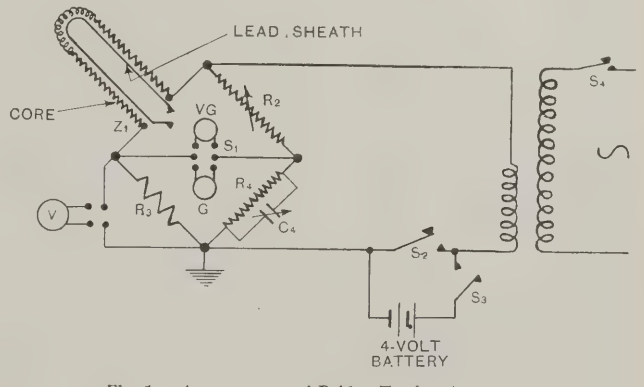

Fig. 1.—Arrangement of Bridge Testing Apparatus.

From these values of R_o, R_a, and R_b—
100 $(R_a - R_o)/R_o$ = loss due to eddy currents, skin effect, &c., as a percentage of the copper loss.
100 $(R_b - R_a)/R_o$ = loss due to circulating sheath currents as a percentage of the copper loss.
and 100 $(R_b - R_o)/R_o$ = total sheath loss as a percentage of the copper loss.
Also $I^2\ R_o$ = "dead" copper loss (on d.c.).
$I^2\ (R_a - R_o)$ = eddy and skin resistance loss.
$I^2\ (R_b - R_a)$ = circulating bonded lead loss.
$I^2\ (R_b - R_o)$ = total bonded loss.

A typical result on a short length of 66,000-volt, single-core, lead-covered cable with 6 inches between axes gave the following results:—

$R_3 = 0.01$ ohm; $R_1 = 4{,}000$ ohms; $R_o = 1{,}980$ ohms; $R_a = 2{,}029$ ohms; $R_b = 2{,}537$ ohms;

therefore loss due to eddy-current and skin effect as a percentage of the copper loss $= 100\ (R_a - R_o)/R_o = 2.47$ per cent.

and circulating bonded loss as a percentage of the copper loss $= 100\ (R_b - R_a)/R_o = 25.7$ per cent.

Therefore total sheath loss $= 2.47 + 25.7 = 28.17$ per cent.

The a.c. and d.c. galvanometers had sensitivities of 100 and 50 mm/microamp. respectively.

A check test on the circulating bonded loss from a knowledge of the lead open-circuit volts and lead and copper resistances gave the following result:—

Core current, 50 amps.; core resistance, 0.004951 ohm.

Lead voltage (open circuit), 0.290 volt; lead resistance, 0.02450 ohm.

Lead inductance (calculated), 20.5×10^{-6} henries.

Therefore, sheath loss $= 0.29^2 \times 0.0245/[0.0245^2 + (314 \times 20.5 \times 10^{-6})^2] = 3.205$ watts;

and copper loss $= 50^2 \times 0.004951 = 12.38$ watts.

Hence ratio sheath loss/copper loss $= 3.205/12.38 = 0.259 = 25.9$ per cent., which is in very good agreement with the measured value of 25.7 per cent.

The advantages which are claimed for this method are:—

(1) *Simplicity and Ease of Control.*—The method is a null method and only requires the adjustment of a resistance and a capacity; the value of the latter need not be known. No readings are taken from deflectional instruments.

(2) *Time of Reading.*—The three readings take from 3 to 5 minutes.

(3) *Accuracy.*—The accuracy depends solely on the accuracy of the decade box R_2, which has a value of 4,000 ohms, and only requires calibration to the nearest ohm to indicate a change in R_1 of the order of 2.10^{-4} ohms.

(4) *Sensitivity.*—The sensitivity is extremely high, and measurements can be made with currents as low as 5 amps. on a few yards of cable if the ratio arms R_3 and R_4 are reduced in value. The balance point is extremely sharp.

(5) *Wave Form.*—As the vibration galvanometer is tuned to the fundamental, only the loss due to a pure sine wave is measured.

(6) *Range.*—Measurements can be taken from 5 amps. upwards without any alteration to the circuit. The only limit is the ultimate carrying capacity of R_2.

Measurements on lead-covered cables do not require to be taken with the operating value of the core current, as the ratio of the sheath to copper losses is independent of the current. In the case of armoured cables, however, the loss must be measured separately for each working current, as the loss is a function of the permeability of the armour, which varies with the magnetising force.

Due primarily to the sensitivity and accuracy which this bridge method offers for measuring the losses on very short samples and small currents (for lead-covered cables), a large number of experimental data have been accumulated which have been correlated with theoretical calculations to a high degree of accuracy.

Ascertainment of "Kilowatt Maximum Demand."

A criticism of the method of obtaining the kilowatt maximum demand defined in the Electricity (Supply) Act, 1926.

By FREDK. W. PURSE, M.I.E.E., M.I.Mech.E., Chief Engineer, West Ham Electricity Department.

WITH the passing of the Electricity (Supply) Act, 1926, the question is brought into prominence of ascertaining the "kilowatt maximum demand" on which the charges for supply are to be based. It will be interesting to quote the exact words in the Act (Section 52 (3) b) and [Seventh Schedule]:—

"For the purposes of this (sub-Section) [provision], the (number of kilowatts of) maximum demand (for) [in respect of] any month shall be deemed to be twice the largest number of units of electricity supplied (to the undertakers) [from the generating station] during any consecutive thirty minutes in that month: Provided that if the number of kilowatts of maximum demand so ascertained [for any particular month] shall be less than the number of kilowatts of maximum demand (in) [for] any previous month of the same year of account (payment shall be made on) the higher numbers [shall be taken as the maximum demand for the first mentioned month]."

This is the first time that public legislation has actually set out how the kW m.d. shall be ascertained; the system prescribed singularly differs from other methods, and it is difficult to understand the basis of its foundation.

Theoretically speaking, the fixed charge per kW should produce exactly the total of the fixed costs when applied to the respective maximum demands, if these have been correctly ascertained.

In considering this matter it will be useful to enumerate the generally accepted methods of ascertaining the kW m.d.:—

(1) The highest recorded in any year of account to be charged throughout the whole year.

(2) The highest recorded each quarter to be charged for that quarter.

(3) The highest recorded in each month to be charged for that month.

Note.—To avoid severe fluctuations in monthly accounts this method can be applied by charging each month the average of the previous twelve months.

(4) The new method in the Electricity Act, which can be called the "Government method."

It will be obvious that to raise a total "fixed charge" of, say, £100,000, the amount to be levied per kW m.d. will be a varying figure under the methods enumerated above.

It will be lowest under (1), highest under (3), some intermediate figure under (2), and indefinite under (4), depending upon the month in which the m.d. occurs.

What concerns supply engineers, however, is which of the methods, when applied, whilst producing the same result to the undertaking, will be most equitable to all the consumers.

A hypothetical example will be of some assistance, and for simplicity's sake it has been assumed that the

undertaking is supplying two consumers only, as follows:—

	A. Registered. kW.	B. Registered. kW.	Undertaking. Registered. kW.
April	40,000	25,000	65,000
May	40,000	15,000	55,000
June	35,000	10,000	45,000
July	30,000	10,000	40,000
August	30,000	15,000	45,000
September	35,000	15,000	50,000
October	45,000	20,000	65,000
November	50,000	30,000	80,000
December	55,000	45,000	100,000
January	55,000	45,000	100,000
February	50,000	40,000	90,000
March	45,000	35,000	80,000
12 months total	510,000	305,000	815,000
Ave. monthly kW	42,500	25,416	67,916

Now assume that the undertaking's fixed costs amount to £407,500. This sum must be obtained in one way or another through the kW m.d., and represents (*a*) £4,075 per kW reckoned on the highest m.d. on the undertaking, or (*b*) 10s. per kW m.d. per month on the actual monthly demand (NOTE.—The same charge of 10s. per month would apply if the average of the twelve months were taken, as mentioned above), or (*c*) £1.2936 per quarter per kW m.d. if charged on the highest m.d. in the quarter.

To clearly see the effect of the method inserted in the Electricity Act, it will be necessary to repeat the above table, but modified to show the figures on which the charges will be made:—

	A. Charged under Government method. kW.	B. Government method. kW.	Undertaking. Registered (as in previous table). kW.
April	40 000	25,000	65,000
May	40,000	25,000	55,000
June	40,000	25,000	45,000
July	40,000	25,000	40,000
August	40,000	25,000	45,000
September	40.000	25,000	50,000
October	45,000	25,000	65,000
November	50,000	30,000	80,000
December	55,000	45.000	100,000
January	55,000	45,000	100,000
February	55,000	45,000	90,000
March	55,000	45,000	80,000
12 months' total	555.000	385,000	815,000
	940,000 kW.		

In this case, to produce the same total fixed cost as before, the charge to A and B will, in accordance with the Act, have to be 8.67 shillings per kW m.d. per month.

If the total costs to each consumer A and B are worked out for the respective methods, they will be found as follows:—

	A	B	Total.
(1) Annual max. demand ...	£224,125	£183,375	£407,500
(2) Quarterly max. demand ...	239,400	168,100	407,500
(3) Actual monthly demand ...	255,000	152,500	407,500
(4) Government method ...	240,598	166,902	407,500

It is obvious that the four methods, giving such varying results, cannot all be right; possibly not one is correct, but one may be the nearest approximation that is obtainable.

Which one is it?

Perhaps if another set of illustrations be worked out with somewhat different characteristics it may throw some more light on the subject.

In the following example the maximum load of each consumer is the same, but one occurs in the summer and the other in the winter, and the total maximum load on the station is the same as in the previous example, *viz.*, 100,000 kW, so that the total fixed costs of £407,500 remain the same.

	A. Registered. Kilowatts.	B. Registered. Kilowatts.	Undertaking. Registered. Kilowatts.	Govt. method. A.	Govt. method. B.
April ...	50,000	45,000	95,000	50,000	45,000
May ...	60,000	30,000	90,000	60,000	45,000
June ...	75,000	12,000	87,000	75,000	45,000
July ...	80,000	12,000	92,000	80,000	45,000
August ...	80,000	15,000	95,000	80,000	45,000
September ...	60,000	30,000	90,000	80,000	45,000
October ...	50,000	50,000	100,000	80,000	50,000
November ...	30,000	65,000	95,000	80,000	65,000
December ...	20,000	80,000	100,000	80,000	80,000
January ...	20,000	75,000	95,000	80,000	80,000
February ...	30,000	70,000	100,000	80,000	80,000
March ...	40,000	60,000	100,000	80,000	80,000
	595,000	544,000	1,139,000	905,000	705,000
				1,610,000	

The respective charges would be:—

(1) Annual maximum demand, £2.547 per kW.

(2) Quarterly maximum demand, 17.34 shillings per kW per quarter.

(3) Actual monthly demand, 7.155 shillings per kW per month.

(4) Government method, 5.06 shillings per kW per month.

The total costs apportioned would be as follows:—

	A.	B.	Total.
(1) Annual max. demand ...	£203,750	£203,750	£407,500
(2) Quarterly max. demand...	212,500	195,000	407,500
(3) Actual monthly demand...	212,874	194,626	407,500
(4) Government method ...	229,060	178,440	407,500

Some curious results emerge from these examples.

In the first set of conditions the quarterly m.d. and the Government method give approximately the same results, but under the second set of conditions the quarterly and monthly m.d.'s give almost identical results.

If the second set of conditions are examined, it will be noticed that consumer A represents a class of load eagerly sought after, *viz.*, a high summer peak and a low winter peak, such as would obtain with a supply to an ice factory.

Yet it will be seen that (assuming the year of account commences in April) this consumer pays the highest amount under the Government method, and in no case less than the other consumer whose m.d. is identical and occurs at the usual time in December.

Generally, the consumer with such a special summer load is quoted a lower rate than other "peak-load" consumers because he is being supplied from plant that would be otherwise standing idle, but this is no logical reason, since this consumer, if he were using his own plant, would have to carry his fixed charges whilst his plant was standing idle in the winter.

The fixed charge is, of course, made on the consumers' kWh m.d., and it would be obviously unfair to base it only on the consumers' demands which coincided with the m.d. on the station, especially under the second set of conditions given above.

The lower rate quoted for what is called a non-peak load should not obtain because of the so-called non-peak; it is a lower rate because all the rates move in sympathy, and this is seen above where the rate under the first set of conditions is £4.075 per kW of annual m.d., compared with £2.547 in the second set of conditions.

It would appear generally that method 1 would give the nearest approach to equality as between consumer and consumer without introducing complicated records and calculations.

If the consumer desires to pay his account according to his monthly or quarterly m.d., it should be at a rate which produced the same result as by applying the approximate rate to the annual maximum demand.

Thus in the first set of conditions consumer A's quota should be £224,125 paid on his annual m.d.

On his quarterly m.d. the charge to produce this sum would be £1.211 per kW, as compared with £1.2936.

On his monthly m.d. the charge would be 8.8 shillings per month, as compared with 10 shillings per month.

Naturally, consumer B's rate on such a quarterly or monthly basis would not be the same, but they would both pay at the same rate per kW of annual maximum demand, *viz.*, £4.075 per kW.

Certain factors may come in to cause variations, such as the total amount of load, whether high voltage or low voltage, power factor, and others which need not be enumerated, but there is not the same difficulty in making adjustments for these.

The fundamental basis to be determined is the correct allocation of the fixed costs as between consumer and consumer according to their loads, and maybe each of the methods enumerated above departs sufficiently from a correct allocation to make them all equally unsound.

The matter has received considerable attention in the United States, and even now there does not appear to be a generally accepted method of ascertainment and application.

In view of the prominent place that two-part tariffs will occupy, both as regards the number of undertakings that will be supplied in bulk by the Central Electricity Board and the number of consumers, domestic in particular, that will be supplied by the respective undertakings, the author suggests that the matter should be specially investigated by some authority or committee with a view to a definite and agreed basis being formulated that could be universally applied by all suppliers of electricity.

Central Scotland Electricity Scheme, 1927.

Prepared by the Electricity Commissioners in pursuance of Section 4 of the Electricity (Supply) Act, 1926, and published by the Central Electricity Board.

THE Electricity Commissioners have prepared the above-named scheme and "transmitted" it to the Central Electricity Board. It deals with an area of 4,980 square miles, as outlined on the accompanying map, including roughly, the whole of the industrial, shipbuilding, and coal-field areas of Scotland, and extending from Montrose and Brechin, in the county of Forfar, to the southern boundary of the county of Ayr.

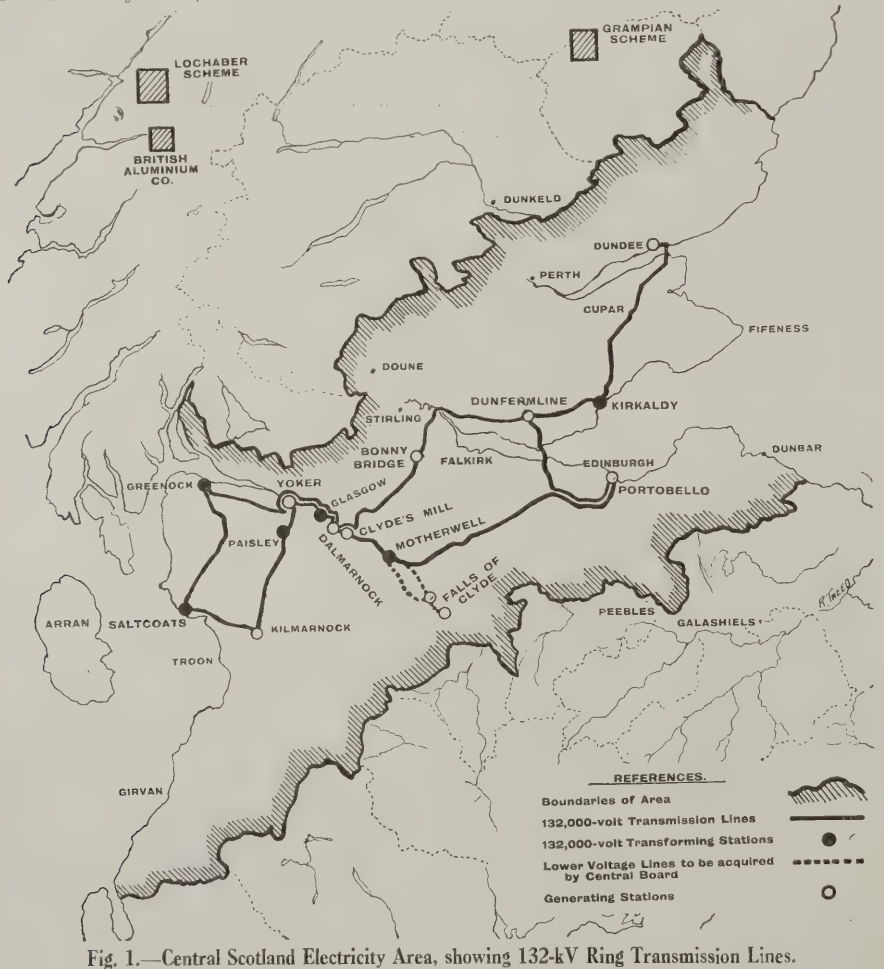

Fig. 1.—Central Scotland Electricity Area, showing 132-kV Ring Transmission Lines.

At present there are 42 authorised undertakers in the area, owning between them 36 generating stations; it is proposed that the following 10 stations shall be selected and operated for the Board: Clyde's Mill and Yoker (Clyde Valley Electrical Power Co.); Dalmarnock (Glasgow Corporation); Portobello (Edinburgh Corporation); the Falls of Clyde (Stonebyres and Corra Linn) hydro-electric stations (Lanarkshire Hydro-Electric Power Co.); Bonnybridge (Scottish Central Electric Power Co.); Carolina Port (Dundee Corporation); Dunfermline (Fife Electric Power Co.); and Kilmarnock (Ayrshire Electricity Board); the four last-named will be required for limited periods only, and will later be dispensed with.

The extension of the following four stations is contemplated: (i) Clyde's Mill; an addition of 50,000 kW for operation by the winter of 1935-36, and a further addition of 50,000 kW for operation by the winter of 1936-37. (ii) Dalmarnock; an addition of 25,000 kW for operation by the winter of 1932-33, and a further 25,000 kW for operation by the winter of 1935-36. (iii) Portobello; an addition of 50,000 kW for operation by the winter of 1937-38. (iv) Yoker; an addition of 25,000 kW for operation by the winter of 1933-34, and a further 50,000 kW for operation by the winter of 1934-35; all to be 3-phase, 50-cycle plant.

The erection of two new 3-phase, 50-cycle capital generating stations, the first section of each to be of not less than 100,000 kW, is contemplated for operation by the winter of 1937-38; the commencement of station B in the east is subject to arrangements which may be made by the Central Board for obtaining electricity from other sources, such as the hydro-electric works authorised by the Grampian Electricity Supply Acts, 1922 and 1924.

It is estimated that by the end of the financial year 1933-34 the capital expended under the scheme will be as follows:—

(*a*) By the Central Board on transmission lines and transforming stations (including capitalised interest), £2,204,034, and on the standardisation of frequency £2,921,250.

(*b*) By the owners of selected stations on extensions (56,250 kW), £850,000.

On the basis of individual development in the absence of the scheme, authorised undertakers would have to provide for the installation in existing or new stations of 250,000 kW (inclusive of the above-mentioned 56,250 kW) to meet the load in that year, representing a capital expenditure of £3,312,320.

Broadly speaking, the scheme looks forward to the area being supplied in ten years' time by 8 capital stations (*i.e.*, 6 existing and 2 new), which will be interconnected by a series of high-pressure main transmission lines. The transmission system is designed to form a series of ring mains, so that there will be alternative routes to points of supply, and consequently greater security against breakdown. Incidentally, the interconnection will release for revenue-earning purposes about 88,000 kW of plant now kept as spare, and representing about £1,670,000 of capital.

The following main transmission lines are to be constructed by the Board for interconnection of selected stations with one another and with the systems of authorised undertakers: Three-phase overhead lines, designed for operation at 132,000 volts between phases and capable in each case of transmitting not less than 50,000 kW, from—(1) Clyde's Mill to Yoker *via* Dalmarnock and Port Dundas (date of completion, October, 1928). (2) Portobello to Dalmarnock *via* Dunfermline and Bonnybridge (date of completion, October, 1929). (3) Portobello to Clyde's Mill *via* Motherwell (date of completion, October, 1930). (4) Dalmarnock to Greenock direct (date of completion, October, 1931). (5) Dunfermline to Dundee *via* Kirkcaldy (date of completion, October, 1931). (6) Yoker to Greenock *via* Paisley, Kilmarnock and Saltcoats (date of completion, October, 1932).

In connection with the aforesaid overhead lines, transforming stations are to be provided at the undermentioned places, each to aggregate a rating in kVA of not less than that specified unless otherwise determined:—

	KVA.		KVA.
Bonnybridge ...	40,000	Kirkcaldy	20,000
Clyde's Mill ...	90,000	Motherwell	30,000
Dalmarnock ...	150,000	Paisley	90,000
Dundee	30,000	Port Dundas ...	90,000
Dunfermline ...	30,000	Portobello	90,000
Greenock	40,000	Saltcoats	20,000
Kilmarnock ...	30,000	Yoker	60,000

Transmission lines are to be acquired by the Board as follows:—Two 3-phase, 11,000-volt, single-circuit main transmission lines from Corra Linn to Stonebyres; two 3-phase, 11,000-volt, double-circuit main transmission lines from Stonebyres to Motherwell.

The Electricity Commissioners have also forwarded with the scheme a series of supplementary particulars in which they have outlined a plan of working the selected stations, with the necessary estimates. These suggestions are, of course, tentative, since the practical working of the scheme, including the fixing of tariffs, is the responsibility of the Board; but, taking the figures as they stand, it is of interest to note that the Commissioners contemplate that the Board should be able to commence supplying in August, 1929, and estimate that in the four years 1930-34 there will be a gross saving to the undertakers in the area of no less than £894,000, or an average of nearly one-quarter of a million per annum. It must be remembered that these savings apply only to a single area in the early days of the Board's work, and should improve steadily even in this area as the use of electricity grows. While the estimates of the Commissioners show that there will be an immediate and substantial saving, the full benefits to the consumer in the shape of reduced prices can only be realised as the progressive economies take effect. The capital already spent on the 30 less efficient stations now existing, but which the scheme contemplates will be closed down, must be paid off, or discharged, and it is only when this has been done that the full advantage of the new system will accrue.

The scheme involves a large measure of standardisation of frequency: no fewer than 11 undertakings and 5 generating stations will have to be altered from 25 to 50 cycles. The Commissioners, in a prefatory memorandum, state that as comprehensive regional schemes cannot be carried out with full economy in areas where there are differing systems without first effecting standardisation, they have advisedly given early attention to industrial areas in which a non-standard frequency has been widely developed. The object is to avoid future expenses on non-standard plant, and to hasten the time when manufacturers as well as undertakers (and consequently consumers) will obtain the benefits arising out of the production of electrical machinery for one uniform frequency only.

Copies of the scheme and supplementary particulars may be purchased for 1s. and 2s. 6d., respectively, from H.M. Stationery Office. Authorised undertakers and other persons may make representations thereon by registered letter addressed to the Board not later than June 14th, 1927. After considering such representations, the Central Board will adopt the scheme, either with or without modification, as need be, and will put the scheme into operation.

The Commissioners have in preparation other schemes dealing with Central England; Yorkshire, Lancashire and Cumberland; South-East England, including London and the Home Counties; South-West England and South Wales, and thereafter for the remaining areas as may be expedient.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The Union Cable Co.

With reference to the paragraph published on page 716 of our last issue under this title we are glad to be able to publish a statement based upon information received from the Union Cable Co. The report was based upon a longer one which appeared in another form in the *Frankfurter Zeitung*, and which we are assured is totally incorrect. There have been no negotiations whatsoever between the Union Cable Co. of Dagenham and the German company mentioned, or with any other German interests. The Union Co. has never been approached either directly or indirectly, and we are informed that the board would not on any account entertain any suggestion of such a nature.

Electric Power in Industry.

Further important industries are dealt with in Preliminary Report No. 10 upon the 1924 Census of Production (*Board of Trade Journal*, May 5th). The first is the jute, hemp and linen group, which is stated to have had 6,076 kW of electric generating plant in 1907, 12,964 kW in 1912, and 12,573 kW in 1924. The trades had 23,132 h.p. of electric motors in 1924, power for 12,368 h.p. of which was purchased. The electrical generating plant possessed by the rope, twine and net trades rose from 575 kW in 1907 to 3,205 kW in 1924. Motors aggregating 14,281 h.p. were installed in 1924, and power for 10,470 h.p. of these was purchased. The canvas goods and sack trades had 92 kW of generating plant in 1907 and 614 kW in 1924. The motors aggregated 5,279 h.p. (power for 4,833 h.p. purchased). The linoleum and oilcloth trades reported 3,564 kW of plant in 1907, 6,129 kW in 1912, and 10,364 kW in 1924. The motor power was 15,831 h.p., and power for only 539 h.p. was purchased.

The Department of Overseas Trade.

The Times says that a new movement to save the Department of Overseas Trade from the fate which threatens it has been inaugurated by a number of Conservative members. They are anxious to obtain facilities for a discussion on the following motion:—"That whereas the Department of Overseas Trade has proved its efficiency and value to the satisfaction of trade and industry generally, at whose urgent request it was established, and whereas by its constitution it has been able to co-ordinate and energise the commercial work of the Consular services, Trade Commissions, and other commercial representations throughout the Empire as well as in foreign countries in a manner which past experience has shown to be impossible under the control of any one of the senior Departments, and whereas any apparent small saving in expense of discontinuing it as a separate Department would prove a false economy, as it would be far more than counterbalanced by the loss direct and indirect to trade as well as in the efficiency of the transferred services, this House is of the opinion that the continued existence of the Department of Overseas Trade as a separate Department is essential to the development of trade and industry throughout the whole Empire."

Wages in the Engineering Industry.

As we have already reported, the considered reply of the Engineering Employers' Federation to the engineering trade unions' request for an offer of increased wages will be given at a joint conference on May 19th. In the interval, a meeting of the London District Joint Committee has been held, and a resolution has been passed calling upon the trade union representatives to demand a definite reply from the employers, and, failing the receipt of this, to empower the London Committee to take action to enforce its claim.

The 1927 Radio Exhibition.

We have received from the Radio Manufacturers' Association a mass of details relating to the National Radio Exhibition which is to be held at Olympia from September 24th to October 1st. This includes a form of application and agreement for prospective exhibitors, full regulations, drawings of typical stands, particulars of charges, and plans of the ground floor and gallery, with the costs and sizes of each stand shown. Positions will be allotted by ballot among firms whose applications are received by June 14th. The primary ballot will be for exhibitors at the 1926 exhibition, whether members of the R.M.A. or not.

A "Cosmos" Valve Display.

One of the windows of the premises of Metro-Vick Supplies, Ltd., Charing Cross Road, W.C.2, is illustrated in the accompanying picture. It advertises in a simple but effective way "Cosmos Shortpath" radio valves.

A "Cosmos" Valve Window.

Bankruptcy Proceedings.

John Atkins, trading as Atkins & Co., 59, Church Street, Tewkesbury, The Electricity Works, Northleach, late High Street, Winchcombe, Gloucestershire, electrical engineer.—The receiving order in this matter was made on April 21st on debtor's own petition. The statement of affairs shows liabilities of £803, against assets of £535, leaving a deficiency of £268. Debtor attributes his present position to the failure of an undertaking for the supply of electricity at Winchcombe, and pressure by creditors. In May, 1920, he commenced business in partnership with another at Windsor as electrical engineers. He provided a capital of £270 in stock and cash, and his partner agreed to provide a capital of £200, but only paid a sum of £45. During the partnership they carried out contracts with two companies for the installation of plant and supply of electricity for two towns in Wales. In addition they did the principal portion of the wiring for the consumers in respect of these undertakings. The partnership was dissolved, and in November, 1924, debtor continued trading on his own account. In 1924 he commenced a contract to install the plant and provide the electricity supply for a Northleach company. This transaction was a success, and he also did the wiring for the consumers. Debtor states that his wife advanced him various sums amounting to £696, and that the amount still owing is £153. He also states that in January, 1925, he commenced negotiations for the supply of electricity to Winchcombe, near Cheltenham, and in October, 1925, a company was incorporated to carry out the undertaking. He was later advised to abandon the scheme, as the necessary permit would only be granted to a large supply undertaking. In the meantime the debtor had incurred considerable expense in the promotion and formation of the company, and a signatory who had made advances was claiming the money from him personally. The debtor had also done work to the value of £163 in wiring and fitting for electric light, which was not payable until the electricity supply had been taken to Winchcombe, and the consumers' premises were connected.

W. J. Broome, trading as the Stockport Electrical Company, Garrick Place, Daw Bank, Stockport, electrical engineer.—The public examination of this debtor was held on May 3rd at the Court House, Stockport. The statement of affairs showed gross liabilities of £582, and a deficiency of £486. Debtor stated that he commenced business on his own account in January, 1925, with £15 capital. For a time he was successful, but later it appeared that he overbought about £250 worth of stock. One of his creditors, who had obtained a judgment order against him for goods supplied, secured a committal order. Debtor said that he advertised the business extensively, but had not been able to maintain it long enough to secure the benefits of the advertising. He admitted that he had under-estimated for jobs and then had to sublet them at a larger figure. After further questions the examination was closed.

Jacob Segal, gas and electrical accessories merchant, 2, Vine Street, Tooley Street, S.E.—This debtor failed in September, 1926, with total liabilities £3,344, of which £2,044 is expected to rank, and assets "nil." According to Mr. D. Williams, Official Receiver, the debtor attributes his insolvency entirely to his liability (£2,044) to the petitioning creditor in respect of three guarantees for which he received no consideration. The debtor attended last week before Mr. Registrar Mellor at the London Bankruptcy Court, and was allowed to pass his public examination.

L. Wintle, late of 27, Stafford Street, Market Drayton, electrical engineer.—This debtor attended for his public examination at Crewe Bankruptcy Court on April 29th. The statement of affairs showed gross liabilities of £237, and assets of £1. He said that in October, 1922, his brother commenced business as an electrician, but in January of the following year left to become an employé of an electricity company. On the invitation of his brother he took over the management of the business, which was not successful. The examination was closed.

L. Bell, Joseph Street, Leeds Road, Bradford, trading as Charles Bell, mechanical and electrical engineer.—The first meeting of creditors was held on May 6th at the Official Receiver's office, Bradford. The statement of affairs showed gross liabilities of £3,132, of which £3,067 was expected to rank, against assets of £1,707. The creditors resolved to appoint Mr. John Lund, I.A., as trustee, while a committee of inspection was also nominated.

A. Smethurst (A. Smethurst & Co.), electrical engineer, 62, Bernard Street, Southampton.—First meeting held May 12th, at the Official Receiver's office, Midland Bank Chambers, High Street, Southampton; public examination, May 18th, at the Court House, Southampton.

J. Turner, electrician, 62, Blackburn Road, Great Harwood, Lancaster.—First meeting, May 16th, at the Official Receiver's offices, 11, Winckley Square, Preston. Public examination, June 15th, at the Court House, Blackburn.

A. P. Pacifico (A. Pacy) (partner in the firm of Comton Wireless Manufacturing Co.), 41, Carlton Mansions, N.16.—Discharge subject to consenting to judgment for £5 being entered against him (£5 paid to the trustee in lieu of entering up judgment).

E. G. Batt, electrical engineer, 20, Iverna Gardens, and Magnet House, Kingsway, W.C.—Application for discharge to be heard June 1st at Carey Street, W.C.

C. J. Brookes, wireless dealer, 6, Cross Street, Wigston Magna, Leicester.—Trustee, Mr. E. Barlow, Official Receiver, 1, Berridge Street, Leicester, released April 25th.

A. L. Weekes, electrical engineer, 13, Crescent Road, Luton.—Receiving order made April 28th, on creditor's petition.

Company Liquidations.

Electricity Finance & Distribution Corporation, Ltd.—A petition for the winding up of this company has been presented to the High Court by F. E. Passmore, of Hollyhurst, Wroxham, T. Passmore, of 83, Cannon Street, E.C., and R. P. Higgs, of Crown Works, South Lambeth Road, S.E., executors of J. E. Passmore, deceased, late of Hollyhurst, Wroxham, and will be heard in London on May 17th.

B.D.S. Wireless, Ltd.—A meeting of members is called for June 8th, at 26, Corporation Street, Birmingham, to hear an account of the winding up from the liquidators, Messrs. H. S. Willmott and F. E. Bendall.

Southern Counties Electric Light & Power Supply, Ltd.—First meetings of creditors and contributories, May 12th, at Carey Street, W.C.

Dissolutions of Partnership.

T. W. Bruce & Smith, plumbers, electrical and heating engineers, 23, Strathmartine Road, Dundee.—Mr. T. W. Bruce and Mr. W. S. Smith have dissolved partnership. Mr. Smith will attend to debts and continue the business under the same style at the old address.

South Coast Electric Welding Co., electric welders, 44, Shelbourne Road, Bournemouth.—Messrs. A. E. Gibbs, T. G. Leach, F. W. Wild and F. C. Duell have dissolved partnership.

Ball & Marchant and the Reliance Garage, motor and electrical engineers and garage proprietors, 8, Warwick Street, and South Street, Tarring, Worthing.—Mr. R. Ball and Mr. C. H. Marchant have dissolved partnership. Mr. Ball will attend to debts and continue the business.

Canning's New Works.

Messrs. W. Canning & Co., Ltd., of Birmingham, have placed a contract for their new engineering works to be built in Constitution Hill, in close proximity to their principal premises. The work will be completed in about 15 months' time.

Chinese Dry Battery Organisation.

The *Chinese Economic Bulletin* reports that a Guild of Dry Battery Factories has been formed in Shanghai with a view to the elimination of the "cut-throat" competition which is prevalent. The members number 35, and the first action of the Guild has been to increase prices.

New Catalogues and Lists.

MESSRS. MAVOR & COULSON, LTD., 47, Broad Street, Mile End, Glasgow.—A May calendar-blotter advertising the "Samson" coal cutter.

BROOK MOTORS, LTD., Empress Works, Huddersfield.—Sheets 161 and 162, announcing the prices of "L" type squirrel-cage and slip-ring motors.

X-RAYS, LTD., 11, Torrington Place, W.C.1.—A profusely illustrated brochure describing the company's X-ray equipment. Fully priced.

MESSRS. L. MCMICHAEL, LTD., Wexham Road, Slough, Bucks.—A circular letter dealing with the company's radio apparatus and a blotter and leaflet (priced) advertising the "Dimic Three" receiving set.

SADIA, LTD., 30, Ely Place, E.C.1.—List H, containing illustrated details of "Sadia" water heaters and auxiliary equipment, with prices and particulars of running costs. Also a folder upon the same subject.

HOPKINSON INDUCTION MOTORS, Willesden Lane, North Acton, W.3.—May stock list of a.c. motors.

MESSRS. YOUNG & WILDSMITH, LTD., 20, Bloomsbury Street, W.C.1.—A net trade price list of electrical materials, accessories, and appliances.

MESSRS. GARNETT, WHITELEY & Co., LTD., Lotus Works, Broadgreen Road, Liverpool.—A series of leaflets dealing with "Lotus" radio components, including a remote-control system. Illustrated and priced.

THE RELAY AUTOMATIC TELEPHONE CO., LTD., Marconi House, Strand, W.C.2.—"The Relay Recorder" for May, containing, in addition to notes on the "Relay" system, a number of interesting little articles.

WESTINGHOUSE ELECTRIC INTERNATIONAL CO., Westinghouse Building, 2, Norfolk Street, Strand, W.C.2.—Three illustrated pamphlets describing the company's "Sentinel" circuit breakers for washing machines, &c., line-starters for squirrel-cage motors, and the thermal overload relay used with the latter, enclosing a sample of the metal employed.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—Coloured showcards illustrating various types of "Sterling" variable and fixed condensers, and examples of transformers and chokes.

THE ARMORDUCT CABLE CO., LTD., AND REDUCED, 159, Westminster Bridge Road, S.E.1.—A booklet describing a new non-breaking non-kinking damp-proof flex.

THE FACTORY EQUIPMENT CO., 180, Windsor House, Victoria Street, S.W.1.—A price list of various types of pulley blocks.

THE EDISON SWAN ELECTRIC CO., LTD., 123-125, Queen Victoria Street, E.C.4.—A pamphlet describing the R.C.610 valve for resistance coupling.

MESSRS. PETTERS, LTD., Westland Works, Yeovil.—A brochure dealing with "M" type oil engines and their applications.

MESSRS. WARD & GOLDSTONE, LTD., Frederick Road, Pendleton, Manchester.—List No. E.12, describing battery eliminators for radio work, including valve, electrolytic, and d.c. types. Priced and illustrated.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, E.C.4.—May price sheet of electrical materials, appliances, and accessories.

MESSRS. LACY-HULBERT & Co., LTD., 91, Victoria Street, S.W.1.—A pamphlet containing illustrated details and prices of "Boreas" electrically-driven air compressors and tire inflators.

MESSRS. FREDERICK J. GORDON & Co., LTD., 92, Charlotte Street, W.1.—A priced and illustrated catalogue of the leading makes of accumulators and dry batteries and accessories.

MESSRS. J. H. TUCKER & Co., LTD., King's Road, Tyseley, Birmingham.—An illustrated folder containing details and prices of small ironclad switch- and fuse-gear.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—May stock list of dynamos and motors.

Aluminium in America.

We quote the following from an April issue of the *American Metal Market*:—"Several railroads in the country have constructed trains employing aluminium extensively, 'bus makers are expanding rapidly, and the general automotive trade is swinging back to aluminium and its light alloys on a scale unsuspected by the uninformed observer. The aircraft industry, destined to become one of the chief outlets for aluminium, is probably operating at a heavier rate to-day than at any time since the war, with encouraging prospects for still greater activity in the near future. In the high-voltage transmission field aluminium is established and recording almost uninterrupted gains from year to year."

Wimbledon's Electricity Service.

The chief engineer and manager of the Wimbledon Corporation electricity undertaking (Mr. A. E. McKenzie) has sent us a recently-issued booklet. This announces reductions in the prices of electricity, and contains a great deal of information regarding the hire and hire-purchase of appliances of all kinds. A number of the leading electrical manufacturers advertise their cookers, washers, water heaters, &c., many of which are supplied by the department. A novel feature of the cooker-hiring scheme is the fact that no rental is charged for the December or March quarters if the quarterly consumption of the appliance is 300 kWh or more.

Unemployment.

The official returns dated April 25th show that the total number of unemployed was 1,044,800, as compared with 1,106,440 on April 18th, a decrease of 61,640. The total on April 26th, 1926, was 981,877.

The Paris Fair.

Among the exhibitors at the Paris Fair which is being held from May 14th to 29th is the Compagnie Française Wild-Barfield, which will show examples of its electric furnaces.

Local Exhibition.

STEPNEY.—Mention was made in our last issue of the electrical exhibition organised by the Stepney Borough Council at

The G.E.C. Stand at Stepney.

the People's Palace, Mile End Road. Among the exhibitors was the General Electric Co., Ltd., whose excellent display is shown in the accompanying illustration.

Book Notices.

"Standards Year Book, 1927"; Miscellaneous Publication No. 77 of the U.S.A. Bureau of Standards. Pp. 392; figs. 39. Price $1.—This book outlines the activities and accomplishments of the Bureau of Standards and other agencies of the Federal Government and the States and Municipalities, and also the American societies and associations of which standardisation is a major or very important activity.

"Simplified Practice Recommendation" of the U.S.A. Bureau of Standards. No. 56. Carbon brushes and brush shunts (5 cents).

Circular of the U.S.A. Bureau of Standards. No. 319. Alphabetical index and numerical list of U.S. Government master specifications, promulgated by the Federal Specifications Board.

The Admiralty has issued tables of the velocity of sound in pure water and sea water, for use in echo-sounding and sound-ranging (H.D. 282). They are to be obtained from Mr. J. D. Potter, 145, Minories, London, E.1, price 1s. 2d. post free.

"Hydro-Electric Hand Book," by W. P. Creager and J. D. Justin. Pp. xxiv+897; 494 figs. London: Chapman and Hall, Ltd. Price 40s. net.

We have received from British Insulated Cables, Ltd., a well-printed 35-page brochure, wherein is reproduced a series of photographs illustrating the overhead trolley wire supporting structures, some of which are of unusual designs, in connection with the electrification work which the company carried out for the Great Indian Peninsula Railway.

Electrical Appliances on an L.C.C. Estate.

The whole of the heating and cooking apparatus for the L.C.C. housing estate, Castelnau, Barnes, will be supplied by the CABLE ACCESSORIES CO., LTD., and the kettles and irons by PREMIER ELECTRIC HEATERS, LTD.

A Siemens-Schuckert Development.

It is announced that the Siemens-Schuckertwerke has taken over from the Swiss Brown, Boveri Co. the majority of the shares hitherto held by the latter in the Isaria Meter Works Co., of Munich. This means an extension of the sphere of the Berlin company, which only a few weeks ago was able to establish itself industrially in the western coal and steel region by the acquisition of the electro-technical department of the Deutsche Maschinen A.G.

Irish Free State Electrical Imports.

The imports of electrical goods, excluding machinery, into the Irish Free State during March last amounted to a value of only £35,949, as compared with £38,065 in the corresponding month of 1926. The aggregate imports during the first three months of the present year are returned at £108,322, as compared with £129,187 in the first quarter of the last year.

D

E.D.A. Activities.

Among the latest publications of the British Electrical Development Association is a booklet dealing with battery-charging equipment for electric vehicles (E.D.A. 653). This contains notes for non-technical users on modern apparatus and methods, with a number of illustrations.

A Colonial Conference.

A conference of representatives of the Colonies was held at the Colonial Office this week. Among the questions discussed were trade agencies in London and radio communication and broadcasting.

The Liverpool Cable Co.'s Football Team.

The stalwart group depicted herewith is the football team of the Liverpool Electric Cable Co., Ltd. The team has had a

The Liverpool Cable Co.'s Football Team.

very successful season, winning the Liverpool Citizens' League Championship Cup and the Liverpool Citizens' Challenge Cup.

Sussex Contractors' Dinner.

The annual dinner of the Sussex Branch of the Electrical Contractors' Association was held at Brighton on May 4th. Mr. H. L. Smith, who was chairman for two years, presided, and the guests included the president of the Association (Mr. H. J. Miles) and the Mayor of Brighton. The chairman, proposing the toast of "The Corporations of Brighton and Hove," said that the relations of those bodies with the contractors, by means of working agreements, were very amicable; the Mayor of Brighton replied. Mr. F. Winstanley proposed the toast of "The E.C.A. Allied Associations and Officials." In reply, Mr. Miles referred to the fact that the attendance that evening was over 80, whereas only 13 or 14 attended the first annual dinner. That growth was typical of the growing strength of the Association. He called upon members to aid the Government in making the new Electricity Act a success. Mr. L. C. Penwill (secretary, E.C.A.) also responded. Among the other speeches was one by the newly-elected chairman of the branch (Mr. H. L. Holford), who proposed the visitors' health.

Merchandise Marks Acts.

The *Board of Trade Journal* for May 5th contains a joint memorandum by the Board of Trade and the Commissioners of Customs and Excise respecting the requirements as to marks on imported goods.

Trade Announcements.

Mr. Marcel Porn, of 72-78, Fleet Street, London, E.C.4, has converted his business into a private limited company, under the name of Porn & Dunwoody, Ltd. Particulars appeared in our issue of April 29th, page 688. Mr. Porn is managing director of the new company.

Mr. M. Thorburn, 14, Cavendish Vale, Sherwood, Nottingham, formerly representative in Nottinghamshire, Derbyshire, and Lincolnshire for the Siemens & English Electric Lamp Co., Ltd., and other companies, has now joined Messrs. H. R. Cleare & Co., Ltd., Bristol, and will represent them in the same area.

Mr. H. A. Chard, late sales manager to the Electric Art shades, of Kelvedon and Regent Street, W.1, has been appointed general manager of the firm.

Messrs. Hough Bros., radio engineers, have opened premises in High Street, Huntingdon.

The County Electrical and Wireless Stores, Ltd., Deal, has closed its premises at 7, South Street, and the business will now be carried on at 19, High Street.

Messrs. A. Emanuel & Sons, Ltd., have opened a new electrical fittings showroom at 9, George Street, Manchester Square, W.1. A very wide selection of lighting fittings is on view.

The General Radio Co., Ltd., has opened large radio display and demonstration rooms at 105, Regent Street, W.1, in which all kinds of up-to-date receiving apparatus and testing equipment are shown in use.

Recent Contract.

The Electric Furnace Co., Ltd., informs us that the aluminium-annealing furnace which it is supplying to a Scottish undertaking (*vide* Elec. Rev., April 29th) embodies the Wild-Barfield principle of grooved bricks.

The American Refrigerator Industry.

Mr. A. Williams, vice-president of the New York Edison Co., recently stated that 600,000 electrical refrigerators will be manufactured this year, as compared with 200,000 last year. The estimate for 1927 is based on the sales during the first quarter. Reports of the manufacturers, Mr Williams said, indicate that the electrical refrigerator is finding favour not only in the cities and towns, but in many out-of-the-way places. Wherever electrical power is available, it is being installed rapidly. In 1914 only 600 electrical refrigerators were sold in the United States. In 1924 the sale had risen to 24,000, in 1925 to 75,000, and in 1926 to 200,000. These figures do not include the larger refrigerators sold for hotels and other commercial purposes.

Hungarian Radio Import Regulations.

By a recent ordinance radio receiving apparatus may now be imported into Hungary without restriction by anyone having a licence for the "production, sale or maintenance and use" of a receiving apparatus. The importation of radio broadcasting apparatus and parts is, however, still subject to the permission of the Minister of Commerce. Consignments of apparatus will still be cleared by the Budapest Central Customs Office, and will only be delivered to the addressee if he can produce the necessary licence. The regulations also apply to the movements of apparatus within the country.

Storage Batteries in Australia.

In the course of a recent debate in the Federal House of Representatives, reports the *Daily Telegraph* (Sydney), Mr Coleman (N.S.W.) said that complaints had been made that storage batteries, which were provided for in the last tariff schedule, and which prior to their manufacture in Australia were sold at £11 10s., were now being dumped. There were now six manufacturers in Australia, and the overseas article had been reduced to £5 5s. and £6 6s., with a 40 per cent discount to garages, as against 25 per cent. previously. Mr Pratten, Minister for Trade and Customs, said the statement suggested a triumph of protective policy, in the direction of reducing prices to the consumer by the competition created by local manufacture.

Correction.

We wish to direct our readers' attention to an error which occurred in the advertisement of Messrs. Parmiter, Hop and Sugden on page xxviii in our last issue. The company's old address was given instead of Fluvent Electric Works, Vernon Street, Longsight, Manchester.

For Sale.

Darlington Corporation Electricity Committee invites offers for one 220/280-kW steam generating set. (See our advertisement pages to-day.)

Prices of Raw Materials.

Messrs. James Forster & Co., in their report on lead, state on May 7th:—"The market has been marking time this week with small daily fluctuations. . . . A fair amount of buying by home consumers has been seen, cable-makers taking moderate quantities, but not enough to give the needed filli to the market. . . . Reports from the Continent are optimistic. . . . The weak spot is in America, and the future largely depends upon the course events take in that country."

Messrs. F. Smith & Co. report, May 10th:—Copper (electrolytic) bars, £61 15s., 5s. inc.; do. do., sheets, no change; do. do. wire rods, £71 15s., 5s. inc.; do. do. H.C. wire, no change.

Messrs. James & Shakespeare report, May 10th:—No change in the prices of copper bars (best selected) sheet and rod. English pig lead, £27, 5s. dec.

Messrs. Edward Till & Co. report, May 10th:—No change in the price of india-rubber, para fine.

Lighting and Power Notes.

Algeria.—New Power Station.—In order to meet the increasing demand for electricity supply the Société Algerienne d'Eclairage et de Force is about to commence the establishment of a new steam-operated power station on the Mole at the port of Algiers. The output of the existing station advanced last year to 44,463,925 kWh from 39,033,907 kWh in 1925.

Australia.—Cairns (Q.).—The Cairns Hydro-Electric Board has received a report from Mr. P. A. W. Anthony recommending the harnessing of the Barron Falls without delay. The cost of the scheme is estimated at £202,500, made up as follows:—Plant, £180,000; transmission line and reservoir, £19,500; line to Cairns, £3,000.

Shoalhaven River Development.—The *Electrical Engineer of Australia and New Zealand* states that investigations are being made of the economics of a proposal to generate hydro-electric power from the Shoalhaven River, N.S.W. It is estimated that 50,000 kW can be developed at a cost of £2,413,000 from power stations at Sewell's Point and Murray's Bend. This scheme would provide energy for Canberra amongst other places.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—Projects which will entail large expenditure in the development of natural resources in Albert and Westmoreland counties of south-eastern New Brunswick are before the Government and Legislature of the Province. A Bill, which has received its first reading, is to incorporate the Petitcodiac Tidal Power Company and would give the right to develop hydro-electric power on the confluence of the Memramcook and Petitcodiac rivers. It has been estimated that a minimum of 100,000 h.p. and a maximum of 200,000 h.p. can be developed and that the cost of the entire development would be $23,000,000.

Development of Albert County oil shales is also before the Government. The Maritime Education Co., Ltd., has been interested in this project and has carried out preliminary work. It is proposed to spend $150,000 this summer on plant erection, and the undertaking has been underwritten by New York financial interests.

Chichester.—ELECTRICITY IN BULK.—The Corporation, on the recommendation of the Electric Light Committee, has consented to the Bognor Gas Light and Coke Co. laying a cable within the Corporation's area of supply, *viz.*, from the boundary of the parish of Pagham to the Corporation's sub-station at the Anchor Inn, Sidlesham, for the purpose of enabling the company to receive a supply of electricity in bulk, the draft agreement, as altered on behalf of the company for the supply through the Chichester cables, having been approved.

Cornwall.—INAUGURATION OF POWER STATION.—The first stage in the electrical development of the Fowey, Par, St. Blazey, and St. Austell districts of Cornwall was completed on May 7th, when the Lord-Lieutenant of the county inaugurated the new power station of the St. Austell and District Electric Lighting and Power Co., Ltd., at Pont's Mill, St. Blazey. The plant includes two 300-h.p. and one 200-h.p. Diesel engines and three dynamos. Electricity is transmitted to Fowey, Par, St. Austell, and other places. Provision has been made for further extensions as required.

Continental.—FRANCE.—The Société Electrique du Nord-Ouest, in its report for the past year, states that all its power stations are now interconnected so that a supply can be given throughout the whole of its area, which includes the towns of Amiens, Arras, Dunkirk, Calais, Boulogne, and Abbeville. The company has now about 280 miles of 45,000-, 90,000 and 150,000-V transmission lines in operation. The sales of electricity during the last financial year showed an increase of 21 per cent. over 1925-26.

Steady progress is being made with the construction of the hydro-electric power stations which the Société de l'Energie du Rouergue is establishing to utilise the water power of the River Tarn. The company has recently secured the concession for a h.p. transmission line from Le Truel to Beziers with an extension to Pinet and a branch to Màdiere. Contracts have also been secured for the supply of large quantities of electrical energy to the Société Sud Electrique, the Société d'Energie Electrique de la Sorgue et du Tarn, the Office Nationale de l'Azote of Toulouse, and the Société Vieille Montagne, whose hydro-electric plant at Thuries, which has an output of 20 million kWh per year, will be connected with the transformer station at Pinet, and in future be operated by the Rouergue Co.

ITALY.—The output of the various plants of the Società Ligure Toscane d'Elettricità during the past year amounted to 189,019,400 kWh, as compared with 171,084,400 kWh in 1925. In order to meet the increasing demand the company is engaged on the construction of a new steam-operated power station of 60,000 h.p. and the erection of a 120,000-V transmission line to connect with the power stations at Valdarno and Adamello.

Epsom.—ELECTRICITY FOR HOUSING ESTATE.—The Urban District Council has applied for sanction to a loan of £3,100 for laying cables to supply electricity to Council houses on the Horton Estate. It has also decided to purchase 120 electric cookers to be installed in the houses.

Grangemouth.—ELECTRICITY SUPPLY.—The Town Council has granted an application by the Scottish Central Electric Power Co., for permission to lay a 6,000-V cable underground along Earl's Road, from Larbert to a sub-station in Bridge Street, Grangemouth. Consent was refused to an application by the Scottish Midlands Electric Supply Co., Ltd., to erect an overhead l.p. line between Grangemouth and Skinflats.

Hull.—LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £3,150 for the purchase of land for railway sidings at Sculcoates Lane generating station and for sub-station sites in Clarendon Street and Plane Street.

SUPPLY TO HOUSING ESTATE.—The Committee has informed the Housing Committee that it will be prepared to lay mains on the East Hull Housing Estate if the Housing Committee will undertake to wire the whole of the houses on the estate.

Iceland.—HYDRO-ELECTRIC DEVELOPMENT.—It is announced from Copenhagen that the Lower House of the Icelandic Alting has approved by 12 votes to 9 the granting of a concession to the Norwegian A.S. Titan for the utilisation of the water power of the River Tjorsaa in the South of Iceland to the extent of 160,000 h.p. Under the concession the company would have to construct a railway from Reykjavik to the South of Iceland, and the State would participate in the expenditure on this line. The bill is now under the consideration of the Upper House.

Irish Free State.—DUBLIN.—At a recent meeting of the City Commissioners it was reported that the Department of Industry and Commerce had sanctioned the expenditure of £150,000 on the work in connection with the electricity undertaking.

Leeds.—LOAN SANCTIONED.—The Corporation Finance and Parliamentary Committee has received sanction to the borrowing of £500,000 for the erection of the new power station on Bedcote Farm Estate, Kirkstall.

Leicester.—LOAN.—The Electricity Committee has recommended to the Corporation that application be made for sanction to a loan of £640,000 for extensions to the electricity undertaking.

Liverpool.—LOANS.—Application is being made by the Electricity Committee for sanction to the borrowing of the following loans: Main transmission line, Lister Drive to Aintree, £36,742; transforming plant, £18,291; switchgear, £9,500; construction of main transmission lines—Lister Drive to Smithdown Road, £30,306; Lister Drive to Lark Lane, £32,493; Lister Drive to Beaumaris Street, £37,082.

London.—HACKNEY.—The Electricity Committee has submitted a report to the Borough Council on extensions to the electricity undertaking to be carried out during the periods 1927-28 and 1929-30. For the period 1927-28 an expenditure of £131,400 is proposed, which would include the substitution of one 10,000-kW turbo-alternator for the 5,000-kW set at present in use, and the installation of additional plant and equipment at six sub-stations. During 1929-30 extensions are recommended involving an estimated expenditure of £199,890. This would include further additions to existing, and the erection of new, sub-stations, and the laying of e.h.p. feeders. The Committee has recommended that application be made to the London and Home Counties Joint Electricity Authority and the Electricity Commissioners for sanction to the scheme and necessary loans.

WIMBLEDON.—The Corporation Electricity Committee has received sanction to the borrowing of £80,000 for mains and services, and £4,000 for sub-stations and equipment.

SOUTHWARK.—The Electricity Committee has approved an estimate prepared by the borough electrical engineer for new mains and services during the financial year amounting to £7,190.

Lytham-St. Annes.—LOAN SANCTIONED.—Sanction has been received by the Town Council to the borrowing of £33,000 for mains, meters, and services.

Mexico.—HYDRO-ELECTRIC DEVELOPMENT.—A new hydro-electric power plant with a capacity of 100,000 h.p. is to be established on the River Lerma by the Mexican Light and Power Co., Ltd.

Northern Ireland.—WARRENPOINT (Co. ANTRIM).—At the last meeting of the Urban District Council it was decided to offer no objection to either the Warrenpoint Gas Consumers' Co., Ltd., or Mr. J. U. Finney, Banbridge, applying to the Electricity Commissioners for Northern Ireland for powers to supply electricity in the town.

Nottingham.—ELECTRICITY ACCOUNT.—A report of the Electricity Committee, which has been presented to the City Council, states that whilst a profit of £22,000 was made during the past year, it is undesirable to allocate any portion of it to the relief of rates, in view of the fact that it is hoped shortly to reduce the charges for electricity.

Peterhead.—PROPOSED NEW POWER STATION.—The Town Council has agreed to give the Electric Supply Corporation, Ltd., a site in Ugie Street for the erection of a generating station. The consent of the Electricity Commissioners has not yet been obtained to the scheme.

Preston.—ELECTRICAL DEVELOPMENT.—Rapid progress is now being made with the various extensions of the electrical distribution system from Ribble power station. The Blackburn-Preston cable is now practically completed, and a commencement has been made with the Blackpool overhead cable.

Price Reductions.—Reduction in the charges for electricity have been made or recommended in the following districts:—

WIMBLEDON.—General lighting: From 4½d. to 4d. per kWh. Basement and cellar lighting (business premises): From 3½d. to 3d. per kWh. Shop window lighting (time switch): From 2d. to 1d. per kWh. Outside advertising signs: From 4½d. and 2d. to 4d. and 1d. per kWh. Maximum demand system (rental wiring): The rental of 2d. per point per week throughout the year reduced to 1½d. during the summer quarters. Water heaters (continuously in circuit): From ¾d. per kWh during the summer and 1d. during the winter to ½d. per kWh by separate meter all the year round. Reductions have also been made in the kinema and industrial power supplies.

SOUTHPORT.—Power (maximum demand system): First 90 kWh per kVA of maximum demand, 2d. per kWh; next 30 kWh, 1½d.; beyond 120 kWh, 1d. per kWh.

ALDERSHOT.—Ordinary lighting: From 8d. to 7d. per kWh. Factory and outside lighting: From 6d. to 5d. per kWh. Power: Existing rates up to 10,000 kWh to continue; from 10,000 to 15,000 kWh, from 2¾d. to 2½d.; 15,000 to 20,000, from 2½d. to 2¼d. per kWh; all energy in excess of this amount,

from 2¾d. to 2d. per kWh. Kinemas, &c.: First 100 kWh per week, from 8d. to 7d. per kWh; beyond, from 4½d. to 3½d. per kWh.

Shaldon.—Inauguration of Supply.—An electricity supply for the district was recently formally inaugurated. Electricity is obtained from the Newton Abbot generating station and is being conveyed to Shaldon by an 11,000-V cable laid in the bed of the river.

Sheffield.—Electricity Supply.—In connection with the recommendation of the Electric Supply Committee to obtain authority to incur the expenditure necessary to proceed with the installation of an additional 20,000-kW set at Blackburn Meadows, the general manager states that he has been in communication with the Electricity Commissioners to ascertain if such proposals agree with the arrangements which they are contemplating for the development of electricity supply in this area. The Commissioners have replied that they are now making a survey of an area which includes Sheffield and anticipate that they will be in a position to publish the scheme during the autumn. They are therefore of opinion that the position of Sheffield will not be prejudiced by delaying a decision until after the scheme for that area has been formulated. The Committee has decided to inform the Commissioners that further generating plant is urgently required to meet the increased demand anticipated in the near future, and that it is therefore imperative that it should be informed at an early date of the Commissioners' contemplated arrangements.

Loans Sanctioned.—The Committee has received sanction to the borrowing of £1,122 for the Roach Road sub-station, £12,150 for mains, £4,300 for converting plant, £3,918 for switchgear and building work, £31,782 for mains, and £75,000 for sub-station equipment.

South Africa.—Cape Town.—According to the *South African Engineer*, the Corporation's programme of electrical development for the years 1927, 1928, and 1929, involves a total estimated expenditure of £500,000, made up as follows:—Land and buildings for 18 static transformer sub-stations 11,000-380-200 V, £30,000; equipment of new and extensions of equipment in a total of 40 sub-stations, £88,400; extensions of and additions to generating plant and equipment, £87,750; provision of new d.c. feeders and further instalment of reconstruction of l.p. distribution network, £83,000; additional street lighting, £12,500; extensions of mains, £30,000; provision for altering network in central city area from overhead to underground, £10,000; new 11,000-V, 3-phase feeders, £32,850; new l.p. feeders, £40,000; provision for respective portions of cost of tie feeders and other cables for joint operation of Council's and Electricity Supply Commission's generating stations, £25,500; share of supervisory control and telephone communication throughout combined E.S.C. and Council's systems, £10,000; extension of mains outside municipal area, £50,000. The plant extensions include an additional 7,500-kW turbo-alternator and two 50,000-lb. water-tube boilers with auxiliary equipment, practically all of which is already on order, and will be installed within the next few months.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the Cumberland Waste Heat Owners Co., Ltd., authorising it to supply electricity within part of the rural district of Whitehaven, and the Urban District Council of Wivenhoe to supply electricity in the urban district.

Watford.—Power Station Extension.—The Corporation Electricity Committee has approved the expenditure of £65,500 for the extension of the power station, the Committee not being in favour of a bulk supply from the North Metropolitan Electric Power Supply Co., Ltd.

Loan.—The Committee is applying for sanction to borrow £7,000 in respect of underground mains and sub-station buildings and equipment at King's Langley.

Extension of Supply.—An application from the Berkhampsted Rural District Council for a supply of electricity to Bourne End is under consideration.

West Ham.—Loans Sanctioned.—The Town Council has received sanction to loans of £35,486 for electricity purposes, and £45,000 for the provision of additional offices, &c., in Romford Road, for the Electricity Department.

York.—Extension of Supply.—The City Council has decided to extend its area of electricity supply to the villages of Stockton-on-Forest, Shipton, Naburn, and Acaster. The laying of the necessary cables will cost £7,630.

Tramway and Railway Notes.

Australia.—Sydney Suburban Railways.—The *Industrial Australian and Mining Standard* reports that the New South Wales Minister for Works and Railways (Mr. Flannery), has supplied the following information regarding the electrification of the various sections of the Sydney suburban system:—Bankstown line.—Electric service commenced, October 10th, 1926; electric service to be completed, July 1st, 1927. Milson's Point to Hornsby.—Service to commence July 1st, 1927; complete service, December 31st, 1927. Main suburban line to Homebush.—Service to commence, December 1st, 1927; complete service, January 1st, 1929. Liverpool and Bankstown to Regents Park.—Service to commence, January 1st, 1929; complete service, April 1st, 1929. Homebush to Parramatta.—Service to commence April 1st, 1929; complete service, November 1st, 1929. Granville to Cabramatta.—Service to commence, November 1st, 1929; complete service, March 1st, 1930. Strathfield to Hornsby.—Service to commence, March 1st, 1930; complete service, November 1st, 1930. Mr. Flannery states that this programme is subject to the necessary funds being made available as required. When the whole city and suburban electric system is completed there will be in the city proper 22 miles of track and nine stations, and a total of 221 miles of track is to be electrified in the suburban zone. For the electrified system about 1,200 cars will be required. During the year ended June 30th last, more than 100,000,000 passengers were carried on the suburban railways. The direct result of the completion of the electrification of the first section of the suburban lines (from St. James to National Park, a distance of 19 miles) has been an increase in revenue on that section of 20 per cent., although the work has been completed for only a little more than four months. The total cost of the works at present in hand and chargeable to railway capital are:—Sydney Harbour Bridge (two-thirds debitable to railway capital), £4,000,000; city railway, £6,950,000; electrification and widening of suburban lines, immediately necessary, £8,981,000; new rolling stock, £5,805,000; total £25,736,000.

Continental.—Austria.—The Austrian State Railway authorities are preparing two new railway electrification schemes. The first scheme, which will occupy a period of five years, includes the electrification of about 380 miles of track and comprises the Vienna-Salzburg and Vienna-Gratz-Nauer lines. The second plan provides for the electrification of about 475 miles.

France.—New electric local railways have lately been completed and opened for traffic between Champagnole and Boujailles and between Champagnole and Froncine-le-Haut in the Department of Jura, the total length of the lines being about 32 miles.

Irish Free State.—Proposed Railway Reconstruction.—English visitors, believed to be members of a British syndicate, recently visited Portumna, Co. Galway, and inspected the disused railway from that town to Birr, in King's County, a distance of nearly 20 miles. The inspection was carried out with a view to the possibility of reconstructing the railway to carry on the service with power obtained from the Shannon scheme later. The visitors were satisfied that the reconstruction of the line would present very little difficulty, and in connection with the Shannon scheme, might easily become a paying proposition.

Japan.—Railway Schemes.—The Tokio suburban electric railway lines are being extended in all directions. The Nanbu Railway line from Kawasaki station on the Government Keihin line to Noborido, crossing the Tokio-Yokohama Railway line, was opened for traffic on March 10th. This railway is to eventually join the Tamagawa Railway and the Odawara Rapid Transit Railway. The Odawara Rapid Transit Railway with a length of 50 miles, from Shinjuku (Tokio) to Odawara, was to be opened in April. The Seibu Railway's new line from Takata-no-Baba Station on the Government Yamate line to the Higashim-Urayama station on the Government Kokubunji line will be opened shortly. Other railways to be opened are the Meguro-Kamata Railway Co.'s Oi-Shibuya line, and an extension of the Ikegami Railway.

On March 7th the inaugural meeting of the Nikko Mountaineering Railway Co., Ltd., was held. The company will construct an electric railway from Myowaga-hara to Chugu Temple.

The I.G.R. has decided to complete the electrification of the Hachioji-Kofu line during the next five years at an outlay of 8,906,000 yen. Four sub-stations will be erected between Hachioji and Kofu. The system will be 1,500 V. The Hachioji-Otsuki section will be completed by the fiscal year of 1929-1930, and the Otsuki-Kofu section between the fiscal years 1929-1930 and 1930-1931.

London.—L.C.C. Tramways.—The estimates for the year 1927-28 in connection with the L.C.C. tramway undertaking show that the revised estimated deficiency for the year 1926-27 is £302,114. It was originally estimated that there would be a net deficiency of £127,330. The revised estimated surplus on working is £178,575, as compared with the original estimate of £407,795. The financial loss during the general strike is estimated at £74,000, and the additional cost of fuel due to the coal dispute at £152,000. Apart from these two factors, therefore, the original estimated gross surplus would have been practically maintained in the revised figures.

Manchester.—Loan.—The City Council has approved a recommendation of the Finance Committee that application be made for sanction to a loan of £155,000 for reconstruction of the Middleton Light Railway and the erection of a garage in Queen's Road. The light railway was recently purchased from the Middleton Electric Traction Co., Ltd.

Nottingham.—Year's Working.—Although results were marred by the coal strike, the working of the Corporation tramway system during the past year was satisfactory. Total receipts, including rent of leased lines, amounted to £423,092, this being a decrease of £19,813, as compared with the pre-

vious year, and the working expenses were £317,550, an increase of £2,461. After meeting capital charges and making contributions to the reserve and renewals funds, a sum of £20,000 was transferred to the borough fund. The Corporation now owns 200 tramcars, 45 motor omnibuses, and 10 railless cars. During the year 74 million passengers were carried by the combined services.

Stretford.—EXTENSION OF TIME.—The Urban District Council has given notice of its intention to apply to the Ministry of Transport for permission to extend by one year the time for the completion of the railways authorised by the Stretford Light Railways Order, 1906, and of Railway No. 10 authorised by the West Manchester Light Railways (New Lines, &c.) Order, 1906.

United States.—PHILADELPHIA.—Delivery of equipment for the Philadelphia subway has commenced. The cars are being constructed by the J. G. Brill Co., and the motors, control and other equipment for the first 150 cars have been delivered by the Westinghouse Electric and Manufacturing Co. According to *Electric Traction*, each car will carry two motors, the motor rating being 200 h.p. The control is the ABF type for rapid transit service, having a special automatic feature that allows the controller handle to be turned to the full " on " position at once and the car will then automatically accelerate. The cars will be 67 ft. long, 10 ft. wide, and 12 ft. 3 in. from rail to roof. The construction includes longitudinal seats for 25 passengers and transverse seats for 50 passengers. Each car is equipped with six double doors, three on each side. The total weight, completely equipped, will be 105,000 lb. These cars will embody every conceivable safety device, including automatic stop control, and when completed will constitute the most perfect group of this kind of rolling stock. The Westinghouse Co. is also manufacturing 750 specially-designed electric fans for the ventilation of the new cars. The total cost of the subway is estimated at $100,000,000.

Telegraph and Telephone Notes.

Continental Telephony.—HOLLAND-SWITZERLAND SERVICE.—The Postal and Telegraph Administration announces that on and after May 16th direct telephone communication will be opened between all offices in Holland and Switzerland.—*Reuter* (Amsterdam).

Germany.—SHIP-SHORE TELEPHONY.—It is reported from Hamburg that experiments are in progress with the object of connecting steamships and other vessels, when in port, with the local telephone system.

Guatemala.—WIRELESS TELEGRAPHY.—An arrangement with the Tropical Radiotelegraph Company (a subsidiary of the United Fruit Company organised to handle the radio business of its steamships and stations in the United States) has been concluded by the Government for the connection of the State radio station with the Fruit Company's system in Central America. The Tegucigalpa (Honduras) station has been decided upon as the connecting link with the other five States, and the Company's station in New Orleans will connect with the rest of the world and transmit Press messages at a discount of 50 per cent. on the actual rates. By special arrangement with the Minister of Promotion, messages of general interest up to 300 words from the Press of Guatemala City to that of San Salvador will be sent free of charge.—*Reuter's Trade Service* (Guatemala City).

Italy.—REPORTED WIRELESS DISCOVERY.—Signor Majorana, Professor of Physics at the University of Bologna, has written to the Reale Accademia dei Lincei at Rome, claiming to have discovered a system of wireless telephony in which ultra-violet rays are employed. In experiments made between Bologna and a place 16 kilometres distant conversations were, it is said, carried on with great clearness and in secrecy.—*Reuter* (Rome).

The Telephone Service.—" TANDEM " EXCHANGE.—The new " Tandem " exchange, which, by means of junction lines, will enable any London exchange to be accessible to all the others during the transference of the system from manual to automatic switching, has been completed, and is being tested by means of artificial traffic.

LARGE PRIVATE EXCHANGE.—A new automatic telephone exchange, the largest private installation in Scotland, has been opened by the Glasgow Corporation. The exchange is built on the expanding bookcase system, and is fitted with duplicate ringing machines; while the central switching apparatus has a capacity for 500 lines, the total number of lines now working is 321 of all classes, including 41 external lines connecting outside departments with the City Chambers. The automatic equipment was installed by the Relay Automatic Telephone Co., Ltd.

Wireless at Sea.—SHIPS' " AUTO-ALARMS."—At the annual meeting of the Marconi International Marine Communication Co., Ltd., its managing director (Mr. F. G. Kelleway) announced that the authorities in this country were on the point of issuing rules governing the installation on merchant ships of the " auto alarm," actuated by a special signal which, in time of distress, would give audible warning of the need for help, and summon to the wireless apparatus on the ship where the alarm was received the telegraphist who at the time might be off duty.

Radio Notes.

Atmospherics.—AN INVESTIGATION.—The Royal Meteorological Society recently issued a report on an attempt to ascertain the range of atmospherics; that is, how far away are the storms that produce the X's which interfere with reception in England. The Society, with the co-operation of the B.B.C., appointed observers in various parts of Europe, equipped with broadcast receivers and advance copies of certain talks transmitted simultaneously by B.B.C. stations, to which they listened. Whenever they heard a strong atmospheric they put a mark on the manuscript through the syllable on which it occurred. At the same time automatic direction finders in Aberdeen, London and Egypt, recorded the directions of atmospherics which occurred when the talks were taking place. When the papers were gathered and compared with the records made by the direction finders, the results were remarkable, says the *Evening News*, which explains that in several cases atmospherics were observed at identically the same moment by listeners in Madeira, Ireland, Germany and Norway, and the direction finders showed that the thunderstorm responsible at the moment was situated somewhere in the West Atlantic. The results show that atmospherics may be due to storms taking place perhaps 4,000 or 5,000 miles away. Instructive observations of a similar nature are contained in I.E.E. papers (Vol. 63, No. 346, and Vol. 64, No. 353), by Capt. H. J. Round and Mr. R. A. Watson Watt, respectively.

Lithuania.—NEW LICENCE FEES.—The Lithuanian Parliament (Seimas) has adopted a new radio tariff which is already being provisionally put into operation by the institutions concerned. According to *World Radio* the monthly charge for a receiving set installed in private dwellings, State and Municipal institutions, by cultural and charitable organisations and in newspaper offices, if special taxes are already being levied, is as follows:—In towns: (*a*) crystal detector, tenpence; (*b*) valve receiver, 2s. 1d. In villages and other localities: (*a*) crystal set, fivepence; (*b*) valve set, 1s. 3d. For a receiving set in restaurants, clubs, shops, kinemas, and similar public places, the monthly fee is to be: (1) in Kaunas and Klaipeda, one pound sterling; (2) in district towns, 12s. 6d.; and in other places, 4s.

United States.—100-kW VALVE.—For the past few weeks the high-powered transmitter of WGY, at Schenectady, N.Y., has been using a 100-kW vacuum power tube, which takes the place of eight 20-kW tubes. It is a development of the General Electric Co., and engineers are now securing data on its performance; with its water jacket, the tube stands 7½ ft. high and weighs 100 lb., or 1 lb. per kilowatt, and it is used as a radio amplifier, fulfilling in the transmitter a function comparable with the radio-frequency stages in receivers. Outside its water jacket the tube is 5 ft. high, and two-thirds of this height consists of the copper envelope, 4 in. in diameter; the upper third is made of glass through which the filament leads and the grid lead find insulated entrance. The glass bulb is 22 in. long and 4 in. in diameter, and it is sealed to the spun-out end of the anode cylinder, or copper envelope, by a machine process in such a way as to make the junction of glass and copper mechanically strong and vacuum tight. Two copper cables capable of carrying several hundred amperes are connected to tungsten rods which, in turn, pass through a pinch seal terminating at the filament ends; three lengths of tungsten wire, each 16 in. long, connect to each of the inner leads, forming six parallel filament spans, which pass within the grid and meet at a common point at the filament spring suspension in the lower end of the tube. The grid, within the copper envelope, is cylindrical and has an over-all length of 3 ft. 5 in. The grid frame is a most ingenious structure of molybdenum and tungsten; bracing, such as is common in steel bridges and tower construction, provides strength with a minimum of metal; rigidity is necessary to prevent short-circuiting from swaying or sagging, and minimum metal in the grid structure facilitates exhaust and minimises the possibilities of gas evolution. The grid connection is brought out through an arm part way up the high-voltage glass bushing to a flexible outside grid terminal. To guard against failure due to pressure increase in the tube, an ionisation gauge is used which takes the form of a special three-element vacuum tube, in appearance much like an ordinary receiving tube; it is sealed to the large tube, connections to filament, grid and plate are made from the pressure-indicating device at the operating panel, and the gauge operates on the principle of the ratio of ionisation by collision with electrons to the pressure, or amount of gas present.—*T. & T. Age.*

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Aberdare.—June 2nd. Electricity Department. E.h.p. overhead and underground main and branch transmission lines. (See this issue.)

Armagh.—June 1st. Urban District Council. Heavy oil engine generating plant, underground and overhead mains. (See this issue.)

Australia.—Melbourne.—June 1st. Victorian Government Railways. Electric time-releasing mechanisms. (B.X. 3431.)*

July 5th. State Electricity Commission. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*

July 4th. 66,000-V and 22,000-V insulators for the Yallourn brown coal scheme. (May 6th.)

June 28th. Postmaster-General's Department. Jacks, switchboard instruments, &c. (B.X. 3474.)*

Sydney.—June 22nd. New South Wales Government Railways. Remote-control switchgear. (B.X. 3442.)*

June 20th. Municipal Council. Turbo-alternators for Bunnerong power station. (B.X. 3443.)*

Brisbane.—May 18th. City Electric Light Co., Ltd. Outdoor switchgear. (B.X. 3456).*

Basingstoke.—June 7th. Corporation. Electrical installations at the Council's housing estate (approx. 1,015 wiring points). (See this issue.)

Belgium.—Antwerp.—June 20th. Municipal Council. 32 portal travelling electric cranes. (A.X. 4653.)*

Chile.—Santiago.—July 18th. Chilean State Railways. Materials for electric lighting and power (Group 30). Materials for electric lighting of locomotives and coaches (Group 32). August 22nd. Signalling, telegraph and telephone supplies (Group 36). (C.X. 2271.)*

Dartford.—May 21st. Urban District Council. 1,062 yd. l.p. cable. (See this issue.)

Darton.—May 17th. West Riding Education Committee. Electric lighting installation at Darton Kexborough new school. Specifications from Education Department, County Hall, Wakefield.

Darlington.—May 23rd. Electricity Committee. One 500-kW rotary convertor, with transformer. (May 6th.)

Dublin.—May 23rd. Electricity Department. Pipework for the 5,000-kW turbo-alternator. (May 6th.)

Dundee.—May 19th. Electricity Department. 2-core and 4-core l.p. cable. D.c. and a.c. house-service meters. (May 6th.)

Edinburgh.—May 16th. East Lothian Education Authority. Works, including electric lighting installation, for the extensions, &c., at Macmerry Public School. Schedules from the surveyors, Messrs. R. & A. K. Smith, 44, Queen Street, Edinburgh.

Egypt.—Cairo.—June 4th. Egyptian State Railways, Telegraphs and Telephones, Chief Inspecting Engineer, Queen Anne's Chambers, S.W. Underground cables (approx. £E12,000 to £E13,000).

May 28th. Ministry of Education. Electrical equipment for Beni Suef Trades School. (B.X. 3488.)*

Epsom.—Electricity Department. E.h.p. cable. (May 6th.)

Glasgow.—May 16th. Corporation. Electric light installations at a number of housing schemes. Mr. R. B. Mitchell, engineer, 75, Waterloo Street, Glasgow.

May 18th. Electricity Department. Materials for 12 months, including l.p. and e.h.p. cable, i.r. insulated cables and flexibles, meters, carbons, cast-iron boxes, section pillars. Mr. R. B. Mitchell, engineer, 75, Waterloo Street, Glasgow.

Glentanar, Aberdeenshire.—May 16th. Work in connection with the hydro-electric scheme, intake works on the River Tanar. Specifications from Messrs. Tawse & Allan, civil engineers and architects, 10, Bon Accord Square, Aberdeen.

Grimsby.—June 4th. Electricity Department. Sub-station equipment. (See this issue.)

Guildford.—May 16th. Town Council. Wiring 60 flats for electric light. Mr. J. W. Hipwood, borough surveyor, Tuns Gate.

India.—June 14th. India Stores Department, Simla. Generating sets for Fyzabad power station. (B.X. 3486.)*

London.—St. Marylebone.—May 18th. Electricity Department. L.p. and e.h.p. cables for 12 months. (April 15th.)

Islington.—June 1st. Electricity Department. Steel-tube lamp columns, 2,200-V feeder switchgear, rotary and/or static power factor correctors. (April 22nd.)

Metropolitan Asylums Board.—May 18th. Installation of a multiple roller ironing machine; new steam boiler, &c.; steam main; electric power in laundry, &c., at Darenth Tramway Colony; conversion of mechanical stokers to hand firing at North-Eastern Fever Hospital. (April 29th.)

London County Council.—May 17th. Electrical installation at the Albion Road, Stoke Newington, Central School (approx. 133 points). (May 6th.)

Manchester.—May 30th. Electricity Department. L.p. valves for circulating water system, two electrically-driven and one steam-driven boiler feed pumps. (See this issue.)

New Zealand.—Wellington.—June 21st. Public Works Department. Sub-station switchgear and metering equipment for Arapuni. (B.X. 3398.)*

Auckland.—July 4th. Auckland Electric Power Board. Switchgear. (B.X. 3471.)*

Richmond-on-Thames.—May 23rd. Municipal Water Department. Electrically-driven centrifugal pump, with motor, &c. Mr. H. P. Williamson, engineer, Riverside.

Scarborough.—June 3rd. Corporation. Installation of electrical pumping plant in duplicate for the new Irton water scheme No. 2. Specifications (£5) from Dr. H. Lapworth, engineer, 25, Victoria Street, S.W.

Sleaford.—May 17th. Electricity Department. Cables, boxes, &c. (April 29th.)

Stirling.—May 27th. Corporation. Electrical work at 96 houses. Specifications from Mr. Andrew H. Goudie, burgh surveyor.

Thorne.—May 17th. West Riding Education Committee. Electric lighting installation at new boys' school. Specifications, &c., from Education Department, County Hall, Wakefield.

Tynemouth.—June 11th. Electricity Department. One voltage regulating transformer. (See this issue.)

Whitley.—Electricity Department. One 1,000-kW turbo-alternator, with condenser, pumps, air filter, &c.; one 200-kW semi-Diesel or heavy-oil engine alternator. (May 6th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Australia.—Melbourne.—Electricity Supply Committee. Accepted :—

D.c. switchgear (£4,246).—Johnson & Phillips, Ltd.

H.p. armour-clad switchgear (£5,277).—A. Reyrolle & Co., Ltd.

Electrically-driven pump (£1,425).—Kelly & Lewis.

7,400 yd. triple braided cables (£932).—British Insulated Cables, Ltd.

Postmaster-General's Department.—Primary battery material (£977).—Siemens Aust. Pty., Ltd.; (£26,862) Widdis Diamond Dry Cells, Ltd.

Accumulator plates and separators (£645).—T. K. Steanes and Son; (£924), Chloride Elec. Storage Co., Ltd.; (£1,341), Tudor Accumulator Co., Ltd.

Motor-generator sets (£232).—Crompton & Co., Ltd.

Automatic exchange equipment for Brisbane Central and Paddington Exchanges, Queensland (£161,105).—Siemens (Aust.), Ltd.

State Electricity Commission of Victoria.—555-kVA transformers (£971).—Weymouth's, Ltd.

V.I.R. control cables (£1,278).—British Insulated Cables, Ltd.

SYDNEY.—New South Wales Railways.
H.p. cable (£17,903).—Enfield Cable Works (Aust.), Ltd.

Electricity Supply Committee. Recommended :—
Copper busbars (£450), two 2-ton electrically-operated jib cranes (£754 each), one 3-ton ditto (£937), one 5-ton ditto (£1,577).—Noyes Bros. (Sydney), Ltd.
14½ tons corrosion-resisting bars and fittings for Bunnerong (£406).—Armco Australian Agency.
3½ tons bare copper cable (£390).—W. T. Henley's Telegraph Works Co., Ltd.

Finance Committee. Accepted :—
5,000 metal filament lamps (£312).—Condor Lamps (Aust.), Ltd.

Tenders.

Ayrshire.—Education Authority. Accepted:—
Electric lighting work at new primary school at Irvine (£107).—C. Banks (Irvine).

Belgium.—International competition was again experienced at Schaerbeek, Belgium, on April 29th, when the municipal authorities opened tenders for the supply of 11,000 metres of h. and l.p. armoured cable. Offers were received from Belgian, German, Dutch, French, Czecho-Slovakian, and British firms. The quotations ranged from 429,670 fr. to 616,885 fr., the lowest being that of the Land-und-See Kabelwerk Gesellschaft, of Cologne, this being 3,650 fr. under the lowest Belgian quotation. The British competing firms were Callender's Cable and Construction Co., Ltd., who quoted 564,800 fr., and British Insulated Cables, Ltd., whose price was 585,882 fr.

Canterbury.—Town Council. Accepted:—
Equipment for a central sub-station :—
E.h.p. cables, control, telephone and pilot wires (£2,322).—Standard Telephones & Cables, Ltd.
Switchgear (£460).—Ferguson, Pailin, Ltd.
Overhead travelling crane (£164).—Herbert Morris, Ltd.

Dartford.—Urban Council. Accepted:—
Supplying and laying cables from the electricity works to Park Road (£1,952).—Power Lines Construction Co., Ltd.

Doncaster.—Town Council. Accepted:—
Two 500-kVA transformers (£700).—Bruce Peebles & Co., Ltd.
E.h.p. switchgear (£500).—Ferguson, Pailin, Ltd.

Hitchin.—Rural Council. Accepted:—
Installing electric light at 26 houses at Knebworth (£7 10s. each).—Stevenage Electric Light and Power Co.

Hull.—Education Committee. Accepted:—
Electric light installation Park Avenue Special School (£376).—Alexander Shaw & Sons.

Tramways Committee.
Renewal of tram track in Newland Avenue (£5,598).—Sangwin, Ltd. (Recommended.)

Telephones Committee.
Instruments.—Automatic Telephone Manufacturing Co., Ltd. (£475), W. F. Dennis & Co. (foreign) (£337). (Accepted.)

Liverpool. — Electricity and Tramways Committee. Accepted :—
70 tons tiebars (£700), 20 tons fishbolts (£220).—Société Anonyme Usines & Aciéries.
20 miles e.h.p. cable (£44,320).—British Insulated Cables, Ltd.
10 miles e.h.p. cable (£21,780).—W. T. Henley's Telegraph Works Co., Ltd.
Maintenance of electric lifts at electricity and tramways offices for three years.—Express Lift Co., Ltd.

London. — LONDON COUNTY COUNCIL. — Highways Committee. Accepted :—
Tramway stores :—
Controller segments, fingers, tips, &c.—Dyer & Young, Ltd.; Higgs & Hill, Ltd.; E. Showell & Sons, Ltd.; Yorkshire Switchgear and Engineering Co., Ltd.
Gear wheels and pinions.—Metropolitan-Vickers Electrical Co., Ltd.; Cammell, Laird & Co., Ltd.; Power Plant Co., Ltd.
Rheostats.—Rheostatic Co., Ltd.

WIMBLEDON.—Electricity Committee. Accepted :—
Twelve 100-kVA transformers (£1,026).—Hackbridge Electric Construction Co., Ltd.

SOUTHWARK.—Electricity Committee. Accepted :—
Meters.—Chamberlain & Hookham, Ltd.
Brush holders.—J. Child & Co., Ltd.
Steel pipes.—Millwall Engineering Co., Ltd.
Stoneware ducts.—Sutton & Co., Ltd.

GENERAL POST OFFICE.
Telephone switchboard lamps.—Edison Swan Electric Co., Ltd.

Maidenhead.—Town Council. Accepted:—
Wiring houses at Cox Green for electric lighting (£4 17s. 3d. each).—W. H. Arundell & Co.

Oldham.—Electricity Committee. Accepted:—
Earthenware cable ducts.—Albion Clay Co., Ltd.
Overhead electric travelling crane for new power station.—Clyde Crane & Engineering Co.

Manchester.—Tramways Committee. Accepted:—
Trolley wire.—Messrs. Richard Johnson & Nephew, Ltd.
Two Millars concrete mixers.—Millars Machinery Co., Ltd.
Block tin.—French & Smith, Ltd.

Paving Committee. Accepted :—
Electrical work at new depot.—Meta Manufacturing Co., Ltd.
Motor and starter frame for driving machinery at depot.—Metropolitan-Vickers Electrical Co., Ltd.

Electricity Committee. Accepted :—
Static transformers.—Bruce Peebles & Co., Ltd.
Feeder cables.—Callender's Cable & Construction Co., Ltd.

Education Committee. Accepted :—
Electric cooker at Cheetham Central School.—R. H. Clampnett & Co.

Ross-shire.—LOCH LUICHART.—Ross-shire Electric Supply Co., Ltd.
Supply and erection of pipes, water turbines, and electrical plant for the station at the outlet of Loch Luichart.—James Gordon & Co.

The plant will consist of two 750-h.p. Francis turbines, coupled to two 500-kW generators, with switchgear, transformers and about 40 miles of transmission line.

South Africa. — CAPETOWN. — South African Milling Co.
Wiring contract, the new flour mills.—Gearings, Ltd., of Cape Town. The contract comprises wiring for 20 motors (4 being of 130 h.p. each) and for over 500 lighting points.

Electricity Supply Commission. Accepted :—
Wiring the new power station at Salt River Mouth, near Cape Town (£2,550).—Edward A. Shaw & Co., Cape Town.

Walsall.—Town Council. Accepted:—
Modification of the existing switchgear at the station, including the provision of 10 new switches (£5,866).—A. Reyrolle & Co., Ltd.

Warwick.—Board of Guardians. Accepted:—
Installing electric light in the new children's block, &c. (£242).—Ellis & Ward, Ltd.

Watford.—Electricity Committee. Accepted:—
Cable.—W. T. Henley's Telegraph Works Co., Ltd.

Worthing.—Town Council. Accepted:—
L.p. distribution cables (£6,498).—Enfield Cable Works, Ltd.

Forthcoming Events.

Physical Society.—Friday, May 13th. Imperial College of Science, South Kensington, S.W. 5 p.m. Ordinary meeting.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, May 14th. South Wales Institute of Engineers, Cardiff. 6 p.m. Annual meeting.

(North of England Branch).—Saturday, May 21st. Annual general meeting.

Röntgen Society.—Tuesday, May 17th. 32, Welbeck Street, W.1. 8.15 p.m. Ordinary meeting.

Institution of Electrical Engineers (Wireless Section).—Wednesday, May 18th. London. 6 p.m. "A Wireless Works Laboratory." Mr. P. K. Turner.

Royal Society of Arts.—Wednesday, May 18th. 8 p.m. "Industrial Welfare in Great Britain and the United States." Mr. R. R. Hyde.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the name and address of makers of the following :—

SILOVAC vacuum cleaner.
ROBERTSHAW vacuum cleaner.
MARVEL electric curling iron.

Notes.

Sir Charles Soame, Bt., and Co-Directors Charged.

At the Mansion House, before Ald. Sir G. Truscott, on May 10th, Sir Charles Buckworth Herne Soame, Bt., Edward Warden, Robert George Harley, and Col. Edmund Octavius Eaton were summoned at the instance of the City Police on charges of conspiracy to defraud such persons as might receive prospectuses, &c., relating to the Chalk Fuel Power Gas and By-Products Corporation, Ltd.; to obtain money from them by representing that the statements made regarding the fuel were genuine reports; and to commit offences against the Larceny Act, 1861 (Section 84). A letter from Sir Charles Soame was read, explaining that he was unable to attend by reason of an accident, in 1924, which had crippled him. It was also stated that Col. Eaton was too ill to appear. The hearing was accordingly adjourned for six weeks.

Irish Free State Electricity Supply.

At a meeting of the Irish Centre of the Institution of Electrical Engineers on April 28th, in Dublin, a paper was read by Mr. MacEntee on the subject of "Rural Distribution of Electricity in the Irish Free State," in the course of which he said that the comparative scarcity of the rural population, coupled with the fact that it lived more or less in isolated homesteads, would considerably influence the rural distribution system of electricity. The network in connection with the hydro-electric development of the Shannon would be so extensive and so close-knit that a considerable number of towns within a distance of from 10 to 15 miles of each other would become the terminal points of 10,000-volt lines. In Ireland they had embarked upon an undertaking very large in proportion to their resources—one which might cripple the State if it failed, but, if it succeeded, would bring returns in prosperity and in social amelioration more than commensurate with the risk. One of the essentials was the successful application of electricity to the conditions of rural life, and experimental rural lines should be immediately constructed, so that fundamental data necessary for a sound scheme for electrification of rural areas might be secured.

The Free State Government's Bill for the absorption of local electrical undertakings under the Board of Control in connection with the Shannon hydro-electric scheme is now before the Senate at last, and passed second reading after an amendment proposed by Sir John Keane in favour of delay had been rejected. This amendment urged that the House should refuse a second reading to the Bill until "it is satisfied that the Executive Council (Cabinet) is unable to lease the Shannon works at a rent to cover interest and sinking fund on the capital cost." Several Senators complained that, in view of the dissolution of the Dail (Lower House) this month and the approach of a General Election for members of that Chamber, it would be impossible to have a definite discussion in Committee, whereupon Mr. McGilligan, Minister of Industry and Commerce, announced that, if necessary, the election could be postponed, as the Government was determined to get the Bill through without delay. The policy of the Government is the subject of keen hostile criticism by various speakers in the election campaign throughout the country, but Ministers and their friends continue to defend it and to plead that a Bill for the control of the whole electricity supply of the State is essential to the success of the Shannon scheme and the distribution of cheap power through an efficient service. A party of members of the Institution of Civil Engineers in Ireland was this week to have paid a visit of inspection to the Shannon works.

Electric Threshing Demonstration.

To demonstrate the possibilities of electricity on the farm, the Chester Corporation Electricity Department, in conjunction with Messrs. Ransomes, Sims & Jefferies, Ltd., arranged a demonstration of threshing machinery at Deeside Farm, Sealand, recently. The experiment was witnessed by farmers from various parts of the country. Threshing was done under the direction of Mr. F. Ayton. The Class "AM" medium threshing machine and a 25-b.h.p. electric motor, mounted on a portable carriage for removal from place to place by a horse, were employed.

The British Association.

Preliminary details of the 97th annual meeting of the British Association for the Advancement of Science have been issued. The meeting is to be held at Leeds from August 31st to September 7th under the presidency of Prof. Sir Arthur Keith, M.D., LL.D., F.R.S. Prof. Sir J. B. Henderson is to be president of the Engineering Section, Prof. D. H. MacGregor president of the Economics Section, and Prof. E. T. Whittaker, F.R.S., president of the Mathematical and Physical Science Section.

Electric Ship Propulsion.

The Peninsular and Oriental Steam Navigation Co. has placed a contract with Messrs. Alexander Stephen & Sons, Ltd., Linthouse, Glasgow, for a passenger liner of 19,000 tons, which will be the largest vessel of the liner type fitted with electrical gear; she will be over 600 feet in length and the turbines will obtain steam from Yarrow water-tube boilers working at a pressure of 375 lb. per square inch. The transmission of power from the turbines to the propeller shaft will be electrical and the speed of the ship will be 19 knots. Accommodation will be provided for 400 first-class and 300 second-class passengers. Another "electric" ship is being built at Scott's Yard, Greenock, for the Holt line.

Electric Vehicles in Italy.

It is reported from Rome that among the efforts that are being made to render Italy less dependent on imported motor fuel is a campaign by the Italian Automobile Club to popularise the greater use of electric vehicles. In this connection it is reported that a new type of secondary battery has been developed by Count Gallenga, which is considerably lighter than those at present available.

River Water—or Cooling Towers?

In a recent communication to the Société des Ingénieurs Civils, Mr. T. J. Guéritte touched upon the above question, and in the *Génie Civil* of April 9th he developed the subject with reference to the article by Mr. J. N. Waite, M.I.E.E., published in the Electrical Review of January 14th, and the correspondence which ensued. Accepting Mr. Waite's figure of 4 per cent. for the relative advantage of using river water, in place of the 7 per cent. formerly claimed, the author further points out that the peak load only lasts a few hours, and at other times the average temperature of the circulating water is lower. Where cooling towers are installed, if the ponds are designed so as to profit by the lowering of temperature and the reduction of load during the night, the increased consumption of steam due to the use of towers instead of river water takes place only during a very short time. In addition, the cost of screening the river water and pumping it to the station, and the high cost of foundations for a station built on the bank of a river, tend to annul the economy due to using river water. Recently some important stations which could have been sited on rivers have been built on land nearer the centres of distribution. On the other hand, the necessity of softening make-up water for cooling towers must often be allowed for, though this is partially off-set by the cleaner and more efficient condition of the condensers.

Unless highly efficient cooling towers are employed, however, the 4 per cent. loss may rise to 10 per cent. or more. Recent developments are in the direction of hyperbolic towers, especially in England, as at Liverpool. The Corporation of Birmingham is going to build 20 enormous towers, each having an output of 21,000 tons of water per hour, the power station being projected for an ultimate capacity of 840,000 kW.

In his communication to the Society, Mr. Guéritte examined the efficiency of natural-draught coolers, and showed that a wide range of cooling was not essential. On the contrary, it was desirable to have a rapid circulation of water, between relatively narrow temperature limits, but ensuring as low a temperature as possible at the condenser inlet. He explained why wood and steel construction had been dropped, and why the circular form had been adopted, and stated that large coolers were the most economical; a cooler 40 m. in diameter was as effective as four of 20 m. diameter, and far cheaper, but in very large cylinders it was difficult to ventilate the central portion. Hence the hyperbolic type of Messrs. Van Iterson and Kuypers was invented, which had no projections from the shell, so that the air circulated freely and uniform temperature was obtained over the whole surface of any horizontal section.

Appointments Vacant.

Head of the Electrical Engineering Department (£500) for the Robert Gordon's Colleges, Aberdeen. Showroom attendant (70s.) for the Borough of Stoke Newington Electricity Department. Junior scientific assistant for the Admiralty Research Department. Electrical engineer and general manager (£1,500) for the Corporation of Belfast. Lecturer in electrical engineering for the Borough Road Polytechnic. Salesman (84s.) for the Farnworth Urban District Council electricity undertaking. Junior mains records assistant for the Croydon Corporation Electricity Department. Mains engineer for the Corporation of Lowestoft. Plumber-jointer for the Eccles Corporation Electricity Works. Telegraph foreman (£400) for the Government of Nigeria. Assistant telephone engineer for the Oriental Telephone and Electric Co., Ltd. (See our advertisement pages to-day.)

H.P. Electrode Steam Generators.

In a recently-issued bulletin of Messrs. Oerlikon, Ltd., a description is given of electric steam generators which have been introduced. They are designed for working pressures from 3,000 to 8,000 V and for outputs ranging from 300 to 5,000 kW. These h.p. electrode steam generators, like the l.p. Oerlikon equipments, are provided with fixed electrodes, the output being regulated by varying the level of water. The electrodes are separated by insulated bodies arranged in an iron frame fitted in the boiler; they are secured to the cover and can be removed by raising the latter. Tests on a 1,200-kW electrode boiler for 6,400 volts have shown, it is claimed, that the efficiency of this plant can reach 98 per cent. An equipment of this capacity has been in service for some time at one of the

hospitals of the city of Basle; it is designed for 1,200 kW at 6,000 V. The plant works in conjunction with a steam accumulator with a storage capacity of 2,500 kW-hours, which can feed the different parts of the hospital when the electrode boiler is not in operation. The hot water also required is heated in a separate counter-flow apparatus by means of the steam generated in the electrode boiler and stored in large tanks. The generators were built by the Oerlikon Co. in conjunction with Messrs. Escher, Wyss & Co., of Zurich.

The First European 380-kV Transmission Line.

What is stated to be the first 380-kV electricity transmission line in Europe has recently been completed between Neuenahr and Rheinau by the Rhenish-Westphalian Electric Power Works Co., to connect its steam-operated and hydro-electric power stations. Actually there are two lines about 125 miles in length, each consisting of three hollow copper cables 42 mm. in diameter, supported on masts about 110 ft. high and spaced at intervals of approximately 328 yards. A noteworthy feature is the section of the line across the River Rhine near Coblenz, a single span of 547 yards. Fig. 1 illustrates the construction of the hollow cable, which was developed by the Allgemeine Elektricitäts Gesellschaft, of Berlin, in conjunction with the R.W.E.; it has a cross section equivalent to 400 sq. mm., as against 1,000 sq. mm. for a solid conductor, and it consists of a large number of flat wires arranged in two layers over a central support. The latter, which the A.E.G. has patented, consists of a spiral-shaped flat-copper band wound edgeways on a mandril, which is removed when the spiral is completed; the two layers over the spiral, which run in opposite directions and are wound in the usual manner on a tandem stranding machine, consist of flat hard-drawn copper wires of segmental section, *i.e.*, in the form of a trapezium, by which means the various wires are forcibly supported in their relative positions; the latter effect is augmented by increasing the thickness of the wires of the inner layer, the principal function of the weaker outer layer being to keep the structure together. For the erection of the line new methods and special equipment were necessary in order to protect the cable from undue stresses during the stretching and erection operations. Fig. 2 represents one of the towers with the platforms temporarily fitted up for the cable-erection operations and the wheels over which the cables were pulled by means of a winch. During the erection the cable was maintained taut by means of a tension-regulating device specially constructed for the purpose. It is claimed that the manufacture of hollow cables does not present any difficulties, provided the material is good and the dimensions of the spiral and layer wires are appropriately chosen.

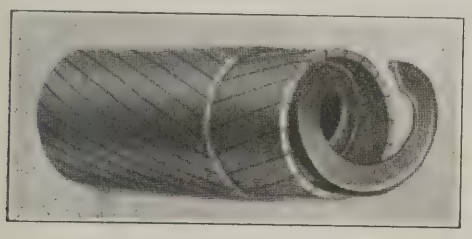

Fig. 1.—A.E.G. Hollow Copper Cable.

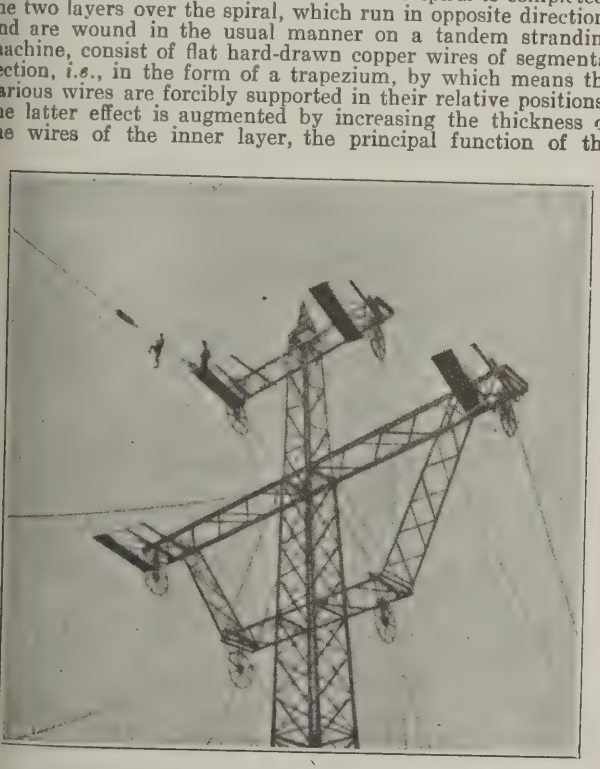

Fig. 2.—Tower with Erection Platforms and Wheels.

How to Reduce Electricity Prices.

The *Daily Express* reports that taxpayers at Grasse on the Riviera seized the town hall as a protest against the high cost of electricity, gas, and funerals.

Street Accidents Caused by Vehicles.

The returns for 1926 show that in Great Britain there were 96,742 accidents caused by mechanically propelled vehicles, of which 7,426 were due to omnibuses and motor coaches, and 5,697 due to tramcars and railless trolley vehicles. The total number of accidents was 124,287; 4,886 persons were killed and 133,888 injured. In the Metropolitan Police District there were 43,507 accidents, and 1,003 persons were killed.

Association of Supervising Electrical Engineers.

The results of the fifth annual competition for the W. E. Highfield Shield, 1927, have been announced. The winner of the shield and first prize, value 4 guineas, presented by the Board of Control, is Mr. G. H. Conway, for a paper on "Electrically-heated Glasshouses"; second prize, value 2 guineas, presented by Messrs. V. G. Middleton & Co., Ltd., Mr. B. C. Garman, for some "Notes on Electric Cooking Apparatus"; and third prize, value 1 guinea, presented by Messrs. Johnson & Phillips, Ltd., Mr. E. J. Davies, for a paper on "Electricity as Applied to the Asphalte Industry." The winning Associate competitors are:—First prize, value 2 guineas, Messrs. Hogan & Wardrop, Mr. T. V. Harding, "Electric Crane Control"; and second prize, value 1 guinea, editor of *Electricity*, Mr. F. Anderson, for a paper on the "Testing of Electrical Machines."

Educational.

RESEARCH SCHOLARSHIPS.—A limited number of research scholarships in technology (each of a value not exceeding £100) will be awarded in July, 1927, tenable during the academic year 1927-28 in the Manchester Municipal College of Technology (Faculty of Technology in the University of Manchester). The subjects include electrical engineering and electro-chemistry. Applications must be received on or before July 6th, 1927; forms of application may be obtained by written application to the Registrar of the College.

The Armourers and Brasiers Company has arranged for lectures to be delivered at the Sir John Cass Technical Institute, 31, Jewry Street, Aldgate, E., at 6.30 p.m., on May 17th and 31st, and June 14th, by Dr. W. H. Hatfield, on "Special Steels and their Application in Engineering," and at the Royal School of Mines, Prince Consort Road, South Kensington, S.W., on May 18th and 25th and June 1st, by Mr. U. R. Evans, on "Oxidation, Corrosion, and Passivity of Metals." Admission is free, without ticket. The company has also founded Industrial Bursaries to assist honours graduates and students to pursue their studies. (See our advertisement pages to-day.)

Rating Electricity Undertakings.

The Local Government Committee of the L.C.C. recommends in connection with the report of the Advisory Committee on Domestic Supplies appointed by the Electricity Commissioners, that representations should be made by the Council on the subject of the recommendation of the Advisory Committee dealing with assessment for rating, which is as follows:—"With regard to assessment for local rating, the Committee are of opinion that the present method of assessing electricity supply undertakings requires immediate amendment. The Committee recommend that electricity undertakings should be assessed on the basis of the profits of the undertakings, with a rebate of such a sum as would represent 75 per cent. of the sum payable on account of the general district rate in respect of underground cables and works." The Local Government Committee points out that no arguments are adduced in the report in justification of the proposed rebate, but that it is probably based on the precedent of section 211 (1) (b) of the Public Health Act, 1875, which provides that certain classes of property shall be assessed to the general district rate at one-fourth only of their net annual value. By the Rating and Valuation Act, 1925, the general district rate is abolished as a separate rate, but the effect of the exemption is continued by reducing the value on which rates will be levied by an amount representing the average amount of the relief from the general district rate over the period from 1914-1924. There is, however, very little, if any, analogy between underground cables and the classes of property dealt with. On the other hand, there is a close analogy between electric cables and water and gas mains. The assessments of water and gas undertakings are based on profits in the same way as electricity undertakings, no exemption being allowed in respect of their mains. There is frequently active competition between gas and electricity undertakings, and it would be manifestly unfair to impose on gas undertakings additional rates in order to relieve their competitors. If partial exemption were granted to electric cables, it would be difficult to refuse it to gas mains or other similar classes of property. During the committee stage of the Rating and Valuation Bill an amendment was moved to grant an exemption (similar to that enjoyed by railways) in respect of the underground mains and pipes of gas, water and electricity undertakings, and of the rails, tracks, &c., of tramways. This amendment was, however, withdrawn, on the representation of the Minister of Health. The Royal Commission on Local Taxation reported in 1901 against the extension of exemptions. In this connection the Council passed a resolution to the effect that no further exemptions from rating should be allowed, and that existing exemptions should be abolished as opportunity offered. It is true that the recommendation of the Advisory Committee relates only to general district rate purposes and does not affect London; but if the rebate were conceded outside London, it might be difficult to resist the application for a similar rebate in London.

The Thury D.C. System in France.

For the past twenty years a power transmission line on the Thury high-voltage, direct-current, variable-voltage system has been in operation between Moutiers and Lyons, France, for the supply of power for the tramway system in the last-named city. The system has worked well, the only difficulty encountered having been that of the supervision of the line between Chambery and Novalaise, a distance of nearly 20 miles, where an altitude of 3,290 ft. is attained and the weather is very severe, especially in winter. To overcome this drawback the Société Générale de Force et Lumière recently decided to install a new underground cable on this section of the line, placing a contract with the Compagnie Générale des Cables, of Paris, for a d.c. cable capable of working at 150,000 volts and of attaining 300,000 volts between the positive and negative wires with the central point earthed. It is claimed that this constitutes a new step forward in cable manufacture, the highest d.c. voltage transmission hitherto attained in France being 60,000 V.

Chief Technical Assistants' Association.

On May 7th a party of members of this Association paid a visit to the Ilford Electricity Department's sub-stations. At Gant's Hill sub-station the automatic gear was inspected and operated for the benefit of the visitors. The next stop was the Goodmayes sub-station, where some more automatic equipment was seen in operation. Mr. G. F. Gregory (Ilford) presided at tea at the sub-station, supported by Mr. A. Murdoch (Fulham), the chairman of the Association. The party is seen in the accompanying illustration. After inspecting the showroom a number of the members visited the Stepney Electrical Exhibition.

The C.T.A.A. at Ilford.

Carnegie Grant for X-Ray Martyr.

An allowance of £120 per year has been made by the trustees of the Carnegie Hero Fund to Dr. G. C. W. Williams in recognition of his X-ray work. Dr. Williams has been compelled to give up his professional work as the result of the loss of his right hand and part of his left. He had carried on X-ray work since 1895, and much of it was of a valuable nature.

Electro-Farming Discussed in Paris.

Last week the Société Française des Electriciens devoted a long evening to the subject of the "Applications of Electricity to Agriculture." Papers illustrated by kinematograph films were presented by Mr. R. Borlase Matthews, who dealt with the British point of view; Dr. A. Ekström, who illustrated Swedish practice; and M. Bitouzet, who referred to the electric ploughing work now being carried out in the rural districts within a radius of 40 miles of Paris. A part of the film shown by Mr. Matthews was entirely new, and has not yet been exhibited in England; it demonstrated the application of electric light and heat for the treatment of bees, showing the results of experiments conducted during the past three years at East Grinstead. The result of such treatment is that the bees are kept free from disease and produce considerably more honey per hive per annum. The feature of Dr. Ekström's paper was the fact that in Sweden it was now more profitable to supply a rural area than an urban one. M. Bitouzet's film was a revelation as to the serious progress that was being made in electric ploughing in France.

Radiation.

Mr. John B. Kramer, of the General Electric Co., Ltd., who has been investigating phenomena associated with radio-active energy, described some of the interesting results he has achieved in a lecture on "Radiation" before the Birmingham Electric Club recently. He showed how it is possible to harness, in a small way, the energy of certain radio-active materials, which exist in quantities in various parts of the world. In his early experiments, Mr. Kramer had used monazite sand from India as a source of radiation, and batteries were made by placing the sand between plates of carbon and zinc; the sand remained radio-active for years, but it was eventually found to be unsuitable owing to changes in the atmosphere setting up an electrolytic action. Other materials, notably thorium, had since been used. Mr. Kramer demonstrated various experiments, and claimed that they had brought him nearer to the practical utilisation of the energy stored in radio-active minerals. He showed a method of using radiation energy to work a small electronic balance, and also an electronic cell; the radio-active substance was placed upon a carbon plate, above which, with an air space between, was a zinc plate. He was engaged in examining such cells with a view to developing a battery which would produce sufficient energy for useful work, even if only in a small way for a start. He pointed out that, up to a certain point, the determination of the air gap in an electronic cell, a very important matter, was contrary to Ohm's law, in that the charge increased as the gap was made larger; this was probably explained by the fact that a certain volume of air was required for maximum ionisation.

Boiler Explosion Report.

A report has been issued of the preliminary inquiry into the cause of an explosion which occurred from a water-tube boiler at the Lister Drive power station, Liverpool. One of the tubes failed longitudinally over a length of 7 in., and at each end of the opening it ruptured circumferentially, creating an aperture 7¾ in. wide. The explosion was caused by overheating due to excessive scale deposit on the inside surface of the tube. There appears to have been no thinning of the tube as in ordinary cases of over-heating.

The Electro-Deposition of Rubber.

According to *Science*, the electric rubber moulding process was worked out by two groups of research workers, one in America and one in Hungary, neither of which knew that the other was engaged in the problem. The American workers were S. E. Sheppard and L. W. Eberlin, of the Eastman Kodak Company, and the Hungarian group was led by Paul Klein and A. Szegvari. Both groups knew that when solid dried crude rubber was worked upon a mixing mill in the rubber factory the rubber substance was made softer and weaker. They knew that the less rubber was heated or worked, the better was its quality; they also knew that research in recent years had shown how vulcanisation might be carried on at lower temperatures than formerly and the necessary sulphur combined with rubber with the minimum loss of quality. Certain substances known as "accelerators" possess the property of permitting vulcanisation to be accomplished at relatively low temperatures. However, if these accelerators were incorporated on the usual mixing mill, the temperature would be sufficiently high to cause vulcanisation during mixing and to spoil the goods.

These men conceived the plan of so depositing rubber on forms, from latex, that the rubber particle itself was not altered, and made the discovery that electro-deposited rubber had the highest quality ever observed. There were many problems to be solved before this was made practical. It was necessary for other substances to be deposited simultaneously, such as sulphur, zinc oxide, and carbon black; the last two substances are required to give toughness. A long investigation was carried out to find means to disperse them in water, mixed with the latex particles, without coagulating the latex. A noteworthy achievement was the discovery of means by which the rubber layers might be free from bubbles —by surrounding the anode with a porous clay diaphragm. The anode is therefore immersed in electrolyte inside a porous clay cell or dish, and the rubber particles, together with those of zinc oxide, sulphur, &c., are deposited upon this porous diaphragm. The rubber as it collects forms a continuous homogeneous tough covering of uniform thickness. Any thickness up to an inch or more is practicable. Rubber thus formed is stronger than rubber prepared by the old methods, and is free from gas or air holes. Industrial development is already well advanced. The continuous, automatic production of certain kinds of articles is feasible. Insulation for wires and other things electrical is another application. No high temperatures are used. Previous reference to the subject was made in the Electrical Review of January 28th, p. 155.

Electrical Association for Women.

On March 24th some members of the Electrical Association for Women, Birmingham and Midlands Branch, paid a visit to the General Post Office, Birmingham, where they viewed the engine room, rotaries and generators, and had explained to them the intricacies of the telephone, telegraph, and postal sections. On April 14th three American films, brought over by Mrs. C. Frederick and kindly loaned by Mr. J. W. Beauchamp, director E.D.A., were shown to the Association by the Gaumont Co. in its private theatre. These were much appreciated, as they gave the English woman an idea of how the American woman achieves her leisure by means of electricity. On Thursday, April 28th, a demonstration of the Hoover suction cleaner and heater was given by the manager of the Birmingham Branch of the Hoover Co. at Ridgway's Café, Birmingham.

A sixth branch, North-East Coast, has been added to the Association; the inauguration meeting was held at the Lighting Service Bureau, Dial House, Newcastle, on April 28th. Viscountess Grey of Fallodon was elected president, and Miss A. Holm hon. secretary and treasurer.

Service Note.

The eighth Royal Air Force Display will take place on Saturday, July 2nd, at Hendon Aerodrome. The programme has been arranged to demonstrate the efficiency and airmanship of service squadrons, and new features are being introduced which will enable the public to appreciate the developments that are constantly taking place in the air arm. Arrangements have been made to improve accommodation and traffic facilities at the aerodrome. The proceeds will be devoted to Royal Air Force charities.

Institution of Railway Signal Engineers.

The proceedings, 1926-27, of the above Institution, are now available (7s. 6d. to non-members). The papers read during the session, together with the discussions and authors' replies, are included in the contents, among which are: "A Comparative Survey of American and British Signalling," by J. Parsons; "Fundamentals of Automatic Telephone Switching," by H. H. Harrison; "Electrical Power for Railway Signalling Communications," by M. G. Tweedie; and "Railway Signalling in Germany," by T. S. Lacelles. It is hoped that it will be possible to view at least three large recent signalling installations in France during the summer meeting this year, which is expected to be held from June 17th to 21st.

Institution Notes.

Institution of Electrical Engineers.

WESTERN CENTRE.—The following officers have been nominated for the 1927-28 session:—*Chairman*: C. G. Morley New; *second vice-chairman*: S. B. Haslam; *new members of committee, south of the Bristol Channel (four vacancies)*: R. D. Archibald, A. F. Coates, L. A. Hards, F. G. Jones, and J. W. Spark; *north of the Bristol Channel (one vacancy)*: G. D. Arden, J. M. Bowman, H. O. Davies, and P. J. Plevin.

LONDON STUDENTS' SECTION.—During the 1926-27 session 11 meetings have been held, the average attendance being 63, as against 104 last year. The record attendance was 160 at the joint meeting of the London Students' Sections of the Institutions of Civil, Mechanical and Electrical Engineers. The Committee is, however, not satisfied with this low average attendance of 4.1 per cent., the number of members attending the discussion being nearly always less than those present when the paper is read, and the quality of papers was not up to the usual standard. The number of visits during the session was 13, the average attendance being 86. The social functions held during the year have been fewer than last year. The summer meeting of the Students' Sections was held in Belgium and Luxemburg.

Royal Institution.

The annual meeting of the members was held on May 2nd, Sir Arthur Keith, treasurer and vice-president in the chair. The annual report of the Committee of Visitors was read and adopted, and the report of the Davy-Faraday Research Laboratory Committee was also read. Sixty-four new members were elected in 1926, and 78 lectures and 19 evening discourses were delivered. The following members were unanimously elected as officers for the ensuing year:—*President*: The Duke of Northumberland. *Treasurer*: Sir Arthur Keith. *Secretary*: Sir Robert Robertson.

Our Personal Column.

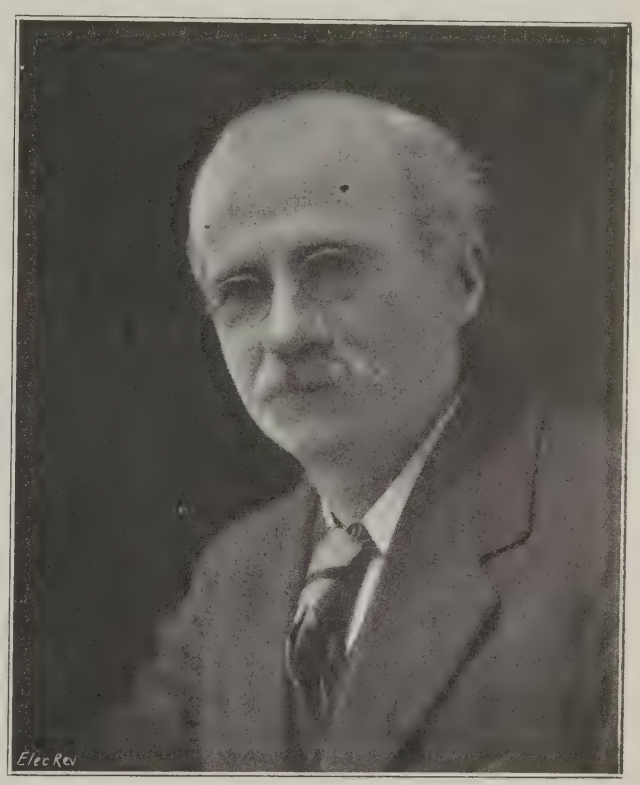
Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements.

Mr. J. W. BURLEIGH, chief electrical engineer at Newton's Dynamo Works, Taunton, has resigned in consequence of ill-health, and sails with his family on May 21st for California. His association with the Dynamo Works dates from 1900. The staff on May 4th presented Mr. Burleigh with a silver cigarette casket as a farewell gift.

We learn that Mr. JOHNSTONE WRIGHT'S appointment is under the Central Electricity Board, not the Electricity Commission of Great Britain as stated in our last issue.

We regret to learn that Mr. STANLEY J. HARDING is resigning his position as managing editor of the *British Engineers' Export Journal* owing to the deterioration of his eyesight consequent upon ill-health. Mr. Harding was with the *Electrical Times* for many years, and he has edited the *Export Journal* for the past eight years. He hopes to be able to resume his activities after a period of rest.

Capt. H. LEIGH MOSSLEY has been appointed chairman of the Willesden Electricity Committee.



Mr. A. W. MAKOVSKI (Messrs. Tamplin & Makovski, Ltd.) has been re-elected president of the Reigate and Redhill Chamber of Commerce.

M. MARS, general secretary of the Compagnie Française pour l'Exploitation des Procédés Thomson-Houston, Paris, has been appointed a Chevalier of the Legion of Honour.

On May 4th, Mr. H. A. RATCLIFF, who has relinquished the position of deputy chief engineer to the Manchester Corporation Electricity Department to become chief electrical engineer to the London Power Co. (under the engineer-in-chief, Dr. S. L. Pearce), was presented by his colleagues with a set of silver-ware. Mr. Ratcliff has also received a gold cigarette case from his colleagues at the Polygon testing station.

Mr. A. L. LUNN, who is the hon. secretary of the North-Western Centre of the I.E.E., succeeds Mr. Ratcliff as deputy chief engineer at Manchester, and the following new appointments have been made:—Mr. T. BAXENDALE, superintendent of power stations; Mr. W. DUNDAS, resident engineer, Barton station; Mr. F. P. SEAGER, resident engineer, City station; Mr. J. L. CARR, B.Sc., chief electrotechnical engineer; Mr. J. D. PEATTIE, B.Sc., electrotechnical engineer; Mr. A. PHILIP, B.Sc., assistant superintendent of testing section.

Mr. W. A. SHAW, of Stockport, the president-elect of the E.C.A. Allied Associations, whose portrait appears herewith, commenced business as an electrical contractor in 1886, and was joined two years later by his brother, who was his partner for 10 years, afterwards going to Capetown, where he is still in business as an electrical contractor. In the early years of his business career the work carried out by Mr. Shaw was principally private lighting installations in mills, &c., with a large amount of business in private telephone installations,

Elliott & Fry] [*London.*

Mr. W. A. Shaw,
President-elect of the E.C.A. Allied Associations.

for public authorities such as the Lancashire County Police, Liverpool Corporation (Vyrnwy and Rivington Waterworks), and others. The firm were pioneers in street fire alarm work, and put in the system for Stockport and many other towns in Lancashire and Cheshire. Of late years the work has principally been lighting and power, and the maintenance of the telephone systems before mentioned. Mr. Shaw has been a member of the E.C.A. since the earliest days of the Association, and has taken an active part in its work, principally in development. He was elected first chairman of the Development Committee, and still holds that office.

The *Manchester Guardian* reports the retirement of Mr. HENRY ELLIOTT from the position of Post Office telephone contract manager for the Manchester district. Mr. Elliott joined the National Telephone Co. in 1891. He has been presented with a gold cigarette case by his colleagues.

Mr. J. H. BUTTERS, who relinquished the position of chief engineer to the Tasmanian Government Hydro-Electric Department to become chief commissioner at Canberra, was knighted upon the occasion of the inauguration of the new Federal Parliament at Canberra.

The Accrington Town Council has referred back a proposed increase in the salary of the electrical engineer (Mr. A. W. CLEGG). His remuneration is: Salary £700, bonus £166. The energy sold last year amounted to 15,500,000 kWh. The Electricity Committee now asks the Council to agree to a remuneration of £700, bonus £213, and to institute a sliding scale for increased sales of energy to bring the salary and bonus to £991 when 20 million kWh is sold.

To-morrow, May 14th, Mr. H. Topley, A.M.I.E.E., is leaving the position of charge engineer at Doncaster Corporation electricity works, to take up a similar appointment at the power station of the United Alkali Co., Ltd., Widnes.

Alderman A. G. Ellaway (Birmingham) has been elected chairman of District Joint Industrial Council No. 5 for the Electricity Supply Industry (West Midlands Area). Mr. R. F. Dempster (A.E.U.) is vice-chairman. Mr. E. J. Jennings, who has been secretary and treasurer since the formation of the Council, has been re-elected to the position.

Mr. W. A. Rhind, late of the English Electric Co., Ltd., and Messrs. Siemens Bros. & Co., Ltd., has joined the Empire Rubber Co., of 25, Victoria Street, S.W.1, where he will deal with business in rubber as applied to the electrical industry.

We regret to note from our contemporary, the *South African Mining and Engineering Journal* for April 16th, that Mr. John Roberts, the Durban borough electrical engineer, was seriously indisposed. He was expected to leave Durban for a time for complete rest and change. "His second in command, Mr. E. Poole, will be acting borough electrical engineer in the meantime."

Obituary.—Mr. H. Hartnell.—We record with regret the death of Mr. Henry Hartnell, A.M.I.E.E., a retired staff engineer to the General Post Office, which occurred on May 3rd, at Wellington, Somerset, at the age of 81 years. In the course of his lengthy service at the Post Office he was for many years examiner in technology. He possessed a special knowledge of electric cable matters, including loaded submarine and underground cable, and his committee work included duties as a member of the Committee on Copper Conductors, and as a member of the Engineering Standards Sub-Committee on Telegraphs and Telephones. For some years he was joint editor of the *Journal* of the Institution of Post Office Electrical Engineers, and he was an accomplished translator of technical and scientific matter from many languages. He had a considerable knowledge of languages, both ancient and modern. Mr. Hartnell was in many respects a remarkable man; of great technical ability, he was at an early period selected for transference from the telegraph staff at the Nottingham Post Office to the engineer-in-chief's office in London under Sir W. H. Preece, where he had many opportunities of showing his sterling worth in every branch of the service. Those who had the privilege of his acquaintance were warmly attached to him and delighted to renew their acquaintance on every opportunity. As a worker he was indefatigable, and kept in harness almost to the last.

Mr. A. V. Burtonshaw.—The death took place on March 29th of Mr. Arthur V. Burtonshaw, who was for 16 years electrical engineer to the late Mr. Albert Brassey, at Heythrop, Oxon.

Mr. W. E. Beer.—We have great regret in recording the sudden death of Mr. W. E. Beer, B.Sc., D.I.C., at the very early age of 28 years. Mr. Beer, who was an assistant in the Electricity Department of the National Physical Laboratory, where he was held in high esteem, was on his way to the laboratory on the morning of April 27th when he succumbed to an attack of hæmorrhage. He had published several original scientific papers, and was a member of B.E.S.A. and other committees.

Will.—Mr E. Bremner Smith, chairman of the Oswestry Electric Lighting and Power Co., Ltd., left £13,848 gross and £8,464 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Peters & Co., Ltd.—Private company. Registered May 2nd. Capital, £1,500 in £1 shares. Objects: To acquire the business of an electrical factor now carried on by Amy L. Peters, at 5, York Road, Colwyn Bay, as "Peters & Co.," and to carry on the business of electrical engineers, manufacturers of and dealers in all electrical appliances and apparatus and wireless instruments and accessories, &c. The subscribers (each with one share) are:—H. Peters, Hill Croft, Church Road, Rhos-on-Sea, electrical factor; H. V. Lee, Hazelhurst, Church Road, Rhos-on-Sea, commercial traveller. H. Peters shall be permanent governing director and chairman, so long as he holds £250 shares. Qualification of directors: £25 shares. Secretary: R. Roberts, 13, Erskine Road, Colwyn Bay. Solicitor: D. Thomas, Post Office Chambers, Colwyn Bay.

Sherrin-Goodridge Patents, Ltd.—Private company. Registered, May 5th. Capital, £100 in 1s. shares. Objects: To adopt an agreement with P. Sherrin and H. C. Goodridge, and to carry on the business of electrical and mechanical engineers, manufacturers, and repairers of thermionic devices and parts, and instruments for the production of alternating currents, vacuum measuring instruments, vessels and lamps, scientific glass blowers, manufacturers of and dealers in electrical, mechanical, telegraphic, telephonic, television, and other appliances and apparatus, &c. The subscribers (each with one share) are:—E. C. Goman, 44, Leghorn Road, Harlesden, electrical engineer; A. Secretan, 44, Montgomery Road, W.4, clerk. Secretary: F. B. Weller. Registered office: 64, Mill Hill Road, Acton, W.3.

Buell Combustion Co., Ltd.—Public company. Registered, May 4th. Nominal capital: £250,000 in £1 shares. Objects: To acquire (1) from the Buell Pulverised Coal Syndicate, Ltd., and Bolton & Partners, Ltd., certain inventions relating to the systems of combustion or burning of pulverised fuel known as the "Buell System," (2) from United Water Softeners, Ltd., and Kek, Ltd., certain inventions relating to systems of grinding and crushing or disintegrating known as the "Kek Mill," and (3) from the British Columbia and West Canadian Agency, Ltd., and W.A.C. Pulverisers, Ltd., certain inventions relating to the systems of pulverisation and disintegrating known as the W.A.C. Pulverisers, and to carry on the business of iron and brass founders, mechanical and electrical engineers, &c. The directors are:—C. A. Bolton, Littleworth Lodge, Esher (director, G. T. Holloway & Co., Ltd.); W. I. Anderson, British Empire Club, St. James', S.W. (director, British Columbia and West Canadian Agency, Ltd.); L. A. Neel, 38, Drayton Court, Drayton Gardens, S. Kensington, S.W. (director, United Water Softeners, Ltd.); H. A. Procter, 48, Queen's Drive, West Derby, Liverpool (director, Buell Pulverised Coal Syndicate, Ltd.); N. Liversidge, Oxley, Woodhouse, Huddersfield (director, Jas. Watkinson & Son, Ltd.); J. G. Robertson, Drayton Gardens, S. Kensington, S.W.10 (engineer, Babcock & Wilcox, Ltd.). Qualification: £500 shares or stock. Solicitors: Herbert Smith & Co., 62, London Wall, E.C.2.

Official Returns of Electrical Companies.

Mann, Egerton & Co., Ltd.—Equitable mortgage dated April 12th, 1927, to secure £10,000, charged on certain properties in Marylebone. Holders: Armstrong Siddeley Motors, Ltd., Parkside, Coventry. Collateral mortgage dated December 2nd, 1912, securing £3,000, being part of a sum not exceeding £10,000 secured by debenture dated October 3rd, 1912, was satisfied to the extent of the first-named sum on January 28th, 1920. (Notice filed April 26th, 1927.)

Newcastle-upon-Tyne Electric Supply Co., Ltd.—Acknowledgement of further indebtedness dated April 8th, 1927 (supplemental to trust deed dated October 16th, 1913), to secure £430,000 additional second mortgage debenture stock, ranking *pari passu* with £1,546,000 like debenture stock. Trustees: Law Debenture Corporation, Ltd., 24, Old Broad Street, E.C.

C.A.C. Valve Distributing Co., Ltd.—Debenture dated April 7th, 1927, to secure £250, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: V. J. Woolley, Sherrington School of Physiology, St. Thomas's Hospital, S.E.

Charles Mickleburgh, Ltd.—Particulars filed on April 17th of £1,000 debentures authorised February 17th, 1927, charged on the company's undertaking and property, present and future, the whole amount being now issued.

North-Western Wireless Company and Wallasey Motor Exchange, Ltd.—Debenture dated April 12th, 1927, to secure £500, charged on the company's property, present and future, including uncalled capital. Holder: D. Greenwood, 5, Ashburton Road, Wallasey.

Electrical and Allied Instrument Manufacturing Co., Ltd.—G. C. McEwen, of 35, Copthall Avenue, E.C.2, and S. R. McDonald, of "Elstan," The Mall, Surbiton, ceased to act as receivers or managers on February 28th, 1927. (Notice filed April 25th.)

Acme Production Co., Ltd.—T. G. Weavers, of 4, Drapers Gardens, E.C.2, ceased to act as receiver or manager on April 20th, 1927.

India Rubber, Gutta Percha and Telegraph Works Co., Ltd.—Capital, £1,250,000 in 750,000 ordinary, 250,000 preferred, and 250,000 unissued shares of £1 each. Return dated December 9th, 1926. 750,000 ordinary and 250,000 preferred shares taken up. £1,000,000 paid. Mortages and charges: £400,000.

South Metropolitan Electric Tramways and Lighting Co., Ltd.—Capital, £400,000 in 200,000 ordinary and 200,000 preferred shares of £1 each. Return dated March 16th, 1927. All shares taken up. £365,110 paid on 165,110 ordinary and 200,000 preferred shares. £34,890 considered as paid on 34,890 ordinary shares. Mortgages and charges: £128,791.

Rhayader Electric Light and Power Co., Ltd.—Capital, £2,000 in £5 shares. Return dated November 4th, 1926. All shares taken up. £2,000 paid. Mortgages and charges, nil.

Electric Light Insurance and Maintenance Co., Ltd.—Capital, £5,000 in £1 shares. Return dated October 1st (filed December 24th), 1926. 1,255 shares taken up. £1,257 10s. paid (including £2 10s. paid on 50 shares forfeited.) Mortgages and charges: £1,567 14s.

Poynter, Griffiths & Co., Ltd.—Return dated December 31st, 1926 (filed February 2nd, 1927). Capital at date of return, £6,000 in £1 shares (increased March 4th, 1927, to £20,000 in £1 shares). 6,000 shares taken up. £4,500 paid. £1,500 considered as paid. Mortages and charges: £1,746.

Baynton's Wholesale Wireless, Ltd.—Capital, £2,500 in £1 shares. Return dated March 12th, 1926 (filed March 25th, 1927). All shares taken up. £2 paid, £2,498 considered as paid. Mortgages and charges, nil.

John Lewis (Wireless), Ltd.—Capital, £100 in £1 shares. Return dated March 7th, 1927. All shares taken up. £100 paid. Mortgages and charges, nil.

Wholesale Electric Lamp Co., Ltd.—Capital, £1,500 in £1 shares. Return dated December 31st, 1926 (filed March 11th, 1927). 425 shares taken up. £425 paid. Mortgages and charges, nil.

City Notes.

Johnson & Phillips, Ltd.

The annual meeting was held on May 8th, Sir Philip Dawson presiding in the absence of the chairman (Mr. C. Johnson). In moving the adoption of the report (ELEC. REV., April 29th, p. 691), the chairman read a statement prepared by Mr. Johnson, in which he said that the profit for the year, after making provision for bad and doubtful debts, and after charging to revenue some £15,000 odd for maintenance of buildings, plant, &c., amounted to £115,114. Referring to the balance sheet, the chairman said that a further £94,000 had been expended on additions to the property. It was always necessary in a business like theirs to keep on spending money on capital account in order to keep pace with the latest developments. The total assets exceeded the liabilities by just over £1,000,000. Investments at £136,649 were somewhat less than appeared in the last balance sheet, and included a £50,000 8 per cent. mortgage debenture in Burndept Wireless, Ltd. The directors were of opinion that the debenture was amply covered by the assets of that company. Burndept's were very good customers of the company, which in the past had done a profitable business with them. The falling-off in the profits as compared with the previous year was caused entirely by the general strike and the prolonged coal stoppage. The value of the orders booked from the beginning of May until the end of October was rather less than 50 per cent. of the amount booked during the corresponding six months of 1925. As a matter of fact, the disastrous month of May was so bad that they only booked one-third the value of orders compared with the corresponding month in the previous year. Due to the same unfortunate industrial conditions, they experienced considerable difficulty in obtaining certain raw materials, and the general conditions which prevailed rendered the task of maintaining output very costly. The results obtained, therefore, must be considered satisfactory in the circumstances, and reflected the highest credit on the management, staff, and workers. Notwithstanding the industrial upheavals which occurred during the past year, the relations between their workpeople and the management continued to be of the most cordial nature. During the last few days of November, after the settlement of the coal dispute, they booked so much work that the total value of orders taken that month created a record—exceeding the previous record by nearly 100 per cent. Among the more important orders in hand at the present time was the large extension order for the Southern Railway Company, comprising some 78 miles of h.p. cable. Having the benefit of the large additions made to the factory during the last year or so, they were able to undertake the manufacture of the whole of that cable themselves, whereas of the previous order, which was for 125 miles, they had to sublet part of the actual cable manufacture to other cable makers. The success of this great railway electrification scheme, as indicated by the rapid extension of which this repeat order formed part, was an encouraging augury for the electrical industry as a whole. With regard to their own position, he might fairly summarise it by saying that they had weathered a peculiarly difficult year without having sustained too serious a setback. He did not wish to underrate the difficulties which might lie ahead of them. Competition was still very keen, both at home and abroad, and the British manufacturer had to stand up to it everywhere unsheltered. But they had tremendous assets in their thoroughly up-to-date equipment, their world-wide selling organisation, their skilled personnel, and, above all, their reputation, extending over half a century, for manufactures of the very highest quality. They were engaged in an industry for whose products the world's needs were enormous, incalculable, and cumulative, so that no question of a saturation limit could arise. Our own country's electrical under-development was such as to constitute a vast reserve of demand. The Electricity Act was now on the Statute Book with the express object of remedying that under-development. The transition stage must involve some delays, perhaps even a temporary lull in demand, but as to the ultimate effect all round, there could be no doubt, and as the products of the company, cables, transmission lines, transformers and switchgear, formed the very spearhead of electrical progress, the lines along which all electrical advance must be made, concerns such as theirs must be the first to feel the benefit of the new impetus to the industry. Mr. J. MacGregor, the managing director, in seconding the motion, remarked that they had started the new year very well, and it looked as if labour had settled down to an earnest desire to work steadily and get back their losses. Replying to questions, Mr. Macgregor said that they were members of the Cable Makers' Association, and as far as it had worked, it was a very fair system indeed, both to those who were in it and to their customers. Shareholders need have no anxiety about the £50,000 debenture which the company held in the Burndept Company. It was fully secured, and their monthly accounts from that company were being paid promptly. The report was adopted.

Shropshire, Worcestershire and Staffordshire Electric Power Co.

The accounts of this company for 1926 were reviewed in our issue of April 29th, p. 690. The annual meeting was held on May 3rd, when Mr. E. Garcke, who presided, pointed to the satisfactory improvement in the revenue in face of the industrial dislocation last year. He said that although the great industries in the Midlands had not yet fully recovered, applications from new customers of all classes were being received in considerable numbers. Dealing with the development of business, the chairman repeated the statements in the report relating to the Avon Valley Order and the acquisition of the Ludlow undertaking, and also said that arrangements had been made to take over the electricity supply assets of the Bishop's Castle Electric Light and Power Co. and the Fladbury Electric Light and Power Co., two unauthorised undertakings working in the company's area. The Stourport station had been completed, and during the current year would probably be able to carry a large proportion of the Smethwick load and some part of the Redditch load. The linking-up of the company's system with that of Birmingham was almost finished; by that means the undertakings could furnish reciprocal supplies. The company had pursued its policy of providing electricity in some of the less densely populated districts, and an encouraging demand had been received from some of the smaller towns and villages on the route of the power lines. During the past year 85 miles of mains had been installed and extensions of the distribution network had been carried out in such places as Bromsgrove, Evesham, Astwood Bank, and Stourport, which were formerly considered rural but were becoming industrial. Mr. Garcke expressed the company's confidence in the Central Electricity Board, and concluded with a statement regarding a change in the company's name. The directors had proposed "The Severn Electric Power Company," but were open to other suggestions.

Calcutta Electric Supply Corporation, Ltd.

The annual meeting was held on May 4th, Lord Meston (chairman) presiding. In presenting the report (which we reviewed in our last issue, p. 730), the chairman said that the issue of 150,000 ordinary and 150,000 preference shares during the year had enabled them to add £97,500 to the capital reserve. The redemption of the first mortgage debentures had been completed and the balance of the sinking fund had been transferred to general reserve, and the result was a very healthy balance-sheet. The work done on the new station at

the Calcutta Docks had added nearly half-a-million sterling to their fixed assets. One generator at the station was working before the end of the year and two others had since been brought into use, and the company now had an ample reserve of plant. Riots and industrial disturbances had adversely affected the company's business during the year, but the economy effected in running costs had caused a slight improvement in the net profit. The past year had been marked by a good deal of activity: the duties of the staff were reorganised; the distribution system was improved; plans for replacing overhead cables by underground mains were matured; an efficient a.c. fan was designed; they took over the electricity supply of Dum-Dum; and the company's licence for operating in Howrah was renewed on satisfactory terms. The new station now had three 6,000-kW sets, and another similar set was being installed; the station was planned for eventual extension to 100,000 kW. The company had decided to decrease its charges and hoped that the extended use of electricity would compensate them. The unfailing support of the shareholders had enabled the company to build up large reserves, and the directors accordingly proposed to capitalise a part of those reserves and distribute it as ordinary shares in the proportion of one to each ten held at present; that would mean the creation of 136,000 shares. The prospects appeared to be encouraging. Maj.-Gen. R. H. Mahon seconded the adoption of the report, and it was approved. Subsequently a resolution providing for the capitalisation of part of the reserve was passed.

Cornwall Power Co., Ltd.

Mr. P. D. Tuckett (chairman) presided at the annual meeting on May 5th. In presenting the report, the chairman said that the company was formed last year to facilitate the financing of the Cornwall Electric Power Co. (the Parliamentary Company). The accounts were therefore very simple, consisting substantially of two items: A holding of shares and debenture stock of the Parliamentary Company on one side against the issued shares of the limited company on the other; at the date of the balance-sheet those items stood at £221,322 and £250,000 respectively. Their holding in the Parliamentary Company represented the whole of its issued share capital and all but £5,960 of its issued debenture stock. Their own capital consisted of 150,000 partly-paid convertible preference shares and 212,500 fully-paid ordinary shares held by the Urban Electric Supply Co. There was a balance of £12,367, from which they proposed to pay the 7 per cent. preference dividend and 5 per cent. on the ordinary shares. When the preference shares were fully paid, the holding in the Parliamentary Company, and consequently the income, would be increased. Referring to the operations of the Parliamentary Company, Mr. Tuckett said that, in spite of the industrial position, its gross profit had increased. £17,000 was put to the reserve, raising it to £121,000—over 60 per cent. of the issued capital. The power station was being extended to meet the demands from the tin mines.

Marconi International Marine Communication Co., Ltd.

Mr. F. G. Kellaway (deputy-chairman and managing director) presided at the annual meeting on May 5th, and at the commencement of his speech said that since the date of the report Col. Simpson had resigned from the board. Dealing with the report and accounts (Elec. Rev., April 29th, p. 690), the chairman said that the progress of profits in the past four years must give the shareholders a sense of security. The sum of £230,316 in the balance-sheet, representing investments in subsidiary companies, included the cost of acquiring a majority of the shares in the Radio Communication Co., Ltd., and the whole of the shares in the Brazilian Marconi Co. The sum of £24,051 for shares in associated companies included the amount involved in the purchase of shares in the Canadian Marconi Co. and Amalgamated Wireless (Australasia), Ltd. The company was in a strong financial position, and at December 31st last the gilt-edged securities stood at £511,795, and £66,000 of War Loan had since been purchased. The company's prospects had been considerably enhanced by the acquisition of a controlling interest in the Radio Communication Co., the company's principal competitor. Dealing with the improvement in the shipbuilding industry, Mr. Kellaway said that in the first three months of the current year the company had done 66 per cent. of the total amount of new business for the whole of last year.

New Issues.

County of London Electric Supply Co., Ltd.—The company's offer of £4,250,000 of 5 per cent. debenture stock at £96 per cent. was several times over-subscribed by 11 a.m. on the day of issue (May 4th).

Buenos Aires Lacroze Light and Power Co., Ltd.—On Monday last the public were offered £300,000 of 6½ per cent. redeemable mortgage debenture stock of this company at 96½ per cent. The principal and interest are guaranteed by the Buenos Aires Central Railway. The company was formed *inter alia* for the supply of electricity to this railway company and the Buenos Aires Lacroze Tramways Co., and these two undertakings have agreed to purchase from the company an annual minimum of 30 million kWh each while any portion of the debenture stock is outstanding. The proceeds of the issue will be mainly employed in the erection of an 18,000-h.p. generating station and an agreement for the execution of this work has been entered into with Balfour, Beatty & Co., Ltd. The list was closed, for London, at 10.45 a.m. on the day of issue.

Electrical Finance and Securities Co., Ltd.—This company has a controlling interest in the Colne Valley Electric Supply Co., Ltd., the Northwood Electric Light and Power Co., Ltd., the Foots Cray Electricity Supply Co., Ltd., the Lothians Electric Power Co., and the Boston and District Electric Supply Co., Ltd. It was formed for the purpose of financing electricity undertakings, the securing of provisional orders for supply, &c. This week an issue was made of £100,000 5½ per cent. debenture stock, at £92 10s. per cent., and 100,000 7 per cent. preference shares of £1 each at par. The 1926 profits were sufficient to cover the service of the debentures more than three times, and to twice cover the preference dividend after deducting debenture interest, &c. The proceeds of the issue are to be used for the redemption of the existing debentures (£20,000), and loans (£154,000), and for the general purposes of the company. The issue was quickly over-subscribed.

Electric Supply Corporation, Ltd.—The directors have offered to existing shareholders 50,000 £1 ordinary shares at 30s. each to provide funds for the further development of the company's business.

Calcutta Tramways Co., Ltd.

Mr. J. G. B. Stone (chairman) presided at the annual meeting on May 3rd. After reviewing the financial results of the past year (*vide* Electrical Review, April 29th, p. 691), he said that the period had been a troubled one on account of the communal riots, but they could now look forward to more normal conditions. Although they still had to meet a considerable amount of omnibus competition, there had been a material reduction in the number of their competitors. They had added to their own fleet of 'buses, and further additions were projected, to act mainly as feeders to the tramways. Fares had been reduced, with a resultant benefit in increased traffic; the company was endeavouring to attract the poorer class in Calcutta which did not at present use the cars. He (the chairman) was convinced that tramways were the best means of dealing with the transport of the mass of the population of Calcutta. The board was proceeding with the appointment of a traffic advisory committee consisting of representatives of the company, the Calcutta Corporation, the Commissioner of Police, the Calcutta Improvement Trust, and the Howrah Municipality. The report and accounts were adopted.

Ever-Ready Co. (Great Britain), Ltd.

The report for the year ended March 31st last shows a profit of £174,588, to which is added £23,864 brought forward, making £198,452. The reserve accounts receive £29,514, and after allowing for the interim dividends, there is a balance of £129,058, with which it is proposed to deal as follows:—Final preference dividend; final dividend of 25 per cent. on the old ordinary shares, making 35 per cent. for the year; dividend of 25 per cent. on the new ordinary shares; carried forward, £26,558. The directors again report a considerable expansion in the company's business; this was contributed to by the subsidiary undertakings and overseas branches. The profit shows an increase of £35,100. During the year, plant and works extensions involved an expenditure of £66,000, and since the close of the year a further expenditure of £20,000 has been undertaken. The 71,200 ordinary shares offered to the shareholders at 50s. each in November last were fully taken up, and the premium of £106,800 has been transferred to general reserve. Meeting: May 31st.

Stock Exchange Notices.

The undermentioned have been ordered to be officially quoted:—

Atlas Light and Power Company.—1,500,000 ordinary shares of £1 each, fully paid, Nos. 925,212 to 2,425,211; and 1,000,000 seven per cent. preference shares (cumulative) of £1 each, fully paid, Nos. 1,000,001 to 2,000,000.

Midland Electric Corporation for Power Distribution.—70,000 ordinary shares of £1 each, fully paid, Nos. 280,001 to 350,000.

North Metropolitan Power Station Company.—£850,000 five per cent. guaranteed debenture stock, 1957.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Baird Television Development Co.—100,000 10 per cent. preferred participating ordinary shares of £1 each, partly paid and fully paid, Nos. 1 to 100,000; 100,000 deferred ordinary shares of 1s. each, fully paid, Nos. 1 to 100,000.

County of London Electric Supply Co.—£4,250,000 5 per cent. debenture stock, issued at 96 per cent., partly paid and fully paid.

Craigpark Cable Co., Ltd.

As reported in our last issue, the ordinary dividend for 1926 is 7½ per cent., as against 12½ per cent. for the previous year. The directors state that the company's business was seriously affected by the coal stoppage, and the relatively unsatisfactory results were caused by this to a considerable extent. In addition, the company has spent money in necessary alterations and improvements in the workshops and increasing its selling organisation, which has brought no results so far on account of the prevailing industrial conditions.

Scottish General Transport Co., Ltd.

The revenue for 1926 was about £2,000 higher at £30,793. The balance brought forward is £11,345, making £42,138. After meeting all expenses and allocating £22,847 to renewals, it is proposed to carry forward the balance (£4,789). No dividends were received on the company's holding of ordinary shares in the Greenock and Port Glasgow Tramways Co. and the Rothesay Tramways Co. This and the effects of the coal stoppage combined to reduce the company's available balance.

Stratford-on-Avon Electricity Co., Ltd.

At the recent annual meeting, the directors reported a net profit of £2,727, to which was added £409 brought forward, making £3,136. A dividend of 5 per cent. was declared on the ordinary shares, £1,500 put to general reserve, and £665 carried forward.

Ross Electric Light and Power Co., Ltd.

The gross profit for 1926 was £959, and the net loss has been reduced to £6,657. Arrangements have been made for an a.c. supply from Hereford in place of the d.c. supply; this is expected to reduce costs.

Fairbairn Lawson Combe Barbour, Ltd.

The directors report a net loss of £123,571 for 1926. Against this is set a balance of £87,739 brought forward, reducing the loss to £35,832. No dividend is paid on the preference or ordinary shares.

Pernambuco Tramways and Power Co., Ltd.

From the profits of the past year the directors propose to place £8,000 to reserve (against £7,000), to pay the dividend on the 7 per cent. participating preference shares, and to carry forward £5,644.

Mexican Light and Power Co., Ltd.

A meeting of the holders of the company's 5 per cent. second mortgage bonds is to be held on May 24th, to give approval to the scheme for dealing with arrears of interest and dividends outlined in our last issue.

Brush Electrical Engineering Co., Ltd.

The dividend on the ordinary shares for 1926 is again 10 per cent. Under the company's co-partnership scheme £7,354 is to be distributed among the staff and employés.

Glenfield & Kennedy, Ltd.

The directors have declared a final dividend of 6 per cent., making 10 per cent. for the year as for 1925-26.

Melbourne Electric Supply Co., Ltd.

An interim dividend of 10 per cent., free of tax, has been declared on the ordinary shares, as in 1926.

Radio Corporation of America.

The gross income for the quarter ended March 31st was $10,572,490, and the surplus profit amounted to $126,788.

Coventry Chain Co., Ltd.

The directors have declared an interim dividend of 2 per cent., as against 3 per cent. last year.

French Companies.

The *Société des Accumulateurs du Nord* reports a net profit of 260,000 fr. for 1926, which has been placed to the reserve fund.

The *Société Gramme* proposes to repeat the dividend of 60 fr. per share out of net profits of 623,000 fr. for 1926.

The *Compagnie des Locations Electriques* records net profits of 799,000 fr. for 1926, as compared with 743,000 fr. in the previous year, when a dividend at the rate of 7 fr. per share was declared.

The *Compagnie Générale Electrique* has decided to carry forward the net profit of 463,000 fr.

The *Compagnie Electro-Mécanique* reports an available surplus of 4,944,000 fr., of which 4,610,00 fr. has been devoted to depreciation and the balance carried forward.

The *Compagnie d'Entreprises Electro-Mécanique* reports orders for the construction of sub-stations for the Orleans Railway Company, a dam above the Coindre station for the utilisation of the Upper Dordogne and two hydro-electric works in the province of Segovia, Spain. The accounts show a net profit of 579,000 fr., which sum has been applied to depreciation.

Norwegian Company.

The report of the *A.S. Elektrisk Bureau* states that 1926 was a still more difficult year than 1925, as a result of the appreciation of the krone and the stagnation in business, while the level of wages did not keep pace with the declining prices of manufactures. The turnover amounted to 4,700,000 kr.; the sales of telephone material reached 1,790,000 kr., or 700,000 kr. less than in 1925. The accounts show a deficiency of 300,000 kr., which is extinguished by appropriations from the reserve funds.

North Metropolitan Electric Power Supply Co.

The company offers the holders of its 8 per cent. second preference stock (which is under notice of redemption) the right to exchange their holdings, on July 1st, into 6 per cent. cumulative preference shares at par.

Swedish Company.

The *Svenska Accumulator A.B. Jungner* reports net profits and balance forward, amounting to 230,000 kr. for 1926, permitting of the payment of 8 per cent. on the ordinary shares, as compared with 7 per cent.

Belgian Company.

The *Société Internationale d'Energie Hydro-Electrique*, Brussels, has made an issue of 50,000 preference shares in Amsterdam at the price of 196 guilders per share.

Siemens Bros. & Co., Ltd.

The directors have declared a final ordinary dividend of 5 per cent., making 7½ per cent. for 1926, as for 1924 and 1925.

Stocks and Shares.

MONDAY EVENING.

INVESTMENT has taken the bit between its teeth, now that money conditions are regarded as being favourable to all sound stocks and shares. Prices are rising in nearly every section of the more serious markets, leaving speculation behind in the matter of public popularity. The prompt closing of the County of London Electric Supply Company's subscription lists for so large an amount of stock as 4½ million pounds of 5 per cent. debenture at 96 is clear illustration of the general appetite for a first-class security offered at a reasonable figure. Reduction in the Bank rate to 4 per cent. is considered to be sufficiently probable as to justify advance discounting of the anticipated change. The cable group shows a number of rises. The chief gain in our lists to-day is one of 8 points in British Electric Traction preference. Mexican Light and Power preferred follows with an advance of 7.

Immediate success attended upon the offer by the Electrical Finance and Securities Company of £100,000 5½ per cent. debenture stock at 92½ and 100,000 7 per cent. cumulative preference shares of £1 each at par. Originally, in 1914, a few weeks before the outbreak of war, the company was incorporated with an authorised capital of £50,000 in £1 ordinary shares. Later, an issue was made of £20,000 in 10 per cent. debentures. These are to be repaid in July this year. The company's assets comprise interests in the Colne Valley Electric Supply, the Northwood Electric Light and Power, Foot's Cray Electricity Supply, Lothian Electric Power, and the Boston and District Electric Supply Companies. Two of the three directors are also on the board of British Insulated Cables, Ltd. The 5½ per cent. debenture stock has a reasonable margin of cover, and should prove a good investment. The preference shares carry an element of speculation. For both issues the public promptly oversubscribed.

Another new issue that went very well is £300,000 Buenos Aires Lacroze Light and Power 7½ per cent. sterling redeemable mortgage debenture stock at 96½. The company was formed for constructing, equipping, and operating an electricity generating station in Buenos Aires to supply, primarily, the B.A. Central and the B.A. Lacroze Tramways, these two companies undertaking to purchase sufficient energy annually to ensure the interest and sinking fund of the debenture issue now offered. The principal, sinking fund and interest are guaranteed unconditionally by the B.A. Central Railway, and the security is very fair. The County of London Electric Supply allotments will be dealt in this week. A premium was an assured certainty from the day that the lists closed so promptly.

In the demand for investment stocks of all kinds, it seems reasonable to expect that the London electricity supply shares are not likely to remain unmoved. Reference to our table will show that from 5¼ to over 5½ per cent. is obtainable from the ordinary shares of the Brompton, Charing Cross, Chelsea, Kensington, London, St. James', South London, and Westminster shares, the calculations being based on the 7 per cent. dividends that will come into force at the end of 1931. Meanwhile, the return on the money is higher, in consequence of reasons too often mentioned here to require reiteration. People are on the look out for good shares that pay anything like 6 per cent. on the money, and, in spite of the objection which attaches to a fall in dividend in four years' time, the knowledge that the 7 per cent. laid down by Act of Parliament can be maintained with ease, and that there is a possibility of this being exceeded, will serve to bring into prominence such purely investment shares as those mentioned. When money rates are high, the attraction becomes less noticeable, but, seeing that the Government recognises the national importance of reducing money rates in order that interest and other charges can be lowered in successive Budgets, it is justifiable to look for money conditions to be easy over a period of years. There will be spasms of tightness, no doubt, but, looking at the matter broadly, the investor who is content to take 5¼ or 5¾ per cent. on his money need have no qualms about keeping his present holding

of London electricity supply shares, or of adding to it when opportunity serves.

The Home Railway market is quiet, and there is nothing fresh to report in any of the Underground issues, all of which hold the gains which they secured last week. Current traffics now run against those of the strike, a year ago. It must be repeated that the public show little inclination to buy Home Railway stocks, but the Undergrounds are in a different position from that occupied by the steam railways, and the prospects of the District are hopeful enough to warrant appreciation from a present price which still pays over 5½ per cent. on the money.

The Electric Supply Corporation offers its proprietors 50,000 shares at 30s. each. As the existing shares stand at 32s., and as the company is likely to continue its 10 per cent. dividend payments, shareholders may be advised to take advantage of this offer for increasing their interests. In the manufacturing group, the tendency is somewhat dull. Johnson & Phillips are unchanged at 47s. 6d. Sir Philip Dawson read an optimistic speech by the chairman, Mr. Claude Johnson, at the recent meeting, Mr. Johnson being unfortunately indisposed and unable, by his doctor's orders, to take the chair. The managing director stated that "the only financial interest of Johnson and Phillips in Burndept Wireless is a mortgage debenture for £50,000 and a current account for supplies that is paid month by month." He referred to the drop in the Stock Exchange price of the shares as being a purely market phenomenon over which the company had no control.

Mexican utility issues are very much to the fore, in consequence of the publication of the scheme for dealing with the Mexican Light & Power arrears. The overdue dividend on the 7 per cent. cumulative preference shares is to be funded by the allotment as fully-paid, to the registered holders of the shares, of a new 4 per cent. cumulative redeemable second preference share. It is proposed to convert the ordinary share capital into shares of no par value. The directors are of opinion that, should no unforeseen events occur, the company's earnings will be sufficient to pay the dividends on the 7 per cent. preferred, the new 4 per cent. second preference, and to leave something over. This has had a marked effect upon prices. Mexican Light & Power preferred at 115 are 10 points up. The 5 per cent. first bonds at 72½ have gained 4 points. Mexico Trams rose 3 to 30½, and the 5 per cent. first bonds at 79½ are 4½ up on the week. Mexican Electric Light fives advanced to 67½, and the whole of the group shows pronounced strength, due primarily to the Mexican Light & Power statement, which comes up to the most optimistic expectations that had been formed in advance.

The cable group is good, thanks to the investment enquiries which are going on all round the markets. Rises have occurred in Easterns, Globes, Westerns, Anglo-Americans, Great Northerns, and Indo-Europeans, amongst others. United River Plates keep firm at 9. Venezuela Telephones are a little better at 34s. 3d.

Marconis are quiet, the ordinary shares at 17s. 6d. and Marines at 23s. 9d. The Marconi Company has secured an important contract in Bolivia whereby the company will undertake the control and operation of the entire postal, telegraph and wireless service of that country. This is an arrangement somewhat similar to that already in force between Marconi's and the Peruvian Government. Canadian Marconi's gave way a little to 4s. sellers. We understand that a meeting is to be held in the near future, possibly this week, at which information will be given of the progress which the Canadian company is now making. Automatic Telephones remain a dull market at 46s. 3d. Three new automatic telephone exchanges are expected to be ready towards the end of this year, and it is said that the first will be opened in five months' time.

Calcutta Electric Trams are £2 ex rights, which, making allowance for deduction of the value of the new shares, is a little better on balance. At last week's meeting, the Chairman referred to the loss of traffic occasioned by last year's communal riots in India. A complete absence of pilgrims and of the usual influx of holiday-makers into Calcutta, during the Punjab holidays in October, was due to the same cause. Anglo-Argentine Tramways are again a little higher. There has been a noticeable demand for the company's 5 per cent. debenture stock. British Columbia Railways remain firm. Fewer fireworks have been seen in Brazilian Traction, Barcelona, and Sidro shares, but no reactions have occurred in the advanced range of prices.

British Electric Traction preference rose 8 points on the assumption that the proposed scheme will be adopted whereby the stock is to receive 8 per cent. dividend for last year. The directors proposed, it may be recalled, to convert the present ordinary stock into an 8 per cent. non-cumulative preferred ordinary, and to distribute new deferred ordinary stock by way of bonus. The distribution of the latter will be 10 per cent. on the present ordinary, the price of which now stands at 150. It may not be considered wholly uncharitable to infer that the recent material rise in the price of the ordinary stock was due to intelligent anticipation that some kind of bonus distribution might be made.

Ever-Ready shares recovered to 4⅜, after being 4¼, on the issue of a good report. Iron and steel descriptions hold their recent gains, and Armstrong debentures attract buyers. Advances of several points have occurred in the junior issues. The rubber market is a trifle better. Business in most industrial sections is tolerably active.

The Electrical Imports of India.

Principal Sources of Supply.

FULL details of India's import trade in 1925-26 in electrical goods, showing the principal countries of supply, have recently been issued. From these the following particulars have been extracted. The corresponding figures for 1924-25 have been added for purposes of comparison and a note of increases or decreases given :—

	1924-25. Rs. (Thous.)	1925-26. Rs. (Thous.)	Inc. or dec. Rs. (Thous.)

British Goods in Argentina.

The subject of conditions in the Argentine market, particularly as they affect British goods, is again dealt with by the Buenos Aires correspondent of the *Chamber of Commerce Journal*. He says that certain recent events have created an atmosphere favourable to British goods and unfavourable to American wares. "Happily there appears to be a better realisation of market needs, as well as of the difficulties which those who sell goods here have to face. The agency question, in one or two cases which have come under the writer's knowledge, is being studied in a more liberal spirit, though it must be added that there is still a disposition to try and find men who are willing to work on what, for want of a better phrase, may be termed old-fashioned conditions. Contrasted with the American agency agreements, those of most English houses are illiberal and impractical in many clauses. American firms pay cables, costs on samples—which remain their property, and are re-shipped or sold when of no further utility, as they may direct—and all advertising outlay, the latter on a very liberal scale, while expenses of office and transport are matters of arrangement."

The Argentine trader's point of view is forcibly put in the March *Journal* of the British Chamber of Commerce in the Argentine Republic. In the course of a leading article the following appears :—"When we find London newspapers referring to the 'lack of energy and enterprise of British merchants' we are entitled to presume that the writer of the article is well primed with ideas as to how the British merchant in Argentina can redouble his energies and enliven his enterprise. But is he aware of the fact that this market is perhaps the most keenly competitive market in the world to-day, that the condition of the rural industries is so momentarily unsatisfactory that the price factor is even more impressive to the purchaser than it has ever been before, and that the agents and representatives of British firms are, in the majority of cases, working on a narrower margin of commission and with less support in respect of publicity expenses than competitors serving the interests of other nations. The fact that British trade in Argentina has not suffered even more severely than has been the case, really speaks volumes for the energy and enterprise of British merchants in this country, for . . . in addition to the difficulties created in the sphere of production by such factors as strikes and continuous unemployment, there are others of an equally harassing quality which manifest themselves at the merchandising end of the trade channel. However, a more earnest interest is being taken in the potentialities of this market, while the mere fact that the ordeal of direct comparisons with other countries have not been shirked, is a very good sign and should lead, eventually, to a reasonably accurate distribution of responsibilities for anything that may be lacking in the scheme of British trade reconstruction in Argentina."

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A Weatherproof Bell.

A recent introduction of the MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, London, W.1, is a Sterling loud-ringing weatherproof bell of novel design for a.c. working, fig. 1. It is primarily a loud-ringing magneto extension bell and eliminates the use of relays and local bell circuits; it is claimed to be suitable for factory alarms. It is designed for continuous working at 220 V, but the pressure may be considerably increased for intermittent working. The operating movement, which has a resistance of 1,000 ohms for standard use, is of the polarised type with no contact breaker, and is thus suitable for use in gas-laden atmospheres. The signal is

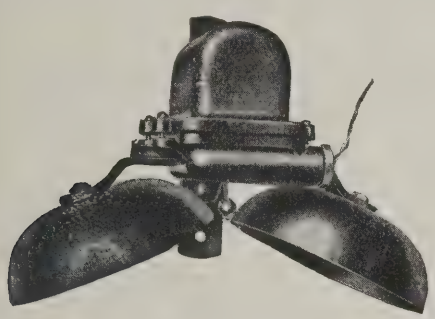

Fig. 1.—Loud Magneto Bell.

said to be of a very distinctive character, capable of being easily heard above other signals and over a considerable area. The bell is enclosed in a robust cast-metal case finished with black enamel. The hammer protrudes through an aperture underneath, and is well protected by the gongs. Access to the terminals and working parts is easily obtained by removing the cover, which is held on with four screws and clamps down on to some packing in the base, making a watertight joint. A watertight cable gland fitted to the side takes the incoming cable, and a wrought-iron fixing strap is fitted to eliminate the risk of the casting breaking, due to strain when fixing. The gongs are mounted eccentrically to allow of ample adjustment. An earthing terminal is fitted near the cable gland.

A Kettle Protective Device.

A recent development of MESSRS. CREDENDA CONDUITS CO., LTD., Oldbury, Birmingham, is the "Creda" protector kettle, which is equipped with a cut-off device of very simple design. Figs. 2 and 3 depict the automatic arrangement. Excessive

Fig. 2.—Automatic Device Closed.

Fig. 3.—After Operation.

heat melts a tiny fuse, which releases the spring-controlled movable portion of a protective switch, throwing it into the "off" position. When the device has operated the words "Boiled Dry" appear in a small window in the base of the kettle. The kettle is made in six sizes with capacities ranging from 2 to 8 pints and loadings from 650 to 1,300 W respectively.

A Novel Cable Gland.

An interesting design of cable gland has recently been introduced by the WALSALL HARDWARE MANUFACTURING CO., LTD., Hatherton Works, Ablewell Street, Walsall. It consists essentially of four parts, and the arrangement is shown in figs. 4 and 5. A suitable screwed nipple is provided for the necessary connection to the box. A gland through which the lead-sheathed cable is passed serves for the bonding of the sheath, and is provided with a suitable collar by means of which a nut screws it right home to the nipple. Hinged to this nut is a clamp which, when in position and tightened up, clamps

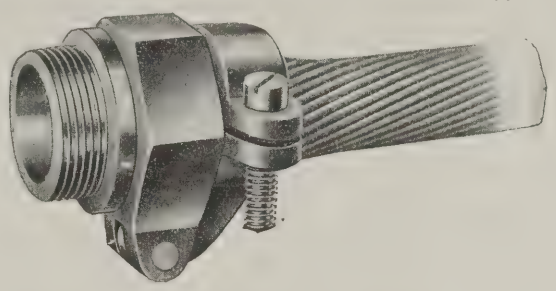

Fig. 4.—Cable Gland in Position.

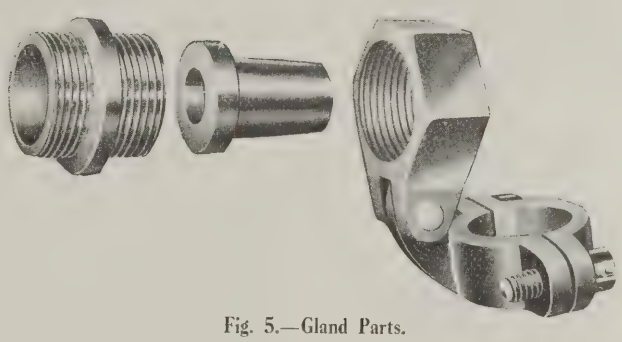

Fig. 5.—Gland Parts.

the armouring to the gland. It is claimed that the metallic connection between the box and the cable is watertight and that a perfect joint can be made in less than half the time required by the old method.

A New Change-over Switch.

We have received from the MIDLAND ELECTRIC MANFG. CO., LTD., Barford Street, Birmingham, some particulars of its most recent production, the "Memlock" change-over switch, fig. 6.

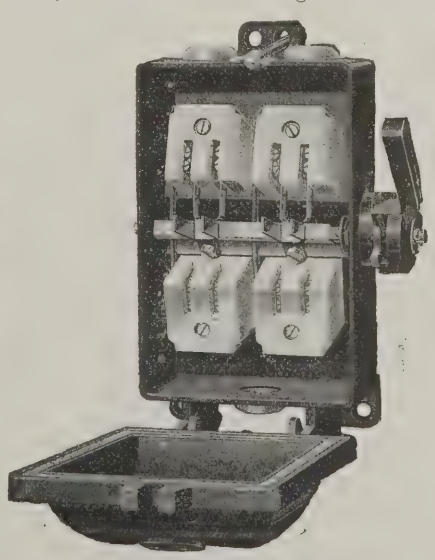

Fig. 6.—Ironclad Change-over Switch.

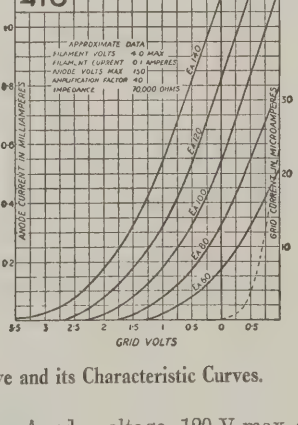
This is made in three sizes, 15-, 30-, and 60-A capacities, for both double- and triple-pole types, and is suitable for pressures up to 500 V. The smallest size is particularly suitable for shop-window lighting under special tariffs. The contacts are completely shrouded in porcelain and the positive quick-make-and-break action is independent of the springs. The apparatus is contained in a cast-iron case with a jet-black enamelled finish. The lead-in and-out holes are of standard clearance size for conduit, and bushes are also provided.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.



New " Steep-Slope " Valves.

The interest created by the recent introduction of the 2-volt DEP.215 power valve has encouraged the Marconiphone Co., Ltd., and the General Electric Co., Ltd., to add to the series. The three new patterns, of which we have had samples, are of the 4-volt filament type, each having a current consumption of only one-tenth of an ampere.

The DEH.410 is a valve specially designed to have a very high amplification factor, while at the same time to keep its internal impedance down to moderate limits. Thus when the now very popular method of resistance-capacity coupling is used, the magnification with one of these valves and suitable resistance should be equal to transformer coupling; in addition, when worked at a lower anode voltage the sharp bend of the characteristic curve permits this type to be employed as an " anode-bend " detector: its characteristics are:—Anode voltage, 140 V max.; amplification factor, 40; impedance, 70,000 ohms; normal slope, 0.57 mA per volt.

The DEL.410 valve may be used in almost any position, having features which conduce to marked economy in the running of the set, and is preferable to the " Osram " DE.3, which is designed primarily for operating off dry batteries; it being rated 3.8 to 4 volts, there is far less danger of over-running the new one, and no special filament resistance is

Figs. 1 and 2.—" Steep-Slope " Valve and its Characteristic Curves.

required. Its characteristics are:—Anode voltage, 120 V max.; amplification factor, 13; impedance, 14,000 ohms; normal slope, 0.93 mA per volt.

The DEP.410 power valve falls into line, as a factor in economy, with its companions, for by means of the new " electronised " filament an increased surface is available for electron emission, and, in conjunction with the disposition of the electrodes, gives the valve its distinguishing " steep-slope " characteristic. Moreover, by the adoption of separate filament resistances as a precaution against over-running, it is now possible to use a real power valve in conjunction with the DE.3 type—a power valve which will work off dry filament batteries, if desired. The characteristics of the DEP.410 are:—Anode voltage, 120 V max.; amplification factor, 6.25; impedance, 6,250 ohms; normal slope, 1.0 mA per volt.

New Marconiphone Products.

A decidedly useful and neat component has been added to the range of accessories marketed by the Marconiphone Co., Ltd., in the form of a novel switch for cutting out the last stage of a receiver; it breaks the filament circuit of the last valve and then connects its anode socket to the corresponding socket of the previous valve holder, it being, of course, essential that both valves should operate at the same anode voltage.

Another new product is a valve holder the shock-absorbing material in which is a selected grade of soft rubber, which supports the valve and also insulates it entirely from any vibration that may be imparted to the set, tending to damp any movement of the valve itself. Unlike metal springing systems, resilient rubber does not introduce a period of its own.

New Siemens Batteries.

With 50 years' experience of battery manufacture, Messrs. Siemens Brothers & Co., Ltd., recently placed on the market two new types of dry batteries which are intended to be employed for energising the anode circuit of broadcast receiving sets. Known as the " 60 "- and " 100 "-volt patterns, they have been specially priced in order to compete with the cheap imported article, and preference given to the British product will not be regretted. The new batteries are tapped at convenient stages, and appear to be of standard construction, though a bituminous compound is used for insulating purposes instead of the usual wax.

Resistance Amplification.

The distinctive feature of the new method of resistance amplification due to Von Ardenne and Heinert is the employment of anode resistance of much greater magnitude than hitherto considered suitable: instead of the customary value of from 50,000 to 100,000 ohms, the use of megohms is advocated. This is a drastic departure from current practice, for it is usually assumed, as is pointed out in *Experimental Wireless and the Wireless Engineer*, that the anode resistance should be such that the fall of potential therein will still leave sufficient voltage at the anode to ensure that the valve will operate in the straight-line region of its characteristic curve, even with a negative grid voltage. If from 1 to 3 megohms are used with anode-battery voltages of, say, 50-100 volts, as recommended, practically the whole voltage will be absorbed in the resistance, leaving only about 10 to 20 volts on the anode, and it might therefore be anticipated that the anode current-grid voltage characteristic with the resistance in circuit would show pronounced curvature, which would cause partial rectification and distortion. Actually, however, the working characteristics obtained under these conditions are remarkably straight over quite useful ranges of grid voltage. The method appears to have all the well-known advantages of resistance-capacity amplification combined with a higher degree of amplification per stage than has hitherto been conveniently obtainable, at the same time avoiding the necessity for high anode battery voltages, but the claims made originally and the estimate of the possibilities of further development are a little over-enthusiastic, says Mr. F. M. Colebrook, who carefully examined the subject in a recent issue of the above-mentioned journal. He reaches the conclusion that low-frequency amplification by the new method can be stated to have the following characteristics:—

1. Amplification per stage amounting to from 80 to 90 per cent. of the voltage factor of the valve used; in the case of small amplitudes (up to about one volt) amplification of at least twenty per stage can be obtained by means of high voltage factor triodes: these results can be obtained with anode battery voltages of, say, seventy to one hundred volts.

2. Valves used in this way require in most cases considerably less than normal filament current.

3. Low-frequency amplification by this method will be practically free from amplitude or frequency distortion, if the component magnitudes are suitably chosen: the following are suggested:—Anode resistances: 1 to 2 megohms, for normal h.f. valves; 2 to 3 megohms for high voltage factor valves. Grid-leaks: 3 to 5 megohms. Coupling condensers: 1,000 to 2,000$\mu\mu$F. The following precautions must be observed: sufficient negative grid bias must be applied to each valve following a resistance stage to ensure that the grid voltage does not at any time rise above about two volts negative. The insulation resistance of all components used must be as high as possible. The wiring and valve sockets must be such as to reduce to a minimum the stray capacities of the system. The resistances used must also have small self-capacity, ordinary grid leaks of standard make appear to be satisfactory.

New B.T.-H. Valves.

A series of 2-volt 0.1-amp. filament, 100-volt anode, valves is being produced by the British Thomson-Houston Co., Ltd. The B.21 high-frequency and detector has an amplification factor of 16, an anode a.c. resistance of 32,000 ohms, and a mutual a.c. conductance of 0.5 mA per V. The B.22 general purpose type has an amplification factor of 7.5, an anode a.c. resistance of 14,000 ohms, and a mutual a.c. conductance of 0.53 mA per V. The B.23 power amplifier (the filament current of which is 0.2 A) has an amplification factor of 6, an anode a.c. resistance of 8,000 ohms, and a mutual conductance of 0.75 mA per V, being a last-stage companion to the B.8 valve and approaching the performance of the B.4 type.

The Institution of Electrical Engineers.

The Council's Annual Report and Accounts for 1926-27.

DR. W. H. ECCLES, F.R.S., president, occupied the chair at the annual general meeting on May 5th, and announced that the Council had made the following awards of premiums for papers during the 1926-27 session:—Institution premium to Messrs. J. R. Beard and T. G. N. Haldane. Ayrton premium to Lt.-Col. K. Edgcumbe and Mr. F. E. J. Ockenden. Fahie premium to Mr. G. F. O'dell. John Hopkinson premium to Mr. P. Dunsheath. Kelvin premium to Mr. J. W. T. Walsh. Paris premium to Mr. A. R. Cooper. Webber premium to Mr. W. McClelland. Extra premiums to Mr. A. H. M. Arnold; Mr. F. W. Carter; Mr. A. Rosen. Wireless premiums to Mr. T. L. Eckersley; Messrs. R. V. Hansford and H. Faulkner. The awards for papers read before Students' Sections will be announced later.

Dr. Eccles then moved the adoption of the Council's report, which is summarised below.

Annual Report.—(*Abstract.*)

The Institution has continued to progress and prosper; the net increase in membership is the satisfactory figure of 505, and it is a matter for congratulation that the 12,647 members include no less than 3,625 students, who will in time provide the largest recruiting ground for the class of corporate members. Senatore Guglielmo Marconi, G.C.V.O., LL.D., D.Sc., was elected an honorary member. The sixth award of the Faraday Medal was made to Elihu Thomson, D.Sc., honorary member. In April, 1924, the Société Française des Électriciens founded the Mascart Medal of Honour in memory of that eminent French scientist, to be awarded triennially to scientists or engineers distinguished for their work in pure and applied electricity, whatever their nationality. The first award of the medal was made in 1924 to Monsieur A. Blondel, Hon. M.I.E.E., and the second (1927) award has recently been made to Sir J. J. Thomson, O.M., M.A., F.R.S., Hon. M.I.E.E. Ten other honours and distinctions have been conferred on members. The Council records the death of 62 members during the year.

At the meeting on December 2nd, 1926, oil portraits of Faraday and Kelvin were formally installed in the lecture theatre, that of Faraday having been presented to the Institution by Mr. Sydney Evershed; the portraits are the work of Mr. George Harcourt, R.A. The Council has since accepted offers of portraits of Clerk Maxwell and of Wheatstone from Mr. Ll. B. Atkinson and Sir George Sutton, Bart., respectively, and also an offer by the Cable Makers' Association of a portrait in oils of Mr. Ll. B. Atkinson, which will be placed in the Council Chamber, where there are already oil paintings of former presidents.

During the past twelve months 358 meetings have been held in London and at the local Centres by the members, the Council, and the various committees. The attendances and proceedings at the meetings of the local Centres and Sub-Centres have well maintained the high standard of the past. Eight Wireless Section meetings have been held, at which six papers were read, and there were two informal discussions. A Local Wireless Section, of which three meetings have been held, has been formed at the South Midland Centre (Birmingham), and papers on wireless subjects have also been read and discussed at Manchester and Liverpool. Eleven informal meetings have been held during the session, the average attendance being 59, against 65 last year, and the eight Students' Sections carried out a very full programme of meetings, visits to works, and social functions, and a summer meeting was held in Belgium and Luxemburg.

The Faraday lecture, by Prof. W. M. Thornton, O.B.E., D.Sc., who took for his subject "What is Electricity?," was delivered at London, Birmingham, Bristol, Dublin, Glasgow, Leeds, Liverpool, Manchester, and twice at Newcastle-on-Tyne. The total attendance was approximately 6,000, and the presence of over 4,000 non-members indicates that the lecture achieved the object in view, *viz.*, the bringing of electricity to the attention of the public.

Under the scheme approved by the Council in 1925 for the publication in the *Journal* of periodical reviews of progress in electrical engineering, four reviews were published during 1926 and seven in 1927, and arrangements are being made for reviews of the three remaining sections to be published in 1928, together with further reviews of research and electrical standardisation. The Council will be glad if members will forward to the secretary of the Institution criticisms of the present reviews, and also suggestions as to the ground to be covered by those to be published in the future.

Two David Hughes scholarships and two Salomons scholarships (value £50 each, tenable for one year) were awarded. That part of the trust deed of the War Thanksgiving Education and Research Fund which provided for the education and technical training of men who served overseas in H.M. Forces during the great war has come to an end, as there are no longer any students at educational establishments who fulfil the condition of war service. A scheme has therefore been prepared which will permit of grants being made each year to one or more post-graduate research students, to assist them in carrying out approved researches of an electrical nature; the first of such grants will be made this year.

The Council appointed Mr. C. P. Sparks, C.B.E., Lieut.-Col. K. Edgcumbe, R.E. (T.A.), Mr. S. W. Melsom, and the secretary delegates of the Institution to attend the meeting of the International Electrotechnical Commission in New York from April 13th to 22nd, 1926; the meeting was attended by 116 delegates, representing 17 countries. At the annual conversazione in 1926 there was a record attendance of over 1,800 members and guests. At the annual dinner in 1927 the Prince of Wales was principal guest; there were present 618 members and guests, and the function was the largest of the kind held by the Institution.

The two sets of Conditions for Export Contracts B1 (delivery f.o.b.) and B2 (including complete erection or supervision of erection) are under revision.

During the year 128 books and pamphlets were presented to the reference library, and 58 volumes have been purchased. The total number of readers for the year was 4,666, of whom 139 were non-members, against 3,537 and 114 respectively in 1924-25. The circulation of books from the lending library has been well maintained; 71 new volumes were added, and 2,401 books were issued to 933 borrowers, the corresponding numbers for the previous year being 1,938 and 857 respectively. A new edition of the lending library catalogue, with a subject index, is available.

The net cost of printing and posting the *Journal* in 1926 was £4,447, compared with £4,166 in 1925. The increase was due partly to the greater size of the volume (1,230 pages, compared with 1,180 in the previous volume), and partly to the larger number of copies printed (12,800, against 12,500).

The Physics volume of *Science Abstracts* for 1926 contained 896 pages of abstracts, compared with 904 pages in 1925. The Electrical Engineering volume contained 584 pages of abstracts, compared with 616 pages in the previous year. Mr. H. G. Solomon has been appointed to the Institution staff and is charged with the editorial duties.

The Joint Committee set up by the Council of the Institution and the National Gas Council, "to consider whether in the national interest an inquiry might advantageously be held into the possibility of closer co-operation between gas and electricity undertakings in promoting capital and fuel economy in the supply to the public of energy derived from coal," held six meetings, and two sub-committees have been set up by it. Among the first matters which have engaged its attention are the utilisation of waste heat in gasworks and the consequent release of solid fuel for other uses, and also the utilisation of surplus coke or coke breeze from gasworks as fuel for steam-raising at electric power stations.

For the final examinations of 1926 the Joint Standing Committee representing the Board of Education and the Institution examined at various schools and colleges students from 58 approved courses for the award of ordinary certificates in electrical engineering, 23 courses for higher certificates (including 1 post higher certificate course), 4 courses for ordinary diplomas, and 1 course for higher diplomas; the number awarded was as follows:—245 ordinary certificates; 116 higher certificates (including 4 post-higher certificates); 8 ordinary diplomas; and 6 higher diplomas.

A further list of urgent amendments to the eighth edition of the Regulations for the Electrical Equipment of Buildings was approved by the Council last September for publication in the form of an alterations leaflet; in addition, alterations have been agreed upon as a result of suggestions received since the eighth edition was published, and it has therefore been considered advisable to issue immediately a revised edition (ninth) containing all the alterations referred to above. The Committee proposes, however, to proceed at once with a more comprehensive revision.

The Council has set up a Committee of representatives of the Institution and of bodies closely associated with electricity supply to consider and report on (*a*) the practicability and cost of raising or lowering to 230 the declared lighting

voltage of the general supply networks of all systems in Great Britain; (*b*) the ways in which the Electricity Commissioners may be able to assist voltage standardisation; (*c*) any other matters affecting the standardisation of low-voltage distribution systems.

The Council has adopted the following rule: "Any corporate member who has reached the age of 65 and has retired from the practice of his profession or business, may apply to the Council to remit or reduce his future annual subscriptions, provided that his membership of the Institution has been continuous for at least 25 years. If his request be granted, he may, nevertheless, be required to pay, at a rate to be determined by the Council from time to time, for such publications of the Institution as he may wish to receive."

On December 31st, 1926, the capital account of the I.E.E. Benevolent Fund stood at £12,003, and the accumulated income at £882. The donations and subscriptions to the fund in 1926 amounted to £1,484. In 1926, 87 grants were made to 32 persons, amounting to a total of £1,497. The accounts of the I.E.E. show a balance to the good on the revenue account for 1926 of £3,882, which compares with £1,196 in 1926. The income amounted to £38,179, compared with £35,620 in 1925. The assets amount to £152,906, an improvement of £8,279 on the 1925 figure.

Annual Meeting.

Mr. F. GILL seconded the motion to adopt the report.

Mr. D. G. HURLBATT suggested that the I.E.E. Electrical Appointments Board should be made better known, so that employers who found it necessary to increase their staffs could make use of the facilities offered.

Mr. F. W. PURSE expressed full satisfaction at the work done during the year. He compared the rate of increase of corporate and student membership, and counselled the encouragement of Students to "follow on" into higher grades so as to give the Institution the benefit of higher subscriptions as some compensation for the money it spent for their benefit in the earlier stages.

Mr. F. W. PHILLIPS again advocated the re-admission of late "enemy" members. The president explained that the Council had already approved of the change being made and in due course a meeting would be called to alter the by-laws accordingly.

The report was adopted.

The hon. treasurer, Lieut.-Col. F. A. CORTEZ LEIGH, moved the adoption of the accounts and balance sheet. Mr. ROGER T. SMITH seconded, and Mr. W. RAWLINGS offered congratulations on the extraordinary results of the year. The anticipated further increase in the assets next year, he said, showed that there was money to spend, and he accordingly advised that the I.E.E. grant of £500 to the British Engineering Standards Association should be increased to £1,000, which suggestion was supported by Mr. LL. B. ATKINSON.

The accounts having been adopted, a vote of thanks to the officers of the Institution was carried, and Messrs. Allen, Attfield & Co. were re-elected auditors.

Mr. D. J. BOLTON proposed a resolution to the effect that no paper should be rejected without some reason being given to the author. The motion was seconded, but it was opposed by several members for diverse reasons and the president suggested that it be withdrawn on his promise to bring the matter before the Council.

The withdrawal of the resolution terminated the meeting.

H.P. Transmission.

The Design of Towers for Overhead Lines, with Particular Reference to American Practice.

IN a paper read recently before the Institution of Structural Engineers, the author, Mr. H. R. White, outlined the general considerations necessary for designing overhead electrical transmission lines, and reviewed what has been done up to the present time, particularly in the United States and Canada.

Wooden and tubular poles and structural masts with wire guys were objectionable, he said, both electrically and as regarded the cost of maintenance. The tendency in America and Canada was to use structural steel towers, square in plan, of the self-supporting type, or, for very light or auxiliary lines, structural steel lattice poles of the self-supporting type. The mileage of transmission lines on the North American Continent and the consequent demand for these steel towers was such that leading makers formed entirely separate engineering departments and laid out independent shops to deal with this work.

The two most usual sets of loading in use in the United States were class A, 15 lb. per sq. ft. on the bare wire and 25 lb. on the structures, for districts where the temperature did not fall below freezing point, where it was found that in these districts a somewhat higher range of wind pressures was encountered than in winter time in the cold districts; class B, 8 lb. per sq. ft. on the cable covered with ice ½ in. radial thickness, and 13 lb. on the structures, for districts which were subject to low temperatures in winter. Where winter conditions were very severe a third loading, C, was used, in which case 11 lb. per sq. ft. was allowed on cables covered with ¾ in. thickness of ice. The wind load on the structure was taken on one and a-half times the exposed area of one side. It was customary to calculate the wind on the ice-covered wire at zero F.

The weight of the tower was a question of either experience or trial. Considerable experience was necessary to forecast weights accurately, it having been found absolutely impossible to standardise towers, no two lines being exactly alike.

The load due to the breaking of wires was usually taken at or near the elastic limit. It was the item of loading that chiefly accounted for the difference in design between various types of towers in a line.

The clearance between conductors and the nearest tower member for pin-type insulators was 12 in. for 22,000 V or less, and up to 19 in. for 44,000 V. In the case of suspension insulators swung 45 deg. from the vertical, the figures were the same, and ranged up to 61 in. for 165,000 V. In the case of suspension insulators swung 60 deg., due to an angle in the line, the figures were the same, but if due to wind load the clearances might be about 10 per cent. less due to the fact that the angle of 60 deg. was less likely to be maintained.

The clearance between one conductor and another for pin-type insulators was given for 44,000 V as 49 in. for 200-ft. spans, ranging to 82 in. for 800 ft. For suspension insulators at this voltage the clearances would be 56 in. and 100 in. respectively, while for 144,000 V the figures were 110 in. and 144 in. In the case of conductors swung 60 deg. it was necessary to use either a specially long insulator or to drop the point of suspension below the cross arm by means of a bracket in order to provide the necessary clearance between the wire when swung and the cross arm above it. The determination of the general outline would be based on the above figures, and it was here that the experience of a designer might effect considerable economy.

Open-hearth steel was used in the manufacture of these towers; the dead load was not a serious factor, and in a number of members the slenderness ratio governed. The loads and stresses were small by comparison with those in bridge and building work, and it was, therefore, necessary to use small sections. In some towers the legs were as small as 3½ in. by 3½ in. by ¼ in., and this was about as small as could be used consistent with economic detailing. Many towers contained web members 1½ in. by 1½ in. by ⅛ in. Makers' specifications recommended a minimum thickness of 3/16 in. in an endeavour to advocate the use of more substantial towers, and due to the fact that some structures built in the early days were lighter than they should have been.

The American Bridge Co. and the United States Steel Products Co.'s tower shops were quite apart with separate organisation. All the work was punched, but the machines were designed and arranged to ensure exact duplication. Protection by galvanising was coming to be more and more generally used. It cost more than painting in the first place, but in the extra thickness of the members required for painting, and the cost of subsequent painting, the extra cost of galvanising disappeared. Galvanised structures should have a much heavier coating than was applied to ordinary materials.

Discussion.

Prof. J. HUSBAND pointed out that the towers used in France had a smaller base than similar towers in the United States because most of the lines in France ran over cultivated country and it was desired to create as little inconvenience as possible to the farmers.

Mr. J. C. TELFORD regarded the French method of casing the base of the column in concrete as better than putting it into bare earth. A feature of tower failures in America was that they were given prominence so that other people might learn from them. He asked if any experiments had been conducted on sherardising the whole of a tower.

Mr. S. BYLANDER said that for the railway electrification scheme from Gothenburg to Stockholm, in Sweden, the posts were made of two-channel lattice. The foundations for the towers were concrete, and one type of tower used near Stockholm had three legs and not four. This was the most modern and clever design he had seen, and made the tower cheaper. For towers not of too great a height it was the best type.

Prof. HUSBAND said the usual practice in France was to galvanise the upper parts of the towers which were near the live wires. The lower portions could be painted with safety whilst the current was on.

The author, replying to the discussion, said that the cost of timber varied very much in different parts of the world. In England it was very much more expensive than in America. It might be possible to get a lattice pole which cost double as much as a timber pole, but it would be of very much greater strength, not only as a pole, but in its ability to take up torsional stresses. The stresses recommended by the various manufacturing companies were such that, under test, members with punched holes and bolted connections gave 10 per cent. increase in strength at the joints, compared with what they gave in the member. Towers built in this way which had been tested to destruction did not fail at the joints but through buckling of the struts. He did not know what was the objection to sherardising, but people in America who had had sherardised poles would not have them any more. Triangular towers had not been found cheaper when tried for high radio towers. No allowance was made for rust when the towers were galvanised, and galvanising, if properly done, would last as long as 20 years.

The Trade Disputes Bill.

Debate on the Second Reading.

ON May 2nd the Government's Trade Disputes and Trade Unions Bill, which was dealt with in our issue of April 22nd, p. 633, came before the House of Commons, and four days were allotted for the debate.

In moving the second reading, the Attorney-General (Sir Douglas Hogg) said that the Government believed that the Bill was well drafted, and, while it would be glad to accept amendments to remove any ambiguities, it would resist to the utmost any amendments designed to defeat the objects of the measure. The first five clauses, which were, perhaps, of the most general importance, could be stated in the form of four propositions:—(1) That a general strike was illegal, and no man could be penalised for not taking part in it; (2) That intimidation was illegal; (3) That no man should be compelled to subscribe to the funds of any political party; and (4) That Civil Servants must give their undivided allegiance to the State. The right of workmen to strike was preserved, although many legitimate industrial strikes affected large bodies of the community. To be illegal a strike had to be one which was not purely industrial, and was intended to coerce the Government or intimidate the community, or a substantial part thereof. The Government did not think that the inclusion of lock-outs in the Bill was possible. A general lock-out directed against the Government had never been suggested; any attempt would be met by the Government stepping in and running the undertakings, as it already had power to do. If, however, a case could be made out for the inclusion of lock-outs, the Government had no objection to including them. Employers, equally with workmen, were included in Clause 3, dealing with intimidation, and Clause 4, dealing with the political levy. Clause 2, which provided that no one should be penalised for refusing to take part in an illegal strike, definitely applied only to strikes declared by the Bill to be illegal; Sub-Section 3 of the clause made it retrospective to cover the general strike of last year. Clause 3 dealt with intimidation; peaceful picketing was not prohibited. Clause 4 altered the status of the political levy. The change from contracting-out to contracting-in should not injure those unions which had been loyal to the Act of 1913. Clause 5 dealt with the position of Civil Servants; Clause 6 prohibited public authorities from making trade union membership a condition of employment; and Clause 7 empowered the Attorney-General to apply for an injunction restraining a union from using its funds in contravention of the Bill. He asked the moderate Labour men to co-operate with the Government in improving the measure and making it workable.

Mr. Clynes (Labour) moved the rejection of the Bill, saying that the fight against it would not end when it was on the Statute Book. The Bill would make it almost impossible for trade unions to enter into effective contracts with the Government or employers of labour. It would be the duty of his party to repeal the measure when it came into office. The Bill did not debar a group of men from striking, but it prevented their strike from being successful. As regarded intimidation, there had been a great deal of exaggeration. There was more on the other side: no weapon was so potent as the power of dismissal. The Civil Servants had taken no part in the general strike and, in addition to their obligations as Civil Servants, were entitled to the privileges of wage-earners. The political levy clause brushed aside an agreement come to between all parties in 1913, and it was an attempt to deprive the working classes of representation. Mr. Harney (Liberal) considered that the Bill was directed against all strikes by means of its "intimidation" clause, but Sir W. Greaves Lord (Conservative) said that the clause was rendered necessary by the events of last year. Sir H. Slesser (Labour) said that in the case of a strike being declared illegal it would be criminal for men to leave their employment even after giving notice; the Government was thus reducing workmen to a state of servitude. The Bill went far beyond a general strike; any strike which "intimidated the community" was illegal, and the word "intimidate" was not defined. The matter was purposely left vague for any interpretation to be put upon it and thus make any strike illegal.

Mr. Hurst (Conservative) spoke in favour of the Bill, and Capt. MacMillan (Conservative) said that if the Government had not proceeded with the Bill it would have been interpreted as a sign of weakness. He and other Unionists would support the Government, hoping, however, that it was not the beginning of a reactionary policy. Mr. G. Spencer (Labour) said that unless something upon the lines of the Bill were done, the unions would be captured by the revolutionary element. The Bill would do more good to the Labour Party than to any other. The movement against the Bill had not sprung spontaneously from the working man. Mr. Spencer continued his speech on May 3rd, and related his experiences during the coal dispute. He concluded by saying that the unions devoted more time to political than to trade union matters. Mr. A. Henderson (Labour) described the Bill as an invasion of the established rights and legal powers of the trade unions. It prevented combinations of workers, while capital was allowed to enter into any combination thought desirable. What was the position of such a body as the Transport and General Workers' Union which embraced men in a number of industries?

Sir L. Worthington Evans (Secretary for War) said that Mr. Justice Astbury had decided that the general strike was illegal, and the Bill made the matter definite. Labour leaders had condemned the strike, but that did not preclude the possibility of another. Contrary to Opposition opinions, the Bill was designed to protect the working class, which was the greatest sufferer in a general strike. Sir R. Horne (Conservative) considered that the Bill should include lock-outs, and said that that was the opinion of the bulk of the Conservative Party. If the political levy was really voluntary, the unions should not be injured in any way. The great mass of trade unionists would be grateful for the Bill. Mr. Walsh (Labour) said that under the Bill any strike could be made illegal, and the trade union movement would be rendered impotent.

On May 4th, Sir John Simon made a long speech, in the course of which he said that the objects of the Bill as expressed by the Attorney-General were unexceptionable. The real objection to the Bill was the method in which it was drawn up. He expressed doubt regarding the wisdom and necessity of the political levy clause, but agreed that if it was necessary no harm should be done. Clause 1 might lead to complications, and lock-outs should certainly have been included. He considered that a general strike was already illegal, and a simple declaration to that effect would have been sufficient, and he concluded by saying that all members should endeavour to make the Bill fulfil the declarations of the Attorney-General—neither more nor less. The Prime Minister said that the Trade Disputes Act, 1906, took a far more extreme form than was originally intended, and the ground covered by trade unions had since then moved from industrial to political action, and in some unions the power was getting into the hands of the "minority movement," such as in the Miners' Federation. The Government had refrained from introducing legislation, and had decided not to proceed with Mr. Macquisten's Bill to deal with the political levy in 1925, but its hands were forced by the general strike; that was the Government's mandate for the Bill. He concluded by inviting the co-operation of the House in giving effect to the propositions enunciated by the Attorney-General. Mr. T. Shaw (Labour) said that the Bill aimed at the destruction of the Government's political opponents, and was so drafted as to provide endless work for the lawyers. It did not touch the employers, who were left to do as they pleased. Capt O'Connor (Conservative) said that although it was incorrect to describe the Bill as "industrial conscription," it went a long way in that direction. It should be the aim in committee to prune the Bill and remove the ambiguities. Mr. Dixey (Conservative) said that the measure should have been introduced two years ago. He also urged the Government to include lock-outs in it.

On May 5th, Mr. Townend (Labour) said that no attempt had been made in the Bill in dealing with sympathetic strikes to define a line of demarcation between trades. Mr. Snowden (Labour) said that if general strikes and intimidation were already illegal, the repealing of the Act by a Labour Government would leave things exactly as they were. Under modern conditions it was impossible to confine all disputes to the industries in which they arose, and the banning of sympathetic strikes rendered all strikes useless. The Government was constantly being coerced by all parties, including its own, and to merely refuse to work was a very peaceful form of coercion. No amount of legislation would stop a general strike if the workers intended to have one. The Bill said nothing about taking the leaders first; could they put 5,000,000 men in prison? He agreed that the inclusion of the employers would be useless for they had a thousand means of coercion at their disposal of which no legislation could deprive them. He ridiculed the attempt to expand the meaning of "intimidation," and with regard to the political levy said that improvements in conditions were mainly brought about by political means, and trade union members should be prepared to pay for them. He wished that the Government had devoted itself to the setting up of machinery to settle industrial disputes by reason and not force. Sir R. Sanders (Conservative) claimed that the demand for the Bill had come from the working classes, not the employers.

Mr. Lloyd George (Lib.) challenged the wisdom of introducing the Bill at such a time. The Bill, instead of clarifying trade union law, created new obscurities. It was dangerous to leave the interpretation of its terms to magistrates who might unconsciously be prejudiced in favour of the employing class. The first clause rendered sympathetic strikes and all strikes in vital industries possible. With regard to Clause 4, the Mineowners' Association had used its funds freely for political purposes—would that be impossible in future unless a special fund were set up to which individuals would have to agree to subscribe? He did not believe that the general strike could be repeated, but how would the Bill stop one? No important industrial group of any kind wanted the Bill; it was dictated entirely by political expediency. Conditions were improving, and the Bill would set them back. Mr. Jephcott (Conservative), speaking as a former trade unionist, said that a large number of unionists would be grateful for the measure if it separated industrial from political matters. Mr. Wheatley (Labour) claimed that whether a sympathetic strike was right was a question to be decided by the men concerned. The workers would find means of evading the Bill if it became law. Mr. Hilton Young (Conservative) said that any attempt to substitute the rule of the Trade Union Congress for that of Parliament must be made impossible. Mr. J. H. Thomas said that in his union 55,000 members were exempt from the political levy; among the shipwrights in Sunderland there were more exempted members than members paying the levy, and that also applied to the boilermakers. After preaching industrial peace, Mr. Baldwin had given his support to an attack upon the trade unions and his political opponents. After quoting examples of what he described as intimidation by employers, Mr. Thomas said that the unions were being deprived of the only weapon that they possessed. The bulk of the magistracy was of the employing class, and he had no doubt as to what their opinions of the legality of a strike would be. The Government had struck a serious blow at those who were desirous of peace in industry. The Solicitor-General (Sir T. Inskip) said that Clause 1 did not prohibit a strike for the improvement of conditions in an industry even if it was a national one and might possibly bring pressure to bear on the Government and compel the community to submit. The word "sympathetic" was one of no very exact meaning, but the word "intimidate" was perfectly plain. Regarding Mr. Snowden's suggestion that the Government might have to imprison five million workers, the speaker said that Acts of Parliament were not administered by the police, but by the law-abiding character of the English race. The employer was prevented from intimidating his men by Clause 3, just as much as the worker was prevented from the use of intimidation. If a man was compelled to join a union, he should be protected from compulsory contribution to a political fund. The Bill was wanted by the community which had suffered from the general strike. The closure was then moved and carried, and on a division the Bill was read a second time, the Government majority being 220. It was then decided to commit the Bill to a committee of the whole House.

Powdered Lignite in America.

Some notes on an electricity works in the United States which is said to be the largest user of powdered lignite for steam-raising purposes.

THE largest steam turbo-generator between the Mississippi River and the Pacific Coast of America has been installed in a Rocky Mountains generating station which at present claims to be the largest single consumer of powdered lignite fuel in the world. The turbine, a 25,000-kW set, being added to the Public Service Company's Valmont station wherein a 20,000-kW set is already in operation, was built by the General Electric Company of America. While the Valmont plant is at present said to be the largest consumer of lignite fuel, a larger plant is being installed in Texas to utilise lignite from that State; 80 per cent. of the powdered lignite tonnage is converted into utilised heat, the balance including 5 per cent. ash and 15 per cent. radiation and chimney gases.

Electricity is generated at 13,000 volts, stepped up to 100,000 volts, for transmission to Denver, and to 44,000 volts for the transmission system distributing throughout Northern Colorado. Lake Valmont, upon whose shore the plant is located, and which furnishes the condensing water for the steam turbines, has an area of 127 acres, or enough to care for four sets similar to the present ones. Land is owned and a dam site has been laid out to increase this area to 600 acres, which will care for the ten sets that are contemplated in the ultimate scheme.

The first step of economy in the use of powdered lignite, according to the practice at the Valmont plant, is the utilisation of a grade of fuel heretofore largely waste, consisting of the dust and slack from the mines. Before the fuel is powdered, the discharged hot fumes from the boilers are passed through it to extract the moisture; it is then ground in centrifugal mills of the Chilean type and lifted by air pressure created by fans to the distributing storage bins above the boilers. Its distribution to the combustion chambers of the boilers is by screw conveyor and air pressure, the air furnishing the necessary oxygen. A stream of powdered lignite one foot in diameter is fed into the boilers at the rate of eight feet per second. Within three feet after entering the combustion chamber the powdered fuel becomes entirely incandescent and burns like a gas, at a temperature of from 2,500 to 2,800 deg.

The ash falls in the form of a fine dust through the grates, which are internally water-cooled to prevent the ash from vitrifying. As this incombustible waste represents only 5 per cent. of the original volume of coal, its disposal is negligible. The lignite used is obtained from mines only a short distance away, and the present consumption is 1½ lb. per horse-power-hour, representing from 400 to 500 tons daily.

Steam enters the turbines at a pressure of 375 lb. per sq. in. and a temperature of 680 deg. F., being exhausted into a 24-in. vacuum. The feed water to the boilers is preheated to 260 deg. under pressure, and all free oxygen is removed from the water to prevent corrosion in the boilers. The condenser cooling water enters at a temperature of 70 deg. during the summer and discharges at from 78 to 80 deg. Each unit uses 40,000 gallons per minute, supplied by two 20,000-gallon pumps.

Two independent transmission lines furnish outlets from the Valmont plant to Denver, Boulder, Fort Collins, and Greeley, which arrangement ensures against interruption of service.

Parliamentary News.

(By Our Special Parliamentary Reporter.)

The Trade Disputes Bill.

After a four-days' debate, the House of Commons, on May 5th, carried the second reading of the Trade Disputes and Trade Unions Bill by 386 votes to 171. A report of the debate appears on p. 779.

Wednesday and Thursday of this week were to be devoted to the Committee stage, and the Government had prepared amendments providing for the inclusion of lock-outs in the Bill and substituting the words "inflicting hardship upon the community" for "intimidating the community or any substantial portion of the community" in the definition of an illegal strike.

The Southern Railway Contract.

On May 4th Mr. Dennison asked the Minister of Labour whether the recent contract given by the Southern Railway Company to a Swedish electrical company would involve the introduction into this country of Swedish artisans; and if he was prepared to give permits to such foreign workpeople to take part in the erection of plant and machinery manufactured abroad while large numbers of British skilled engineers were still unemployed.

Sir A. Steel-Maitland said that no application for permits in that connection had so far been received. He could not say what decision he should come to unless and until such an application was made.

Mr. Hannon asked the Financial Secretary to the Treasury if, having in view the guarantees given by the Trade Facilities Committee for the electrification of the Southern Railway, any condition was imposed on the railway company that, as far as possible, contracts should be placed in this country.

Mr. McNeill said that the South-Eastern and Chatham Construction and Equipment Co. did not avail itself of the guarantee, which was subsequently withdrawn.

Railway Electrification.

On May 3rd Mr. Hannon asked the Minister of Transport whether the Electricity Commissioners had been consulted on the extension of the electrification schemes of the Southern Railway Company; and if such extension schemes had had their approval.

Colonel Ashley said that the approval of schemes for extensions of railway electrification was not a matter in which the Electricity Commissioners were directly concerned.

On May 5th Lt.-Commander Kenworthy asked the Minister of Transport how many miles of main railway line had been electrified in Great Britain, and whether plans had been prepared for the electrification of other portions of the main line railway system.

Colonel Ashley said that at December 31st, 1926, 946 track miles of the railway lines of the four amalgamated companies were worked either wholly or partly by electric traction. In addition, 295 track miles of railways belonging to other companies, mainly operating in London, were worked by electric traction on that date. He understood that the principal railway companies had the question of railway electrification constantly before them.

Oil from Coal.

On May 5th, in reply to Mr. Thurtle, who asked for information as to whether the process of extracting oil from coal was now being carried out on a commercial basis in Germany, the Duchess of ATHOLL said that low-temperature carbonisation processes had long been employed for the extraction of oil from brown coals in Germany. It was understood that oil was now also being produced on a commercial scale in Germany by the hydrogenation of brown coal.

Private Bills.

The London and Home Counties Joint Electricity Authority (No. 2) Bill has been read a second time in the House of Commons. The Yorkshire Electric Power Bill and the Farnham Gas and Electricity Bill have been read a third time and passed in the Lords.

A Select Committee of the House of Commons this week commenced the consideration of the County of London Electric Supply Co. Bill, the principal object of which is the extension of the company's powers in relation to the supply of electricity in Essex.

Correspondence.

Correspondents should forward their communications* as early as possible.** ***No letter can be published unless we have the writer's name and address in our possession.

Electroculture.

I note in your issue of April 29th that your Paisley correspondent would like to have particulars of experiments in the culture of tomatoes by means of electricity.

This is a method of treatment which has been tried in several forms by a number of people from time to time. In tomato growing, electricity can be used in the following five ways:—

(1) *Seed treatment.* Mr. A. Carr Bennett, of Fairfield, New South Wales, has reduced the electric treatment of seeds to a commercial proposition, and particulars of his results are contained in a book published by Messrs. Angus & Robertson, Ltd., 89, Castlereagh Street, Sydney, entitled "Electro-Culture, the Application of Electricity to Seeds in Vegetable Growing." Mr. Carr Bennett reports phenomenal yields from crops of treated seeds and considers that such treatment so strengthens the seed, that weeds have little chance of making way in their neighbourhood. Not only is the yield increased, but the quality of the tomatoes is enhanced.

The Wolfryn process of seed treatment, which has been developed in England, does not seem to have been tried on the tomato seed, but there is no reason why it should not be as successful as with other seeds.

(2) *High-tension treatment* by means of positively charged wires placed close above the plants (about 1,000 volts).

(3) *Local electric heating.* By placing a heating cable in the soil, under the roots of the plants.

(4) *Intensive illumination.* Intensive electric light can be applied (*a*) to seedlings immediately after transplanting in order to prevent wilting, and (*b*) to plants, in order to speed up the flowering. The time of maturity can to a certain extent be regulated, *i.e.*, the grower could be sure of having fruit available in time for the best markets.

(5) *Sterilisation of soil,* by means of a portable electric steam boiler.

As far as the bibliography of this subject is concerned, little has been written dealing with the electrical side, but I suggest that your correspondent in addition to the above booklet should refer to "The A.B.C. of Tomato Growing," by W. Dyke (The Lockwood Press), post free 3s. 9d. Two books on the general subject which might also interest him are "Growing Crops and Plants by Electricity," by E. C. Dudgeon (Rentell), and "Electricity in Agriculture and Horticulture," by K. S. Lemström (Benn Bros.), although neither of these deals specifically with tomatoes.

By the way, in an article that you asked me to write for your Jubilee issue on the future of electro-farming, I suggested that probably concrete beds would be employed in which to grow crops. It is of interest to note that to-day this is an accomplished fact for tomato and water-cress growing.

R. Borlase Matthews.

Greater Felcourt, East Grinstead, *May 2nd*, 1927.

The Ideal Wiring System.

Mr. H. R. Taunton, in Part 1 of his article in your current issue, rightly states that no wiring system can be safe unless properly fitted by a careful workman. With this I heartily agree, and I would add that the careful workman can best be evolved by apprenticeship with a registered contractor who is also a member of the E.C.A. or the E.C.A. of Scotland.

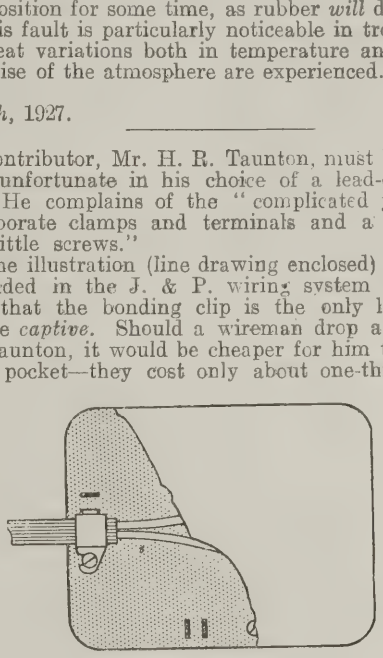
I observe that Mr. Taunton places h.g. screwed conduit at the top of his list, but says: "It is rare to meet an installation in which the logic of the system does not lapse at a wooden fuseboard or a ceiling block or the like." Surely he has been unfortunate in his district. Speaking from my experience all over Scotland, and Edinburgh in particular, it is the exception to come across any recent installation work done by qualified contractors on which iron boxes behind fuseboards and ceiling blocks are omitted.

There is no system for domestic work so lasting, safe, reliable, and so well adapted for extension or replacement of cables as a properly installed screwed-conduit installation. No other building item in the modern house gives such a useful return as the electrical installation if it is well fitted in the first instance, and the price of a reliable system is a small—too small—item in general building costs.

It is not the place of anyone interested in the welfare of the electrical industry to belittle the importance of a sound wiring job, and flexible surface systems for the most part should only be adopted as temporary expedients until the opportunity arises for fitting a concealed and continuous safe and lasting steel conduit system.

J. Johnston Foggo, N.R.E.I.C.

Edinburgh, *May 2nd*, 1927.



With reference to Mr. Taunton's article on "The Ideal Wiring System," he appears to consider that the cab-tire sheathed system most nearly approaches the ideal. He does not, however, mention one fault of this system, namely, that the rubber sheathing is apt to crack on the outside of bends after it has been in position for some time, as rubber *will* do when in tension. This fault is particularly noticeable in tropical climates, where great variations both in temperature and in dampness or otherwise of the atmosphere are experienced.

C. T.

May 7th, 1927.

Your contributor, Mr. H. R. Taunton, must have been particularly unfortunate in his choice of a lead-covered wiring system. He complains of the "complicated junction boxes, with elaborate clamps and terminals and a multiplicity of fiddling little screws."

From the illustration (line drawing enclosed) of the junction box included in the J. & P. wiring system fittings it will be seen that the bonding clip is the only loose part; the screws are *captive.* Should a wireman drop a clip, as feared by Mr. Taunton, it would be cheaper for him to take another from his pocket—they cost only about one-third of a penny

J. & P. Junction Box.

each—than to waste time getting down from a ladder to pick it up. To bond the sheathing of a cable firmly and permanently the tail of a clip is inserted in one of the slots in the back plate, the notched end is slipped over the cable and under the head of the captive screw, and the latter is tightened. No complexity, no elaborate clamps, no fiddling screws.

Mr. Taunton deplores the lack of a simple joint box for use with C.T.S. cable. We would refer him to our list C.T.S.W., where he will find particulars of a totally-enclosed universal joint box which is inexpensive, easily wired, and has no loose screws.

Johnson & Phillips, Ltd.

(CHARLES STEWART, *Director.*)

London, *May 7th*, 1927.

I have read Mr. Taunton's excellent article with considerable interest, as it confirms my opinion as regards C.T.S. which you published some years ago. My long experience, however, in the use of C.T.S. compels me to differ from him in the following points:—

(*a*) On page 710 he refers to cab-tire as being neither metal-sheathed *nor protected.* Cab-tire is well protected mechanically. It is astonishing what rough treatment it will stand during erection. Anyone who has used C.T.S. flexible in engine rooms and similar situations where it is subject to extremely rough treatment will appreciate this.

(*b*) On the same page he refers to potential danger through carelessness in stripping the sheathing, and states that such risk is greater with cab-tire than with lead-covered. Surely the reverse is the case, because of the close proximity to "earth" with lead-covered. This risk with C.T.S. is to my mind negligible.

(*c*) Further on he again refers to mechanical protection and the possible attack of nails, &c. This risk is certainly no greater than with lead-covered or light-gauge tubing. I have seen many a nail and screw driven through both lead-covered and conduit, with the result that the fuse usually blows and repairs are at once necessary. The wires cannot always then be drawn out of tubing as tube enthusiasts would have us believe.

Incidentally, a neat cement covering in chases is a much more effective protection than metal.

(*d*) As regards Mr. Taunton's statement as to cost, C.T.S. certainly costs less than lead-covered or tubing, because C.T.S. is more rapidly erected, and therefore the labour cost is less. Also, contractors can be certain of a high insulation test and need not allow for the possibility of paying the supply authority a fee for a second test, frequently necessary through moisture.

One can dismiss the remaining unimportant shortcomings —no wiring system is perfect—some risks must be taken, and after giving all the other systems a prolonged and thorough trial, not only for house wiring but for works wiring in the most difficult situations, I still prefer the small mechanical risks with C.T.S. to the much greater electrical and chemical risks of other systems.

C.T.S.

May 7th, 1927.

Off-Peak Supplies.

An article on "Electric Water Heating," in a recent issue of your journal by Mr. J. W. Meares, draws attention to some interesting possibilities of "selective" supplies.

The most effective method of controlling peak supplies, or of ensuring that certain supplies shall be "off-peak," is by means of the time switch, for this purpose not used here to the same extent as in certain foreign countries.

Mr. Meares perhaps attaches too much importance to the first cost of the time switch; the best appliances, of British make, are so satisfactory in action and have such low maintenance costs that their employment for supplies of any reasonable magnitude is easily possible.

The time has arrived when more attention should be given to storage methods; the possibility of storing electrical energy in the form of heat over long periods and with little loss is of immense value to the supply authority, allowing peak control without inconvenience to the user of the supply; moreover, it allows the time selection to take place at any period of the twenty-four hours, which is important, as it does not follow that the peak period will continue in the position on the clock which it generally occupies to-day.

The work already done in storage water heating and in warming rooms by heat accumulation, is sufficient to show how valuable this business can be in improving load factor. It would be worth while to revive interest in time-switch metering methods, in the "Dispensible" circuit proposals by Mr. Wilkinson, and even in methods of meter and switch control from a central source as carried out with the "Ripple" impulse appliances, to a limited extent already adopted for switching on and off street lighting.

Running motor appliances, as suggested by Mr. Meares, may be difficult to control, although it should not be beyond the capacity of the designer to produce a motor drive with speed to a great extent independent of pressure variation.

It may be too much to suggest "direct" switch control from a central point for all consumers; the distributing engineer will hardly welcome a proposal to run with every service a third wire for that purpose, but already in certain places the ordinary distributors carry a switch wire, permitting street lights and signs to be controlled from central points.

Some day perhaps electricity supply undertakings may be willing to provide a standard time service which could be linked in with peak control, or might even be able to work in conjunction with the telephone or radio service, those organisations, for a consideration, communicating to every one of their clients some periodic impulse adapted for operating meters or switch gear for the "selective" use of electrical energy.

We have not heard recently of "Wired Wireless," a proposal whereby central stations were to add to the attractions of their service a supply of music or news which could be picked up from any lighting installation; possibly the "Broadcasting" provisions of the world are too complete for anything of the kind to be attempted, but the existence of a "conductor" link between the power stations and each building in our cities and towns offers a tempting prospect to those inventors who study the more abstruse applications of electricity.

J. W. B.

Bad Business Methods.

It may interest your readers to know exactly what goes on in the selling organisations for marketing certain domestic appliances. On April 28th we received an order for a Hoover sweeper for a new client. On April 28th we rang up the Hoover Co. and gave them the order over the telephone, and confirmed it the same evening, enclosing with our order a cheque in settlement. The machine was delivered on the 29th, and we invoiced our client on May 2nd. On May 6th we received a cheque from our client in settlement, and on the same morning, by first post, our client received an invoice from the electricity supply company, Edgware, for this same machine.

We do not know what impression our client now has of us, but we think possibly he may not trouble us again.

Jacob, White & Co., Ltd.

London, *May 6th*, 1927.

A Commutation Problem.

The letter in your issue of May 6th by Mr. A. O. Griffith is of considerable interest. My opinion is that the solution lies, not in the design of the machine, but in a purely mechanical point.

It is noted that turning the commutator cures the trouble whereas apparently no alteration in brush position, kind of brushes, or recessing the mica does so. Furthermore, the machine runs sparkless for a period of weeks after turning the commutator; clearly this eliminates all possibility of faulty design causing sparking.

On the other hand, it is noted that the speed is high. I suggest therefore that the trouble is in the design or assembly of the commutator, resulting in the possibility of one or more segments moving outwards slightly under centrifugal force, thus lifting the brush at each revolution.

When one realises that if a high bar gives the brush sufficient impetus to remain out of contact with the commutator for one hundredth of a second nine or ten bars will fail to establish direct contact with it at each revolution, it is not difficult to see that considerable arcing must inevitably take place.

The remedy is to put a wire band round the segments and re-turn the vees to fit the vee-rings accurately, then reassemble and tighten up hot, and finally, of course, skim up.

One other possibility, but a less likely one, is that in cutting down the micas a thin film is left adhering to adjacent segments at the commutator face. No doubt your correspondent is familiar with this pitfall. Perhaps he would like to communicate with me direct.

Legal.

Claim for Electricity Consumed.

In the Mayor's and City of London Court, recently, before Mr. Registrar Dell, a claim was made by Daniels Agency, 94, Cannon Street, inquiry agents, against Mr. J. Waterhouse, formerly trading as Waterhouse & Co., Tothill Street, S.W., for £2 15s. in respect of electrical energy used. Mr. H. Daniels, partner in the plaintiff firm, said when moving to their present offices in April last they received a bill from the electric light company, and they made a complaint. As a consequence of inquiries which were made, it was discovered that the defendant, who was the tenant occupying the floor below them, was using the same meter. He called upon the defendant several times, and afterwards came to an arrangement, after going into the figures, by which it was thought that £2 15s. was a fair amount to be paid by the defendant. He had promised to pay the amount, but had not done so. The defendant did not appear, and judgment was entered for the plaintiffs for the amount claimed, an order being made for payment on May 12th.

Impex Electrical, Ltd., v. Norton Wireless Co.

Mr. Justice Tomlin, in the Chancery Division, on May 4th, had before him an action by Impex Electrical, Ltd., of 538, High Road, Leytonstone, for an injunction restraining the alleged infringement by the Norton Wireless Co., 17, Norton Folgate, E.C., of their trade mark, "Dario," for wireless valves. The defendants denied infringement, and said they had never sold any valves bearing the word "Dario."

Mr. Courtney Terrell, for the plaintiff company, said that his clients dealt in various kinds of electrical apparatus, and especially in wireless valves. A French company, La Radiotechnique, supplied the plaintiff company with valves unmarked, and the trade mark "Dario" was attached to them by the plaintiff company. The latter was formed in 1925 by M. Auguste Fevre, who originally represented the French company in England. The valves supplied to the plaintiff company were made to a special specification, and they came from France in a carton worded in French. Last summer M. Fevre, hearing that defendants were applying his company's trade mark to their valves, sent a man, who saw in their shop window cartons similar to those containing the plaintiff company's "Dario" valves, and in the following October, after the defendants had been warned by letter, M. Fevre caused a purchase of a valve to be made. This bore the plaintiff company's trade mark. When an interim injunction was applied for, Mr. Thomas Kelly, of the defendant company, said it was true that a valve was sold to the plaintiff company's representative, but that the valve in question was not the one sold. The salesmen said not only was the valve not sold, but they never had in their possession valves marked "Dario," nor had they any cartons bearing French words. Evidence was called to prove the purchase of the alleged infringing valve.

For the defence, Mr. THOMAS KELLY, the principal member of the defendant firm, said he had never had any cartons in the shop bearing French wording, nor had he seen the plaintiff company's valve until it was produced in court. Mr. MELVILLE, K.C., for the defendants, said the utmost that could be proved against them was that they sold one article in regard to which there might be a complaint, and he asked his Lordship to hold that there was no threat to infringe the plaintiff company's rights. While there was an innocent offence, there was no case for the granting of an injunction.

Mr. Terrell did not proceed with his final speech, but asked that Mr. Kelly be recalled for further cross-examination in view of certain information that had just come into the possession of the plaintiff company.

The case was adjourned until a time to be fixed for further cross-examination and, if necessary, further evidence.

Bosville v. Wood.

HENRY WOOD, motor engineer, Leyburn, was sued at York County Court, recently, for £43, for alleged defective electric wiring, the plaintiff being Thomas Bosville, Leyburn. According to the evidence the defendant was engaged to re-wire the house, plaintiff thinking he was a qualified electrical engineer, and he was paid £175 for the work. Examination by an expert revealed many defects and he refused to pass the house for insurance as the wiring was unsafe. The defence was that there was no contract for Wood to do the work, and that what he did was according to Mr. Bosville's instructions. The Judge remarked that a good many of the mysterious fires which had occurred were probably due to causes such as had been revealed in that case. He gave judgment for plaintiff for the full amount claimed with costs.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

26,333. "Television and apparatus for use in transmitting views, scenes, images, pictures, and other objects of an animated or inanimated nature to a distance" J. L. Baird. October 21st, 1925. (269,219.)

26,384. "Receiving apparatus for wireless telegraphy and telephony." G. B. Ellis (Sachsenwerk Licht-und Kraft Akt. Ges.). September 2nd, 1926. (Convention date not granted.) (255,013.)

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from May 4th :—

Jupiter. No. 475,348. Class 8. Electric lamps for projection purposes.—Juperlicht Gesellschaft Kersten Brasch, Berlin. (British representatives: Chatwin & Co., 253, Gray's Inn Road, W.C.1.)

P.P.P.P. (lettering and design). No. 476,960. Class 8. Radio-telephonic sets, telephone instruments, and electrical control apparatus.—Plessey Co. (1925), Ltd., Vicarage Lane, Ilford.

R. & B. (lettering and design). No. 477,928. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Reynolds & Branson, Ltd., 13, Briggate, Leeds.

Britex. No. 478,150. All goods in Class 8.—C. S. Pyser, 50, Bank Chambers, 329, High Holborn, W.C.1.

Noctovisor. No. 478,271. Class 8. Apparatus for use in transmitting views, scenes, or images to a distance by telegraphy.—Television Ltd., Motograph House, Upper St. Martin's Lane, W.C.2.

Inadequate Distribution Mains.

In a letter recently sent to the Incorporated Municipal Electrical Association and the Provincial Electrical Supply Committee of the United Kingdom, the Electricity Commissioners urged authorised supply undertakers to adopt the policy of anticipating the future demands on their mains by the provision of distributors of adequate section. The Commissioners have noted that the practice prevails in some cases of laying distributors of so small a sectional area as to tend to restrict or preclude the use of such distributors for dealing with any development of the domestic load. It has also been observed in a number of cases that the cost of excavation, reinstatement and jointing has exceeded the cost of the cable itself; and that by a comparatively small additional expenditure on cable of a larger size provision could have been made for dealing with a load at least twice as great as that possible with the cable actually laid. It is suggested that, except in special cases, distributors having a cross section of not less than 0.05 sq. in. should, as a general rule, be provided.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

AUDENSHAW.—Adaptation of Westernlea as clinic; Lancashire Education Committee.

AYR.—Alterations to Mansion House (electric lighting) for Corporation; burgh surveyor.

BASFORD.—Secondary school for Notts Education Committee; H. James, Mansfield.

BIDDULPH (Staffs.).—Additional 50 houses, for the U.D.C.; Mr. Gibson, surveyor.

BILSTHORPE.—Elementary school for Notts Education Committee; Greenwoods (Mansfield), Ltd.

BIRKENHEAD.—Fire station and firemen's houses, for the T.C.; Charles Brownridge, borough engineer.

BIRMINGHAM.—Elementary school, Billesley; Education Committee.

BOLTON.—Extensions, Dove Mill, Deane Church Lane; Dove Spinning Co. Pattern stores, Bark Street; Ryder Bros. Conversion of school in Fern Street to cinema; F. Moorhouse. Alterations cinema, Rumworth; Bolton Cinema Co. Bank, Derby Street; Manchester and County Bank, Ltd.

BRAINTREE.—Housing scheme (56), for the U.D.C. Ward block, &c., Cressing Road hospital, for the Joint Hospital Board; D. G. Armstrong, architect, Great Square.

BROWNHILLS (Staffs.).—Houses (54), for the U.D.C.; J. W. Edwards, builder, Birmingham.

BULKINGTON.—Cinema, Rieton, for Frank Voce, Nuneaton.

CLOWNE (Derbyshire).—Additional 50 houses, for the R.D.C.; surveyor.

COATBRIDGE.—Re-erection of premises, Main Street, for D. M. Stark, Ltd. (£3,500).

COVENTRY.—School (1,250 places), Radford, for the borough E.C.; director of education.

DARTMOUTH.—100 houses for the T.C.; borough surveyor.

DARTON.—Ex-Service men's club, Station Road; W. Wrigley, architect, 2, King Street, Wakefield.

DUNBAR.—Additions to secondary school (£6,812); clerk School Management Committee.

DUNCHURCH.—School (£8,000), for Warwickshire E.C.; director of education, Warwick.

DUNDEE.—School at Lochee; Bishop Toner. Maternity hospital for directors of Royal Infirmary; the secretary.

EASINGTON (Co. Durham).—Additional 50 houses, for the R.D.C.; surveyor.

EASTBOURNE.—Masters' quarters, &c., Eastbourne College; Tatchell & Wilson, architects.

EAST GRINSTEAD.—Offices (£6,258), for the U.D.C.; J. Bodle, builder.

EDINBURGH.—Reconstruction of Empire Palace Theatre; manager, Moss Empires, Ltd.

EXETER.—Joint mental institution; City Council and Devon and Cornwall County Councils.

GLOSSOP.—Works, J. Hadfield & Sons, Derby Street.

GRANTHAM.—Rebuilding church schools, for the managers; Messrs. Parks, builders.

HARLESCOTT.—School, for Salop E.C.; director of education, Shrewsbury.

HEANOR.—Clinic, for Derbyshire E.C.; G. H. Widdows, education architect, St. Mary's Gate, Derby.

HERTFORD.—Hospital extensions, for the Joint Hospital Board (£3,000); G. H. Gisby, clerk.

HUDDERSFIELD.—Roman Catholic schools (£6,000); Joseph Berry & Sons, architects, Market Place; James Horkin and Son, builders, Liversedge.

HULL.—Extensions, Royal Infirmary (£150,000); governors.

KIRKBY-IN-ASHFIELD.—Sewage scheme (£19,000); U.D.C. surveyor.

KIRKINTILLOCH.—Baptist church; Rev. Jas. Scott.

LEEDS.—Extensions, Meanwood mental colony; J. Kirkland, architect of the Board of Control, Corporation assessor.

LEWIS.—Sanatorium extensions (£13,180), for Ross and Cromarty C.C.; the clerk, Dingwall.

LLANBISTER.—School, for Radnorshire E.C.; T. W. Wishlade, county surveyor, Llandrindod Wells.

LONDON (Ilford, E.).—104 houses, Lonsdale Gardens, &c.; Suburban Developments, Ltd. School, Benton Road (£5,721), for the borough E.C.; the clerk. Extensions to Roman Catholic schools, High Road, for the managers; P. Palmer, correspondent.

(St. Marylebone, N.W.).—Blocks of flats, Carlisle Street area; Ashley & Newman, architects for Borough Council. Flats, Abbey Lodge estate, Park Road; J. Murray.

(Greenwich, S.E.).—Nurses' quarters, &c., for the B.G.; A. Roberts, architect, 92, London Street, S.E.

(S.W.).—Re-wiring Southern Hospital; Metropolitan Asylums Board.

MAIDSTONE.—Offices, King Street, for the B.G.; the clerk. Offices, Palace Avenue, for the T.C. (£3,000); borough surveyor.

MANCHESTER.—Houses for staff, Partington gasworks; city engineer. School, Dover Street; managers, Holy Name Roman Catholic School.

MANSFIELD.—Technical college for Notts Education Committee; Greenwoods (Mansfield), Ltd.

MIDDLESEX.—Bath Road widening (£145,000); county engineer.

MIDDLETON (Lancs.).—Electric light installation, Rhodes School, for the borough E.C.; the clerk.

NEWCASTLE.—29 houses, White Brickfield estate, for Corporation; J. S. Hetherington.

NORMANTON.—School, for Derbyshire E.C.; H. W. Skinner, clerk, County Offices, Derby.

NORTHAMPTON.—Hall, Brunswick Street (£8,000), for the Salvation Army.

NORTHCHURCH.—Offices, High Street; Berkhampstead R.D.C. surveyor.

NOTTINGHAM.—Office extensions, St. Mary's Gate; county surveyor.

OXFORD.—Library extensions; city engineer.

POOLSBROOK (Staveley).—School (300 places), for Derbyshire E.C.; H. W. Skinner, clerk, County Offices, Derby.

PURLEY (Surrey).—Additional 50 houses, Coulsdon, for the U.D.C.; surveyor.

RETFORD.—Theatre, Coronation Street; C. Getliffe. Cinema, Regent Picture Palace Co.

SEAHAM (Co. Durham).—Houses (100), for the Londonderry Collieries, Ltd.

SHEFFIELD.—Church, Manor estate; trustees, Roman Catholic Diocese of Leeds. Adaptation of Redmires Camp as infectious diseases hospital; medical officer of health. Sewage plant (£53,000), for the Corporation; city engineer. 172 houses, Ridgway estate; city architect.

SHOTTON.—Central school (450 places), for Flintshire E.C.; J. Bevan Edwards, secretary, Flint.

SCHOOL AYCLIFFE.—Mental colony, Durham County Council.

SMETHWICK.—64 houses, Alexander Road, for Corporation; G. Stubbings, Birmingham. Church, Church Lane, Spiritualist Community. Extensions, Soho Foundry; W. & T. Avery, Ltd. Extensions, North Works Foundry; Midland Motor Cylinder Co., Ltd.

STOKE-ON-TRENT.—Additional housing schemes (3,056), for the T.C.; A. Burton, city surveyor.

TRANENT.—School (£15,474); clerk, School Management Committee.

TWICKENHAM.—Shops, workshops and 47 garages, Richmond Road; Brewer, Smith & Brewer, architects, Richmond-on-Thames.

UPMINSTER (Essex).—Extensions, St. Laurence Church (£8,000); Sir Charles Nicholson, architect.

WEST STANLEY.—Training centre, for Durham County E.C.; education architect, Durham.

WHIXLEY.—Extensions, mental institution; Mid-Yorkshire Joint Board.

WINNINGTON (Cheshire).—Electric light installation, St. Helen's Church, Witton; Rev. A. W. M. Wood, M.A., vicar.

WINTERTON.—Infirmary; Durham county architect.

WORTHING.—Extensions, Christ Church (£4,322); Sandell and Sons, builders.

The

Electrical Review

VOL. C. MAY 20, 1927. No. 2,582.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON." Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Electricity Supply Tariffs.

THE question of tariffs is one that we have always with us; it will only be finally solved when the load curve becomes a horizontal line and electricity can be sold for all purposes at the same price—a flat rate of less than a halfpenny per kilowatt-hour. In the meantime no plan by which we can make a nearer approach to that desirable consummation should be neglected. In many respects the two-part tariff which we have consistently advocated, and which has been adopted in principle in the Act of 1926, is the most suitable for general application; it inherently tends to improve the shape of the load curve, and cheapens the supply of electricity to those consumers whose demands are very economically met—namely, those who make a low maximum demand and yet consume a large quantity of energy. Such consumers' loads have a high load factor of their own.

As we have pointed out, there is a still more desirable class of consumer—the one whose demand falls entirely within the "off-peak" hours, and thus improves the general load factor by helping to fill up the valleys in the load curve. A consumer of this type may reasonably be relieved of the kilowatt charge and be supplied at the net kilowatt-hour rate, for no appreciable proportion of the standing charges can be debited to his account. But an arrangement of this kind usually involves the provision of a time switch, restricting the use of the supply to certain specified hours; the objection is not so much to the switch as to the time, which is usually a fixed period or periods, the supply being cut off at other hours. A modified system which lessens this inconvenience is that which employs a two-way switch, enabling, say, the cooker to be used when the water-heater is cut off, and *vice-versa*, but never both together. Incidentally, it may be observed that any domestic load which is to be moulded into a desirable form must necessarily include some long-hour application such as the heating of water, or thermal storage cooking such as Dr. A. Ekström has reported to be widely used in Sweden. And this brings us to the point of this article, for it is to Dr. Ekström that we are indebted for particulars of a system of charging for

electricity for home use which also is in vogue in Sweden, but which appears to be entirely new to this country. It partakes of the nature of a two-part tariff, a contract tariff, and an alternative-use tariff, and attains its end by simple means—a watt-hour meter combined with a switch.

The basis of the system is the division of the domestic load into two parts—an optional or declared kilowatt "basis" demand, for which a fixed annual charge is made (per kilowatt-year), no matter how many hours' use the consumer makes of it; and a "supplementary" load comprising all energy consumed at a higher demand rate than the "basis" wattage, for which a charge is made per kilowatt-hour. For example, a consumer may declare his demand at 500 watts, for which an annual charge of £7 may be made; he may, if he likes, take 500 watts for 8,760 hours a year without further payment, but experience in Stockholm shows that a longer period of use than 7,000 hours is never reached, and in that case the charge corresponds to a price of ½d. per kWh. But if the consumer switches on a device consuming, say, 1,000 watts, he is charged for all energy used above the 500-watt line at a much higher price per kWh—say, 1½d. Assuming that a water-heater or thermal-storage cooker forms part of the load, the function of the switch is periodically to cut off the heater when the demand exceeds the "basis" wattage until the excess energy used above the line is compensated for—partially, if not wholly—by a corresponding deficiency below the line.

The exact mode of operation of this system will be explained more fully on a later occasion; in the meantime we would once more extend to Dr. Ekström our thanks for his disinterested efforts to hasten the development of electricity supply in this country as in his own. Recently he has lectured on the uses of electricity before the North-Eastern Centre of the Institution of Electrical Engineers, and the Farmers' Club; he is now, we believe, fulfilling lecture engagements at Berlin and Rome, and he read a paper before the Société Française des Electriciens in Paris not long ago. As an apostle of electrical development he takes high rank, and there can be no doubt that his instructive addresses will do much to increase the adoption of electricity in the home and on the farm.

The Central Scotland Electricity Scheme.

Much interest has been aroused north of the Border by the publication of the Central Scotland Electricity Scheme by the Central Electricity Board, which affects 42 authorised undertakers in the area, and involves eventually the closing of 30 generating stations. By this time next year it is estimated that nearly a quarter of a million sterling will have been expended on the standardisation of frequency, out of the total of three millions allocated to this purpose during the next six years. Our Glasgow correspondent informs us that Bailie J. D. Higgins, Convener of the Glasgow Corporation Electricity Department, says there may be an immediate increase in efficiency and a large expansion of electrical service as a result of the scheme, and it may prove of great advantage to the agricultural community. He is of opinion, however, that it will not result in lower rates to electricity consumers for some considerable time. Even a great increase in consumption, he says, may not give reduced rates to consumers in the near future, as increased capital expenditure will first require to be met. Electricity will perhaps be cheaper after that is done, but the immediate tendency may be to increase the price to the consumer.

Dr. S. Parker Smith, Professor of Electrical Engineering at the Royal Technical College, Glasgow, supports the scheme, but cautions the public against expecting too much from it. He points out that much pioneer work has to be done in putting the scheme into operation, and it will be a number of years before it can be completed. Its benefits in the way of reduced tariffs will be least felt in the big manufacturing centres, for there the rates are already low. The advantage will be experienced chiefly in the areas at present without electricity supply, or with a supply from small stations.

Lord Provost High, of Dundee, says that one effect of the scheme will be to relieve the Council of the cost of further extensions of the electricity station. The Convener of the Corporation Electricity Committee says that the Department has been invited to put forward any observations it has to make on the subject. In the meantime, he says, much doubt has been expressed as to the city's position, but it will be a long time before the scheme affects Dundee at all.

In Dunfermline, the site of one of the generating stations that will be retained temporarily in service—that of the Fife Electrical Power Co., Ltd.—the scheme has aroused much interest. Mr. George A. Nicolson, secretary of the company, states that his directors have not yet fully analysed the scope of the new scheme, but, broadly speaking, he thinks that under it electricity will eventually be cheaper.

Sir Andrew Duncan, chairman of the Central Electricity Board, and Mr. A. Page, chief engineer, were in Scotland last week, and called informally upon Councillor Shaw, Convener of the Edinburgh Corporation Electricity Committee, and Mr. E. Seddon, chief engineer of the Electricity Department, with whom they discussed the new scheme in private. Sir Andrew also visited Dundee. It is pointed out that Edinburgh is in a much better position with regard to the scheme than are the stations in the west, where changes of frequency and voltage will have to be made in order to procure standardisation. Edinburgh is the largest "exporter" of electrical power in Scotland, and it is owing to the large turnover which will be made as a result of this bulk supply that it is expected consumers in Edinburgh will ultimately benefit by reduced charges made possible by increased production.

Electricity in the Irish Free State.

The Irish Free State Government's Electricity Supply Bill has now passed through committee stage in the Senate, and the report and third reading stages are being taken this week. It is expected that the Bill will receive the Royal Assent forthwith. No change of outstanding importance was made by the Senate except that it was agreed that the date for the Board of Control to show a balance of revenue and costs should occur in 1932, and that the actual date should be fixed by the Minister for Industry and Commerce, in consultation with the Board. The Minister (Mr. McGilligan) stated that in 1929 the Board would be in a position to reduce the charges for electricity all over the country and to get revenue that would make the Shannon scheme a paying proposition in 1932.

Cork Chamber of Commerce recorded approval of the Government's action in taking over municipal and other undertakings to work in connection with the Shannon scheme, provided that fair market values were paid. There is, however, no hope that the Government will now accept any suggestion of this sort, nor is there any prospect of an amending Bill being introduced later. The question of confiscation is being freely discussed at meetings of various parties in preparation for the General Election for the Dail (Lower House) next month. Business people appear to be more amenable than they were a few weeks ago, and the view is generally held that the Government's proposal for absorbing the local undertakings must be accepted as a vital part of the Shannon enterprise.

Of course, the original differences of opinion remain among those directly concerned in the electricity industry, and probably more will be heard about the confiscation policy when the election is over and the position of the present Executive Council (Cabinet) is made clearer. The constitution of the Board of Control is much discussed, but no definite step is likely to be taken just now in the selection of members. The Board, it may be recalled, will have plenary powers, and will not be subject to Parliamentary control or criticism.

Electro-Farming.

The ultra-violet ray treatment of live-stock on a commercial scale; some particulars of the apparatus available for the purpose, and of the results obtained.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

A STABLE tip, direct from the horse's mouth (for those persons who have not made a mathematical investigation of betting—as those who have done so will not bet), is to back an animal that gets the benefits of a summer seaside holiday in the midst of winter, through the medium of ultra-violet rays. This treatment is now being applied by several enterprising racing stables. The method is being kept as secret as possible, since it is considered that horses thus irradiated are brought into better condition during the winter racing season, and thus stand a better chance of winning. Very little information is, however, available concerning the manner of application, as the present users do not wish competing race-stables to follow their example—which is in itself excellent evidence as to the good results that they must be obtaining. The fact that the practice of utilising ultra-violet rays is being adopted for this and other purposes is of considerable interest to electricity supply undertakings as a new development calling for the use of still more current.

Recognition has always been given to the sun as the great life-giver and healer. Sun worship has been practised in many countries for centuries; it has also been stated that the cradle of the human race was in some tropical country, so it is claimed that mankind was evolved in the sun and largely by its agency. During the past few years a great deal of interest has been taken in heliotherapy, owing, no doubt, to the discovery that, of the sun's rays, the most beneficial are the short invisible ones, and that these can be reproduced by artificial means. As natural sunshine varies in its intensity and is not obtainable at will, the artificial sources are far more satisfactory, especially during the winter months in Northern climes. The artificial sunlight work carried out in many of the hospitals and doctors' consulting rooms of this country shows that the medical profession is awake to the immense potentialities of this treatment, and the results obtained prove that the practice is now an accepted therapeutic process, which is playing an important *rôle* in medical science. While a great deal of publicity has been given to the treatment of human beings by this means, little is heard of the use of these rays for the treatment of birds and animals, though a considerable amount of research work has already been done and some very definite results obtained. Some particularly valuable work has been done at the Rowett Research Institute, Aberdeen, the Kansas State Agricultural College, and the Wisconsin College of Agriculture, where it has been demonstrated that irradiation is as effective in the case of birds and animals as it is in its application to human beings.

Commercial experimental work has been carried out on the writer's all-electric farm at East Grinstead with both the mercury-vapour and the arc types of lamps. During the past two years he has had a large number of inquiries from pig and poultry farmers on the subject. Several of these enterprising farmers have purchased and are using ultra-violet lamps commercially.

Units of Measurement.

In this article, the wave-length measurements are given in Angström (Å) units, though other terms are sometimes used; those commonly employed are:—

Unit.	Millimetres.	Relative length.	Symbol.
Angstrom.	One ten-millionth.	1	Å
Milli-micron.	One millionth.	10	$m\mu$
Micron.	One thousandth.	100	μ

So that a measurement could be given as 2,700 Å, or 270 $m\mu$.

The visible spectrum of sunlight consists of wave-lengths from 3,900 Å to 7,700 Å. Above this range come, of course, the heat rays (8,000 Å to 20,000 Å). The actual wavelengths of ultra-violet rays used for artificial irradiation range from 3,900 Å down to 1,850 Å. Ultra-violet rays fall to 120 Å where the X-ray region begins; however, air absorption commences at 1,850 Å, hence the part below is of no practical value (fig. 1). Owing to absorption by dust and suspended moisture, the rays of the sun are not as effective for many purposes as the artificially-produced rays. The ultra-violet rays of greatest therapeutic power appear to be those between 2,300 Å and 2,900 Å. The ultra-violet part of the solar radiation, after passing through the atmosphere, is chiefly between 2,900 Å and 4,000 Å. Thus it is not so effective.

Lamps.

There are three principal methods of providing ultra-violet rays artificially:—

(1) By means of a vacuum or gasfilled incandescent filament lamp made of glass which is transparent to the rays.

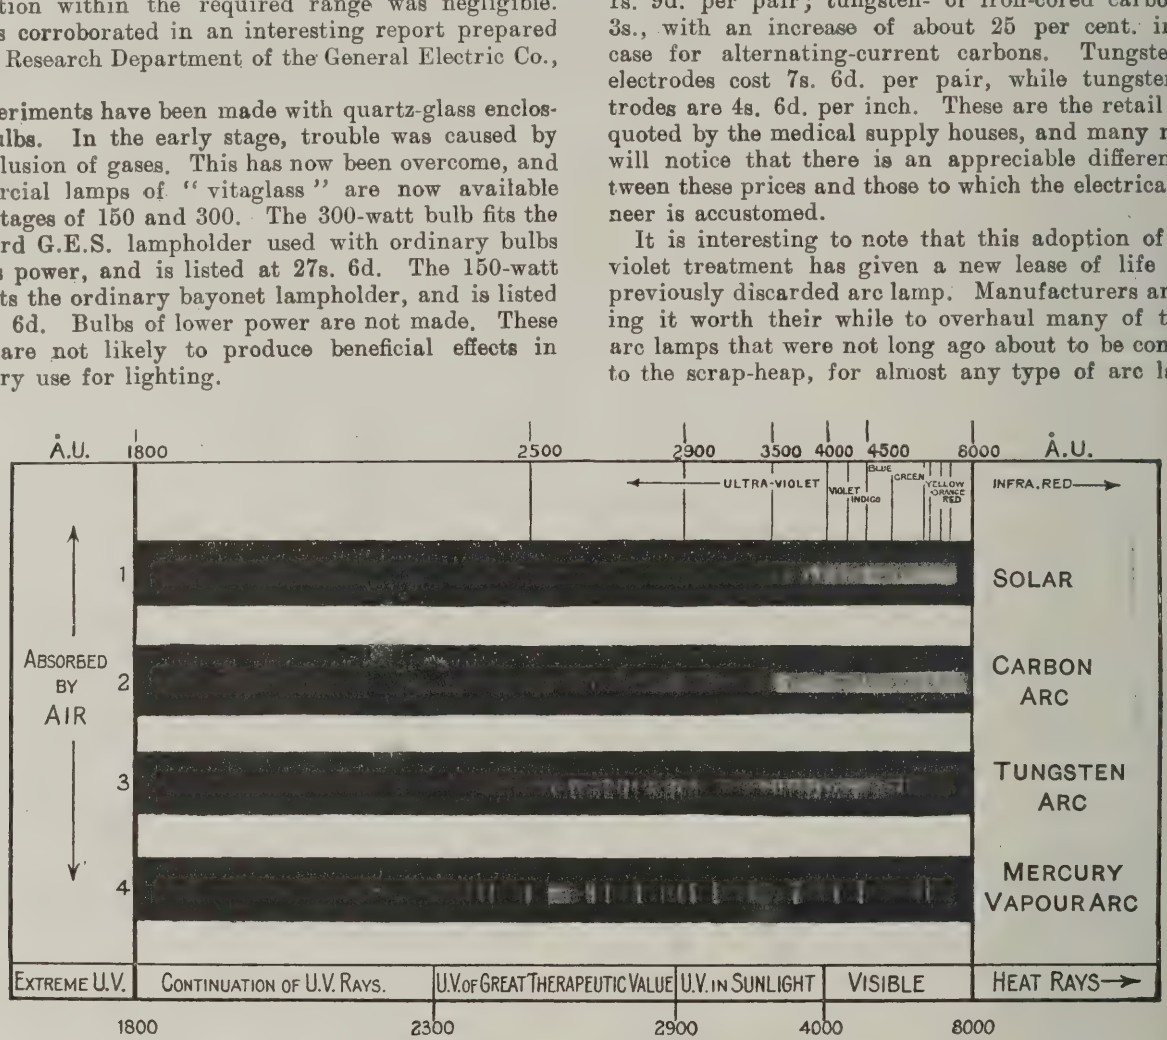
(2) Arc lamps, with (*a*) carbon, or (*b*) impregnated carbon, or (*c*) tungsten electrodes.

(3) The quartz mercury-vapour lamps: (*a*) atmospheric type; (*b*) vacuum type.

The ultra-violet rays of the sun can also be obtained indoors by using a special window glass containing a large proportion of quartz, which permits rays down to 2,700 Å to pass through. Rays below 3,000 Å cannot pass through ordinary glass, and it is these rays that are intimately associated with metabolism and growth. It is very important to keep the surfaces of this glass scrupulously clean on both sides by the aid of spirits of wine, for the slightest deposit will screen the rays.

There is a difference of opinion, at the present time, as to the best type of lamp, for the mercury-vapour lamp is deficient in the biologically active wave-lengths, but has a number of isolated bands of very short wavelengths near the region of atmospheric absorption. The spectrum of the tungsten lamp falls short at 3,500 Å; and the carbon arc is poor in the shorter of the short wavelengths. The tungsten arc is probably the most satisfactory, as it gives a more nearly continuous spectrum band to 2,130 Å. Tungsten positive and tungsten-cored negative carbons give excellent results. The longer wavelengths are more penetrating, hence are probably of more value for treating the thicker and hair-covered skins of animals, though the therapeutical effect of the shorter wavelengths is the greater. The

choice of a reflector needs a little care, as the silvered type reflects only 30 per cent., the nickel reflector 45 per cent., and the silicon reflector 75 per cent., of the ultra-violet rays.



1.—*Incandescent Filament Lamps.*—A test with the spectroscope, made by the writer, upon a standard gasfilled lamp indicated that the ultra-violet ray emanation within the required range was negligible. This is corroborated in an interesting report prepared by the Research Department of the General Electric Co., Ltd.

Experiments have been made with quartz-glass enclosing bulbs. In the early stage, trouble was caused by the occlusion of gases. This has now been overcome, and commercial lamps of "vitaglass" are now available in wattages of 150 and 300. The 300-watt bulb fits the standard G.E.S. lampholder used with ordinary bulbs of this power, and is listed at 27s. 6d. The 150-watt bulb fits the ordinary bayonet lampholder, and is listed at 15s. 6d. Bulbs of lower power are not made. These bulbs are not likely to produce beneficial effects in ordinary use for lighting.

The first grade is used when a long exposure and weak intensity of ultra-violet radiation is required, while the second is stronger in ultra-violet radiation and more effective for a shorter exposure. The third gives a strong ultra-violet radiation of a more penetrating power than either A or B.

Impregnated carbon electrodes for arc lamps cost 1s. 9d. per pair; tungsten- or iron-cored carbons are 3s., with an increase of about 25 per cent. in each case for alternating-current carbons. Tungsten-steel electrodes cost 7s. 6d. per pair, while tungsten electrodes are 4s. 6d. per inch. These are the retail prices quoted by the medical supply houses, and many readers will notice that there is an appreciable difference between these prices and those to which the electrical engineer is accustomed.

It is interesting to note that this adoption of ultra-violet treatment has given a new lease of life to the previously discarded arc lamp. Manufacturers are finding it worth their while to overhaul many of the old arc lamps that were not long ago about to be consigned to the scrap-heap, for almost any type of arc lamp is

(1) Continuous spectrum of sunlight. (2) Spectrum of a carbon arc. (3) Spectrum of a tungsten arc. (4) Spectrum of a mercury-vapour arc.

Fig. 1.—A Comparison of the Spectra of Different Sources of Light.

The writer has not yet had an opportunity of either testing these lamps or seeing their characteristic spectrum, though he has seen them in operation. If the spectrum is satisfactory, this is probably the most practical form of lamp for the farmer—if he keeps the exterior scrupulously clean, by wiping the glass with spirits of wine before using. The very short rays are not emitted by these bulbs, so that the use of goggles for the protection of the eyes is not essential. The ultra-violet radiation is, however, rather weak, necessitating long exposure at a short distance.

2.—*Arc Lamps.*—When a single arc is used, a series resistance has, of course, to be employed in the circuit, with a consequent wastage of energy. However, one firm of manufacturers now produces a series four-carbon arc lamp for 220-volt circuits, which can be operated without a large resistance, the current being used to produce an increase in the quantity of radiation.

The current consumption of the arc lamps employed to produce ultra-violet rays varies from 5 to 45 amps., according to size of carbons and whether they are impregnated or not.

The impregnated carbons are often graded according to their wavelengths; the three usual grades are:—

Grade A	...	2,950 to 3,100 Å.
Grade B	...	2,900 to 3,500 Å.
Grade C	...	2,400 to 3,575 Å.

suitable, if provision is made for preventing the particles of hot carbon from falling on to the treated subject. An effective method of doing this is to provide a glass cup fixed at the bottom of the lamp. It is essential that this cup be manufactured of the special glass, transparent to the rays, or the vital rays will not pass through. Alternatively, sheets of special glass, transparent to the rays, may be placed underneath.

When the lamps are only required for the treatment of live-stock, the hand-feed or non-automatic type can be employed, as they are only required for periods of ten to fifteen minutes at a time.

A new appliance for the treatment of chickens has lately been developed. A hand-fed arc lamp is fixed on a portable frame, which can be placed over the feeding space of the chickens. A piece of the special glass, transparent to the rays, is placed between the lamp and the floor, so as to catch any sparks falling from the arc and yet permit the full action of the ultra-violet rays. In order to prevent fracture of this valuable glass, it is cut in strips, as is done with the protecting front glass of searchlight projectors.

Enclosed-type arc lamps would not be practicable unless the enclosing glasses were made of a substance transparent to the rays, and even then it is doubtful whether a deposit would not form on the inside of the glass and prevent the passage of the rays.

(To be continued.)

Electrical Aids for the Deaf.

The Application of Radio Apparatus to the Relief of Deafness.

By C. M. R. BALBI, A.M.I.E.E., A.C.G.I.

THE subject of "acoustics" is one in which our knowledge has not yet been co-ordinated; hence, those whose professions require them to deal with this branch of physics are apt to judge matters from their own standpoint. Thus the "telephone engineer" states that he is satisfied if he can enable two subscribers to converse without misunderstanding, or, to put it in his own terms, "set up a standard of 100 per cent. intelligibility."

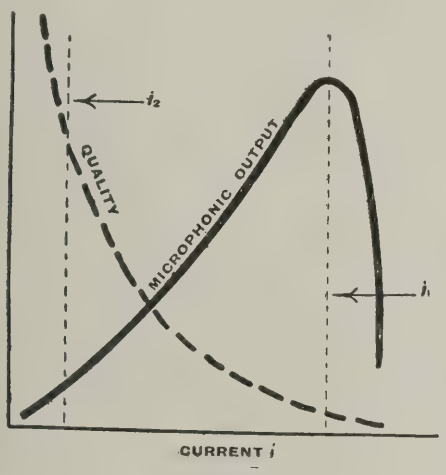


Fig. 1.—Microphone Characteristics.

This ideal can easily be said to have been reached, yet the "radio engineer" will tell you that broadcasting, which is of far better quality than ordinary telephony, has not nearly reached perfection yet. I specially point out this diversity of views as I want to emphasise that for natural reproduction something more than intelligibility is necessary. This fact has been particularly brought to my attention in the case of "electrical apparatus for the deaf." Quite a number of deaf people, who ordinarily wear an electrical aid to increase their range of hearing, have told me that they notice a great difference between their own instruments and broadcast speech and music supplied to them through a wireless receiver and amplifier.

A person who was deaf once expressed the matter to me in the following way: "I can hear so much better on the wireless, and although I can understand everything that is said with the help of my electrical aid, there are distracting buzzing noises which are absent in the wireless."

Now this strikes at the root of the matter, and I will therefore explain why an "electrical aid"* has this inherent defect, and will later discuss a means by which it may be overcome, albeit with limitations.

The question largely depends on the microphone. It is known that a microphone usually consists of a variable resistance made of carbon which can be acted upon by variations of pressure due to sound waves. By passing a small current through the microphone a small microphonic output is obtained, and as the current is increased the microphonic output is increased also. Theoretically modulation is obtainable to any degree of intensity by simply increasing the current, but a limit is soon reached when the modulation attains a maximum and if pushed further it begins to diminish rapidly. The relation is illustrated in fig. 1.

Naturally the microphonic output is greatest when the current is i_1,† but so far I have said nothing about quality; this falls off rapidly as the current is increased. Therefore, there is a choice of great intensity or high quality. The two do not go together.

Now, as the apparatus for the deaf needs to be powerful, it seems to be the general practice among manufacturers of electrical aids for the deaf to operate their microphones at the current i_1, but for broadcasting, where great attention has to be paid to quality, the microphone is operated at the far smaller current i_2, which is later amplified by suitable valve amplifiers.

There is no doubt that manufacturers of electrical aids for the deaf are right in abandoning quality (such as is understood by the radio engineer), and availing themselves of the greatest microphone output that can be obtained, as by so doing they are able to construct a set which is both light and powerful, and it is wonderful what an effective aid can be constructed from parts that only weigh a few ounces complete.

This is what the vast majority of users require—something light and inconspicuous that they can carry about with them, and so long as they are able to hear and understand well, they are willing to waive the matter of quality.

The only alternative is to do as the radio engineer does, and operate the microphone at i_2 and then amplify; but, of course, this greatly complicates matters and adds to both the bulk and expense of the

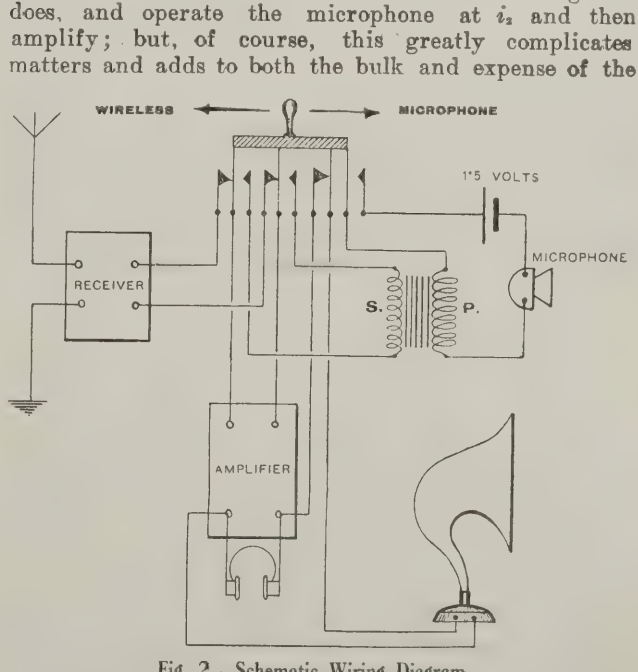

Fig. 2.—Schematic Wiring Diagram.

apparatus. It would be of no use operating a microphone at i_2 without amplification, as the intensity would be too weak for the deaf to benefit by it.

* It is now generally understood that an "electrical aid" refers to an electrical appliance for the deaf, consisting of a small battery, microphone, and receiver.

† i_1 differs considerably for various types of microphones, but in many cases is about 100 milliamperes.

Hitherto it has not usually been thought desirable to construct an aid for the deaf on the lines of the broadcasting studio microphone, on account of the expense of the apparatus and its bulkiness; but now that the radio experimenter has proved his ability in the construction of telephonic apparatus to such a marked degree, and the valve amplifier (the most expensive item required) usually forms part of his equipment, an apparatus of this description could be made up for very little outlay. It is therefore only a question whether in such cases the circumstances are such that the disadvantage of bulkiness might be outweighed by the improved quality of reproduction and the pleasure given thereby.

The circumstance I have in mind is that of a wireless amateur who has in his possession a wireless

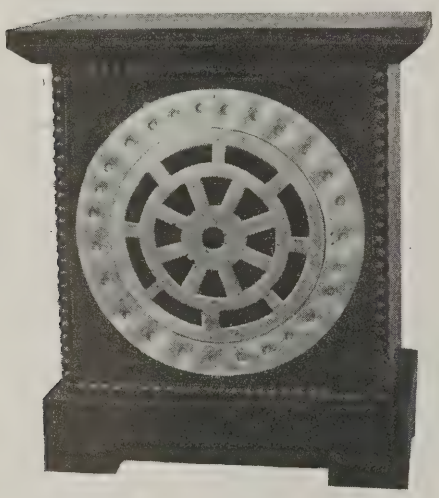

Fig. 3.—Microphone Case.

receiver and a powerful amplifier with which he operates a loud-speaker. He has a deaf relative staying in the same house as himself, who spends much of her time in an armchair by the fireside and who is too deaf to hear the loud-speaker or general conversation.

To make life more tolerable, a pair of headphones have been connected to the output terminals of the amplifier in parallel with the loud-speaker; in this way enjoyment is brought to the sufferer in the form of broadcast reception, but for general conversation an electrical aid is used concerning which an opinion has already been expressed.

My object is to show how, with the aid of a suitably-constructed microphone and the existing amplifier system, quality comparable with that of the broadcast reception may be obtained. For this reason I will pass on to describe the operation of a system which will enable such a patient to listen at will either to general conversation, with the advantage of more natural

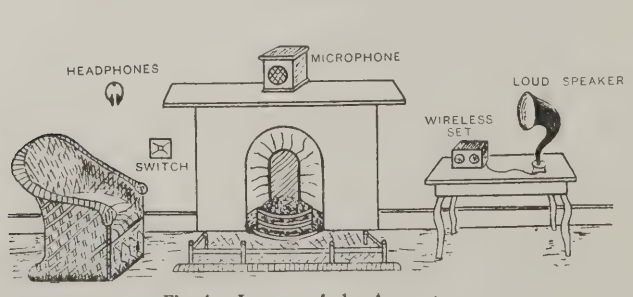

Fig. 4.—Lay-out of the Apparatus.

reception, or to ordinary broadcast reception. The details of the system are illustrated in fig. 2. It will be seen that when the switch is thrown over to "wireless," the circuit is such that the headphones are connected to the wireless set and the patient is able to hear broadcast reception over the same circuit as she did before. The loud-speaker is also connected so that it can be heard by any other members who wish to listen. However, when the switch is thrown over to the other direction (*i.e.*, to "microphone"), the wireless set is cut out and the special microphone which is coupled through a transformer is now connected in at the input of the amplifier.*

The sounds that reach the microphone are conveyed through the amplifier to the same pair of headphones that were previously being used for "listening in," so that the only action that the patient has to perform to change over from "wireless" to "general conversation" is to throw this switch.

It will be observed that when the headphones are connected for general conversation, the loud-speaker is disconnected. This is absolutely necessary—otherwise there would be what is termed a "howl," which is really an acoustic reaction between the loud-speaker and the microphone.

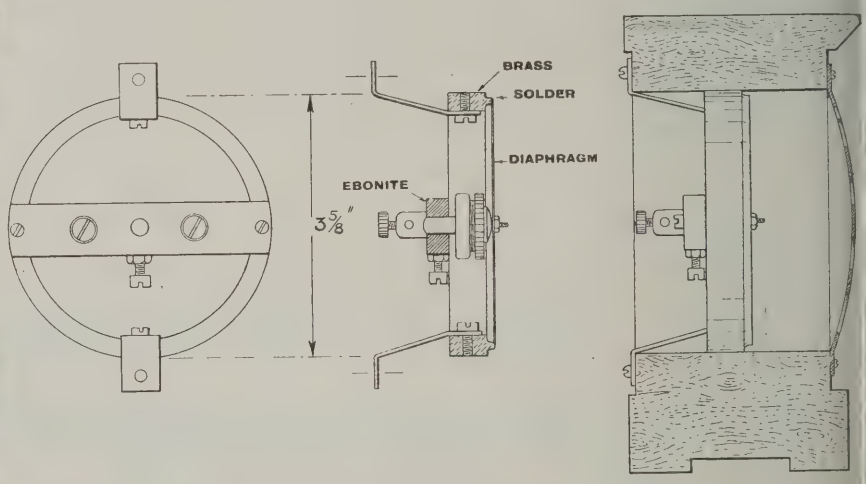

Fig. 5.—Details of Microphone.

A little reflection will show that there is no objection to cutting out the loud-speaker when general conversation is taking place; in fact, in most cases it is found to be more pleasant to do so.

So far as can be seen, there is no advantage in making such a system portable. As has been previously suggested, the patient will spend most of her time in a chair by the fireplace in the living-room where she is wont to "listen in." For any other occasions her electrical aid is available and should be sufficient.

I have, therefore, come to a point where I shall have to consider where to install the various pieces of apparatus in question in the living-room of an ordinary house. I will commence with the microphone.

For acoustic reasons it is found desirable to locate the microphone on the mantleshelf and, therefore some appropriate mounting is required. A very suitable form is a wooden clock case, as shown in fig. An ornamental front has been fitted to finish off the design, the bore, 3⅝ in., is a standard, and into the the microphone can be fitted.

The only other item that requires remark is the location of the multi-point switch which is needed for the purpose of changing-over from broadcast reception to the reception of general conversation; it should be within easy reach of the patient's chair.

A suitable way of laying out the rest of the apparatus is shown in fig. 4, which may be taken as a general guide.

I have now to consider the microphone itself. It is the only part that is likely to present any difficulty to those who may attempt to build up a system for themselves on these lines. Any kind of microphone will produce results, but I have laid down a claim that this microphone must provide natural reproduction. Special precautions, besides the most important

* It was the practice two or three years ago to build the receiver and amplifier separately, but nowadays the set is usually made up as a complete unit. However, the task of opening a circuit at the point where the l.f. amplification begins should offer no difficulty to a person who understands the circuit.

one of working at low microphone current, have to be taken in order that this object shall be attained. If the current through the microphone is of a small enough order, then the variations of current will closely correspond to the variations of pressure that are put on the carbon elements. Now all would be well if it were not for the question of resonance. In almost every form of microphone it is arranged that the sound waves shall exert their minute variations of pressures through the medium of a diaphragm. It is essential that this diaphragm should be non-resonant, otherwise the resonance will be communicated to the microphonic elements and the ill effects revealed in the quality of the reception.

There are two practical ways of overcoming resonance: one is to make the part very heavy in comparison with the forces acting upon it, and the other is to employ damping.

As the diaphragm itself should be as light as possible, I should employ the latter method, but in order that no other part should be acted upon by the sound waves and produce resonance, they should be made as heavy as possible. For this reason it will be found that a light metal diaphragm (afterwards suitably damped) secured about its periphery to a heavy annular ring of brass, makes a very suitable arrangement to which to fix the microphone capsule as illustrated in fig. 5.

The microphone capsule that has been shown is of the type employed by the British Post Office for its standard telephone transmitters, but as these are rather difficult to procure, a slightly different type which will be found equally satisfactory and more easily obtainable is the "Skindeveken."

The diaphragm should be made of hard-drawn brass about 5/1,000th of an inch thick, which is about the thickness of writing paper. It will be noticed that the section of the heavy brass annular ring is pointed; this has been specially arranged so as to facilitate the securing of the diaphragm, which has to be soldered. The diaphragm should be stretched as tightly as possible while it is being soldered, so that it is tight like a drum when it is finished. A light piece of metal with a hole through it should be sweated to the centre where the diaphragm is to be secured to the capsule by its locking nut.

The annular ring, which will require turning, should be of $3\frac{5}{8}$ in. outside diameter, so that it just fits the case,

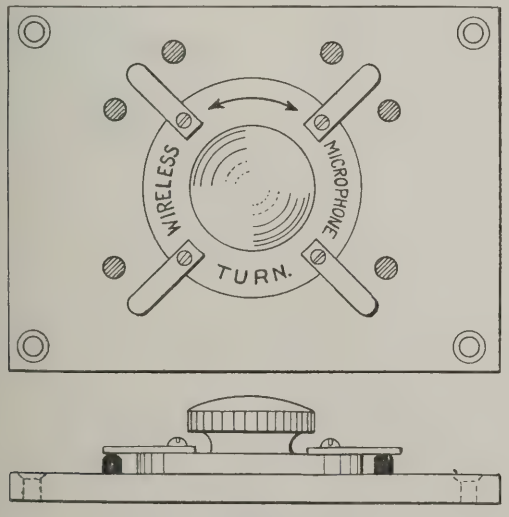

Fig. 6.—A Multi-point Switch.

the bore of which should be also $3\frac{5}{8}$ in., which is a standard for clock cases. The case should be of solid wood as shown.

The ebonite cross-bar fixing for the microphone capsule and terminals will easily be understood from the diagram; the capsule should be fitted so that there is no pull on the diaphragm when the fixing screw is tightened up.

When the model has been completed up to this stage, it will be found to be very resonant for the reasons that have already been given, and the next process is to "damp" the diaphragm, as it is termed, to overcome this effect.

The method of damping to be employed is very important; the best arrangement is to cover the diaphragm with some plastic substance. In certain experimental laboratories ordinary vaseline is used, but this is not suitable in this instance, as in hot weather the vaseline is apt to run. As an alternative to this, I have employed Chatterton's compound, which, I believe, is a mixture of rubber and bitumen, to cover the diaphragm. The amount that should be employed is most critical; if too thick, the action of the diaphragm will be greatly impeded, while if too thin the action will, of course, be insufficient to prevent the occurrence of resonance.

When the damping has been nicely adjusted, one should be able to hear faint, but very clear, reproduction of any sound produced many feet from the microphone. When this is amplified, the same clarity should be obtained, but instead of the faint sound it should be very great in volume. Usually two stages of low-frequency amplification are sufficient to produce the required volume, but less than two stages is not recommended.

There is only one more remark to make with regard to the microphone, and this is that the acoustics of the room should be suited to it. In a room that is very bare of draperies, the echoes about the room have an unpleasant effect when sound is amplified to a considerable extent, even when the listener is deaf. The remedy is to hang more draperies, such as heavy curtains, about the room and spread a thick carpet. This soon reduces the echo. It is for this reason that broadcast studios are so heavily draped. In the early days of broadcasting it is possible that the effect was rather overdone, but it shows the necessity for such a step where the acoustics of a room are not good.

With regard to the multi-point switch, something is required that can be conveniently fixed to the wall. I therefore outline the details of such a switch, which can be mounted on a piece of ebonite, as shown in fig. 6.

The rest of the apparatus required can be seen by referring to fig. 2, in which are shown the circuit connections. This comprises a transformer and a battery (a $1\frac{1}{2}$-V dry cell). The resistance of the primary of the transformer should be between 120 ohms and 200 ohms, and that of the secondary between 1,000 and 5,000 ohms. This type of transformer is sometimes spoken of as a modulation transformer.

Although most of the apparatus described may be obtained from any suitable dealer, I have made arrangements with the Thames Electric Co., Kingston-on-Thames, to supply any of the required parts, including a clock case as shown in fig. 2. I have also arranged for a demonstration model to be fixed up at that address. It will be shown to anyone who is interested or would like to try it.

Electric Mine Locomotives.

The Baldwin-Westinghouse mine locomotives exhibited at the American Mining Congress represented modern trends in the development of haulage and gathering types. The four-ton gathering locomotive was claimed to be the lowest and slowest of its type ever built, and meets the demand for motive power for working thin seams, having an overall height of $23\frac{1}{4}$ in. and speeds of $2\frac{1}{4}$ miles an hour when operating from conductor cable and 6 miles an hour when operating from the trolley. Its features include semi-magnetic control, bar-steel frames, self-equalising coil springs, spacious accommodation for the driver, ball-bearing motors, vertical type cable reel, and a new type of resistor. One of these locomotives with drum-type control is now used by the Erskine Coal Company, of Staunton, Virginia.

The Royal Society's Soirée.

Annual Exhibition and Demonstrations.

THE first of the Royal Society's two annual conversaziones was held at Burlington House, London, on May 11th. Sir Ernest Rutherford, O.M., president, welcomed Fellows and guests for whose inspection the customary display of scientific apparatus, specimens, and demonstrations had been arranged. The total number of exhibitors was 30; several showed two or three items, but electrical exhibits were not so numerous as in previous years, and some of them had previously been exhibited elsewhere.

The National Physical Laboratory's several exhibits included specimens of metals of high purity, the impurities in which were only detectable spectrographically, prepared in its Metallurgy Department: amongst them were iron prepared electrolytically from a chloride electrolyte, melted in a high-frequency induction furnace, and deoxidised by means of pure dried hydrogen; manganese made by vacuum distillation in a high-frequency furnace; chromium obtained by electro-deposition and subsequently freed from hydrogen and deoxidised; and beryllium of 99.8 per cent. purity prepared by fusion-electrolysis.

For gas analysis by utilising high-frequency vibrations (Dr. Ezer Griffiths, F.R.S., and Mr. J. H. Awbery), a quartz crystal, maintained in vibration piezo-electrically, was used to set up a stationary wave system in the gas mixture; the positions of the nodes were identified by the reaction on the crystal in the manner described by Pierce; by moving the reflector from node to node, the wave-length was determined, affording a measure of the composition of the gas mixture.

The Cambridge Instrument Co., Ltd., had a portable magnetometer of the null type on view, which was designed by Dr. F. E. Smith, F.R.S., for measuring the horizontal component of the earth's magnetic force. The magnet system is supported by floats and is practically free from friction effects. The earth's horizontal magnetic force is nearly balanced by an opposing force due to a current in the coils, the two forces being inclined at an angle of a few degrees; the magnet sets in the direction of the resultant force, and the angle is varied until the resultant field is at right angles to the force due to the coils. The angle is observed by means of a telescope, and measurements may be made with an error not exceeding 1 gamma (0.00001 c.g.s. unit).

A beautifully made improved form of Paschen galvanometer was shown, the moving system of which consists of two groups of cobalt steel magnets so made as to ensure uniformity of physical condition and size, thus ensuring almost perfect astaticism. The system is protected from external magnetic fields by a shield of "mumetal" as suggested by Prof. A. V. Hill, F.R.S., and Mr. A. C. Downing, surrounded by a mild-steel tube and by an outer gun-metal shield. A model (ten times full size) illustrated the method of mounting the magnets and mirror, and a group of magnets shown under the microscope demonstrated the accuracy of dimensions which can be obtained.

The Company's apparatus for recording radiation from the sky makes use of a photoelectric cell so connected in an electrical circuit containing capacity that the frequency of discharge depends on the intensity of the radiation falling upon the cell. The total discharge is recorded on a standard thread recorder without the use of an auxiliary relay, the curve obtained being a record of the intensity of radiation.

Prof. O. W. Richardson, F.R.S., and Mr. F. S. Robertson demonstrated apparatus for comparing the yield of soft X-rays from different substances. They employed a small X-ray tube of transparent silica with an incandescent cathode; its target was a vertical hexagonal prism, whose faces consisted of six plates of the substances to be tested, which could be turned about its central axis and put into any one of six set positions by means of an external magnet. Thus each substance could be used in turn as target and the rays generated compared by the photoelectric effect they produced in another part of the tube. With this apparatus the exhibitors have been able to show that the generation of soft X-rays is a periodic function of the atomic number of the elements concerned.

The International Standard Electric Corporation showed apparatus for precision measurements of circuit efficiencies as used on the Anglo-American transatlantic telephone service, that is, transmission levels and losses and repeater gains at telephone frequencies of from 35 to 5,000 cycles. The oscillator used with the equipment had a frequency range from 35 to 50,000 cycles, the higher range being used for carrier-current telephony. The working of the instruments was demonstrated by making measurements on artificial cable.

Mr. H. Dewhurst demonstrated how the rapidity of response to radiant heat of bolometers has been much enhanced by an entirely new method of constructing them. By means of a press flat annular disks of wax containing two inlaid metal contact pieces are stamped out, and thin collodion films are stretched across the disks by floating the latter on mercury. A narrow strip of bismuth (10^{-6} cm. thick) is next deposited on each disk by electrical evaporation, or "sputtering," across the film from contact to contact, the whole being then blackened.

The British Thomson-Houston Co., Ltd., showed a new type of electric discharge, the phenomena having been discovered by Dr. I. Langmuir (see Elec. Rev., November 21st, 1924). An arc was produced in a hot cathode discharge tube 3 cm. in diameter and 50 cm. long, containing argon. Before the injection of a dose of tungsten vapour the arc did not possess unusual characteristics, but after the liberation of tungsten vapour from the filamentary cathode, the arc exhibited phenomena of interest and beauty.

Lt.-Commander F. J. Campbell Allen and Mr. A. E. Salisbury exhibited a new thermostat for use in conjunction with electric circuits, which depends upon the fact that magnetic metals lose their magnetism at certain given temperatures, and alloys of these metals can be made to vary the temperature apart from doing so by means of radiators. In the "on" position an armature was held up by attraction to a controlling arm in a suitable position to be affected by heat, the arm being partly or wholly made of magnetisable material; on a given temperature being reached, the armature was released and fell on a switch, thereby cutting off the current, and the temperature of the apparatus was reduced, when the armature was again lifted and the current switched on.

(To be concluded.)

Modern Stage Lighting.

A brief review of the apparatus developed by the General Electric Co., Ltd., for the production of effects on the stage, with particular reference to the Schwabe-Hasait system.

THE development of electrical methods of lighting has placed at the disposal of stage managers the means of vivid and accurate mimicry of nature. A recent demonstration by the General Electric Co., Ltd., at its new stage-lighting showrooms (ELEC. REV., November 5th, 1926, p. 758) of some examples from the wide range of stage-lighting equipment produced by it, gave some indication of the progress that has been made in this direction. The apparatus includes that specially designed for the Schwabe-Hasait system, first described in our issue of March 16th, 1923, the sole rights of which have been acquired by the G.E.C. for the United Kingdom and the Colonies.

Fig. 1.—Magazine Stage-lighting Batten.

There are two principal considerations in general modern stage lighting, the illumination of the acting area and also of the "artificial horizon." While still retaining the use of footlights and battens where required, the latest methods of lighting the acting area rely to a great extent upon the use of specially designed floodlights, projectors and spot-lights. Fig. 1 shows a magazine-type batten. It consists of a series of compartments, each fitted with a lampholder and reflector.

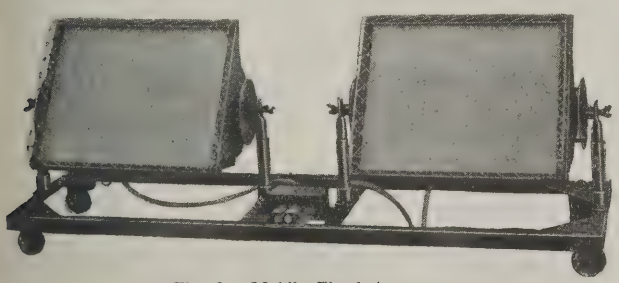

Fig. 3.—Mobile Flood Apparatus.

The reflectors may be of highly polished aluminium, silvered glass, or stainless steel. The lamps are spaced at from 6- to 7½-in. centres, and are of sizes up to 150 W.

A very wide range of flood-lighting apparatus is produced, only a few examples of which can be dealt with here. Fig. 2 shows the "Horizon" flood, which is primarily intended for the illumination of the cyclorama or "artificial sky." The special feature in the design lies in the shape of the colour filter; this is semi-cylindrical in shape, and allows a spread of light covering about 180 deg. Each fitting is designed to take one 1,000-W tubular theatre horizon-type lamp, and is equipped with an aluminium reflector. A particularly useful piece of apparatus is the mobile ground flood, fig. 3. It consists of two 1,000-W floods carried on a light metal trolley which can be easily moved to any required position with a minimum amount of trouble. The floods are mounted on uprights, and are hinged so that each one may be tilted at any desired angle. Glass colour slides in metal frames are supplied in varying colours. A proscenium floodlight apparatus is shown in fig. 4. It is of the magazine type, and is specially adaptable for use on the small stage as a substitute for battens, and in the case of large stages it may be used as an auxiliary to the battens. The special feature is a magazine equipped with a set of four glass colour slides. These are operated by steel tracker wires running over pulleys to a four-lever control gear in a convenient position.

Fig. 2. Horizon Flood.

A large variety of apparatus for spot lighting made by the company includes a small 100-W hand spotlight lamp and a large bracketed apparatus designed to take a 1,500-W horizontal burning projector type lamp. The latter is fitted with a universal joint enabling the light to be thrown at almost any angle in any direction. Fig. 5 shows a proscenium spotlight apparatus suitable for a 1,000-W lamp. For the correct illumination of the artificial horizon, very strong light, variable at will both in colour and intensity, is required, and the ideal source is the gasfilled lamp. A number of special fittings of the type shown in fig. 2 are used, depending upon the size of the "horizon" or the dimensions of the stage itself. They are built up in three or four tiers, forming a homogeneous unit, and are supported in a rigid metal frame

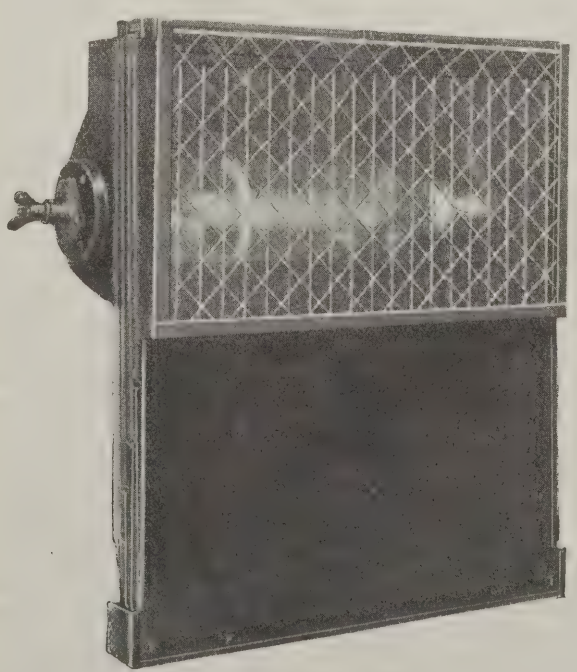

Fig. 4.—Proscenium Floodlamp.

suspended from the roof. The representation of natural effects—such as dawn, sunrise, and so on—is possible, with innumerable shades and intermediate gradations, by the use of the "artificial horizon," and the scientific combinations of colour necessary for these charming sky-pictures have been studied exhaustively and worked out to a nicety. By suitable combinations of the basic colours it will be seen that a very wide series of tones is available by which any natural sky phenomena may be produced.

Complete and flexible control of the lighting of the "artificial horizon" is obtained by a master control apparatus which operates a series of resistances in circuit with the individual lamps. This is designed in such a way that dimming or raising the light takes place smoothly and easily. As the source of light is at a high level, the lower part of the horizon does not receive from it the same intensity of illumination as the upper portion. To remedy this a number of horizon lamps are placed at the level of the stage. These are contained in movable trolleys, spaced round the bottom of the screen, and are supplied with colour slides and

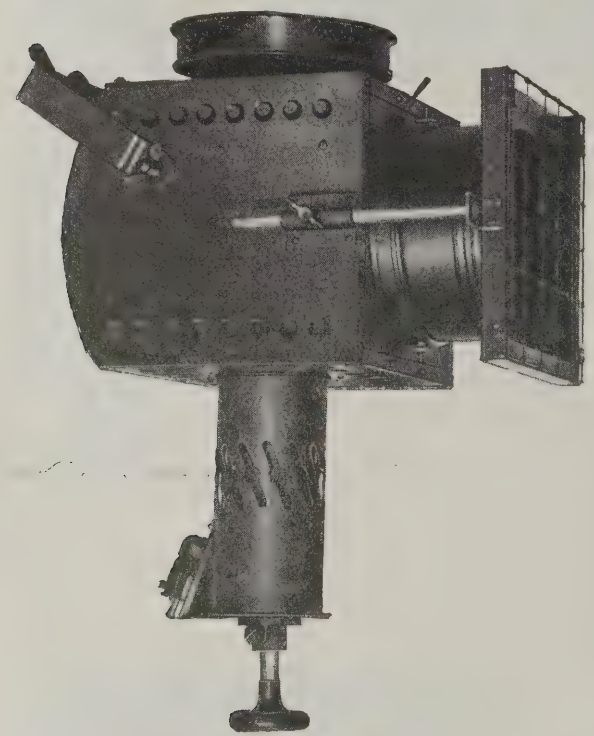

Fig. 5.—Proscenium Spotlamp.

arranged so that they can be tilted at any angle. Ample provision is made for the adequate ventilation of the lamps, each of which is protected by wire guards from accidental breakage.

A far wider range of sky effects than is possible with any of the other apparatus is obtainable by means of the cloud apparatus, used in conjunction with the "artificial horizon," which offers an ideal setting for the reproduction of moving clouds. Fig. 6 shows a unit of this description. It consists of two essential portions: one which is stationary carries the main driving motor, the collector rings, and a 3,000-W gasfilled lamp; the other, which rotates round the first, carries a system of cloud-pictures, lenses and reflectors, and two small motors for driving two lines of shafting through special gearing. The shafts give motion to a series of eccentrics which cause a number of reflectors to rotate through a definite angle, thus causing the cloud-images to rise or fall as desired. The moving system has its cloud slides arranged in two tiers. Immediately behind each slide a condenser transmits the rays from the lamp through the slide on to a fixed glass reflector; this in turn transmits the picture through an objective lens on to a movable glass reflector actuated by one of the eccentrics, the reflector throwing the picture on the horizon screen.

The slow motion of clouds across the sky is simulated by the rotation of the two tiers, which are driven by the main motor through reducing gears; the motor is reversible, so that the clouds can move from right to left, or *vice versa*, and by combining the horizontal with the vertical movements, diagonally travelling and thickening clouds may be produced. One particularly interest-

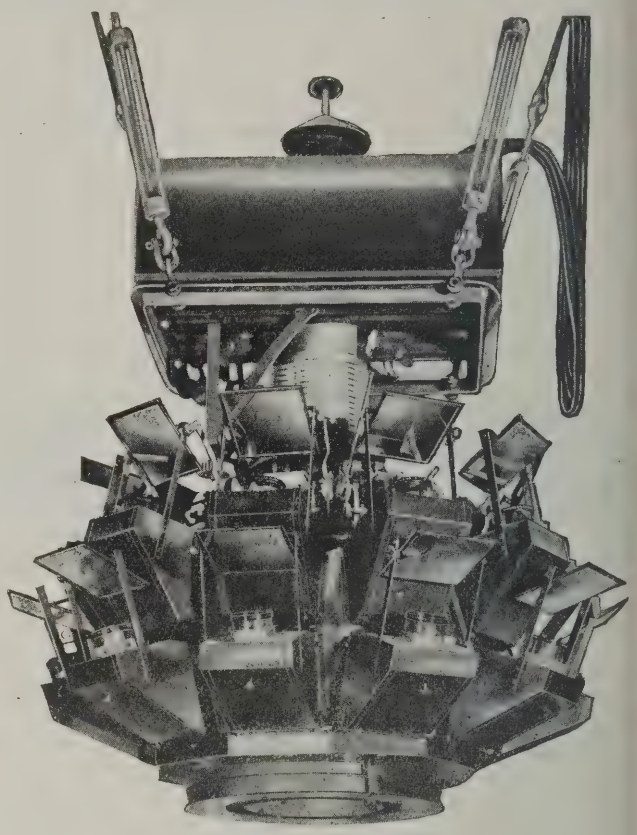

Fig. 6.—Cloud Apparatus.

ing effect obtainable by the combination of these movements is that of two separate banks of cloud travelling independently one above the other, a phenomenon frequently observed in nature. The success of the cloud apparatus is greatly influenced by the manipulation of the horizon lighting, which creates the illusion of the sky itself.

The effect of the cloud apparatus may be intensified by the addition of the panorama projection apparatus, fig. 7, which projects a series of cloud pictures or landscapes on the artificial horizon. It consists essentially of three projectors mounted on a tubular steel frame,

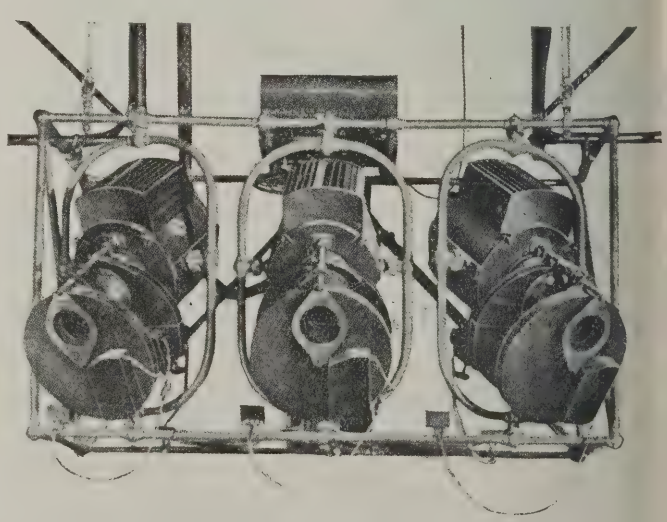

Fig. 7.—Panorama Projection Set.

capable of being tilted in an upward or downward direction, and with each lamp mounted in such a manner that it can swing on its horizontal axis and be locked in the desired position by a set-screw. The raising and lowering movement is obtained by a small motor driving a screwed spindle, the rotation of which operates wires attached to the projectors. Each pro-

jector, in addition to its 3,000-W lamp, adjustable by means of a handwheel operated from the exterior, is equipped with an adjustable reflector which enables the focus of the beam of light to be readily corrected. Two disks are fitted to each lamp, one being a colour-screen, the other containing several dia-positives, so that it is possible, to take one illustration, to obtain three entirely different panoramas without the necessity of changing slides. In front of the projector lens a circular motor-driven colour-screen is fitted by which the operator can control various special colour effects.

In addition to the foregoing, many pieces of apparatus are produced which would not come under the heading of general stage-lighting apparatus, being specially designed to meet particular requirements and conditions. For instance, lightning is produced by an electrical discharge. Special arc lamps with impregnated flame-carbons are used; as soon as the current is switched on an arc is struck, only to be broken immediately by the rapid raising of the upper carbon by means of a coil; the sudden flash is projected through a shutter having a suitable aperture, thus giving a vivid momentary glare. The carbon is retained in its raised position until the switch is opened.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

South America the Battleground: A Berlin Report.

In view of recent statements regarding hopes of foreign electrical interests concerning an organised attempt to dominate the electrical market here and elsewhere to our own exclusion, the following report received from the British United Press in Berlin, under date May 11th and published in the *Financial Times*, will probably be found both interesting and amusing. The "remarkable statement," as it is described, is attributed to the *Deutsche Bergwerks Zeitung*, the organ of the Ruhr industrialists:—"The British electrical industry suspects the existence of a secret agreement between French and German electrical producers for the domination of the European market. Because of this, Britain has launched a policy of reprisal in South America."

International Trust Rumours.

According to various reports circulated in some Continental newspapers, discussions have just taken place at Uschy between representatives of the electrical industries of the leading countries. It is, however, stated to be incorrect that these conversations are connected with proposed arrangements concerning the division of the production and sales. In this respect a Cologne newspaper states that the matter solely concerns the negotiations taking place before the world economic conference at Geneva in so far as applies to the countries participating in the conference; and, moreover, the discussions have only been of a general nature.

Results from Propaganda.

The desire of our kith and kin in New Zealand to deal with electrical manufacturers and traders in this country rather than make their purchases from American or other foreign sources is very marked, but it is essential that British concerns should keep themselves and their product well in evidence there. We have lately had brought to our notice an experience which shows the reward that suitable publicity, even of a most general kind, may bring. A New Zealand paper reported a statement on the all-electric house, made at a meeting of the Walsall Rotary Club by Mr. H. G. Truman, of the Truman Electrical Co., electrical contractors, of Walsall. This attracted the attention of the secretary of the Wellington Golf Club, who deduced from it that the Truman Company manufactured electric ranges, and wrote: "We are considering installing a cooking range at this club. There is no English range on the market here, but any number of American ones. We should naturally prefer to buy one from England if possible." A quotation was asked for. We quote this as an example of the way in which electrical propaganda works round and brings business in quite unthought-of ways.

Wages in the Engineering Industry.

Referring to the engineering trade unions' request for an advance of wages, which is under consideration by the employers, the May *Journal* of the Amalgamated Engineering Union deals with the future of the industry. It is suggested that a joint committee should be formed to examine trade conditions at least half-yearly with a view to making recommendations regarding wages; it is considered that a minimum should be fixed below which wages could not fall.

United States Radio Patent Litigation.

The *Telegraph and Telephone Age* reports that the "big three" of the American radio industry, the Radio Corporation of America, the American Telephone and Telegraph Co., and the General Electric Co., have commenced a legal campaign against infringers of their patents, which, it is said, may "tie up" most, if not all, of the sets in use in the United States and elsewhere. The campaign follows a recent decision of the Canadian Courts in favour of the Canadian General Electric Co., Ltd., against the Fada Radio Co., Ltd., in relation to the alleged infringement of a radio-frequency tuning patent. The General Electric Co. is taking action upon an alleged infringement of the United States patent on the same subject granted to Dr. E. F. W. Alexander and others. This is said to affect every type of receiving set employing tuned radio-frequency amplification. The General Electric Co. owns the Alexanderson patent, but the Radio Corporation of America controls the licence in the United States. The Radio Corporation has already taken action against the Atwater Kent Radio Manufacturing Co., of Philadelphia, for alleged infringement of the Alexanderson patent.

A B.T.-H. Lighting Scheme.

In the reconstruction of their general offices and the provision of a staff restaurant, Messrs. John Player & Sons, Nottingham, have adopted B.T.-H. lighting fittings according to a scheme prepared by their engineer, Mr. Wardle, and the British Thomson-Houston Co., Ltd. The new offices and restaurant occupy two floors each 240 ft. long by 38 ft. wide. On the lower floor, which is now one large general office, the installation comprises 40 "Trojan" totally-enclosed fittings (ceiling type), fitted with 200-W "Mazda" gasfilled lamps. The top floor is partly divided into a number of small offices, necessitating a larger number of fittings. On this floor there are 61 ceiling-type "Trojan" fittings each equipped with a 150-W gasfilled lamp. The installation provides a uniform illumination of about 6 ft.-candles.

The Irish Radio Import Duty.

A motion for the repeal of the duty upon imported radio apparatus was defeated in Dail Eireann on May 11th. The Minister of Posts and Telegraphs said that the duty was essential to cover the difference between the expenditure upon broadcasting and the receipts from licence fees. He mentioned that it was proposed to erect a high-power station at Athlone, and also stated that the number of licence holders was expected to be 100,000 in four years' time.

German Lamp Production.

The *E.T.Z.*, Berlin, has recently published some figures showing the production of electric lamps in Germany in 1925. The output of metal filament and Nernst lamps is returned at 78 millions, as compared with 71½ millions in 1924. Of this total 29 million lamps were exported as against 29.8 million in the preceding twelve months. The production of mercury vapour lamps declined from 4,200 to 1,900. On the other hand the output of arc-lamp carbons increased from 715.8 tons to 777.4 tons.

Indian Tariff Revision.

The *Board of Trade Journal* of May 12th contained the first part of a reprint of the revised Indian tariffs. Among the classes of goods dealt with is electrical control and transmission gear, comprising switches, fuses, and current-breaking devices of all descriptions, designed for use in circuits of less than 10 A at a pressure not exceeding 250 V, and regulators for use with motors designed to consume less than 187 W; bare or insulated copper wires and cables, any one core of which has a sectional area of less than one-eightieth of a square inch, and wires and cables of other metals of not more than equivalent conductivity; and line insulators, including cleats, connectors, leading-in tubes and the like, of types and sizes such as are ordinarily used in connection with the transmission of power for other than industrial purposes, and the fittings thereof. All the above are subject to an import duty of 15 per cent. *ad valorem*.

Modern Floodlighting.

We illustrate two widely-different examples of the employment of floodlighting which have recently come to our notice. The first illustration is the exterior of the People's Palace, Mile End Road, which was illuminated by means of ten

The People's Palace, E.

B.T.-H. 500-W projectors. It was in this building that the Stepney Electricity Department recently ran a successful exhibition.

The other example comes from the "Underground" group. The picture shows the results obtained in the floodlighting of the corridors at Finsbury Park station leading to the Piccadilly Tube. Inner walls have been built, and

Corridor Lighting at Finsbury Park Station.

from behind cornices concealed projectors throw their rays upwards on to the white roof. In this way diffused adequate illumination is obtained. Floodlighting has also been used upon the station front.

Electrical Power in Industry.

Preliminary Report No. 11 upon the 1924 Census of Production (published with the *Board of Trade Journal* dated May 12th), deals with further branches of industry. The section relating to the silk and artificial silk trades shows that the capacity of electrical generating plant in use rose from 1,660 kW in 1907 to 16,910 kW in 1924. This supplied power for 14,391 h.p. of electric motors, while in addition power was purchased for 17,732 h.p. The elastic webbing trade reported 258 kW of generating plant and 1,993 h.p. of electric motors (power for 1,758 h.p. purchased). In the pen, pencil, and artists' materials trades there was 314 kW of generating plant and 3,126 h.p. of motors (power for 2,859 h.p. purchased). The generating plant employed by the ink, gum and sealing wax trades aggregated 314 kW, and there was 4,584 h.p. of electric motors (power purchased for 4,425 h.p.).

Our Electrical Machinery Exports.

We give below the distribution of the electrical machinery exports shown in our monthly table on p. 813. The figures are compared with those of April, 1926 :—

Destination.	April, 1926. £	April, 1927. £	Inc. or dec. £
European countries	81,783	89,655	+ 7,872
Japan	23,021	3,889	−19,132
South American countries ...	22,652	35,505	+12,853
South Africa	48,806	69,431	+20,625
British India	99,488	94,818	− 4,670
Australia	62,426	109,267	+46,841
New Zealand	10,704	14,569	+ 3,865
Canada	16,765	9,887	− 6,878
Other countries	47,217	43,960	− 3,257
Totals ...	£412,862	£470,981	+£58,119

A Kent Electrical Retailer's Enterprise.

An example of aggressive electrical propaganda by an electrical retailer has been brought to our notice. Mr. C. O. Clark, of Deal and Dover, recently organised exhibitions in these two towns and attracted a great deal of attention and business. The first show was held at Dover on May 3rd and 4th, and was opened by Sir Edwin Farley, president of

Domestic Section of the Exhibition.

the Dover branch of the Wireless League. In addition to a wide range of radio apparatus, there were examples of the latest lighting, heating and cooking apparatus of leading makes. The whole exhibition was moved to the Winter Gardens, Deal, on May 5th, and was opened by the Mayor

Radio Display at the Exhibition.

of Deal, who considered that he was not exceeding his duty in supporting the enterprise of one of the citizens; the exhibition, he said, would not merely secure business for Mr. Clark, but would show what electricity could do. The exhibition remained open until the following day, and during its run lectures and demonstrations were given. Two of the stands are shown in the illustrations herewith. The attendance at the two shows was over 3,500.

Unemployment.

The total number of registered unemployed declined further during the week ended May 2nd. At that date the number was 1,021,700, as compared with 1,044,750 on April 25th, and 1,105,916 on May 3rd, 1926.

New Italian Companies.

Among the companies recently formed in connection with the electrical engineering industry in Italy are the Società Fabbrica Articoli Isolanti, F.A.I., Pianezza, capital 240,000 lire; La Società Italiana Construcioni Elettromeccaniche, Turin, capital 700,000 lire; and La Società per la Fabbricazione di Isolanti Elettrici, Milan, capital 50,000 lire.

Social Events.

The G.E.C. Social and Athletic Club cricket season is now in full swing. An auspicious start was made on April 30th, when three elevens were fielded. The batting augured well for a successful season. Most of last season's players are available, with much promising new talent. Twelve tennis courts are available, and a "Beginners' Evening" once weekly provides a welcome "nursery" where advice and instruction is given to novices. A Swimming Club has also been formed and is attached to the Holborn Municipal Baths. The football season just ended was one of the most successful in the history of the club. The first and second elevens won the championships of their sections of Divisions I and II of the London West End Amateur Football Association.

In its first season in the "Beatty" League of the Sheffield and District Works Sports Association, the football club of the Metropolitan-Vickers Electrical Co., Ltd., was successful

The Metro-Vick Football Team.

in winning the championship. The team won 13 out of 19 matches, and only lost two. Our illustration shows the team with the handsome shield presented to the Association by Admiral Earl Beatty.

The Macintosh Cable Co.'s team, in First Division Association football, has won the Derby Amateur Cup.

Registered Contractors.

The following applications were accepted by the Executive Committee of the National Register of Electrical Installation Contractors on May 13th:—

Lambert & Vallack, South Shields.
Wilkins Electrical Works, Ltd., W.12.
Brice, W. V., W.C.1.
Taylor, F. W., & Son, Milnsbridge, near Huddersfield.
Bacchus, H., Ltd., Bedford.
Headen & Brennand, Halifax.
Holt, W. P., & Co., Bradford.
Thomson, D., & Sons, Carlisle.
France's, Darlaston.
Penty & Margetts, Bradford.

At the same meeting four applications were declined.

The Timber Trade.

Our Timber Trade correspondent writes:—"Whilst there is a better consumption of building woods, including poles, than at this time last year, stocks are not so large. Fresh supplies, however, are likely to be heavier than those of the corresponding period of 1926 now that navigation has been reopened, for there has been large forward buying. Prices keep very firm for the better qualities, whilst values for inferior grades are steady. The Mississippi disaster has had the effect of steadying the market on this side for the American hardwood varieties, and values are firmer, although not on such a large scale as might be anticipated by the more optimistic operators. Stocks, however, are ample, and should spot prices show any great increase, consumption is sure to be affected. The better market for the American woods also has an influence on values of other descriptions. The hard and fancy woods, including the better grades of mahogany, teak, ebony, and rosewood, are strong in value, but the demand for these is not active."

New French Companies.

A company has lately been formed in Paris (1, Rue de Metz) with a capital of 500,000 fr. and the title La Société de la Lampe Microlux, to manufacture electric lamps.

La Société d'Amenagements Hydro-Electriques is the name of a new company which has been formed in Paris (10, Rue Rossini) with a capital of 500,000 fr., to develop hydro-electric undertakings.

New Municipal Showrooms and Offices.

The East Ham Corporation has appointed a committee to select a site for the erection of electricity showrooms.

The Scarborough Corporation has adopted a recommendation of the Electricity Committee to purchase 89, Westborough, at a cost of £6,875 as showrooms for the electricity undertaking.

Trade Announcements.

Mr. Berl Wober, late manager in Scotland for the Lunar Electrical Co., Ltd., has been appointed managing director of the Bryterlite Electrical Co., Ltd., at 10, West Campbell Street, Glasgow, from which address a wholesale electric lamp and accessory business will be carried on.

The address of Messrs. Robert Blackwell & Co., Ltd., is now Mitcham Road, Croydon. Telephone: Thornton Heath 2410-11-12; telegrams: "Kurkee, Croydon."

Messrs. J. V. Brittain & Co., Ltd., have removed to larger premises at Kingsway, Stoke-on-Trent, with a trade counter in Back Glebe Street. The company has a varied stock of wiring and colliery supplies, and runs a wholesale radio department.

Mr. F. Sandler, wholesale electrical and wireless factor, has removed to larger premises at 2, Mayes Street, Shudehill, Manchester.

Mr. Leonard J. Ive, electrical and wireless engineer, of 7, Clarendon Corner, Watford, has opened new showroom premises at 11, The Parade.

A new company registered recently under the designation of Fiat British Auxiliaries, Ltd., with its head office at 133, Helen Street, Govan, Glasgow, is to start at an early date the manufacture of marine Diesel engines of the Italian Fiat type. The initial capital is £125,000. The subscribers are Messrs. James Caird, shipowners, London; Mr. J. Howden Hume, engineer, Glasgow; and Mr. E. W. Harvey, engineer, London. Operations will be started as soon as the necessary plant and equipment are installed.

An arrangement has been entered into between Messrs. Carlo Brivio, of Milan, and Automatic & Electric Furnaces, Ltd., for the manufacture and sale of "Wild-Barfield" electro-magnetic furnaces in Italy.

The address of the Boston & District Electric Supply Co., Ltd., for all correspondence is Mount Bridge Power Station, Boston, Lincs. Manufacturers and others who have been in the habit of sending correspondence to the Dolphin Lane showrooms are asked to note that no office business is transacted there.

New Catalogues and Lists.

Marconi's Wireless Telegraph Co., Ltd., Marconi House, Strand, London, W.C.2.—A series of illustrated descriptive pamphlets: Leaflet No. 1,069, type 201, 1.5-kW telegraph-telephone transmitter for submarines, gunboats, and other small craft. Leaflet No. 1,068, type 20Y, Marconi-Newton constant-speed propeller for wind-driven aircraft generators. Sheet A12/2, 30-watt transmitting valve. Sheet A19/2, 40-watt dull-emitter transmitting valve. Sheet A20, 1-kW modulating valve. Sheet A21, 1-kW transmitting valve with shield outside bulb for short-wave work. Sheet A22, 400-watt transmitting valve with shield outside bulb for short-wave work. Sheet C20, two-electrode 15 mA dull-emitter half-wave rectifying valve. Sheet C21, double-electrode full-wave 50 mA rectifying valve. Sheet D1, cooled-anode 10-kW transmitting valve. Sheet D2, cooled-anode 12.5-kW transmitting valve. Sheet D3, cooled-anode 5-kW modulating valve. Sheet D4, cooled-anode 5-kW absorber valve. Sheet E1, cooled-anode low-impedance transmitting valve.

The British Aluminium Co., Ltd., Adelaide House, E.C.4.—An illustrated pamphlet dealing with aluminium for special advertising van bodies.

Messrs. Robert McGregor & Co., Alpine Steelworks, East Molesey, Surrey.—List No. 124, giving illustrations, sizes, and prices of mild-steel cable hangers and racks.

The Beko Lamp Co., Ltd., 5, Finsbury Square, E.C.2.—A pamphlet describing the "Beko" 10-gal. electric boiler. Illustrated and priced.

The Metropolitan Electric Cable & Construction Co., Ltd., Fuller Works, Chadwell Heath, Essex.—Price List No. 20, containing prices of v.i.r. taped, braided, and compounded cables and lead-covered cables.

Automatic & Electric Furnaces, Ltd., 173-175, Farringdon Road, E.C.1.—A priced and illustrated pamphlet describing the "Wild-Barfield" electric solder bolt heater.

The Standard Resistance Co., Broomfield, Chelmsford.—List No. 6, containing illustrations, particulars, and dimensions of wire resistance grids.

Messrs. Courtney, Russell & Co., 65a, Holborn Viaduct, E.C.1.—A leaflet illustrating five examples of crystal electric lighting fittings.

The Edison Swan Electric Co., Ltd., 123-5, Queen Victoria Street, E.C.4.—This company has sent us a complete set of its catalogue sections in a neat binder. The sections are well illustrated and priced and cover lamps, lighting fittings, fans, heating and cooking apparatus, instruments and meters, batteries, accessories, d.c. and a.c. motors, and radio apparatus.

Graham Amplion, Ltd., 25-26, Savile Row, W.1.—A black and white wall sheet advertising the "Amplion" cone loud speaker and illustrated and priced folders dealing with loud speakers, gramophone attachments, &c.

D

The Saxonia Electrical Wire Co., Ltd., Roan Works, Greenwich, S.E.10.—A net trade price list of magnet wires, flexibles, v.i.r. cables, &c.

Messrs. Isenthal & Co., Ltd., Ducon Works, Victoria Road, North Acton, W.3.—A preliminary list dealing with the "N.C." automatic rapid action voltage regulator which the company is commencing to manufacture.

Messrs. Mavor & Coulson, Ltd., 47, Broad Street, Mile End, Glasgow.—Pamphlet No. 21/1, dealing with knife switches for pressures up to 660 V, and Pamphlet No. 31/1, describing medium-pressure, heavy-duty fusible cut-outs. Illustrated and priced.

Messrs. S. G. Brown, Ltd., North Acton, W.3.—The "Brown Budget" for May containing articles and notes on "Brown" loud speakers in various parts of the world.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—May calendar-blotter advertising the "No. 154" electric wash-boiler.

Messrs. H. Clarke & Co. (Manchester), Ltd., Atlas Works, Old Trafford, Manchester.—A catalogue dealing with the company's "Neutrofour" radio receiver, containing details, illustrations and prices of the necessary components and accessories.

Berry's Electric, Ltd., 85 and 86, Newman Street, Oxford Street, W.1.—Two pamphlets giving particulars and prices of the "Wilton" fire and the "Fleur-de-lis" basket and dogs. The illustrations show these to be handsome additions to the "Magicoal" series.

The Hart Accumulator Co., Ltd., Marshgate Lane, Stratford, E.15.—A coloured showcard advertising "Hart" automobile lighting and starting batteries.

Messrs. Charlesworth Peebles & Co., 5, Eden Street, Hampstead Road, N.W.1.—Pamphlets advertising the "Protos" vacuum cleaner.

Mr. Alan Wright, 124, Chancery Lane, W.C.2.—A booklet containing illustrations, particulars and prices of "Inventum" electric water-heating appliances.

The Weston Electrical Instrument Co., Ltd., 15, Great Saffron Hill, E.C.1.—A priced and illustrated booklet dealing with the company's voltmeters, milliammeters, galvanometers, &c., for radio measurements.

Bankruptcy Proceedings.

Francis Husband, "The Hollies," Sandpit Lane, St. Albans, engineer.—The first meeting of creditors was held recently at 29, Russell Square, W.C.1. The statement of affairs showed liabilities expected to rank at £4,074, against gross assets of £35, which amount was absorbed by preferential claims. Debtor attributed his failure to liability under guarantees on behalf of a limited company, judgments obtained against him under a building contract entered into with his wife, and expenses of his wife's illness, bad debts, and unemployment. In 1915 debtor and another formed a limited company as F. Husband, Ltd., with £1,000 nominal capital, to carry on business as electrical engineers. He was allotted 700 £1 shares partly for cash and partly as consideration for services in introducing business, and was appointed managing director. The company went into voluntary liquidation in 1920, and as guarantor on behalf of the company he was liable for debts of £3,134. From February to September, 1924, he was engaged on a contract for the supply of switchboards. In July, 1926, judgment was obtained against him for the balance of the purchase price of a house which had since been taken over by the mortgagees. Debtor admitted having been aware of his position since February, 1920. The case was left in the hands of the Official Receiver as trustee of the estate. The following are creditors:—

	£		£
Allied National Corpn., Ltd.	51	General Wireless, Ltd. ...	35
Davis & Ball	53	North Metropolitan E.P.S. Co.	21
Ducat, Dr. A.	75	Record Elecl. Co., Ltd....	71
Electrical Contracts and Maintenance Co. ...	70	Braby & Waller	45
General Electric Co., Ltd.	91	Universal Housing Co. ...	317
		West, L. C.	44

J. Atkins, trading as Atkins & Co., Tewkesbury, Northleach and Winchcombe, Gloucestershire, electrical engineer. The following are creditors herein:—

	£		£
Atkins, E. M. (Mrs.) ...	153	Electrical Components, Ltd.	30
Atkins, J.	32	General Electric Co., Ltd.	46
British Petroleum Co. Ltd.	40	Moss, A. E.	125
Callender's Cable & Construction Co., Ltd. ...	40	Siemens Bros. & Co., Ltd.	44
		Whitworth Electric Lamp Co., Ltd.	61

H. Nutter, electrical engineer, 246, Yorkshire Street, Rochdale.—First meeting, May 24th, at the Official Receiver's offices, Byrom Street, Manchester; public examination, June 17th, at the County Police Court, Rochdale.

J. L. R. Jensen (Jensen & McNicol), wireless accessories factor, 149a, Seabank Road, Wallasey.—Trustee, Mr. E. D. Symond, Official Receiver, 11, Dale Street, Liverpool, released May 5th.

S. Holmes, electrical engineer, 5, Gibson Street, Burmantofts, Leeds.—Trustee, Mr. H. C. Bowling, Official Receiver, 24, Lower Bond Street, Leeds, released May 5th.

G. Youll and A. Fraser (Youll, Fraser & Co.), electric lamp and wireless factors, 6, Hunter Street, Liverpool.—Trustee, Mr. E. D. Symond, Official Receiver, 11, Dale Street, Liverpool, released May 9th.

B. Uttley, electrician, 212, Central Drive, Blackpool, late of Tower Street, Bacup.—Trustee, Mr. J. G. Gibson, Senior Official Receiver, Byrom Street, Manchester, released May 3rd.

H. Tidswell (H. Tidswell & Co.), electrical engineer, 11, Bazaar Street, Pendleton.—Trustee, Mr. J. G. Gibson, Senior Official Receiver, Byrom Street, Manchester, released May 3rd.

C. J. Nichols (C. J. Nichols & Co.), electrical engineer, 7, Park Street, Bridgend, Glam.—Last day for proofs for dividend, May 27th. Trustee, Mr. G. G. Poppleton, 26, Corporation Street, Birmingham.

C. Hubbard, electrician, 13, Magdalen Street, Norwich.—Last day for proofs for dividend, May 28th. Trustee, Mr. C. B. L. Prior, Official Receiver, 9, Queen Street Chambers, Norwich.

G. Mason and G. E. Tinsley (Mason & Tinsley), electrical engineers, 6, Alberta Terrace, Sherwood Rise, Nottingham; and late of 94, Upper Parliament Street, Nottingham.—First and final dividend of 1s. in the £, payable May 23rd, at the Official Receiver's offices, 4, Castle Place, Nottingham.

G. Mason (separate estate).—First and final dividend of 10s. in the £, payable May 23rd, at the Official Receiver's offices, 4, Castle Place, Nottingham.

A. L. Weekes, electrical engineer, 13, Crescent Road, Luton.—First meeting held May 17th, at the Official Receiver's office, The Parade, Northampton; public examination, May 27th, at the Court House, Luton.

P. Cheshire (P. Cheshire & Co.), electrical engineer and contractor, Water Street Works, Middleton, Lancaster.—First meeting held May 19th, at the Official Receiver's offices, Byrom Street, Manchester; public examination, June 15th, at the Court House, Church Lane, Oldham.

H. Bebbington, electrical engineer, 14, Cestrian Street, Bolton.—Last day for proofs for dividend, May 25th. Trustee, Mr. J. G. Gibson, Official Receiver, Byrom Street, Manchester.

E. F. Woodgate, electrical engineer, 7, St. John's Terrace, and Brunswick Cottage, Weymouth.—Last day for proofs for dividend, May 24th. Trustee, Mr. T. Barton, Official Receiver, Catherine Street, Salisbury.

Company Liquidations.

Southern Counties Electric Light & Power Supply, Ltd., 121, Cheapside, E.C.—Under a compulsory winding-up order, made last March, on the petition of a creditor, the statutory first meetings of the creditors and shareholders were held on May 12th at Carey Street, W.C., before Mr. H. E. Burgess, senior Official Receiver. The company was incorporated in November, 1924, with a nominal capital of £11,000, subsequently increased to £21,000, and was promoted by Mr. Edmund Octavius Eaton for the purpose of acquiring, developing, and carrying on electric light and power undertakings in the southern and western counties in Great Britain and elsewhere. The immediate object, however, was to take over the benefit of certain contracts entered into by the Electricity Finance & Distribution Corporation, Ltd. (another of Mr. Eaton's companies) for the supply of electric power in certain areas. Agreements were entered into in December, 1923, with the Rural District Council of Sturminster Newton, Dorset, for the establishment by the company of an electrical generating station, and laying of mains for the supply of electricity in the district of Sturminster Newton. In October, 1924, the directors entered into an agreement for the purchase of electric light undertakings at Battle, Sussex, and in March, 1925, they entered into a further undertaking for the laying of cables and the extension of mains between Chagford and Moretonhampstead, Devon, also for the supply of electricity at the rate of 5d. per kWh for 20,000 kWh per annum and 4d. per kWh in excess of that amount. The company also had an interest in the exploitation of Reid's patent process for the generation of electricity at a cheaper rate than any known process other than by water-power. This process was stated to be for the conversion of a non-combustible gas, obtained from the burning of chalk and coke, into a combustible gas. In the event of that process being a success the company was to have a licence to use the process in all its areas. The company applied for Special Electricity Orders for all its areas, but failed to obtain them, and the work at Battle involved it in a heavy loss. The Sturminster Newton scheme was partially completed at a cost of £3,000, but owing to insufficient funds the company was unable to continue the proposed extensions, and in August, 1926, the company's installation was taken over for £2,000 in shares by the Dorset and Devon Electricity Supply, Ltd., whilst at Moretonhampstead no work was done by the company. In order to obtain the finance necessary to carry out its schemes the directors, on December 12th, 1924, resolved to create first mortgage debentures, carrying 7 per cent. interest per annum, for £25,000. A prospectus was issued on March 23rd, 1925, offering for subscription 20,000 8½ per cent. participating preference shares of £1 each at par, and £15,000 first mortgage 7 per cent. debentures of £10 each at £9 16s. 0d. The issue of the prospectus was carried out by the Electricity Finance and Distribution Corporation, Ltd., at a cost of £8 per £1,000, plus petty cash and out-of-pocket expenses, and was supervised by Mr. Eaton at a fee of £100, plus travelling expenses. Owing to the poor response by the public to the first issue,

the prospectus was reprinted, and further issues made in May, 1925; a new prospectus was issued in the following October; and further prospectuses were sent out in February and June, 1926. The statements contained in the various prospectuses as to the position of the company and its undertakings will be the subject of further investigation by the Official Receiver. In September, 1925, some of the debtors and shareholders brought actions against the company and its directors for the return of moneys subscribed on the ground of fraudulent misrepresentations contained in its prospectus. The total amount subscribed by the public was £32,326. The failure of the company is attributed by the directors to insufficient capital at any one time to carry out its undertakings; the failure to obtain Special Orders for the supply of electricity in its areas; and excessive cost of obtaining capital. No statement of affairs had been lodged at the date of the meetings, but it appeared that the assets were valued at £7,421, and the liabilities were estimated at £19,142, including the debenture debt of £16,700. In consequence there is no possibility of any surplus becoming available for the unsecured creditors or of any return being made to the shareholders. The liquidation was left in the hands of the Senior Official Receiver.

NADIN & DELL ELECTRIC, LTD.—A meeting of members is called for June 13th, at 5, Bold Street, Warrington, to hear an account of the winding up from the Liquidator, Mr. L. A. Voisey.

ELECTRICAL & RADIO DISTRIBUTORS, LTD.—Winding up voluntarily. Liquidator, Mr. F. E. Anderson, 50, Bedford Row, W.C.1. Meeting of creditors, May 25th, at the liquidator's offices.

MAGNETIC SIGNS & CARRIERS, LTD.—A meeting of members is called for June 10th, at 18-19, Ironmonger Lane, to hear an account of the winding up from the liquidator, Mr. J. C. Sherrott.

Private Arrangements.

S. S. JURY, trading as Jury's Electric Service, 128, Far Gosford Street, Coventry, electrical and wireless dealer.—In response to a circular letter issued by Mr. J. W. B. Allen, Barbican Chambers, Earl Street, Coventry, a meeting of creditors was held recently at Birmingham, when a statement of affairs was submitted which disclosed liabilities of £2,914 and net assets of £1,322, leaving a deficiency of £1,592. It was reported that the debtor commenced trading in 1923, and at the outset was successful. Subsequently he acquired other premises, and in consequence of heavier overhead expenses he traded with a very fine margin of profit. He drew from the business about £4 weekly. It was intimated that the debtor had already executed a deed of assignment with a view to protecting the assets. Recently creditors had pressed. The debtor was unable to make any offer, but he hoped that friends would assist him to retain the business. A resolution was passed confirming the deed already executed, and a committee of the principal creditors was appointed. It was arranged that the trustee and committee should deal with any offer that was received.

S. L. STREETER, Petworth, electrical and wireless engineer and kinema proprietor.—A meeting of creditors was held on May 11th at the offices of the Palatine Trade Protection Office, Kimberley House, Holborn Viaduct, E.C., when Mr. P. S. Booth presented a statement of affairs which showed liabilities of £467 and net assets of £432, leaving a deficiency of £35. The debtor commenced business as a wireless and electrical dealer in April, 1925. In January of this year the debtor took over the "Picturedrome," Petworth. The turnover of the wireless business averaged about £400 a year. The debtor had interviewed friends to see if an offer could be made, but so far without success, and he left the matter entirely with the creditors. As there were suing creditors, Mr. Booth said that, in order to protect the assets, a deed of assignment had been executed by the debtor to him (Mr. Booth) as trustee. It was decided that the deed of assignment should be confirmed, and a committee of inspection, consisting of three of the creditors, was appointed. The following are the principal creditors:—

	£		£
Houghton-Butcher (G. B.), Ltd.	91	Radio Communication Co., Ltd.	29
Roneo, Ltd.	47	A. J. Stevens & Co. (1914), Ltd.	44
Woods, Ernest	31		

Dissolutions of Partnership.

GREYCOAT IGNITION CO., electrical engineers, 27, Charles Street, Notting Hill, W.—Mr. R. Tricker and Mr. C. P. Holt have dissolved partnership. Debts will be attended to by Mr. Tricker.

BIRMINGHAM & MIDLAND ELECTRIC WELDING CO., electric welders and boiler repairers, Grove Works, Grove Lane, Smethwick.—Messrs. Frank Parkin, G. Price, Fred Parkin, J. W. Parkin, and H. Jones have dissolved partnership. Debts will be attended to by Messrs. Frank Parkin, G. Price, J. W. Parkin, and H. Jones, who will continue the business under the same style.

GOODMAN BROS., electrical and general engineers, Moretonhampstead, Devon.—Messrs. K. I. and W. R. Goodman have dissolved partnership. Mr. K. I. Goodman will attend to debts and continue the business in his own name.

WYCOMBE ELECTRICAL SUPPLIES, 51, Oxford Street, High Wycombe.—Mr. R. C. Gilbert, Mr. G. H. Turner, and Mr. D. Holt have dissolved partnership. Mr. Gilbert will attend to debts and continue the business.

Local Exhibitions.

STEPNEY.—The exhibition organised by the Borough Council was visited by about 20,000 people, and all the exhibitors received a gratifying number of inquiries which are confidently expected to result in a considerable amount of business in the near future. At the Council's own inquiry bureau over 300 inquiries were recorded for all types of domestic apparatus. No fewer than 191 of these were for cookers. A hiring and hire-purchase scheme is in operation which, together with the attractive rates in force for heating and cooking, place the ratepayers of Stepney in a favourable position.

BERMONDSEY.—Reporting on the all-electric house on the Salisbury Street estate, which was arranged by the Electricity Department, the Electricity Committee states that a total of 11,360 people visited the house—an average of 630 per day. Fifty-eight applications for lighting installations were received from residents where the mains are already laid, and many inquiries were made for lighting in streets where there are no mains. Applications were received for the following apparatus: 20 cookers, 15 irons, 20 radiators, 5 geysers, 3 washing machines, 1 refrigerator, 1 fan, and 1 bedwarmer. Various shades and fittings were sold as a result of the consumers seeing them actually in use.

ABERDEEN.—A Brighter Homes Exhibition is to be held in the Music Hall from September 30th to October 11th. The exhibits will embrace heating, cooking, lighting, and labour-saving devices.

MANCHESTER.—The Power Efficiency Exhibition, which was to be held from June 22nd until July 2nd, has been abandoned on account of lack of support.

For Sale.

Rushden and District Electric Supply Co., Ltd., has for disposal three 240-kW Willans Diesel engine generating sets, with oil tanks, pumps, &c., also one Garrett locomobile-type power plant, boiler, superheater and condenser, direct coupled to a 115-kW Phœnix dynamo, complete with steel chimney, &c. By order of Mr. James White and the Beecham Trust, Ltd., Messrs. Toplis and Harding & Russell, in conjunction with Messrs. Knight, Frank & Rutley, will sell by auction on June 2nd and 3rd, at the British Empire Exhibition, Wembley, electrical and fire equipment, office furniture, miscellaneous effects, &c. (See our advertisement pages to-day.)

Book Notices.

"Towards Industrial Recovery," by Hugh Quigley. London: Methuen & Co. 4s. 6d. net.—Many of our readers who are familiar with the statistical and other writings of Mr. Quigley will no doubt read this book with interest. It comprises eight chapters, the earlier of which consider the changes that have taken place since the war in organisation for production in Britain, Germany, and France, and the main factors determining industrial recovery in Germany, France, and Belgium. Later pages deal with certain developments of international significance and the grouping of forces within industry, and the closing chapters discuss the control of industrial fluctuations and the basis of industrial revival. In this last connection the writer refers to the importance of management, the need of essential statistics, financial obstacles to reorganisation, trustification and central control, and the future of industry.

"*Journal* of the Institution of Electrical Engineers." Vol. LXV. No. 365. May, 1927. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

The HART ACCUMULATOR CO., LTD., has produced for the help of present users of its lighting and power batteries a brochure describing the construction of the batteries and instructions for correct charging, care and maintenance, &c. The book is illustrated, and should be of great service to those for whom it is intended.

New Australian Company.

Stromberg-Carlson (Australasia), Ltd., has been formed in Sydney, with a capital of £50,000, to manufacture, import and export electrical and mechanical engineering goods.

Uruguayan Electrical Import Duties.

The section of the Uruguayan customs tariff relating to "articles for electricity" has recently been revised. Particulars of the revision are available from the Department of Overseas Trade, 35, Old Queen Street, S.W.1.

Proposed Compulsory Safety Measures.

The Home Office has issued a circular to factory employers' associations in which it is said that progress in the development of safety-first arrangements is too slow. An Order requiring the institution of special safety arrangements has been provisionally approved, but is being held up pending representations on the subject from the employers. This Order would apply to all those industries in which accidents are frequent, with the exception of docks, for which, it is understood, voluntary arrangements are being made. Among the industries specially mentioned are dynamo, motor and cable manufacture. One part of the Order requires the employment of a competent safety supervisor, but with the Chief Inspector's approval an alternative arrangement can be made.

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

	Price May 17th.	Fortnight's inc. or dec.
CHEMICALS, &c.		
a Acid, Oxalic ... per lb.	5¾d.	...
a Ammoniac, Sal ... per ton.	£60	...
a Ammonia, Muriate (large crystal) ,,	£52	...
a Bisulphide of Carbon ... ,,	...	...
a Borax ... ,,	£25	...
a Copper Sulphate ... ,,	£25 10s.	...
a Potash, Chlorate ... per lb.	4d. to 4½d.	...

Reporting under date May 14th, Messrs. James Forster and Co. state that lead arrivals this month "are light, and it is to be hoped that this is the forerunner of smaller imports in future, in order to give the market a breathing space in which to absorb the warehouse stocks, and so get on to a healthier basis. It seems more probable that relief will come from a decrease in supplies rather than from an increase in consumption." Board of Trade returns for April, 1927:—Imports, 28,169 tons; exports, 1,682 tons; leaving for home absorption, 26,487 tons.

Lighting and Power Notes.

Alderley Edge.—PURCHASE OF UNDERTAKING.—The Urban District Council has decided to join with the Wilmslow Urban District Council in negotiations for the purchase of the undertaking of the Alderley and Wilmslow Electric Supply, Ltd. Subject to an agreement to purchase being arrived at a Special Order providing for joint working will be applied for, together with powers to supply electricity in the two towns, and also to portions of the rural districts of Bucklow and Macclesfield and the urban district of Handforth.

Argentina.—ELECTRICAL DEVELOPMENT.—The output of the power stations in Buenos Aires of the Compania Hispano-Americana de Electricidad (Chade) during the past year amounted to 534,002,536 kWh, an increase of 37,304,144 kWh over 1925. The number of consumers increased by 23,346, bringing the total up to 229,666, representing a load of 624,282 kW. At the main Dock-Sud power station the extensions are approaching completion. The fourth, fifth and sixth 25,000-kW turbo-generators are now in operation, and a seventh set of the same capacity will be ready for work by the opening of the next Argentine winter season. In order to meet the prospective increase in demand, orders have been placed for two new 40,000-kW sets, which, it is hoped, will be ready for working by the winter of 1928. Preparatory work on the new super-power station which is to be established by the company in Buenos Aires is now in progress, cementing operations in connection with the foundations having lately been commenced.

In the Buenos Aires suburb of Avellaneda the company is now supplying electricity to 21,444 consumers, as against 18,400 a year ago, the sales during 1926 having totalled 33,566,647 kWh, as compared with 30,305,626 kWh in 1925.

The Compania Empresa de Luz y Fuerza of Mendoza increased its output facilities during the past year by the inauguration in May of its hydro-electric plant at Cachenta. The company is now supplying energy to 12,993 consumers, the sales last year having amounted to 11,040,102 kWh, an increase of 2,049,509 kWh over 1925.

Australia.—BUNNERONG POWER STATION.—According to the *Industrial Australian and Mining Standard*, considerable progress is being made in the erection of the power house at Bunnerong, which is being undertaken by the Sydney City Council. The total cost will be about £6,000,000. A feature of the work is the construction of twin tunnels, each three-quarters of a mile in length to provide 100,000,000 gallons of water an hour for condensing purposes. The drive is almost completed. On top, steam navvies, pneumatic drills, and a giant sluicing plant are transferring 140 cubic yards of rock and soil an hour into 26 acres reclaimed from the sea. Foundations for the boiler house, and the ashpits for the 18 boilers in the first section of the undertaking, are rapidly nearing completion. Erection of the steel framework of the building has commenced. It is stated that the work is well up to schedule time.

FORBES (N.S.W.).—Mr. R. T. Hole, supervising engineer for the Department of Public Works, Bathurst, held an inquiry recently into the Municipal Council's proposal to borrow £14,600 for the purpose of establishing an electricity undertaking. The total cost of the proposed work is to be £32,000.

Barnsley.—SUPPLY FOR HOUSING ESTATE.—The Corporation Electricity Committee has recommended that the mains be extended to the Cundy Cross No. 2 housing scheme (139 houses), and provision made for public lighting, at an estimated cost of £1,342.

Bedford.—LOAN.—The Town Council has applied for sanction to a loan of £8,700 for the supply of electricity in the Ampthill district. Subject to the consent of the Ministry of Transport, overhead cables will be used.

Bradford.—NEW TRANSFORMER CHAMBER.—The Corporation Electricity Committee has prepared a scheme for the provision and equipment of a district transformer chamber on the Low Well estate in Bolton Road district, at a total estimated cost, including land and the laying of distributing mains, of £7,538.

Brentwood.—INSTITUTION SUPPLY.—The Essex Asylums Committee has adopted an electricity scheme for Brentwood Asylum, at an estimated cost of £22,700. The Committee proposes to install its own plant and to substitute electricity for gas for lighting purposes.

Bristol.—EXTENSION OF SUPPLY.—In connection with the Corporation's application for an Order extending its area of electricity supply so as to include areas immediately outside the existing area, the Electricity Commissioners required an undertaking from the Corporation that mains would be laid in part of the area applied for within a period of two years from the date of the Order, if granted. The Electricity Committee has recommended the Council to give the required undertaking so far as it relates to mains in the parishes of Almondsbury, Tockington, and Olveston in the rural district of Thornbury. The estimated cost of laying mains in these parishes is £21,995, and the Committee is satisfied that the return upon the capital outlay involved will be satisfactory.

Burton-on-Trent.—BOILER PLANT EXTENSIONS.—At an Electricity Committee meeting the electrical engineer submitted a report regarding extensions to the boiler house, and recommended that two additional 40,000-lb. boilers, complete with stokers, &c., be installed, that the old Lancashire boilers be removed, the old boiler house roof be raised to take one boiler, and that the new boiler house be extended for the second boiler. The bunkers would be extended, together with the coal handling plant. The total cost of these extensions would be approximately £40,000. The Committee has approved the report.

Canada.—NEW E.H.P. LINE.—Permission has recently been granted by the Public Service Commission of Quebec to the Shawinigan Water and Power Co. to connect up the Anglo-Canadian Pulp and Paper Co.'s plant at Limoilu, near Quebec, with a 154,000-V transmission line. Power is being taken from the Duke-Price development on the Saguenay River at Ile Maligne, over 100 miles way, where the addition of two units last year brought the capacity up to 450,000 h.p.

ONTARIO.—A preliminary statement relating to the past year's working of the Hydro-Electric Power Commission of

Ontario shows that the combined revenue of the municipal undertakings served was $22,677,999, as compared with $20,419,115 in 1925, while the expenditure rose from $19,338,837 to $21,500,911. The net surplus thus increased from $1,080,278 to $1,177,811. Only 25 municipalities showed net deficits as compared with 42 in 1925. The percentage of net debt to total assets was reduced from 57.2 to 55.5.

Carlisle.—ELECTRICITY IN BULK.—The Electricity Committee has received an application from the Gretna and District Electric Supply Co., Ltd., to supply electricity in bulk, and intimating that the company had been in communication with the Electricity Commissioners with a view to an application being made for a Special Order. The Committee is to confer with the directors of the company as to the terms and conditions upon which a supply could be afforded.

Colne.—YEAR'S WORKING.—Mr. J. H. Thompson, borough electrical engineer, informs us that for the year ended March 31st last the revenue from the electricity undertaking amounted to £38,014, as compared with £33,676 in the previous year. Working costs increased from £19,510 to £24,385, leaving a gross profit of £13,629 (£14,166). After providing for capital charges, there was a net profit of £1,685, as compared with £3,173 in the preceding year. The maximum supply demanded decreased from 1,858 kW to 1,692 kW. The results of the year have been materially affected by the prolonged coal stoppage, but nevertheless the sales of electricity increased by 249,061 kWh to 3,420,164 kWh.

Continental.—POLAND.—La Société des Reseaux Electriques, which holds the concession for the supply of electricity in the towns of Sosnowice, Zabkowice, Zawiercie, Mijskow, Lodz, and the suburbs of Czenstochowa has nearly completed its distribution system, and hopes to be able to commence supply in the latter half of the current year. The company has entered into an arrangement to draw its electricity supply from the power station of the Société Centrale Electrique du Bassin de Dombrowa, the capacity of which is being increased from 10,000 to 22,000 kW.

PORTUGAL.—The Sociedad Union Electrica Portugesa has recently completed a steam-operated power plant with a capacity of 10,000 h.p., as a reserve for the Lima hydro-electric power station.

FRANCE.—The Paris City Council will have under consideration in June a report relating to the extension of the production and distribution of electricity in view of the growing demands. A special report has been presented to the City Council by the Prefect of the Seine, pointing out the necessity for a decision on the matter being arrived at in the immediate future. As under the most favourable circumstances it is impossible to envisage the practical execution of the scheme referring to the transport of energy from the Massif Central to Paris before 1933 or 1934, it is suggested that provision should now be made for the addition of a new steam power station of 100,000 kW. One solution would lie in the construction of a city works at Orby at a cost of 225 million fr., and a second would be the establishment of one at Vitry. The second solution would be less onerous, as it would involve an expenditure of 175 million fr., and it is this latter which is recommended by the Prefect to the Council.

GERMANY.—It is reported that the great Klingenberg power station of the Berlin Electricity Works has now been completed and put into service. The station comprises three main turbines, with a maximum capacity of 80,000 kW each, three other turbines of 10,000 kW each, and 16 boilers. There are six coal pulverisers. The City of Berlin has already invested some £3,500,000 in the station, and further sums will be required in the autumn to commence extensions, as the station in its present stage can only supply the demands of Berlin until 1930.

Craven (Yorks.).—ELECTRICITY SUPPLY.—The Electricity Commissioners have announced their decision with regard to the applications made last autumn for Electricity Orders in the Craven area of Yorkshire. That of the Electrical Distribution of Yorkshire, Ltd., with regard to Barnoldswick, Earby, Silsden, and 26 parishes in the Skipton rural area is refused, as also is that of the Keighley Corporation with regard to Silsden, Cowling, Farnhill, Glusburn, and Kildwick, while those of the Barnoldswick and Earby Urban District Councils for powers in their own townships are granted. The Silsden Council's application for its own area will be decided later. The Commissioners have intimated that they are prepared to proceed with the consideration of the application by the Electrical Distribution of Yorkshire, Ltd., regarding the remaining part of the area in the Skipton rural district.

Gainsborough.—ELECTRICITY SCHEME.—All the preliminary work in connection with the Council's electricity scheme has been completed, and a supply will be shortly available. The Council has decided to extend the mains to the new housing site at a cost of £3,000. The cost of wiring the new houses will be about £3 per house. The following scale of charges for the hire-purchase of fittings has been adopted:—Two points, 1s. 3d. per month for 120 months, 2d. per month being added for each light up to five and 3d. per month for each light from five to 20.

Hazel Grove and Bramhall.—LOANS SANCTIONED.—The Urban District Council has received sanction to loans of £8,000 for e.h.p. mains and £12,000 for l.p. mains, being part of an application for £35,000.

Kendal.—ELECTRICITY SUPPLY.—The Town Council has decided to engage an expert to advise on further extensions to the electricity works. As a bulk supply will not be available for at least five years, the Electricity Commissioners have recommended the Council to install two 335-kW crude oil engine sets which will meet the town's requirements for the next five years, one of the sets to be a spare.

Kirkcaldy.—ELECTRICITY EXTENSIONS.—The Town Council on May 9th approved a report on the extension of the Corporation electricity undertaking, involving an expenditure of £123,500, and agreed to carry out immediately the first part of the scheme at a cost of £87,200. The second stage, estimated to cost £36,300, has been postponed until it is found to be necessary. It was also agreed to apply for sanction to borrow £87,200 to meet the cost of the first part of the scheme. The report by Messrs. Kennedy & Donkin recommended that the Corporation should change its l.p. distribution system from d.c. to a.c. in two stages. The first stage would affect the outlying areas to the north and south and would necessitate the laying of a new distributing network and mains and the erection of static transformer substations. The second stage would be carried through during the next five to seven years. It affected the centre area, and therefore the change-over should be progressive. It should start with the completion of the first stage on the fringes of the central d.c. area, and should progress inwards as the load increased and as conditions arose. The capacity of the transforming plant in the new sub-stations proposed would meet the demand for the next ten years, but at a later date it would be necessary to build additional sub-stations interposed between the others. It is considered that, as far as possible, the Corporation should discontinue taking the load of factories on its l.p., d.c. network, and that these factories should be supplied from its other mains. It would be impracticable to change over all of them at once. It is expected that the work will begin in August, and that certain parts will be completed by the end of next winter.

Leicester.—ELECTRICITY EXTENSIONS.—The Electricity Committee has submitted to the City Council a report prepared by the engineer and manager (Mr. T. R. Smith) on proposed extensions to the electricity undertaking, involving an estimated expenditure of £640,000, and the provision of additional mains, services and meters to meet requirements during the next two years, at an estimated cost of £183,000. The extensions include new buildings, cooling towers, coal and ash-handling plant (£194,000), two 25,000-kW turbo-alternators with condensing plant, and four boilers (£446,000), mains and services (£163,000), and meters (£20,000). The engineer estimates that when these extensions have been completed the cost of generation and distribution, including the additional charges for interest and sinking fund, will be reduced by about 13 per cent., and that the needs of the city will be met for the next seven years. The Council has adopted the report, and application is to be made to the Electricity Commissioners for sanction to the scheme.

Lincoln.—LOAN.—The Town Council has applied for sanction to a loan of £39,600 to cover the cost of a scheme for the supply of electricity in the south-west part of the city, and for extensions.

London.—CHISWICK.—The Conference of Local Authorities Owning Electricity Undertakings in Greater London has considered the scheme which is being promoted by the London and Home Counties Joint Electricity Authority for the purpose of enabling the Authority to acquire a site at Chiswick for the erection of a principal power station to deal with the demand for electricity in the west and north-west electricity district. The Conference agrees in principle with the proposal, it being considered highly desirable that the station should be owned and operated by the Joint Authority. The Conference is also of opinion that the erection of the station should be expedited.

Manchester.—PROGRESS DURING MARCH.—During the month of March the Corporation electricity undertaking showed an increase in connections of 12,170 kW, bringing the total to 316,638 kW; and the number of applications received for supply, including consumers for additional supplies, was 1,138, representing a total of 3,305 kW. The number of hired cookers connected increased by 112, bringing the total actually on circuit to 3,029. Applications for the hire of cookers totalled 166. Two new sub-stations were put into commission at Burnage and Droylsden (West), and additional plant installed at three existing sub-stations.

Malvern.—NEW CABLE.—The Urban Dsitrict Council is to lay a duplicate h.p. feeder cable from the electricity works to Malvern Links in order to provide an alternative supply for the West Malvern and Malvern Links areas, at an estimated cost of £1,284.

Peterborough.—NEW ELECTRICITY CHARGE.—The Town Council has adopted a new two-part domestic tariff, the basis of which is 12½ per cent. on the ratable value of the premises, plus £1 per annum service charges, and 1d. per kWh for electricity consumed

Portsmouth.—Loan.—The Corporation Electricity Committee is applying for sanction to a loan of £125,000 for mains and services.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Newmarket.—*The Newmarket Electric Light Co., Ltd.*—Lighting: Reduced to 10d. per kWh. Power and heating: Reduced to 6d. per kWh.

Stroud (Glos.).—*The Stroud Electric Supply Co., Ltd.*—An all-round reduction of 1d. per kWh.

Pembroke (Dublin).—Lighting: A reduction of 1d. Cooking, heating, and power: A reduction of ½d. per kWh.

Shoreditch.—Heating: The addition of 25 per cent., which has been in force since December last, has been withdrawn.

Plympton St. Mary.—Electricity in Bulk.—It was announced at a recent meeting of the Rural District Council that terms have been arranged for a bulk supply of electricity from Plymouth Corporation. The first districts which are to be supplied with electricity are Plympton, Plymstock, Crownhill, and Compton; tenders have been received and the work of linking-up will be commenced as soon as possible.

South Africa.—Simonstown.—The Municipal Council, which has hitherto obtained its electrical supply from the Naval Dockyard, has now completed arrangements for a supply from Cape Town Corporation. The latter authority will also give a supply to the village of Glencairn, near Simonstown.

Special Orders.—Applications have been made to the Electricity Commissioners for a Special Order by the Urban Electric Supply Co., Ltd., to extend its area of electricity supply so as to include certain parishes in the rural districts of Newbury and Kingsclere.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising Gloucester Corporation to supply electricity in the rural district of Gloucester, and the Torquay Corporation to supply within parts of the rural districts of Newton Abbot and Totnes.

Stourport. — Inauguration of Power Station. — The generating station of the Shropshire, Worcestershire and Staffordshire Electric Power Co. is to be formally inaugurated by the Premier and Mrs. Baldwin on June 2nd.

Stretford.—Loans.—The Urban District Council is to apply for sanction to the borrowing of £20,000 for l.p. mains and services, and £8,520 for h.p. mains.

Torquay.—Electricity Extensions.—The Corporation is to erect a sub-station at Thatcher Pines, and lay h.p. and l.p. mains, at an estimated cost of £3,361, in order to provide a supply of electricity to the Ilsham Marine Drive district.

Tunbridge Wells.—Electricity in Bulk.—The Town Council has arranged to give a bulk supply of electricity to the Crowborough District Gas and Electricity Co. for a period of ten years, terminable by 24 months' notice, such notice not to be given without the consent of the Electricity Commissioners. The price is to be £2 5s. per kVA of maximum demand, plus 1d. per kWh.

Wakefield.—Street Lighting.—After considering a report of the electrical engineer, together with a statement by the street lighting superintendent, showing the comparative costs of gas and electricity for street lighting, the Corporation has decided to invite an expert to report on the street lighting system, and outline the best methods of development under local conditions. Data are to be obtained showing the complete costs of gas and electricity for lighting along streets where mains are already laid.

Tramway and Railway Notes.

Bournemouth.—Loan.—The Town Council is to apply for sanction to a loan of £18,000 in connection with the doubling of the tramway track from the Cemetery Junction to the top of Rochmond Hill.

Continental.—Italy.—The newly-electrified line between Pistoia and Bagni-della-Perretta will be opened on May 24th. The plant is practically completed and the rolling stock is on the spot. On October 28th the entire electrified line between Florence and Bologna will be formally inaugurated.—*Reuter's Trade Service* (Milan).

The length of electrified railways in Italy at the end of 1926 was 1,093 km. To this should be added the Pistoia-Perretta line and 132 km. from Bologna to Florence mentioned above. Of the lines constructed, 605 km. are double track and 488 km. single. The traction system is 3-phase, 3,700 V, with two aerial phases, except on the Milan-Varese-Porto Ceresio and the Naples-Pozzuoli lines, which are operated with d.c. at 650 V. Included in the above total is a line of 11 km. in French territory operated on account of the Paris-Lyons-Mediterranée Company.—*Reuter's Trade Service* (Rome).

East Ham.—Doubling of Track.—The Corporation Tramways Committee has had under consideration the report of a conference convened by the L.C.C. relative to the cost of the duplication of the tramway track at the "Bull" Corner, Barking, and recommends that the action taken by the delegates in agreeing to bear a proportion of the annual capital charges of reconstruction be approved, subject to the other authorities concurring with the proposals.

India.—Railway Electrification.—The development of the suburbs of Calcutta and the expansion of the city with a view to relieving congestion and to counteracting soaring house rent has been the concern of the Government of Bengal for nearly a decade. According to *Indian Engineering*, a comprehensive scheme for the electrification of the suburban railway system has been drawn up by the Eastern Bengal Railway and submitted for consideration to the Railway Board. No details of the scheme, however, are at present available. If approved by the Railway Board, the scheme will be submitted to the Secretary of State in Council for sanction.

Japan.—Electric Railway Schemes.—It is reported that the Nügata Electric Co., Ltd., has applied for a charter in connection with a scheme for the construction of an electric railway between Nügat and Yahiko, a distance of 21 miles. The cost of the scheme is estimated at 2,000,000 yen.

The Municipal Council of Tokio has applied to the Government for sanction to commence work on the construction of underground railways in the city, at a cost of 17,000,000 yen.

With regard to the electrification of lines of the South Manchurian Railways, it is understood that it has been finally decided to electrify the Dairen, Fushun, Aansan, and some other lines, commencing the work of construction in the fiscal year of 1928-1929.

Liverpool.—Loan Sanctioned.—The Corporation Tramways Committee has received sanction to the borrowing of £100,000 for the erection of a new car shed, works and offices at Edge Lane.

Wolverhampton.—Transport Development.—According to the *Electric Railway and Tramway Journal*, important developments in connection with the transport facilities between Wolverhampton and the Black Country are foreshadowed in an announcement that the Corporation has come to an agreement with the Wolverhampton and District Electric Tramways Co., Ltd., for the purchase of the company's interests from the borough boundary to Bilston, to the Bull Stake, Darlaston, and also from the Square at Willenhall to the Fighting Cocks, which is the borough boundary on the Dudley route from Wolverhampton. It is proposed to remove the existing tramway track from these roads, to introduce railless cars on the route to Darlaston, and to run motor-omnibuses on the section from Willenhall to the Fighting Cocks. This is in accordance with the policy of the Corporation to scrap the tramway on all routes, and to substitute either railless cars or omnibuses.

Telegraph and Telephone Notes.

Belgium.—Long-distance Telephony.—At the annual meeting at Charleroi of the Société des Ateliers de Constructions Electriques, the chairman reported that good progress was being made with the new telephone cables for the Belgian Post and Telegraph Authorities. That between Brussels and La Panne was completed some time ago and had successfully passed all the tests. The Brussels-Rosendael cable had been laid, and that between Brussels and Lille was well in hand. As a result of the successful carrying through of this contract the company had now been entrusted with the order for the telephone cables between Brussels and Luxemburg, and between Brussels, Charleroi, and Mons.

New Zealand.—Telephone Repeaters.—The increase in telephone traffic and a demand for telephone communication between the two islands comprising the Dominion have resulted in the laying of the first submarine telephone cable across Cook's Strait, which separates the North and South Islands. Siemens Brothers & Co., Ltd., of Woolwich, have supplied a four-core, continuously-loaded, gutta-percha insulated cable, which has been laid between Wellington and Seddon (a small station on the South Island), its length being 45 nautical miles. It will provide three telephone circuits: two physical and one phantom. To enable the cable to be linked with the long trunk land lines on either side, Siemens Brothers also supplied telephone repeater stations, one at Seddon and one at Wellington. They are two-wire cord circuit repeaters, and can be connected to any of the trunk wires radiating from the cable-terminating stations. Although the installation of this equipment is as yet far from complete use was made of it recently in connection with the visit of

the Duke and Duchess of York to the Dominion, when conversations took place between Wellington and Dunedin, over 400 miles to the south, at 36 hours' notice.

Russia.—AUTOMATIC TELEPHONY.—In the latest bulletin issued by the L. M. Ericsson Co., of Stockholm, Sweden, it is stated that the Company is to build and equip a 10,000-line exchange for the city of Rostov in South Russia. At present the Company has under construction no fewer than 18 automatic exchanges, of which three are in Sweden, one in Norway, one in Holland, eleven in Italy, one in Poland, and one in South Africa.

The Telephone Service.—GROWTH IN 13 YEARS.—Figures showing the growth of the telephone service since the Post Office took it over in 1912 have just been issued by the Board of Trade. When the Post Office took charge, there were 730,821 stations (telephone instruments) in use, and 797,000,000 local calls were made. In 1925 and 1926 there were 1,390,156 stations and 1,016,000,000 local calls were made. This figure represents a lower calling rate per telephone than that of 1912. The war caused a heavy decrease in the number of local calls: in 1913 there were 834,000,000 calls, but during the four war years they fell to 776; 701; 700; and 716 millions respectively. In the first year following the war they jumped back to 848 millions. Trunk calls, on the other hand, rose during the war period from 38,200,000 to 46,500,000. The income from the service increased steadily over almost the whole period from 1912 to 1926, and was only slightly affected by the war: in 1911-12 it was £5,847,410, and in 1925-6 it was £16,163,206. The only set-back was a drop of nearly £1,000,000 immediately after the war, which fall was recovered in two years.

NEW ANGLO-BELGIAN CABLE.—The Postmaster-General announces that the laying of the new Anglo-Belgian telephone cable has been completed, and that improved service is now available between this country (both London and the provinces) and all the principal towns in Belgium. On May 15th the then current charges ceased to apply, and new rates and conditions of service came into force.

Transatlantic Radio-telephony.—COMMITTEE'S REPORT.—The report of the Committee on Transatlantic Wireless Telephony (H.M. Stationery Office, Cmd. 2,858, price 2d. net) outlines the history of the service, which was opened for commercial public use on January 7th, 1927. The Committee, which has completed its work, recommends that the improvement of the present partially secret system should be pressed to a conclusion by the British Post Office engineering staff in consultation and co-operation with the American Telephone and Telegraph Co.

United States.—UNUSUAL CABLE FAULT.—On April 3rd, the Alaska cable failing to function, the Government sent the cable ship *Dellwood* out from Seattle to locate the trouble. After several days' effort she located the break off Cape Flattery on April 7th, and the line was picked up in 600 fathoms of water. Attached to the twisted wires of the cable was a twenty-ton whale, which had severed the wires in several places and in some manner caught them fast in its jaws. The cable ship cut the whale loose and cast it adrift, but brought back several sections of the damaged cable to Seattle; the strands were so badly twisted that it was almost impossible to separate them. According to *T. & T. Age*, this is the second recorded case of a whale breaking an ocean cable, the Seattle-Sitka cable having previously been broken in the same manner 22 years ago.

Radio Notes.

Another "Wireless Exchange."—SECOND IN ENGLAND.—The second wireless "exchange" to be licensed in this country has started operations at Southsea. The owner is Mr. J. Tubb, who, with a four-valve receiver, is supplying his neighbours with broadcast programmes from the Daventry station at a charge of 1s. 6d. a week. The other exchange is at Southampton, and has been working for nine months. Would-be subscribers have first to obtain a wireless licence and to pay for a loud-speaker and a switch supplied to them by Mr. Tubb. The house is wired free of charge, and, by an automatic device, the first subscriber to switch on his loud-speaker switches on the valves of the receiver. So successful is the scheme, says the *Morning Post*, that the Southsea Corporation has granted permission for a line to be taken over a street, where it connects with another block of houses. Such schemes are working with success in New York.

Hungary.—LICENCES.—In March, 1927, the number of wireless subscribers in Hungary was 70,899, an increase of 1,868 during the month.—*Reuter's Trade Service* (Budapest).

United States.—RECEIVING SETS ON FARMS.—There are now 1,252,126 farms in the United States equipped with wireless receiving sets, the Radio Service of the Department of Agriculture announces in a report on its past season's work. The estimate was based on returns made by country agricultural agents, and showed a 126 per cent. increase on the estimated 553,008 sets on farms in July, 1925. Iowa led the States with 99,990 farm radio sets, or an increase of 160 per cent. since 1925. Indiana came second with 81,144, but this figure represented an increase of 377 per cent., as compared with the 1925 figures. American farmers are not using wireless merely for entertainment; the day's work is now planned according to the weather forecasts sent out by the Weather Bureau and received by radio much more quickly than was formerly possible; market reports issued by the Federal Bureau of Agricultural Economics are also eagerly followed.—*Reuter's Trade Service* (Washington).

PART-TIME STATIONS.—Twenty-eight of the forty-six broadcasting stations authorised to operate in New York City under temporary permits will be obliged to divide time, according to an announcement of the Federal Radio Commission. Fifty-seven stations were operating in New York City when the Commission took up its duties. Nine failed to apply for temporary permits. All stations in the New York area are now licensed at separation intervals of a minimum of twenty kilocycles, says *World Radio*, and in many cases thirty, forty, and fifty kilocycles' separation between stations has also already been arranged.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Aberdare.—June 2nd. Electricity Department. E.h.p. overhead and underground main and branch transmission lines. (May 13th.)

Armagh.—June 7th. Urban District Council. Heavy oil engine generating plant, underground and overhead mains. (May 13th.)

June 7th. A.c. switchboard and overhead travelling crane. (See this issue.)

Australia.—MELBOURNE.—July 5th. State Electricity Commission. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*

July 4th. 66,000-V and 22,000-V insulators for the Yallourn brown coal scheme. (May 6th.)

June 28th. Postmaster-General's Department. Jacks, switchboard instruments, &c. (B.X. 3474.)*

SYDNEY.—June 20th. Municipal Council. Turbo-alternators for Bunnerong power station. (B.X. 3443.)*

Basingstoke.—June 7th. Corporation. Electrical installations at the Council's housing estate (approx. 1,015 wiring points). (May 13th.)

Chile.—SANTIAGO.—July 18th. Chilean State Railways. Materials for electric lighting and power (Group 30). Materials for electric lighting of locomotives and coaches (Group 32). August 22nd. Signalling, telegraph and telephone supplies (Group 36.) (C.X. 2271.)*

Darlington.—May 23rd. Electricity Committee. One 500-kW rotary convertor, with transformer. (May 6th.)

Dublin.—May 23rd. Electricity Department. Pipework for a 5,000-kW turbo-alternator. (May 6th.)

Dundee.—May 25th. Council Fire Department, 27 cast-iron fire-alarm telephone boxes, the price to include delivery at the Central Fire Station.

Edinburgh.—May 23rd. Education Authority. Electric installation at Abbeyhill (New), Dalry, and Victoria schools. Schedules from the offices of the Authority.

Egypt.—CAIRO.—June 4th. Egyptian State Railways, Telegraphs and Telephones, Chief Inspecting Engineer, Queen Anne's Chambers, S.W. Underground cables (approx. £E12,000 to £E13,000).

May 28th. Ministry of Education. Electrical equipment for Beni Suef Trades School. (B.X. 3488.)*

Epsom.—Electricity Department. E.h.p. cable. (May 6th.)

Glasgow.—May 23rd. Corporation. Electric lighting installation for McNeil Street Rehousing Scheme. Specifications, &c., from Mr. R. B. Mitchell, engineer, 75, Waterloo Street.

Grimsby.—June 4th. Electricity Department. Sub-station equipment. (May 13th.)

Hull.—June 16th. Electricity Department. Steel coal bunker and conveyor housing. (See this issue.)

India.—June 14th. India Stores Department, Simla. Generating sets for Fyzabad power station. (B.X. 3486.)*

Ilford.—June 1st. Electricity Department. E.h.p. and l.p. paper-insulated cables. (See this issue.)

London.—H.M. Office of Works.—May 27th. Incandescent electric lamps. (See this issue.)
June 3rd. 5-ton gantry crane. (See this issue.)
Hammersmith.—June 1st. Electricity Department. Cables, transformers, h.p. switchgear and ironclad feeder switchgear. (See this issue.)

Manchester.—May 30th. Electricity Department. L.p. valves for circulating water system, two electrically-driven and one steam-driven boiler feed pumps. (May 13th.)
June 1st. Education Committee. Electric lighting installation at Levenshulme High School for Girls. Specification, &c., from Education Offices, Deansgate.

Middleton.—May 23rd. Wiring for electric light, Rhodes Council School. Specification from borough electrical engineer, Corporation Street, Middleton.

New Zealand.—Auckland.—July 4th. Auckland Electric Power Board. Switchgear. (B.X. 3471.)*

Pudsey.—June 14th. Electric light installation at the School of Art. Specifications from Education Department, County Hall, Wakefield.

Richmond-on-Thames. — May 23rd. Municipal Water Department. Electrically-driven centrifugal pump, with motor, &c. Mr. H. P. Williamson, engineer, Riverside.

Scarborough.—June 3rd. Corporation. Installation of electrical pumping plant in duplicate for the new Irton water scheme No. 2. Specifications (£5) from Dr. H. Lapworth, engineer, 25, Victoria Street, S.W.

South Africa.—Cape Town.—June 30th. South African Railways and Harbours Board. Gasfilled and vacuum lamps for 12 months. (B.X. 3518.)* Telegraph material (B.X. 3519.)*

Stirling.—May 27th. Corporation. Electrical work at 96 houses. Specifications from Mr. Andrew H. Goudie, burgh surveyor.

Tynemouth.—June 11th. Electricity Department. One voltage regulating transformer. (May 13th.)

Whitley.—Electricity Department. One 1,000-kW turbo-alternator, with condenser, pumps, air filter, &c.; one 200-kW semi-Diesel or heavy-oil engine alternator. (May 6th.)

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Barnes.—Urban Council. Accepted:—
Duplicate 1,000-kW rotary convertor panel (£230).—English Electric Co., Ltd.

Birkenhead.—Electricity Committee. Accepted:—
Panel at Sungleton Avenue sub-station (£117).—Ferguson, Pailin, Ltd.
Cubicle at Heath Road sub-station (£143).—Metropolitan-Vickers Electrical Co., Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—
Six 25-kVA transformers (£266).—British Electric Transformer Co., Ltd.

Bury St. Edmunds.—Electricity Committee. Accepted:—
Feeder cable (£690).—Callender's Cable & Construction Co., Ltd.

Croydon.—Libraries Committee. Recommended:—
Electric light installation, Ashburton library (£122).—A. E. Cook.
Electricity Committee. Accepted:—
Artesian well (£1,108).—Le Grand Sutcliffe & Gell, Ltd.

Dartford.—Electricity Committee. Recommended:—
Supplying and laying cable at East Hill (£1,953).—Power Lines Construction Co., Ltd.

Douglas (I.O.M.).—Electricity Committee. Accepted:—
Contract for mains (£6,259).—Siemens Bros. & Co., Ltd.

Dundee.—Corporation Cleansing Committee. Accepted:
Installing electric light at Broughty Ferry Cleansing Depôt.—Marshall, Hutton & Co.

East Ham.—Electricity Committee. Recommended:—
Cable (£4,314).—Enfield Cable Works, Ltd.
Four feeder panels (£326).—Bertram Thomas.

Gravesend.—Electricity Committee. Recommended:—
Removing existing 200-kW units from Queen Street to El Teb and providing a 600-kW induction regulator controlled extension at Queen Street (£4,664).—Hewittic Electric Co., Ltd.

Hull.—Education Committee. Accepted:—
Installation of electric light at Park Avenue School (£376).—Alexander Shaw & Sons.

Ilford.—Electricity Committee. Recommended:—
100-kVA transformer (£116).—Foster Engineering Co., Ltd.
500-kW convertor with automatic control and B.E.T. type transformer (£3,441).—Crompton & Co., Ltd.
1,000-kW rotary convertor (£6,608).—Metropolitan-Vickers Electrical Co., Ltd.
Pavement frames and covers.—W. T. Henley's Telegraph Works Co., Ltd.
Meters.—Edison Swan Electric Co., Ltd.; Ferranti, Ltd.; R. Hornby & Co., Ltd.; Landis & Gyr, Ltd.; and Measurement, Ltd.

India.—India Store Department. Accepted:—
26,775 inert dry cells.—Fuller Accumulator Co. (1926), Ltd.

Irish Free State.—Commissioners of Public Works. Accepted:—
Electric lighting installation at the Custom House, Dublin.—Gleeson, O'Dea & Co., Ltd.—*Irish Builder and Engineer.*

Lamp Contracts.—Renfrewshire Combination Hospital has placed a contract for metal filament lamps with Edison Swan Electric Co., Ltd.
The General Electric Co., Ltd., has received contracts from the General Post Office for 75,000 Robertson carbon-filament telephone switchboard lamps, and from Turton Urban District Council for a 12 months' supply of "Osram" metal-filament vacuum lamps.

Leeds.—Tramways Committee. Accepted:—
Electrical sundries.—Electric and General Stores, Ltd.; British Thomson-Houston Co., Ltd.; L. Andrew and Co.; Micanite & Insulators, Ltd.; Insulation Manufactures, Ltd.; and Hammett & Andrew.
Electrodes.—G. D. Peters & Co., Ltd.
Electricity Committee. Accepted:—
Cable (£2,465), Macintosh Cable Co., Ltd.; (£894), Enfield Cable Works, Ltd.
Parks Committee. Accepted:—
Three electric launches (£600).—R. F. Winder, Ltd.

London.—St. Pancras.—Contract and Stores Committee. Recommended:—
L.p. cable (£1,005).—Hackbridge Cable Co., Ltd.
H.p. cable (£224).—Siemens Bros. & Co., Ltd.; (£320) Standard Telephones & Cables, Ltd.
Davison patent flue dust collector (£1,895).—International Combustion Co., Ltd.
London County Council.—Education Committee. Accepted:—
Electric wiring and fittings at Drayton Park school (£290).—Bailey & Incledon, Ltd.
Bermondsey.—Maternity Committee. Accepted:—
Lighting plant at Fairby Grange Institution.—Broadwell Engineering Co.
Westminster.—Housing Committee. Recommended:—
Electric wiring and fittings at Drayton Park school (£290).—Rashleigh Phipps & Co.
Crown Agents for the Colonies. Accepted:—
Tram lighting cells in wood-lined containers.—Fuller Accumulator Co. (1926), Ltd.

Manchester.—Electricity Committee. Accepted:—
Two 250-kVA and three 500-kVA transformers.—Bruce Peebles & Co., Ltd.

Prestwich.—Highways Committee. Accepted:—
Electric lamps.—Edison Swan Electric Co., Ltd.

Swansea.—Education Committee. Accepted:—
Electric wiring, Sketty mixed school (£130), Cole & Day; Sketty infants' school (£135), H. Norman Kirk; Cwmbwrla school (£137), G. L. Ward & Co.
Electricity Committee. Accepted:—
Auxiliaries for 10,000-kW set (£1,805).—Hick, Hargreaves and Co., Ltd.
Steam-driven boiler feed pump (£585).—G. & J. Weir, Ltd.

Torquay.—Electricity Committee. Accepted:—
2,000-kVA transformer (£1,140).—C. A. Parsons & Co., Ltd.
Switchgear (£797).—British Thomson-Houston Co., Ltd.
50-ton travelling crane at Newton Abbot (£2,400).—Royce and Co.

Wakefield.—Electricity Committee. Accepted:—
Renewing battery of electric vehicle (£138).—Chloride Electrical Storage Co.

Wrexham.—Town Council. Accepted:—
Installing electric light at houses at Acton Park at £562.—William Bright.

Forthcoming Events.

Association of Mining Electrical Engineers (North of England Branch).—Saturday, May 21st. Annual general meeting.

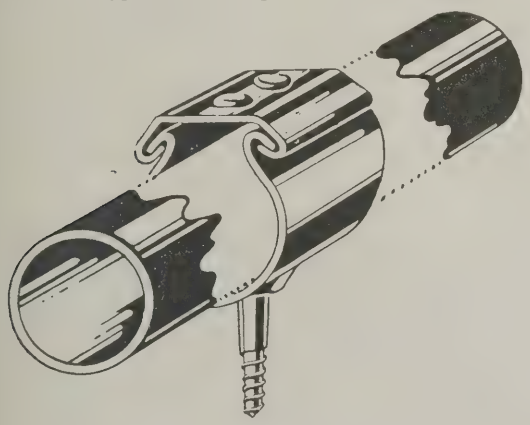
Faraday Society.—Wednesday, May 25th. 8 p.m. Annual general meeting.

Institute of Wireless Technology.—Wednesday, May 25th. 71, Kingsway, W.C.2. 7 p.m. Annual general meeting.

Incorporated Radio Society of Great Britain.—Wednesday, May 25th. Institution of Electrical Engineers, London. 6 p.m. "The Hot Wire Microphone and Audio Resonant Selection." Mr. G. G. Blake.

Institution of Production Engineers.—Friday, May 27th. 83, Pall Mall, S.W. 7.30 p.m. "Rate Fixing." Mr. J. Ronald.

Physical Society.—Friday, May 27th. Imperial College of Science, South Kensington, S.W. 5 p.m. Ordinary meeting.



Incorporated Municipal Electrical Association.—May 30th to June 4th. Buxton. Annual Convention.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the name and address of makers of the following:—

A "D" type conduit clip as illustrated below.

Notes.

The First European 380-kV Transmission Line.

With reference to the note under the above heading on page 765 of our May 13th issue, we understand that, while the hollow conductor has been calculated to prevent corona discharge taking place at 380 kV, its operating pressure will not be so high as that. The line will operate at 220 kV.

Fatalities.

Whilst employed at the Bridgend electricity works, Jack Power, a driver, recently came into contact with "live" apparatus and received a fatal electric shock.

Thomas Owen Thomas, assistant crane-driver at the Margam Iron and Steel Works, Port Talbot, received an electric shock which proved fatal.

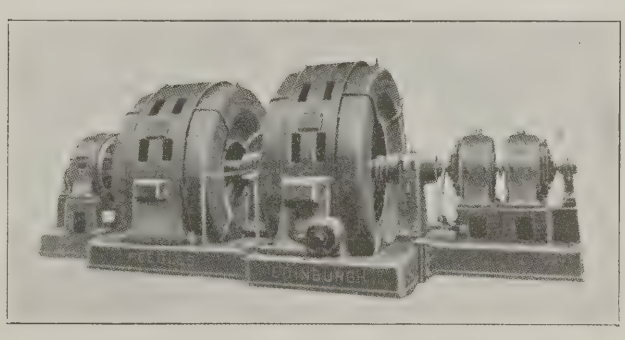
The L.C.C. Tramways.

At a recent meeting of the London County Council, Mr. C. W. Matthews discussed the estimates of the tramway undertaking showing an estimated net deficiency of £302,114 for the financial year 1926-27, and of £222,439 for 1927-28. *The Times* reports that Mr. H. Morrison maintained that the tramway undertaking could not be regarded simply as a commercial concern. It was a public service, which tended to keep all traffic fares down to a reasonable level. The present estimates were somewhat misleading, because they did not make it sufficiently clear to the public that repayment of debt was included in the deficit. Mr. J. D. Gilbert said that, taking the deficits of the last seven years, he found that, on deducting redemption of debt, there was really a profit on working. Last year's figures would have been much more favourable had it not been for the general strike. Mr. Angus Scott pointed out that the present competition made it impossible for the tramway undertaking to pay its way. It remained to be seen what help the Ministry of Transport would afford, for it was unwise to extend the system unless there was some guarantee of a reasonable return.

Appointments Vacant.

Lady demonstrator (70s.) for the Liverpool Corporation Electricity Supply Department. Junior charge engineer for the Borough of Loughborough Electricity Department. Colliery electrician (£400) for the Government of Nigeria. Deputy borough electrical engineer (£605), for the Corporation of Hastings Electricity Department. Head of Electrical Engineers' Department (£500), for the Rutherford Technical College. (See our advertisement pages to-day.)

I.E.E. Annual Meeting.



CORRECTION.—In the report of the annual general meeting of the Institution of Electrical Engineers on page 778 of our May 13th issue the remarks of Mr. W. A. Erlebach, B.Sc., M.I.E.E., were ascribed to Mr. Hurlbatt. The error is regretted.

Electrical Equipment for an Airship.

An interesting contract for the complete electrical equipment of a new airship, which will be much larger than any hitherto constructed, has been placed with the Metropolitan-Vickers Electrical Company. The new giant dirigible is the R100, which is being built at North Howden, Yorkshire, by the Airship Guarantee Company, Ltd. It will have a capacity of 5,000,000 cubic feet of gas, and accommodation will be provided for 100 passengers and 50 crew. The electrical equipment is to provide a service for compartment and navigation lighting, compartment heating, cooking and water heating, and wireless signalling. A direct-current system has been adopted, and a special scheme has been worked out by the Metropolitan-Vickers Company to meet the unusual requirements, in which considerations of safety and minimum weight of apparatus are of paramount importance. Two 25-kW generators are to be installed in the machinery cars, where they will be driven by the small petrol engines which will be used for starting the main driving engines of the ship. Casings of apparatus and most of the fittings throughout the ship will be of light alloys, while for the wiring system a cable with conductor and armouring sheath, both of aluminium, specially manufactured by Messrs. Glovers, Ltd., will be used. Safety features include a special protective system which will not only guard against damage to the equipment by overload or short circuit, but also ensure that open sparking cannot be produced by any fault on the line. The special construction of the wiring cable contributes to this protection. The armouring of the cable is strong, yet capable of considerable extension, so that in the event of undue strain the conductor will break first and the armouring will contract round the point of fracture, thus preventing any external spark. Flameproof casings will be used for all apparatus and fittings.

Electricity Supply in South Wales.

In connection with the description of the Upper Boat generating station of the South Wales Electrical Power Distribution Co. in our issue of May 6th, we are informed that Messrs. Bruce Peebles & Co., Ltd., were the manufacturers of the two frequency changers installed to give a 50-cycle supply to the Great Western Railway Docks. Each of the sets is designed to develop 2,000 kW, their speed being 375 r.p.m., and is provided with a starting motor and two exciters, one

Peebles 2,000-kW Frequency Changer.

for each machine. The synchronous motors operate on a 3-phase, 25-cycle, 11,000-V circuit at unity power factor, and the alternators develop 2,500 kVA at 0.8 power factor and generate 3-phase, 50 cycles at 11,000 volts. The alternators are provided with motor-operated stator rocking gear, the motor for operating which can clearly be seen in the accompanying illustration. The starting motor develops 300 b.h.p. and operates on a 3-phase, 25-cycle, 440-volt circuit, its rated speed being 500 r.p.m.

Electrical Engineers' Ball.

A meeting of the General Committee of the Electrical Engineers' Ball was held on May 13th at the Institution of Electrical Engineers. The hon. treasurer, Mr. J. E. Kingsbury, reported that the financial result of the 18th annual ball held on February 11th compared very favourably with the returns of previous years. The Committee decided to vote the sum of £150 to be divided equally between the Institution of Electrical Engineers' Benevolent Fund and the Electrical Trades Benevolent Institution. As on the two previous occasions, the number of tickets issued had to be strictly limited to the capacity of the accommodation, the number of guests present at the Ball being approximately 700.

"Creeping" Cables.

In a short paper recently presented by Mr. F. E. Bentley to the Mersey and North Wales (Liverpool) Centre of the Institution of Electrical Engineers, he points out that the creeping of lead-covered telephone and telegraph cables along the underground multiple-way earthenware ducts and iron pipes into which they are drawn for protection has been the cause of damage to many cables. The movement varies over a length of several hundred yards; for instance, 18 in. in some parts and from 3 to 12 in. in others. It is arrested by right-angle bends in the duct track and by the lead-sleeve joints of the cable butting against the mouths of the ducts in manholes; the joints then become faulty owing to the strain imposed on the lead sheathing, which eventually cracks.

In some cases it is possible that the method of connecting loading coils to the cables is responsible for pronounced creep: the cable is divided into sections 1.6 miles in length, and it is probable that less movement would take place if the joints in the loading-coil manholes were straight-through, the sections of cable thus forming one long cable without breaks. Creep may take place both in and against the direction in which traffic normally passes along the road under which the cable is laid; one such case was apparently due to ground subsidence shortening the duct track, the surplus cable being thereby pushed into the manhole. Creeping of the paper-covered copper conductors inside the lead sheath is somewhat unusual; in one case the conductors moved bodily from ½ to ¾ in. into a joint in the lead sleeve, but no movement out of the other end of the joint could be detected, whilst the next joint (160 yards away) was normal and there was no evidence that the pipe or lead sheath had moved.

Covering the ducts with a layer of concrete is an expensive way of overcoming the trouble, but a less costly method is the following:—A lead disk and shoulder of metal are wiped on to the cable sheathing about 8 in. from the mouth of the duct in manholes, and a split hard-wood block is fitted round the cable between the disk and duct mouth, thus forming an anchoring device. A suggested method (not yet proved to be effective) of preventing the copper conductors creeping inside the lead sheath, is to carefully dress the sheathing down on to the conductors all round the cable on each side of the joints.

The following conclusions have been arrived at:—Most creeping appears to be directly due to vibration set up by heavy traffic over the road under which the cable is laid; movement takes place in the direction of the traffic and appears to be independent of gradient, sometimes taking place uphill. Creeping is more pronounced in earthenware ducts than in cast-iron pipes, the latter being more rigid. Less movement may be anticipated in a duct track that follows a winding road, and there is no remedy for that due to ground subsidence.

The Photometric Department of the N.P.L.

On April 26th a visit was paid by members of the Illuminating Engineering Society and friends to the National Physical Laboratory. On arrival the party were received by the director, Sir Joseph Petavel, after which they were conducted by Mr. Walsh and his staff over the Photometric Section of the Laboratory. Much interest was taken in the equipment of the laboratories, the arrangements for testing standard lamps, the new 10-ft. diameter integrating sphere, &c. Visitors had also an opportunity of examining some of the special apparatus used for tests of radium paint, atmospheric absorption, the reflection of light by materials for road surfaces, &c.

After a short interval for refreshments a paper was read by Mr. J. Buckley, reviewing the work of the Photometry Department. Dealing with the methods of overcoming the difficulties of comparing lamps which differed in the colour of their light, he said that, unfortunately, it had not yet been found possible to apply gasfilled lamps as standards, though some progress in that direction had been made. Other refinements in photometry included the use of photo-electric cells, the ingenious application of which, to ensure lamps being operated at the same colour-temperature, was particularly interesting. The routine of lamp-testing was described, and the author referred to a number of special investigations, such as the design of picture galleries to secure adequate daylight illumination of the walls and avoidance of reflections in the glass of pictures; the study of ships' navigation lights for the Board of Trade; and the search for a satisfactory primary standard of light.

Electrical Association for Women.

On May 11th the annual business meeting of the Association was held at the Hotel Cecil, London. The annual report was proposed by Lady Brooks, O.B.E., J.P., president of the Birmingham and Midlands Branch, and seconded by Mr. J. W. Beauchamp, both of whom referred to the wonderful progress made by the Association. Short reports of local activities were given by Miss R. F. Kennedy, hon. secretary of the Glasgow and District Branch; Mrs. A. L. Hayes, hon. secretary of the Birmingham and Midlands Branch; Miss Entwisle, hon. secretary of the Manchester and District Branch; Miss A. A. Stemp, hon. secretary of the Cheltenham Branch; Mrs. J. Tyler, hon. secretary of the South Wales and Monmouth Branch; and Miss Anna Holm, hon. secretary of the North-East Coast Branch.

The annual report stated that the past year had been one of great development and afforded overwhelming justification for the existence of the Association. Its growth had been phenomenal. The branches at Glasgow, Birmingham, and Manchester had added very considerably to their membership, and three new branches had been formed at Cheltenham, Cardiff, and Newcastle. Many lectures had been given and visits paid to electrical shops and factories; requests from various other organisations for lectures on "Electricity in the Home" and similar subjects, had also been complied with, and a liaison had been established with the Association of Teachers of Domestic Science.

In order to cope with the needs of women working in electrical shops and showrooms, a series of evening lectures was held during the winter months, with the co-operation of Mr. Beauchamp, of E.D.A., and Mr. Bush, of E.L.M.A., and a committee was formed to endeavour to evolve a scheme which would help the woman in the electrical industry to become more efficient and useful in her work. With a view primarily to training suitable girls for work in connection with the domestic developments of electricity, a syllabus had been drawn up which had been approved by the Headmistresses' Committee, and which was being introduced into the Chelsea and Battersea Polytechnics.

The Association's journal, *The Electrical Age for Women*, already had a large circulation. Evidence of interest in the work of the Association had reached it from America, Canada, South Africa, Japan, Germany, and Austria, and requests had come from Sweden and Southern Ireland for help in forming similar associations.

Alderman Mrs. Hammer had continued to act as chairman of the Council and the Executive and Finance Committees, and her great knowledge had been invaluable to the Association. Thanks were accorded to Mr. Cramb, of the I.M.E.A., and Miss Lanfear, for the very great assistance which they had given in arranging special meetings of interest to women at their annual Convention.

After the luncheon, reported on p. 814, over 150 members visited Magnet House, by kind permission of the General Electric Company, when a lecture was given by Dr. Porter, medical officer of health for St. Marylebone, on "Public Health Regulations," with special reference to the preservation of food. Mr. W. H. Roberts and Mr. Creasser, of the G.E.C., explained the principles of refrigeration. The members were entertained to tea by the company, and afterwards visited the Electric Bungalow.

On Thursday morning, at the invitation of Mr. H. H. Berry, the members visited Touchbutton House, Newman Street, where they were shown a replica of the new electric grate to be installed in the Piccadilly home of the Duchess of York. The members were also interested in the many beautiful examples of Mr. Berry's art in retaining the charms of antiquity and adding to them the modern comforts of electricity. Mr. Berry's hospitality was very much appreciated.

In the afternoon the members visited the Woolwich works of Standard Telephones & Cables, Ltd., where they were received by Mr. Martin, the works manager, Mr. Eve, and Mr. Goodburn. They were conducted through the works and saw the various processes in the manufacture of telephone cables and large electric cables. Much interest was shown in the 450,000-V testing plant recently installed. Afterwards the members visited the Eltham housing estate of the Woolwich Borough Council, where they were met by Mr. Keats, borough electrical engineer, and a representative of the Housing Committee, and inspected several of the "all-electric" homes. On a Sunday morning the maximum load for cooking purposes alone on this estate amounts to 1,400 kW, and last Sunday the domestic load was greater than the evening lighting peak load for the whole of the 30 years' history of the undertaking.

The Eclipse of the Sun.

A lantern lecture on the total eclipse of the sun on June 29th (the first visible in England for 200 years) will be given by the President of the Royal Astronomical Society (Rev. T. E. R. Phillips), on Friday, May 27th, at 8 p.m., at the Polytechnic, Regent Street, in aid of King Edward's Hospital Fund for London. The price of admission is 1s. 6d.; seats numbered and reserved, 4s.

An Electro-Medical Department at Glasgow.

An electro-medical department is being introduced at Stobhill Hospital by the Parish Council, at a cost of £20,427. The department will embrace the latest developments for the treatment of diseases by means of electricity.

The Paris E.h.p. Electrical Conference.

Good progress is being made with the preliminary arrangements for this meeting, which is to be held at the end of June. The present indications are that over 200 foreign representatives will be present from 28 countries, and 65 papers are to be discussed. The English members at present number just over 20; however, as was the case last year, it is probable that the numbers will be considerably augmented (over 40 were present last year). Applications should be made to the secretary of the Institution of Electrical Engineers, London. The British official delegates are Messrs. W. B. Woodhouse (chief delegate), J. R. Beard, P. V. Hunter, R. Borlase Matthews, and C. Rogers.

Cause and Effect.

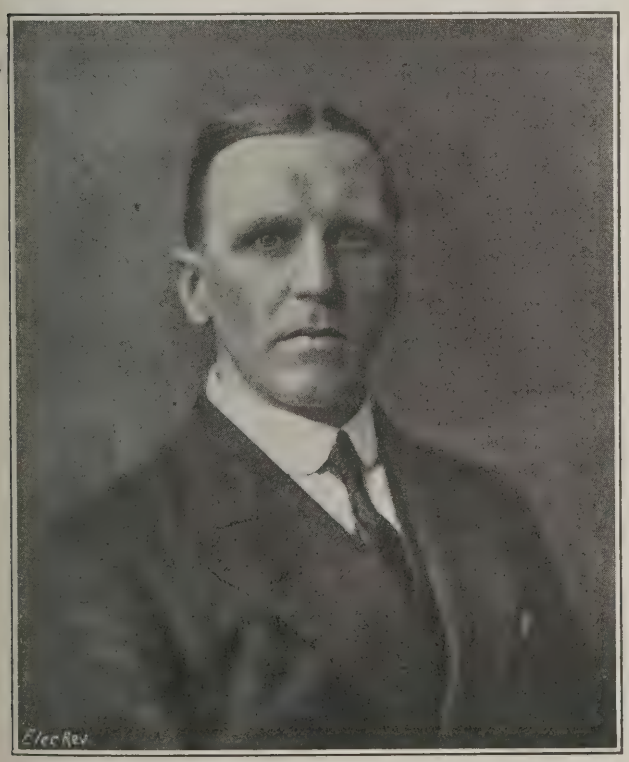
I am told of a lady whose illness was diagnosed by her doctor as acute gastritis. She at once declared that she knew the cause of the trouble. She had lately had her meals cooked on a gas range, instead of on the coal one to which she had always been used!—Peter Simple, in the *Morning Post*.

Institution Notes.

Institution of Civil Engineers.

At the annual general meeting, held on May 10th, the result of the ballot for the election of officers was declared. The president-elect is Mr. E. F. C. Trench, C.B.E., M.A., B.A.I. Amongst the vice-presidents are Sir Archibald Denny, Bart., Sir John F. C. Snell, G.B.E., and Mr. G. W. Humphreys, C.B.E.

Royal Institution.



A general meeting of the members was held on May 9th. Sir J. J. Thomson was elected Honorary Professor of Natural Philosophy, and Sir Ernest Rutherford Professor of Natural Philosophy. The chairman announced that the president, the Duke of Northumberland, had nominated, amongst others, Sir Dugald Clerk and Sir Charles Parsons as vice-presidents for the ensuing year. Mr. P. V. Hunter, Dr. Samuel Insull, and Mr. Charles P. Sparks were amongst the members elected.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements

Messrs. COUZENS & BROWN, consulting engineers, announce that, consequent upon the death of Captain REGINALD J. WALLIS-JONES, who was the sole surviving partner of the firm of Wallis-Jones & Dent, consulting engineers, they have taken over the business of the firm, and all work and correspondence will be attended to by them at 9, Old Queen Street, S.W.1.

Mr. JOHNSTONE WRIGHT, who is leaving Belfast to join the staff of the Central Electricity Board, and whose portrait accompanies these notes, was educated at the Perth Academy and the Glasgow Technical College. He entered business by joining Messrs. Duncan Stewart & Co., Glasgow, and received an all-round practical training. He then went to the British Electric Plant Co., Alloa, where he took charge of the power plant supplying the works and town. Later he went over to the works testing department and was subsequently in charge of outside contracts. One of his principal jobs was the electrification of the Moss End steelworks of Messrs.

Abernethy] [*Belfast.*

Mr. Johnstone Wright, M.I.E.E., M.I.Mech.E.

Stewarts & Lloyds, including power station and works equipment. Leaving Alloa, he became chief assistant engineer at Oban, and in December, 1906, he joined the staff of the Cleveland and Durham Electric Power, Ltd. He spent 13 years altogether with the North-East Coast Power Companies, first as clerk of works and then as constructional and mechanical engineer during the development of the waste heat power stations in the 800 sq. mile area of the Cleveland Co. Later Mr. Wright was appointed engineer and superintendent of the nine stations of the Cleveland and Associated Companies. He entered municipal service in 1919 as chief assistant engineer to the Bradford Corporation, and a year later became deputy city electrical engineer. In 1922 he went to Belfast as city electrical engineer and general manager, and did excellent work. During his tenure the sales of energy rose from 29 to 45 million kWh, and the net profit from £32,766 to £62,402, while the cost of production fell from 2.12d. to 0.769d. per kWh, and the average price obtained from 3.00d. to 1.89d. per kWh. He prepared a complete scheme for electricity generation and transmission throughout Ulster for presentation to the Commission on the Natural and Industrial Resources of Northern Ireland, in 1925. Last year, on behalf of the Belfast Corporation, Mr. Wright made a tour of the United States and Canada to study electricity supply development.

The marriage took place at Shanklin, on April 30th, of Mr. C. U. S. BUXENSTEIN, electrical engineer with the Isle of Wight Electric Light Co., and Miss ELSIE WHITE, daughter of Mr. G. White, of Shanklin. The presents included an 8-day clock from the staff at the Sandown and Shanklin generating station.

The Accrington Town Council has by 15 votes to 7 passed a resolution to the effect that the electrical engineer shall receive his full salary and bonus under the scale, and that the remuneration be further increased until the total sum is £991, according to the number of units consumed.

MR. F. H. BLAXLEY has joined the Electrical Trades Supply, Ltd., Great Charles Street, Birmingham, as Midland representative.

MR. C. PAIGE DICKINS, welfare supervisor at the Sentinel Wagon Works, Shrewsbury, has been appointed sales manager in Liverpool for the Stella Electric Lamp Co. He was the recipient of a number of presents from the Sentinel Works Sports Club, &c., Shrewsbury, on May 6th.

The Hastings Corporation Electricity Committee has received the resignation of Mr. RUSSELL F. FERGUSON, the borough electrical engineer, owing to the state of his health. The committee recommends that Mr. Ferguson be superannuated on September 30th next, and that in view of his long and faithful service extending over a period of 25 years, his special services in connection with works undertaken by him without engagement of a consulting engineer, and of the rapid development of the undertaking, he be granted the sum of £750. The committee recommends that Mr. ALFRED JAMES RYAN, who has held the position of deputy borough electrical engineer since November, 1922, and, for a period of nine years prior to that date, the position of chief assistant electrical engineer, be appointed to the post of borough electrical engineer at £850 per annum, rising to £1,000 per annum.

Mr. W. SINGER has been appointed transformer sales manager and engineer to Messrs. G. Dikkers & Co. (England), Ltd.

Mr. J. W. MASON, manager of the electrical department of Messrs. John Bell & Croyden, Ltd., has been appointed lecturer to the London Clinic, Ranelagh Road, Victoria, in connection with the training of nurses and post-graduate courses for the medical profession.

Mr. EDWIN T. POUND, charge engineer under Glasgow Corporation at Port Dundas power station, has been appointed resident electrical engineer by North Berwick Town Council for the burgh electric lighting works, the Council having recently acquired the local electric light and power undertaking.

Mr. L. ROMERO, who has been in the service of the Salford Corporation Electricity Committee for the past twenty years, latterly as mains engineer, has been appointed to succeed Mr. S. J. Watson as chief electrical engineer. He will take up his new duties on July 1st at a salary of £1,000 per annum, rising to £1,250. It will be remembered that Mr. Watson is taking the post of chief electrical engineer to the London and Home Counties Joint Electricity Authority. Mr. Romero is 44 years of age.

The marriage took place on April 8th at Ahmedmagar, India, of Mr. GEOFFREY EDWARD MARTIN, A.M.I.E.E., of the B.B. and C.I. Railway, and Miss CONSTANCE HEWITT, youngest daughter of Rev. George Hewitt, of Ahmedmagar.

Obituary.—MR. G. F. BURNHAM.—The death is announced from Rye of Mr. George Frederick Burnham, who was for many years on the staff of the Eastern Telegraph Co. abroad.

MR. F. NEWMAN.—We regret to record the death, which occurred on May 11th, at Ruislip, of Mr. Frank Newman, director of the Alliance Electrical Co., Ltd., and late of Drake and Gorham, Ltd.

MR. A. ROTHWELL.—The death occurred at Fern Leigh, Great Harwood, on May 11th, of Mr. Albert Rothwell, aged 30, electrician, a war victim who never fully recovered from an operation following active service. He was one of four sons of Mr. W. Rothwell, electrical engineer, Great Harwood.

MR. K. QUANEY.—The death took place on May 9th of Mr. Kyran Quaney, overhead and cable engineer of the Dublin Tramways Company. He was one of the first engineers appointed when the system was electrified.

MR. J. M. HARLOW.—The death took place on May 10th, at the age of 60 years, of Mr. John Marklow Harlow, founder of the business of J. N. Harlow & Co., electricians, &c., of Burton-on-Trent.

Will.—The late Lieut.-Col. P. W. D'ALTON left £3,233.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Luminad, Ltd.—Private company. Registered May 10th. Capital, £100 in 1s. shares. Objects: To acquire a licence from F. W. Gillard and D. L. West, and to carry on the business of designers, inventors, and manufacturers of and dealers in all kinds of illuminated, mechanical, revolving, swing, fixed, and other signs, and apparatus and processes for internal and external lighting, &c. The first directors are:—F. W. Gillard, 86, Wolfington Road, West Norwood, S.E.27, chartered civil engineer; D. L. West, The Golf House, Mitcham Road, Tooting Junction, S.W., electrical engineer (director of Grant and West, Ltd.); S. M. Stone, M.R.C.S., 86, Harley Street, W.1. T. R. Treloar signs as director and secretary. The first three named are permanent. Solicitors: F. B. Brook, 6 and 7, South Square, Gray's Inn, W.C. Registered office: Bridewell House, Bride Lane, E.C.4.

Electrical Units, Ltd.—Private company. Registered May 5th. Capital, £1,000 in £1 shares (250 7½ per cent. cumulative preference and 750 ordinary). Objects:—To adopt an agreement with H. T. Hall, J. Glanville, and J. F. Rose-Innes, and to carry on the business of manufacturers of wireless component parts and accessories, general and electrical engineers and contractors, tool makers, garage proprietors, &c. The first directors are:—H. T. Hall, 105, Valetta Road, Acton, W., electrical engineer; J. Glanville, 83, Studdridge Street, Fulham, S.W., electrical engineer; J. F. Rose-Innes, 12, Greville Road, N.W., electrical engineer; F. E. Spinner, 83, Studdridge Street, Fulham, S.W., mechanical engineer. Qualification, 25 shares. Secretary: J. F. Rose-Innes. Solicitor: H. W. Stirling, 23, Surrey Street, W.C.2. Registered office: 104, North Street, Edgware Road, N.W.8.

J. Holbrook and Tattersall, Ltd.—Private company. Registered May 13th. Capital, £2,000 in £1 shares. Objects: To acquire the business of an electrical engineer and contractor carried on by J. R. Holbrook as "J. Holbrook & Co.," together with the offices and lease and goodwill thereof at 6, Cheapside, E.C. The life directors are:—J. R. Holbrook, 35, Dalmally Road, Croydon, electrical engineer; J. Tattersall, Sorrento, Church Lane, Sutton-on-Sea, Lincs., gentleman (chairman); G. Langdale, The High Holme, Louth, Lincs. Secretary: J. Tattersall. Solicitors: Curwen Carter & Evans, 1, Grays Inn Square, W.C.1. Registered office: 6, Cheapside, E.C.

Finnell System, Ltd.—Private company. Registered May 13th. Capital, £3,000 in £1 shares. Objects: To act as sole agents, distributors, importers, exporters, manufacturers and dealers in the British Isles of and in electric cleaning machines, known as the "Finnell Electric Cleaner," manufactured and produced by the "Finnell Company of the U.S.A." The first directors are:—R. W. M. Wright, 10, Beach Lawn, Waterloo, Liverpool, agent and importer; L. Buck, 9, Belvedere Road, Great Crosby, Liverpool; J. P. Buck, 13, Marlborough Gardens, Carlisle; and R. W. C. Wright, 10, Beach Lawn, Waterloo, Liverpool (all permanent). Qualification: £100. Registered office: 33, Moorfields, Liverpool.

L. E. Wilson & Co., Ltd.—Private company. Registered May 11th. Capital, £2,000 in £1 shares. Objects: To carry on the business of contractors and suppliers of electricity, electrical, mechanical, and consulting engineers, manufacturers of and dealers in electrical, magnetic, telephonic, telegraphic, and other appliances and apparatus, &c. The first directors are:—L. E. Wilson, 62a, Mosley Street, Manchester, electrical engineer; Mrs. E. L. Wilson, "Ingleton," Bentinck Road, Altrincham; L. Fraser, 43, Radnor Drive, Wallasey, solicitor. The first two named are permanent. Qualification: £1 share. Solicitors: Doughty & Fraser, 43, Radnor Drive, Wallasey. Registered office: 62a, Mosley Street, Manchester.

Electric Bulk, Ltd.—Private company. Registered May 6th. Capital, £100 in 1s. shares. Objects:—To carry on the business of a financial, commercial, electrical, manufacturing, contracting, promoting, mercantile, and developing association, especially electrical matters, &c. The permanent directors are:—J. A. Rogers, 44, Oxford Terrace, W.2; E. J. Woods, 131, Wigmore Street, W.1. Registered office: 12, Mansion House Chambers, 11, Queen Victoria Street, E.C.4.

Liverpool Engineering and Condenser Co., Ltd.—Private company. Registered May 12th. Capital, £20,000 in £1 shares. Objects: To acquire the business of engineers and condenser manufacturers now or recently carried on as "The Liverpool Engineering and Condenser Co., Ltd.," at Perry Street, Liverpool. The first directors are:—H. B. Potter, Lee Cottage, Shawclough, Rochdale; J. E. Tweedale, Barcroft, Marland, Rochdale; W. Kayley, Chancery Lane, Ardwick, Manchester; R. Barnes, The Hollies, Milnrow, near Rochdale; J. W. White, Britain Road, Widnes; D. A. Quiggin, "Freshfield," Liverpool. Qualification: 10 shares. Solicitor: J. A. Hudson, 32, Lord Street, Rochdale.

Cleethorpes Radio Supply, Ltd.—Private company. Registered May 6th. Capital, £1,000 in £1 shares. Objects:—To acquire the business of electrical engineers, &c., heretofore carried on as the "Cleethorpes Radio Supply" at Cleethorpes, Lincs., and elsewhere. The first directors are:—E. Turner, "Birchwood," Clee Road, Cleethorpes; J. Poppleton, 79, Fuller Street, Cleethorpes; H. M. Stannard, "The Ramblers," Old Clee, Grimsby; Mrs. L. Turner, "Birchwood," Clee Road, Cleethorpes. Qualification, 1 share. Secretary: E. Turner. Solicitor: H. A. Howden, Prudential Chambers, Victoria Street, Great Grimsby. Registered office: 11, Short Street, Cleethorpes.

Carrington & Button, Ltd.—Private company. Registered May 13th. Capital, £6,000 in £1 shares. Objects: To acquire the business of an electrical and mechanical engineer, heretofore carried on by C. E. C. Button, at 144, High Street, Crewe, Cheshire. The first directors are:—C. E. C. Button, Lyndhurst, Wistaston, Nantwich; C. E. Gresty, Redmayes, Wistaston, Nantwich. C. E. C. Button is permanent managing director, so long as he holds 1,000 shares. Qualification of directors, 50 shares. Secretary: L. J. Button. Solicitors: Speakman & Hill, 35, Market Street, Crewe. Registered Office: 44, High Street, Crewe.

W. H. Porter & Co., Ltd.—Private company. Registered May 6th. Capital, £100 in £1 shares. Objects:—To carry on the business of manufacturers of, and dealers in wireless, telegraph and telephone instruments, equipment and material, sports outfitters, &c. The subscribers (each with 1 share) are:—C. H. Rosenthal, 12, Rotton Park Road, Edgbaston, merchant; J. Harris, 30, Wheeleys Road, Edgbaston, merchant. C. H. Rosenthal signs as managing director. Qualification, 10 shares. Solicitors: Joseph Cohen & Cowen, 14, New Street, Birmingham. Registered office: 44, Church Street, Birmingham.

Wilrose Co. (Birmingham), Ltd.—Private company. Registered May 6th. Capital, £100 in £1 shares. Objects:—To carry on the business of manufacturers of, and dealers in wireless, telegraph and telephone instruments, equipment and material, sports outfitters, &c. The subscribers (each with 1 share) are:—C. H. Rosenthal, 12, Rotton Park Road, Edgbaston, Birmingham, merchant; J. Harris, 30, Wheeleys Road, Edgbaston, Birmingham, merchant. J. Harris signs as managing director. Solicitors: Joseph Cohen & Cowen, 14, New Street, Birmingham. Registered office: 39, William Street, Ladywood, Birmingham.

M. Woolldridge (Wireless), Ltd.—Private company. Registered May 9th. Capital, £1,500 in £1 shares. Objects:—To acquire the business of a wireless apparatus and material manufacturer and dealer, and dealer in electrical goods now carried on by Mabel Woolldridge at 26 and 39, Lisle Street, W., as "M. Woolldridge." The permanent directors are:—Mrs. M. Woolldridge, 26, Lisle Street, Leicester Square, W.C.2.; P. Parry, 48, Leigh Road, Highbury, N.5. Registered office: 26, Lisle Street, Leicester Square, W.C.2.

Electrical Manufacturing and Plating Co., Ltd.—Private company. Registered May 12th. Capital, £300 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in electrical apparatus and machinery, electrical engineers, and plating experts, &c. The first directors are:—L. French, "Frogholt," Norbiton Avenue, Kingston-on-Thames; E. French, "Glenhaven," 84, Park Road, Kingston Hill, Surrey. Solicitors: Kenneth Brown, Baker, Baker, Lennox House, Norfolk Street, Strand, W.C.2.

Bryterlite Electrical Co.—Private company. Registered in Edinburgh, May 10th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers, agents, commission agents, and dealers in all kinds of electric lamps, globes, shades, wireless valves, &c. The first directors are:—B. Wober, 21, Nicholson Street, Glasgow, commission agent; G. Hope, 52, Carrington Street, Glasgow, clerk. Qualification: £10 shares.

Electrical Agencies (London), Ltd.—Private company. Registered May 10th. Capital, £1,000 in £1 shares. Objects: To carry on the business of agents, factors, and merchants for electrical fittings and appliances of all kinds, &c. The subscribers (each with one share) are:—G. Boggis, 7, Hornsey Lane Gardens, Highgate, N.6, clerk; Jessie M. Thorpe, 126, Salusbury Road, N.W.6, clerk; S. Gevirtzf signs documents as managing director. Solicitors: Landman & Foy, 22-3, Laurence Pountney Lane, E.C.4.

Official Returns of Electrical Companies.

Peter Curtis, Ltd.—Capital, £25,500 in 13,000 7 per cent. cumulative preference and 11,500 7 per cent. preferred ordinary shares of £1 each and 20,000 deferred shares of 1s. each. Return dated March 28th, 1927. 11,455 preference, 11,500 preferred ordinary, and 20,000 deferred shares taken up. £3,000 paid on 2,000 preference and 1,000 preferred ordinary shares. £20,955 considered as paid on 9,455 preference, 10,500 preferred ordinary, and 20,000 deferred shares. Mortgages and charges, £2,000.

Clear Hooters, Ltd.—"A" debenture dated April 21st, 1927, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holders:—Barclay's Bank, Ltd. Also "B" debenture of same date to secure £500, charged on the above property. Holder:—L. J. F. Austin, Lichfield Chambers, Upper Priory, Birmingham. (The company may not create any mortgage, charge or lien in priority to or *pari passu* with the above charges.)

Pulford Brothers, Ltd.—Mortgage and charge on leasehold hereditament Nos. 102 and 104, Whitechapel, Liverpool, with machinery and fixtures, and the company's undertaking and property, present and future, including uncalled capital, dated April 13th, 1927, to secure all moneys due or to become due from the company to the Midland Bank, Ltd.

County of London Electric Supply Co., Ltd.—Satisfaction in full on April 29th, 1927, (1) of debenture stock secured by indentures dated January 23rd, 1899, and July 5th, 1909, securing £500,000, and (2) of debenture stock secured by indentures dated May 12th, 1903, October 13th, 1904, and July 5th, 1909, securing £500,000.

Wallingford and District Electric Supply Co., Ltd.—Capital, £13,000 in £1 shares. Return dated May 20th, 1926. 12,213 shares taken up. £12,213 paid. Mortgages and charges, £3,500. Return of alloments, made up to February 8th, 1927, shows a further 787 shares allotted for cash.

Korting Brothers (1917), Ltd.—Debenture dated April 27th, 1927, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder:—F. A. Robinson, "Sunnybank," Lucknow Avenue, Nottingham.

Eddystone Components, Ltd.—Capital, £1,000 in £1 shares. Return dated January 28th, 1926 (filed March 11th, 1927). 182 shares taken up. £10 paid. £172 considered as paid. Mortgages and charges at date of return, £500. Since registered: Debenture dated April 23rd, 1926, to secure £500.

Sheffield Wireless Depôt (1926), Ltd.—Capital, £500 in £1 shares. Return of allotments, made up to February 4th, 1927, shows 4 shares allotted for cash and 496 shares allotted as fully paid pursuant to purchase agreement. Mortgages and charges, nil.

Radiolicity, Ltd.—Capital, £1,000 in 950 preference shares of £1 each and 1,000 ordinary shares of 1s. each. Return dated December 31st, 1926. 500 preference and 500 ordinary shares taken up. £525 paid. Mortgages and charges, nil.

J. H. Runbaken, Ltd.—S. Barlow, of 14, John Dalton Street, Manchester, was appointed receiver and manager on April 19th, 1927, under powers contained in debenture dated November 8th, 1926.

Vee Cee Dry Cell Co., Ltd.—H. M. West, C.A., of 1, Station Road, Reading, was appointed receiver and manager on May 2nd, 1927, under powers contained in debenture dated November 10th, 1926.

Electron Co., Ltd.—Satisfaction to the extent of £500, £200, and £500 respectively, on April 4th, 1927, of debentures dated September 22nd, 1925, and February 2nd and 19th, 1926, securing the respective sums of £600, £1,400, and £1,500.

H. T. C. Electrical Co., Ltd.—Capital, £2,500 in £1 shares. Return dated January 3rd, 1927. All shares taken up. £950 paid. £1,550 considered as paid. Mortgages and charges, nil.

Whitfield Electrical Co., Ltd.—Capital, £500 in £1 shares. Return dated December 17th, 1926 (filed April 9th, 1927). 401 shares taken up. £401 paid. Mortgages and charges, £2,000.

L. P. S. Electrical Co., Ltd.—Capital, £5,000 in £1 shares. Return dated December 31st, 1926 (filed March 22nd, 1927). All shares taken up. £5,000 paid. Mortgages and charges, nil.

Crossby (Liverpool), Ltd.—Particulars filed of £500 debentures authorised April 14th, 1927, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Anderton Brothers, Ltd.—D. B. Sandeman, of 194, Union Road, Oswaldtwistle, ceased to act as receiver or manager on May 4th, 1927.

M. S. L., Ltd.—Capital, £500 in £1 shares. Return dated March 15th, 1927. All shares taken up. £500 paid. Mortgages and charges, nil.

City Notes.

British Thomson-Houston Co., Ltd.

The report for 1926 records the deaths of Messrs. C. A. Coffin and A. W. Burchard, directors of the company. The profit for the year was £355,385 (against £467,200), and to this is added £220,126 brought forward, making £575,511. After deducting debenture interest, depreciation, and preference dividends, there remains a balance of £226,468 which it is proposed to carry forward. The directors regret their inability to recommend a dividend on the ordinary shares. (The ordinary dividend for 1925 was 6 per cent.) The prolonged coal dispute and the general industrial conditions resulting therefrom had a direct effect upon the company's output which was substantially less than had been estimated. An amount of £1,150,000 in the balance sheet under the head of "loans" comprises advances from one of the company's associated interests for the purpose of completing works under construction and the financing of the extensions of the company's activities. The meeting is to be held on May 24th.

Urban Electric Supply Co., Ltd.

The annual meeting was held on May 12th, Mr. P. D. Tuckett presiding. In moving the adoption of the report (Elec. Rev., May 6th, p. 731), the chairman said that a year ago there was every prospect of a continuance of steady progress. Then, however, the coal strike occurred, and was accompanied by lighting restrictions and business dislocation, and their income was reduced by £1,200 and their profit from contracting work by £720. They incurred an increase of nearly £20,000 in the cost of coal. They endeavoured to recover some part of the cost by raising their rates of charge in the December quarter, but it was only to a limited extent that they were able to protect themselves in that way, since they were already charging their maximum rates in some of their undertakings, whilst in a number of others they had reduced their lighting rates at the beginning of the year by arrangement with the local authorities and were thus precluded from varying them. The increased output of 1,750,000 kWh was little more than half the previous year's increase, and was insufficient to compensate for the heavy increase in the cost of coal, &c. Moreover, nearly 80 per cent. of the increased output represented power and was mainly accounted for by the Twickenham and Cornwall Electric Power Companies, neither of which paid increased dividends. Their tramways at Glossop and Redruth were seriously affected by the strike as well as by increasing motor-'bus competition. They carried over half a million fewer passengers, a reduction of 23 per cent. as compared with 1925, and showed an actual working loss of £1,764. Those tramways had now been in existence for upwards of 20 years, and if they were to continue to operate, the renewal of the rails and a general overhaul of the rolling stock could not be postponed much longer, so that the alternative of their abandonment was now engaging their serious attention. The Walton Urban District Council had recently exercised its right of purchase of their Walton undertaking, hitherto worked in conjunction with their Weybridge undertaking, and it was to be taken over as from July 1st. The purchase price had been agreed at £89,000, which returned them their capital expenditure in full. They regretted parting with the undertaking, however, since they would be deprived of the profits which it had hitherto contributed to their income, besides being hampered to some extent in the independent working of their Weybridge undertaking. It was possible that a similar situation might arise in connection with the Weybridge undertaking, for the Weybridge Council, recognising the advantages attaching to the continued joint working of the two undertakings at the present time, was considering the question of purchase in the event of its being able to arrange a joint working agreement with the Walton Council. Last year, to meet the growing load of the Cornwall Electric Power Company, the whole of whose share capital of £180,000 was held by them, they found it necessary to order a steam turbine of 7,500-kW capacity together with boilers, switchgear, and other accessories. When installed, this new plant would nearly double the capacity of the generating station and would greatly add to the efficiency of its working. Despite the effects of the coal strike, from which it suffered in common with other industrial undertakings, the Cornwall Company earned an increased profit last year and had every prospect of earning increased profits this year, and, he hoped, for many years to come, since the tin mines, to which the bulk of its output was sold and on whose prosperity its success so largely depended, were being actively developed. It would no doubt have been possible, by reducing the carry forward, to recommend some small increase in the ordinary dividend, but after consideration they came to the conclusion that it would be unwise prematurely to make an increased distribution on this occasion out of profits which had not been earned during the past year, in anticipation of improved results which might not be realised during the coming year. As to the future, in spite of the adverse conditions last year they connected an additional 1,832 kW of load, and there was every prospect of a steady expansion of the business. The report was adopted.

Notting Hill Electric Lighting Co., Ltd.

This company's report for 1926 was reviewed in our issue of May 6th (p. 729). The annual meeting was held on May 10th, when Mr. A. E. Franklin (chairman), in a statement read by the deputy chairman (Mr. L. Jacob), explained the arrangements which had been made for the extension of the company's tenure, and dealt in some detail with the reorganisation of the capital and revenue accounts. He said that the basic charge to consumers had not yet been fixed, but it was considered that the figure would be very close to their present charge. The Wood Lane station was now leased to the London Power Co. at 6 per cent. interest on its valuation (£251,908), but that figure excluded the valuation of the sinking fund investments held by the trustees for the debenture holders. The London Power Co. had to pay them funds to redeem their 4 per cent. debentures on the joint station (up to the amount of the valuation). The securities represented by the sinking fund would supply the balance, and the unused portion of those securities would constitute the surplus, which after clearing debts, would be divided between the two companies. They hoped that their share would raise their distribution to about the equivalent of £4 per share. Referring to the general strike, the chairman said that the loyalty of their technical staff made it possible to maintain the supply; and by the foresight of the chief engineer, the Wood Lane station was able to carry on with its stocks of coal for six months. The directors proposed to consolidate the two classes of preference shares and make them all cumulative; to ask for powers to issue the unissued £56,000 of preference shares in such manner as they thought fit; and to capitalise the free reserves. The reports and accounts were adopted, and subsequently the rearrangement of the capital was approved.

Great Northern Telegraph Co., Ltd., of Denmark.

The directors' report for 1926 states that owing to the closing of the Harbin station, the lines between Leningrad, Irkutsk, and Vladivostok, had to carry the whole of the company's Far East traffic during the latter part of the year. Negotiations with the Russian Administration for the exclusive use of another wire between Irkutsk and Vladivostok have not yet reached a settlement. The company's activities in Russia, in so far as the transmission of Russian terminal telegrams exchanged with Western Europe and America is concerned, are not remunerative owing to salary increases, loss of traffic, &c. In spite of the unsettled conditions in China, the traffic exchanged with that country has not decreased; there is even a slight improvement in the Far East traffic. No result has been arrived at in the negotiations between the Chinese Telegraph Administration, the Eastern Extension Co., and the Great Northern Co. The company's offices at Mariehamn and Stockholm have been closed. The coal dispute caused a decline in British traffic and that of most other European countries shows a decrease. Although there is now radio competition in the Far East traffic, the company feels confident of the superiority of its service. There was a fall of £220,000 in the year's revenue and one of £240,000 in the expenditure. As previously reported, the directors propose to pay 30s. per £10 share less tax, making a total dividend and bonus of 20 per cent. for the year.

Siemens Bros. & Co., Ltd.

The directors' report for 1926 states that notwithstanding the grave industrial conditions prevailing during the greater part of the year, the company's profits showed no diminution as compared with 1925, but the hope of expansion from enlarged manufacturing facilities was not realised. The cost of production was increased by the high price of fuel. Nevertheless, the value of orders in hand from 1925 enabled the company to attain a better output than would otherwise have been possible. Many important contracts were carried out, the most notable being the manufacture and laying for the Pacific Cable Board of a loaded submarine telegraph cable from Fanning Island to Suva, Fiji, a distance of 2,143 nautical miles. This cable is giving excellent service at a very much higher speed of transmission than that which was guaranteed. The accounts show a profit of £358,990 (an increase of £2,109). The final ordinary dividend is 5 per cent., making 7½ per cent. for the year. There remains a balance of £70,364, to which is added the amount brought forward, less £100,000 paid on account of excess profits duty, of £196,400, making a total of £266,504. In view of the unsettled trade conditions and the outstanding liability to excess profits duty it is proposed to carry forward the whole of this balance. Meeting: May 23rd.

Barcelona Traction, Light and Power Co., Ltd.

The annual meeting was held at Toronto on May 10th. Mr. M. Lash presided and said that the results for the past year showed a considerable improvement, and that still further progress had been made during the first quarter of the current year. In addition, the exchange had improved from 33.71 in 1925 to 28.70 in the first four months of this year. There were many circumstances tending to aid the company, including the funding of the Spanish debt, the freedom of the country from labour troubles, the electrification of railways, and telephone development. The company had made arrangements to convert its 7 per cent. 30-year peseta bonds into 6 per cent. 45-year bonds, and it had been decided to pay an interim dividend of 1 per cent. on the common shares. The directors intended to review the position every six months to determine what dividends could be paid.

Brush Electrical Engineering Co., Ltd.

The report for 1926 states that the co-partnership scheme has been put into operation and provision for it has been made in the accounts. The surplus profit for the past year (£8,751) has been credited to the shareholders and "co-partners"; the co-partners' share amounting to £7,301 has been distributed. The accounts for 1926 show that after providing for general charges, depreciation, debenture interest, &c., there is a net profit of £62,887. Of this £5,495 is transferred to general reserve; interest on prior lien debenture stock absorbs £2,044; a dividend of 10 per cent. is declared (including the co-partnership shares); and a balance of £8,835 remains for apportionment between the shareholders and co-partners. The co-partners' share amounts to £7,354. The general reserve has been increased to £239,359 by the addition of certain amounts. During the year £7,853 was spent on capital account. The year's operations were adversely affected by the general strike and coal dispute, but nevertheless important contracts for turbo-electric plant, &c., as well as rolling stock, were carried out. While competition remains severe both in the home and foreign markets, the amount of business in hand and in prospect justifies the expectation of a reasonably busy year. A statement issued with the report shows that the trading profit was £135,464, as compared with £145,491. The undivided profits account stands at £79,122. Meeting: May 23rd.

Lancashire Electric Light and Power Co., Ltd.

The trading profit of the Parliamentary Company (the Lancashire Electric Power Co.) for 1926, plus interest receivable, was £199,937, and after adding the amount brought forward and providing for depreciation and reserves, a balance of £131,431 is paid to the Electric Light and Power Co. With the addition of other items, there is a total of £142,798. The profit balance for the year is £133,904, to which is added £9,826 brought forward, making £143,730. A final dividend, making 7½ per cent. for the year, is to be paid on the 7 per cent. cumulative participating preference shares, and the ordinary dividend is also 7½ per cent. A balance of £5,933 is carried forward. The general strike affected the company's output, but the supply was maintained. The new Padiham station was completed during 1926 and placed in regular operation in January last. The Parliamentary Company's returns show that the energy generated or purchased rose from 151,495,964 kWh in 1925 to 168,244,521 in 1926, while the maximum load rose from 70,200 to 80,450 h.p. and the connected load from 89,200 to 100,500 h.p. Meeting: May 23rd.

Sevenoaks and District Electricity Co., Ltd.

Speaking at the annual meeting on May 10th, Mr. C. F. Tufnell (chairman) said that progress was maintained during 1926 in spite of the difficult conditions, and a dividend of 7 per cent. was being paid on the ordinary shares. The delivery of the new generating set was delayed, but the set was eventually put into commission at the end of the year. The directors had decided to reduce charges; they would have been able to do so earlier had it not been for the industrial troubles. It was proposed to create 20,000 £1 preference shares bearing an 8 per cent. cumulative dividend. Those shares would not be issued for cash but offered to the debenture holders in exchange for their holdings. The report and accounts were adopted, and subsequently a resolution approving the increase of the company's capital was passed.

Potteries Electric Traction Co., Ltd.

The total revenue for the past year was £251,914, and after meeting all expenses, including debenture interest, there remains a balance of £2,549, which it is proposed to carry forward. At December 31st last the reserve stood at £126,750, and the renewals fund at £43,539. The company's business was seriously affected by the industrial unrest; there was a profit on the omnibuses, but losses on the tramway services. The differences between the company and the Stoke-on-Trent Corporation are considered by the Minister of Transport to be capable of solution between the two authorities themselves. Meeting: May 28th.

Eastern Telegraph Co., Ltd.

The revenue for 1926 amounted to £3,436,690 and the balance on working was £1,097,961. After providing for income tax, debenture interest, and preference dividends, there remains £850,909, to which is added £555,716 brought forward, making £1,406,625. Of this £400,000 is placed to general reserve, and £493,002 of that fund has been applied in writing off the balance of expenditure on new cables, &c. Four quarterly dividends of 2½ per cent., free of tax, have been paid on the ordinary stock and £506,625 is carried forward. The report records the death of Mr. A. R. Hardie, a director. Meeting: May 24th.

French Companies.

The *Société Radio-Orient* has declared a dividend of 35 fr. per share out of net profits of 652,000 fr. for 1926, as compared with 30 fr. and 360,000 fr. respectively in the preceding year.

The *Union d'Electricité*, Paris, after placing 36,000,000 fr. to reserve and depreciation, intends to pay a dividend of 9 per cent. for 1926, as against 8 per cent. in the previous year.

The *Société de l'Electrification Industrielle*, which undertakes the establishment of h.p. lines, &c., for various supply companies, reports net profits and balance forward amounting to 1,336,000 fr. for 1926. The dividend is 11 fr. per share.

Stock Exchange Notices.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Buenos Aires Lacroze Light and Power Co.—£300,000 6½ per cent. sterling redeemable mortgage debenture stock, issued at £96½ per cent., partly paid and fully paid.

Electric Supply Corporation.—50,000 new ordinary shares of £1 each, fully paid, Nos. 150,001 to 200,000.

Application has been made to the Committee to allow the following to be quoted officially:—

Consolidated Gas, Electric Light and Power Co. of Baltimore.—82,794 common shares of no nominal or par value.

North Metropolitan Electric Power Supply Co.—850,000 ordinary shares of £1 each, fully paid, Nos. 1 to 850,000.

Atlas Light and Power.—£889,757 5 per cent. debenture stock.

Electrical Finance and Securities.—100,000 7 per cent. cumulative preference shares of £1 each, 2s. paid, Nos. 1 to 100,000; £100,000 5½ per cent. debenture stock, issued at 92½ per cent., £10 paid.

British Electric Traction Co., Ltd.

A final dividend of 5 per cent. is recommended on the ordinary stock, making 8 per cent. for the year, as for 1925-26. A further dividend of 2 per cent. is also recommended on the 6 per cent. cumulative participating preference stock, making 8 per cent. An extraordinary meeting was held on Tuesday last, when a proposal to issue a 10 per cent. bonus to ordinary stockholders in the form of deferred ordinary stock was approved.

German Companies.

The *Korting Electricity Works Company*, Berlin, proposes to pay a dividend at the rate of 8 per cent. out of net profits of 204,000 marks for 1926, as compared with the same rate, and 187,000 marks in the previous year.

The *Dr. Paul Meyer Company*, Berlin, which was reorganised last year, reports a net profit of 251,000 marks for 1926, as compared with a loss of 2,200,000 marks in 1925. It is proposed to pay a dividend of 6 per cent. The export trade is stated to have declined, while favourable development has taken place in the home market.

Belgian Companies.

The *Société d'Electricité et de Traction* reports net profits of 5,218,000 fr. for 1926, as compared with 4,187,000 fr. in the previous year. The dividend is 27.50 fr. per ordinary share.

The *Compagnie Belge d'Exploitations Electriques* has declared a dividend of 25 fr. per share for 1926.

The *Federation d'Entreprises de Transports et d'Electricité*, Brussels, which is an investment concern, reports net profits of 1,098,000 fr. The dividend is at the rate of 19 fr. per share.

Spanish-Argentine Company.

The *Compania Hispano-Americana de Electricidad*, of Madrid (the former *German Transmarine Electricity Co.*), reports that the sum of 40,000,000 pesetas has been set aside for depreciation, as compared with 34 millions in 1925, leaving a net profit of 38,976,000 pesetas for 1926, as against 38,873,000 pesetas. It is intended to pay a dividend at the rate of 14 per cent., as in 1925.

Argentine Company.

The *Compañia Italo-Argentina de Electricidad*, Buenos Aires, reports a liquid profit of $4,569,500 for 1926. A total dividend of $10 m/n has been paid. The extension of the Pedro Mendoza station, aiming at the attainment of the maximum power of 100,000 kW, continued during the year, and the erection of the first of the 25,000/30,000-kVA turbo-generators was almost completed.

Companies Struck off the Register.

The names of the undermentioned companies have been struck off the Register, and they are thereby dissolved:—

Adnil Electric Co., Ltd.
"Cedes" Electric Traction, Ltd.
Electrical Industries, Ltd.
Leitner Electrical Co., Ltd.
Maxim Lamp Works, Ltd.
Portable Electric Motors (1919), Ltd.

Birmingham District Power and Traction Co., Ltd.

The revenue for the past year was £119,740, and the available surplus (including £19,890 brought forward) was £123,522. After providing for debenture service, preference dividend and renewals, it is proposed to place £7,260 to reserve, to pay a dividend of 7 per cent. on the ordinary shares, and to carry forward £36,953. During the year debenture stock to the value of £14,265 was redeemed and cancelled. The meeting was to be held on May 18th.

Rothesay Tramways Co., Ltd.

The receipts for 1926 fell slightly to £19,720. The available balance (including £671 brought forward) is £1,815. It is proposed to pay 5 per cent. on the preference shares and carry forward £1,315. Last year the ordinary shares received 3 per cent.

Eastern Extension, Australasia and China Telegraph Co., Ltd.

The report for 1926 shows a gross revenue of £2,047,033 and a surplus of £1,115,975. After providing for taxation and debenture interest, there remains a balance of £951,996, to which is added £413,435 brought forward, making £1,365,431. From this £550,000 is transferred to general reserve; four tax-free dividends of 2½ per cent. each have been paid, and £415,431 remains to be carried forward. Meeting: May 26th.

Greenock and Port Glasgow Tramways Co.

The receipts for 1926 fell from £65,448 to £64,462. After providing for debenture interest, depreciation, &c., there is a net loss of £2,283. Against this is set a balance of £2,371 brought forward, leaving a balance of £88 to be carried forward. The unsatisfactory result is attributed to motor omnibus competition. The company proposes to substitute 'buses for trams on a part of its system.

Oriental Telephone and Electric Co., Ltd.

The directors recommend a final dividend of 6 per cent. on the ordinary shares (free of tax), making a total of 10 per cent. for the year, free of tax, plus a bonus of 2 per cent., free of tax.

Adelaide Electric Supply Co., Ltd.

The usual interim dividends of 4 per cent. on the preferred ordinary shares and 6 per cent., free of tax, on the ordinary shares, have been declared.

Shanghai Electric Construction Co., Ltd.

A final dividend of 6 per cent. (making 10 per cent. for the year, as in 1925) is recommended on the ordinary shares.

Melbourne Electric Supply Co., Ltd.

An interim dividend at the rate of 10 per cent. per annum, free of tax, has been declared on the ordinary shares.

Bengal Telephone Corporation, Ltd.

A dividend of 6 per cent. has been declared on the ordinary shares, as against 2 per cent. for 1925.

Burma Electric Supply Co., Ltd.

An interim dividend of 4 per cent. has been declared on the ordinary shares, as in 1926.

Stocks and Shares.

Monday Evening.

Impatience girds, with a touch of exasperation, at the delay that has occurred in the expected fall to 4 per cent. in the Bank rate. The last change was made on April 21st, and on each successive Thursday there has been a confident anticipation of a further reduction. Stock Exchange markets are counting upon a decline, and new issues achieve notable success in cases where sound stock is offered. "If the Bank rate falls," people argue, "we shall see prices go higher than they are to-day." Business in the industrial departments is tolerably active, with prices well maintained. Our own lists are typical of the general trend, and this week there are four declines to set against nearly a score of rises.

County of London Electric new 5 per cent. debenture, offered at 96, and promptly covered several times over by public subscription, rose from an opening premium of 17s. 6d. until it touched nearly a point higher. At 1¾ premium scrip came to market, and reaction took back the price to 1¼ premium. So many other new candidates have presented themselves for favour during the past fortnight that investment finds it very tempting to change from one thing to another. Buenos Aires Lacroze 6½ per cent. redeemable debenture stock, offered at 96½, is now marketable, the price being about 1 premium. When the market opened in the new Electrical Finance and Securities issues, there was a small premium on the 7 per cent. preference shares, but this ran off, although the 5½ per cent. debenture stock retained a point premium above the issue price of 92½. It may be mentioned that the ordinary shares are all held privately: they received annual dividends of 10 per cent. for the past six years, 1921-1926 inclusive.

Brazilian Tractions, as spectacular speculative leaders, have fallen temporarily out of the front rank, being superseded by other favourites. The common shares are 2¼ points down at 141½. Barcelona Tractions have drooped to 53, and Sidros attract but little attention.

Foreign telephone varieties are strong. United River Plates have been forging ahead steadily for some time past, and are again better at 9¼. Chili Telephones, usually a staid and somewhat humdrum investment, are 18s. 9d. higher this week at 7⅜, jobbers in the market professing some mystification as to what can be the reason for the demand that has swept the shares to their present level. The obvious inference would be buying for control, and in this supposition there may be

an explanation, although nothing definite has transpired to verify it. Anglo-Portuguese Telephones are also rising, the price having advanced to 20s. 9d. The company paid 7 per cent for last year, and at the meeting, held six weeks ago, Lord St. Davids, the chairman, mentioned 8 per cent. as "what you may call the normal rate which the ordinary shareholders in a telephone company expect." Automatic Telephones have fallen to 45s.

Clyde Valley shares are 6d. lower at 30s. 6d. The Central Electricity Board has published the first of the schemes now under preparation by the Electricity Commissioners in pursuance of Section 4 of the Electricity (Supply) Act, 1926. This deals with Central Scotland, and upon adoption of the scheme by the Board, the latter body will put the proposals into operation. The scheme is bold and far-reaching, likely to give rise to criticism as well as to arouse commendation. The Stock Exchange interest lies in the probabilities that it opens of capital requirements in the future, and the advantage that provision of cheap current will afford to the industries in the area served. The East Anglian Electricity Supply Company's scheme is under consideration by a Select Committee of the House of Commons. American capital, according to the evidence presented last week, is invested in the Greater London and Counties Trust, Ltd., which was prepared to find half-a-million pounds, or more, for the purpose of carrying-out the scheme in the Bill.

The Official Receiver has in hand the affairs of the Southern Counties Electric Light and Power Supply, Ltd. Meetings of creditors and shareholders were held last week, under the compulsory winding-up order made against the company. The directors attribute the company's failure to its having insufficient capital at any one time to carry out its undertakings, and other reasons. Readers of the Electrical Review will remember that warnings were raised here against investment of money in the company's shares and debentures. The Southern Counties Electric Light and Power Supply, Ltd., has for its chairman Sir Charles B. H. Soame, Bart. The experience of holders unfortunate enough to own interests in the Southern Counties Electric Light and Power Supply, Ltd., is one which should not be forgotten by people who are tempted to embark money in schemes that have hardly a chance of success.

Brush Electrical shares remain at 28s. 3d., unaffected by the issue of a report repeating the previous 10 per cent. dividend, and showing net profits of £62,900, about £700 more than that of the previous year. A "reasonably busy year" is forecast for 1927. Siemens, as already stated (Electrical Review, May 13th, p. 771) is paying 7½ per cent., also as before, and the price of the shares is 1s. 9d. better at 28s. 6d. The report is very satisfactory. Johnson & Phillips have gained 3s. 6d., at 2½ ex dividend.

Underground Railway stocks have not moved. British Electric Traction stocks retain their substantial rises. The Pernambuco Tramways and Power made a little more profit than in the previous twelvemonth, and again pays the preference dividend of 7 per cent. The price of the shares stands at 16s. 6d., and the ordinary at 6s. 6d. La Plata Trams, after a dip to 3s. 9d., rallied to nearly 5s. Reference was made earlier in the month to vague rumours as to the La Plata Company being coveted by another group. The ordinary shares are a gamble—though an interesting one—because the cumulative preference, now quoted at 20s., carry nearly 14s. per share arrears of dividend.

In December last year the North Metropolitan Electric Power Supply Company announced its intention to pay off at par, on July 1st next, the £250,000 8 per cent. cumulative second preference stock. Stockholders are now offered the right to exchange into the company's 6 per cent. preference shares at par, 20s., carrying dividend as from April 30th, 1927. The existing shares are quoted at 22s. ex dividend. The second preference stock changed hands a few days ago at 105.

The cable list is very hard, and a number of further advances have occurred. Great Northerns are 5s. up, the net profit of £271,200 being £18,000 more than that of 1925. Indo-Europeans, ex their dividend of 37s. 6d. net, have put on 17s. 6d. In the Eastern division, "China" shares rose to 18⅛. A better tendency, too, characterises Marconis. The Marine Company's good showing helped to direct attention to the market. Marconi Marines, ex dividend, are up ¼, and the parent shares touched 19s. 9d. before easing off to 18s. 9d. A few pence were added to Canadian Marconis at 4s. 3d.

Rubber shares present no new points of interest. In the engineering section Babcocks went back a trifle, to 54s. 6d. The iron, coal and steel issues are fairly firm, without any feature developing. Armstrong junior debentures continue to be persistently bought by people in the North of England.

Amongst the dollar stocks, Shawinigan Water common has gained 4 points, at 92. The Mexican Utility issues are somewhat irregular. Profit-taking occurred in Mexican Light and Power preferred, the price shedding a couple of dollars, which, however, were added to the price of the company's 5 per cent. bonds. Mexico Tramways bonds are 1 higher. The Burma Electric Supply interim dividend of 4 per cent. is at the same rate as that of last year. The price of the ordinary shares is 23s. 6d., and the 6 per cent. preference stand at 16s. 3d. Amongst the newcomers, Electrical Distribution of Yorkshire ordinary shares, issued recently at 25s., are changing hands on the basis of 3s. 6d. premium.

Our Foreign Electrical Trade.

Electrical Exports and Imports during April, 1927.

THE Board of Trade returns for April show that there was a further decline in our electrical exports, amounting to £128,304, as compared with the March figure, although when placed against the exports of April last year a substantial rise is apparent. It must be said, however, that April, 1926, was a bad month, exports reaching a very low level; April, 1925, however, was the best month of that year. Comparing last month and March, it will be seen that the machinery section experienced a large decline, the three classes dealt with showing a total fall of over £106,000. Apart from this the only decrease of any magnitude occurred in the case of insulated wires and cables. The other two cable classes (telegraph and telephone) recorded a combined rise of about £21,000. Appreciable increases occurred in the cases of glow lamps and telegraph and telephone apparatus. The increase as compared with April, 1926, was fairly general, outstanding items being unenumerated electrical goods and apparatus, unenumerated electrical machinery, submarine cables, and batteries and accumulators. There were also two substantial decreases, *viz.*, in telegraph and telephone instruments and apparatus and "other motors and generators."

There was a general decrease of imports as compared with March, and only two increases were recorded—in carbons and unenumerated electrical machinery. The imports of unenumerated goods and apparatus were substantially reduced but the rest of the net decrease of £35,730 was fairly evenly distributed. In comparison with April, 1926, although increases and decreases were about equal in number there was a rise of £29,976. This was mainly due to an increase in unenumerated machinery imports (£36,011). The imports of insulated wires and cables were also up £13,480. The decreases were not very large, with the possible exception of non-submarine telegraph and telephone cables in which the fall was proportionately heavy.

Conditions in Poland.

A REPORT upon the industrial, commercial and financial situation in Poland in 1926 has been prepared for the Department of Overseas Trade by Mr. R. E. Kimens, C.M.G., Commercial Secretary at Warsaw (Stationery Office, 1s. 6d. net). Mr. Kimens refers to the adverse effects of the introduction of the gold standard, but states that the favourable balance of trade was maintained, one factor assisting Poland being the British coal stoppage. The Government has introduced measures for encouraging export trade; the export duties on a number of articles have been abolished or reduced, and export premiums are being paid in respect of certain finished manufactured goods. Great Britain was the third largest supplier of foreign goods to Poland in 1926, and the second largest buyer of Polish products. It is stated that the supply of machinery, plant, and equipment is still largely in the hands of Germany, and the conclusion of a commercial treaty between Germany and Poland will still further aid the former. There is a market in Poland for many kinds of machinery, including large motors and generators and coal cutters, as well as household appliances, such as vacuum cleaners. During 1926 Poland imported electrical goods and apparatus valued at 26,699,000 gold zloty (43.79 zloty to the £. December 31st last) and exported such goods to the value of 440,000 zloty. Advice to those desiring to trade with Poland is given by Mr. Kimens; this may be summarised as follows:—Prices must be competitive, even better-class articles should not exceed the price of competitive articles by more than 10-15 per cent.; favourable conditions of payment should be allowed—with proper caution, business can be done on a credit basis without undue risk; the goods offered should be adapted to the country's requirements, which vary in different provinces; prices, if possible, should be quoted c.i.f. Danzig or Gdynia; a knowledge of English is not general—Polish, French or German should be employed in communications; catalogues, photographs, and drawings should accompany offers, and the metric system should be used. Agents should be regularly visited, and should be English or Polish; they should be allowed to carry consignment stocks if possible. Goods should not be dispatched until an import licence is actually issued, and should not be consigned to a German port for transshipment.

United States Electrical Production.

Two Years' Progress.

THE results, so far as they concern the electrical manufacturing industry, of the 1925 Biennial Census of the United States Department of Commerce, were summarised in a recent issue of the *Electrical World*. In all cases the figures are compared with those obtained in the 1923 census. It is shown that the number of establishments rose from 1,671 to 1,739 in the two years—an increase of 4.1 per cent., while the average number of wage-earners rose from 234,892 to 239,921—2.1 per cent. The wages paid increased by 6 per cent. to $323,834,541. The total value of products rose by 19.1 per cent., *viz.*, from $1,293,001,771 to $1,540,002,041; the value of electrical machinery, apparatus, and supplies produced in 1925 was $1,444,287,799. In addition, electrical machinery, apparatus and supplies, are manufactured to some extent as secondary products by establishments engaged primarily in other lines of manufacture. The value of such commodities thus produced in 1923, outside the industry proper, was $82,465,360, but the corresponding value in 1925 has not yet been calculated. An analysis of the establishments reveal that New York is the most important state in electrical manufacturing with 334 establishments; there are 236 in Illinois, 205 in Ohio, 142 in New Jersey, 133 in Pennsylvania, 116 in Massachusetts, and 110 in California; the remainder (463) are distributed over 30 states.

From the detailed analysis of production, it is seen that apart from two large groups ("miscellaneous electrical machinery, apparatus and supplies," $327,616,225, and "all other electrical machinery, apparatus, and supplies," $231,692,684), the most important section was "generators, motor-generator sets and transformers," $172,005,613 (as compared with $165,491,396 in 1923). Radio apparatus followed very closely upon this section, the value of the output having risen from $54,000,470 in 1923 to $170,197,861 in 1925. The third largest section was that covering primary and storage batteries, the total value of which increased from $118,065,613 in 1923 to $155,245,226. The production of motors in 1925 was valued at $112,543,596 (against $109,188,685 in 1923). The largest specified class of motors was the polyphase induction type of 200 h.p. and under, the production value of which is given as $34,653,950 (as compared with $35,586,235 in 1923). The value of fractional h.p. motors produced rose from $23,939,172 in 1923 to $28,249,265 in 1925. With regard to domestic appliances, which rose in total value from $67,002,084 to $74,726,908, details of the numbers of the various devices are given. Of the ten classes shown only two (vacuum cleaners and miscellaneous) recorded decreases; the figures, with the 1923 equivalent in parentheses, were as follows:—Air heaters, convector and radiant type, 416,654 (310,363); percolators 434,095 (260,030); toasters 735,856 (476,606); waffle irons, 306,527 (131,445); curling irons, 1,534,786 (no comparable figure); disk stoves, hotplates and ranges under 2½ kW, 178,585 (no figure for 1923); domestic ranges, 2½ kW and over, 70,931 (no figure for 1923); flat irons, 2,759,218 (2,434,280); vacuum cleaners 1,097,640 (1,240,742); water heaters, over 660 W, 53,936 (14,507); miscellaneous (value), $9,658,388 ($10,833,686). It is noted that although the number decreased the value of vacuum cleaners rose from $35,981,514 to $39,591,336. The total value of lamps produced in 1925 was $73,558,210, as compared with $71,966,225 in 1923. This total included $54,892,438, representing the value of 266,461,754 tungsten lamps, other than miniature types; 114,800,550 automobile lamps, valued at $12,432,676 were produced, as compared with 88,243,456, valued at $11,354,546 in 1923. Switchboards, panelboards, circuit breakers and switches, to the value of $69,072,044, were produced in 1925, comparing with $57,856,166 in 1923. The value of ignition apparatus produced in 1925 was $41,364,998. The only leading class of goods which recorded a decrease was telephone and telegraph apparatus (not including wireless), the value of which fell from $94,483,885 to $84,421,231. In conclusion, we give comparative values of production for other important sections:—Measuring instruments, relays and instrument transformers, $31,650,355 ($28,221,484); interior conduits and fittings, $43,328,140 ($35,305,341); motor control gear, $31,032,159 ($33,176,115); and electric fans $12,562,636 ($12,053,861).

French Electrification Halt.

According to the *Electric Railway Journal*, the electrification of the seven regions in France, as outlined in the extensive programme which was started at the conclusion of the great war, has been held up because of lack of funds The cost of construction is enormous, since long-term loans have risen in cost from 5 to 14 per cent. Several proposals for the completion of the programme have been made, but the only reasonable solution seems to be the stabilisation of the franc.

Electrical Association for Women.

Annual Luncheon.

THE second annual luncheon of the E.A.W. was held at the Hotel Cecil, London, on May 11th, under the chairmanship of Viscountess Astor, M.P., president.

Dr. S. Z. de Ferranti, F.R.S., following the loyal toasts, proposed "The Electrical Association for Women." He said that the growth of the E.A.W. was a sign of its utility. Nothing better could have happened for the development of the electrical industry than the formation of the Association. A new phase of the development upon which we were entering was the provision of electrical appliances in the home; electricity was the greatest labour saver available. Outside the professional classes it was more essential for women to have electrical knowledge than men. He congratulated Miss Haslett, director of the Association, on the success achieved by the body, which was largely due to her good organising. There were some able people working for the Association in the local centres. As an engineer he felt that the E.A.W. had a great future before it, and was indispensable to the industry.

Lady Astor, in response, said that it was due to the vision of a few ardent women that the Association had reached its present state of development. The Association was a wonderful inspiration to those who had women's welfare at heart. There was a fine quality of men behind the movement. Dr. Ferranti had been the Association's greatest friend—it was largely as a result of his efforts that the body ever got started.

"Electricity in the Service of the Community" was proposed by Maj.-Gen. Sir Phillip Nash, K.C.M.G. He said that electricity had already entered into almost every phase of our existence. Electricity in the home was well established for illumination purposes, and was fast coming into vogue for heating, cooking, and washing. Electrical power was now essential in industry. The greatest surgical discoveries of recent times would not have been possible without electricity. Broadcasting was another important phase; a few years ago it was considered a social amenity—a year ago it proved a means of maintaining our social stability. When it was considered that the structure of all matter was of electrical origin, it was realised what a great future electricity had. Each new discovery broadened the horizon and showed how electricity could serve man more. We were passing from an age when fuel and man power were wasted to one when, by means of electricity, they would be saved. In a few years' time it would be impossible to discuss international economics without electricity dominating the discussion. To-day Germany was importing and exporting electrical power. Italy was connected by h.p. lines with France and Switzerland, which saved the situation in Italy during the recent drought. Transmission lines were wanted to connect the centres of production of power with those of consumption. To maintain our industrial supremacy we must put ourselves in line with what other countries were doing. It was the duty of the Central Electricity Board to give a cheap and plentiful supply of electrical power. Sir Andrew Duncan and his colleagues had already published the first big scheme, Central Scotland (Electrical Review, May 13th, 1927, p. 754), for the reorganisation of the supply industry. No greater help could be given than to increase the domestic load. The more the Association could make people clamour for electricity the greater the service it would do for the industry.

The toast was responded to by Dame Henrietta Barnett, D.B.E., vice-president, E.A.W. Twenty years ago she inaugurated the Hampstead Garden suburb; all the original cottages were equipped with electric light. The Association, which was continually advancing under the guidance of Miss Haslett, would come to the relief of the overburdened woman and give her the opportunity to gain knowledge.

In proposing "Our Guests," Lady Snell, vice-president E.A.W., heartily welcomed the visitors, referring particularly to Sir Andrew Duncan.

Sir Andrew, in reply, recommended those present not to build their immediate hopes too high. Patience was necessary during the early stages of the Central Electricity Board's work. If Scotland had been favoured with regard to the first scheme, it was not due to him. He hoped that the scheme would set the pace for other areas.

Particulars of the Annual Conference, which preceded the luncheon, appear in our "Notes" pages.

South Wales Centre.

In a recent lecture by Mrs. L. E. Wright, according to the *South Wales News*, before the South Wales and Monmouthshire centre of the E.A.W., at the South Wales Engineers' Institute, she gave an interesting description of the methods of electro-therapy which have become of special importance in the prevention and cure of disease. Mrs. Wright said that the adoption by the medical profession of these new methods of treatment had opened up an interesting sphere of work for women who were prepared to spend two or three years studying the theoretical and practical aspects and obtaining the requisite knowledge of anatomy and physiology.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

A New Ironclad Switch-Fuse.

The illustration, fig. 1, depicts a new combined ironclad d.p. switch and fuse which has been designed and marketed by MESSRS. BERRY'S ELECTRIC, LTD., The Switch House, 85-86, Newman Street, Oxford Street, London, W.1. The apparatus has a commercial rating of 10-15 A, and is suitable for working pressures up to 250 V. The switch has a quick-make and -break, and its substantial copper blades are securely clamped to a square-section mica-insulated steel shaft turning in brass bearings. The porcelain fuse holders have a 3-in. straight

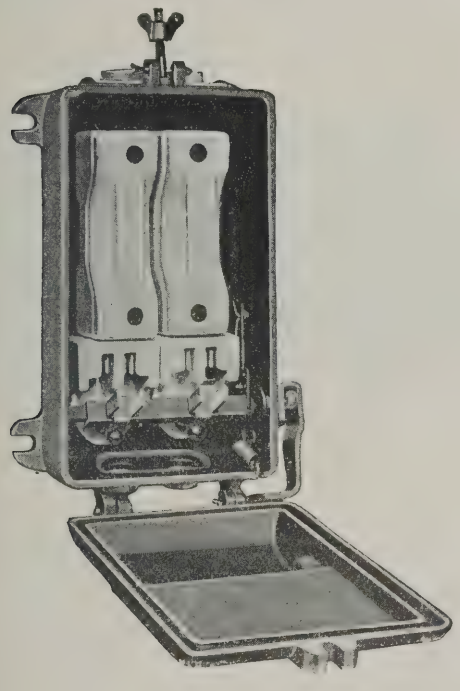

Fig. 1.—Ironclad d.p. Switch and Fuses.

"fuse break" and the copper base clips which accommodate the copper bridge blades are of the self-aligning type. Each pole is mounted on a separate porcelain base, and ample metal-to-case clearances are provided to meet the B.E.S.A. requirements. The internal fitments are all secured from the front. It is claimed that the leading-in cables are easily directed to their respective terminals, and are free from any possible abrasion by the switch shaft. The inlets and outlets are fitted with bushes accommodated in detachable end plates.

Apparatus for Automatic Temperature Control.

A recent production of the DRAYTON REGULATOR & INSTRUMENT CO., LTD., West Drayton, is the "Drayton" transmitting electric thermo-contactor, for the automatic control of temperature. The apparatus consists of a bulb at the far end connected by means of capillary tubing to a helical Bourdon tube, the instrument end of which is connected by a metal strip to a spindle arranged in the tube axis and mounted between two end-plates. Any increase of the temperature to which the bulb is exposed imparts a turning movement to the tube and to the spindle. A contact arm is mounted on a bush carried on the spindle between two collars, connection to the spindle being arranged so that the arm can be set to any point on the scale without straining the tube. A bracket fixed to the front end-plate carries coaxially with the spindle a pin on which is mounted an insulating block carrying three contact arms. The pin further carries a pointer which indicates on a dial the position of the contact device. The three contact arms (common, low and high) are connected by flexible leads to the terminal screws at the top of the instrument. By means of a key the whole contact mechanism can be set to any point on the dial. Whilst the temperature is lower than that for which the contact mechanism is set the central moving contact arm makes contact with the left-hand (low) contact, but is moved to the right to make contact with the right-hand (high) contact when the indicated temperature is reached. The right- and left-hand contacts can be set to make and break within 2 deg. F. if desired, or within any higher temperature interval specified. The moving pointer is completely balanced so that it exerts no strain on the movement in whatever position it may be. The contacts are normally of silver-gold alloy, but tungsten-faced platinum may be employed where desired. The contacts are not intended to break the current, an electromagnetically operated relay being employed for this purpose. The instrument is designed for working on pressures up to

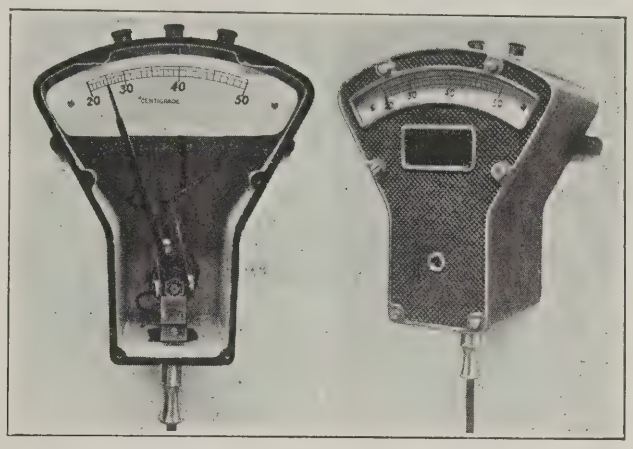

Fig. 2.—Temperature Control Apparatus.

250 V, and is made in standard ranges, covering temperatures up to 1,000 deg. F. Fig. 2 shows interior and exterior views of the control instrument.

A New Electric Fan.

The accompanying illustration shows the "Ellipso" oscillating fan, a new product of MESSRS. BERKELEY & YOUNG, LTD., Hay Mills, Birmingham. It is suitable for a.c. or d.c. working. The makers claim that the elliptical movement of the fan is obtained by the simplest gear yet evolved. A simple traversing link is connected to and rotates with a slow-motion shaft, and is anchored by a universal ball joint to a fulcrum on the pedestal. A simple gearing transmits the drive from the motor spindle to the slow-motion shaft. The link is constructed to turn crankwise and increase and decrease its angle to the slow shaft, thereby giving an elliptical traverse.

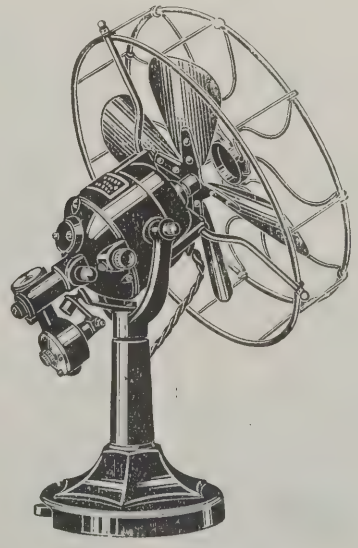

Fig. 3.—An Oscillating Fan.

A simple friction clutch allows the drive to "cut-out" automatically in the event of the movable unit of the fan or guard being obstructed, and also automatically permits of the re-starting of the drive when the obstruction is removed. The clutch may be hand-operated, if desired, by means of a small knurled knob extending from the gear box. The fan can be used as a fixed or oscillating unit in either the desk or wall-bracket position. It can be supplied in various finishes to match decorating schemes. A 3-speed regulator is provided, and standard 12-in. blades are employed.

A Remote-Control Public Lighting Scheme.

A novel system of public lighting control has been adopted at Barnsley, where groups of separate street lighting sections are each, by means of relays, controlled by one switch.

WITH a view to economy, the simplification of switching, centralisation of control, and levelling up of the times of lighting and extinguishing, a system of remote control for public lighting has been developed at Barnsley which presents several features of interest.

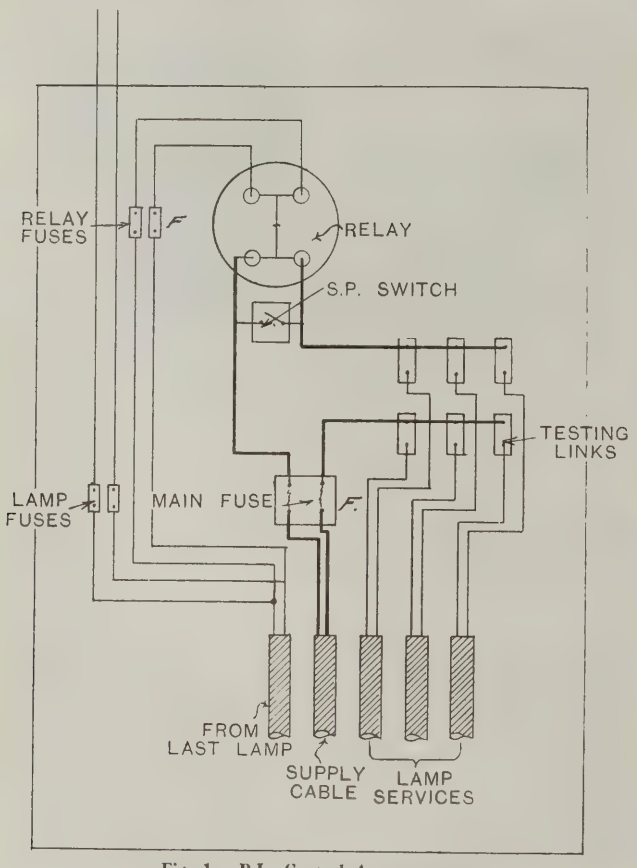

Fig. 1.—P.L. Control Arrangement.

Fig. 2.—Pillar and Standard.

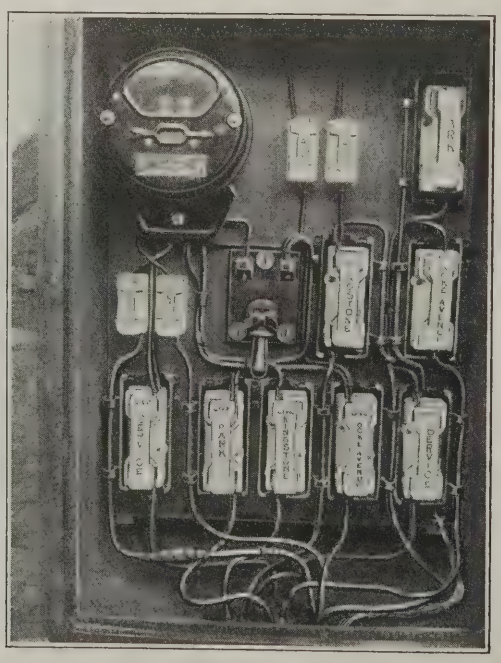

Fig. 3.—Control Chamber.

Since 1919 it has been the practice of the Corporation to lay a 0.0225-sq. in. twin armoured cable in the same trench with all new distributors. This cable is reserved entirely for public lighting and is fed from pillars, or other convenient points on the distribution system. It is looped into all the lamp standards along the route and is divided into sections, each supplying up to a maximum of approximately twenty 100-c.p. lamps, or their equivalent. At the last point on all but the last section a Chamberlain & Hookham relay is installed which is energised by the supply current and switched on with the lamps. The first section is hand controlled by an ordinary switch, each relay controlling the next section of lamps. A separate supply cable is, of course, put in at each relay point for lamps controlled by the relay. Fig. 1 shows the wiring arrangements at one of these control points, where a number of circuits are controlled by the one relay. In one case over 140 100-W lamps are switched on by a 10-A

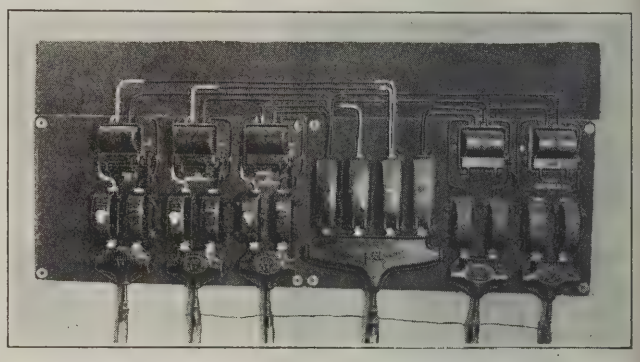

Fig. 4.—Hand Control Board.

switch. The system is extremely flexible, and additions to or re-arrangements of the circuits are easily carried out. An important advantage is that any circuit may be fed from either a.c. or d.c. mains.

Fig. 2 shows one type of lamp standard adopted for the relay control. The pillar chamber contains a board carrying the necessary fuses for several groups of lamps together with one of the relays already mentioned, and a s.p. switch. The s.p. switch is in parallel with the load side of the relay, and is used only for the inspection of the lamps during cleaning and for emergencies, should the relay fail to act. The arrangement is shown in greater detail in fig. 3. It is interesting to note that in the six years since the first relay was put into operation there has only been one failure, and that was due to causes outside the relay itself. The relays, though of the d.p. type, are adapted for s.p. use by bridging across the mercury cups.

Owing to the necessarily restricted space in the base of the standards, the twin cables are fitted with rubber tails, the joint between the paper and rubber conductors being covered by lead sleeves, plumbed to the cable sheathing at their lower ends and filled with compound.

The standards are made locally for the Corporation to the design of Mr. E. A. Barker, M.I.E.E., chief electrical engineer.

It is probable that in the future the relay system will be extended so that ultimately the whole of the public lighting will be controlled from three or four sub-stations, all within easy reach of one another and the central station.

The old practice at Barnsley was to provide extra switch cores in the distributors from which the lamps were fed; this necessitated the tapping of the distributors at the lamp posts, with the consequent weakening of the network. Fig. 4 shows a hand-operated control board in one of the "subs." With this system the number of lamps on any one circuit was limited by the size of the switch wire and neutral. It has been found in practice that the separate cable costs very little more than the old system, at the same time carrying all the advantages enumerated above. The whole of the work on the new scheme has been carried out by the staff of the Corporation.

Electrothermics.

The electric furnace in industrial chemistry and metallurgy.

(*An abstract of three Cantor Lectures delivered by* Capt. G. I. Finch, *at the* Royal Society of Arts.)

COMPARED with fuel heating, the electrical generation of heat has many advantages, the chief of which are: 1, great temperature range, up to about 3,700 deg. C.; 2, perfect temperature control; 3, absence of waste flue gases and consequently high efficiency; 4, cleanliness; and 5, that electrically generated heat may be localised and applied exactly where required. The one objection to electric heating is its high cost. The value of heat energy should, however, be judged not only on a basis of quantity, but also on that of quality. The cost of one electrically generated calorie is approximately that of 18 fuel-produced calories.

The choice of resistor material depends primarily upon the maximum temperature aimed at. Of all solid conductors suitable for the purpose of electric resistance heating, carbon has by far the higher evaporisation temperature, about 3,700 deg. C. Its liability to oxidation, however, renders necessary the provision of an inert atmosphere and, again, the mechanical strength of different forms of carbon is such that in order to obtain sufficient robustness of the furnace resistor, it must be of large cross section. This necessitates the employment of high currents at low voltages and results in heat losses and more or less poor efficiencies due to losses of heat from the resistor ends passing out from the interior of the furnace. Nevertheless, carbon in one form or another is practically the only solid resistor material suitable for temperatures above, say, 1,200 deg. C. The maximum temperature conveniently attainable with carbon resistors is in the region of 2,500 deg. C.

The Morgan Crucible Co. has recently introduced a heating element for radiation heating at temperatures up to 1,250 deg. C. It consists of a long slab of carbonaceous material protected from oxidation by a thin covering glaze of refractory material. Furnaces heated by this element are being successfully used for, amongst other purposes, the firing of pottery at 1,100 deg. C. When this process is carried out with coal heating, the rejections of finished ware, due to fouling, &c., amount to 3 per cent. With electrical heating this figure falls to a fraction of 1 per cent. and the saving thus realised more than covers the cost of the electrical energy consumed at ½d. per kWh. Further, the cost of renewing the electrical elements is less than the cost of saggars used in coal-fired kilns.

The Ajax Electrothermic Corporation, of Trenton, U.S.A., has recently developed furnaces with loadings up to 100 kVA and capacities of 600 lb. The power factor of the furnace is naturally low, but is corrected by the use of condensers. Since the induced currents flow mainly in the outer layers of the metal, the choice of frequency is determined by the internal diameter of the charged crucible and also by the resistivity of the charge; it varies from 500 to 1,000,000 cycles. The most difficult metals to fuse, such as tungsten, can be readily melted by this process, and the Gutta Percha Co. has installed at Bilston, near Wolverhampton, a high-frequency induction-furnace plant consisting of 42 units, each of 35 to 40 kVA capacity for dealing with alloys of critical composition where the freedom from contamination by carbon is essential. The chief disadvantage of this process lies in the present high cost of the installation, but this will certainly be lowered with an increased demand for high-frequency generators.

It has been said that the prosperity of a country may be measured in terms of steel and sulphuric acid. But even in a highly industrialised community such as Great Britain agriculture will continue to be a most important industry, and the nitrogen-fixation industry should be held to rank in importance with those of steel and sulphuric acid. For synthetising compounds from atmospheric nitrogen there are two methods in use in which electrothermics play a leading role. By one method nitrogen is directly oxidised in a high-pressure arc discharge; in the other calcium cyanamide is formed by the interaction of nitrogen and calcium carbide, the latter being the product of one of the first electro-thermic processes to be successfully established on a large scale.

To-day the largest proportion of calcium carbide is manufactured in continuous tapping furnaces, of which the Alby furnace may be quoted as a typical example, this being fitted with a tapping spout through which the carbide is run off in a molten state at regular intervals. The walls of the furnace are lined with refractory material and the bottom with a bed of compressed mixture of tar and electrode carbon, making intimate electrical contact with a steel grating to which one lead of the electric supply is connected. The smaller units employ single-phase current and have a bundle of four or five vertical carbon electrodes of square cross section clamped together in parallel in the supply. The largest tapping furnaces of the Halfenstein type have no hearth electrode, and take up to 12,000 kVA at a power factor of 0.85 to three vertical electrodes. The furnace efficiency is over 60 per cent., about 4,000 kW-hours being required to produce one ton of carbide. In all carbide furnaces the charge is heated by a smothered l.p. arc.

Electrode consumption is an important item, and in the carbide industry accounts for about 10 per cent. of the total production costs in the manufacture of calcium carbide. Despite several advantages the high cost of graphite often renders its use prohibitive and carbon has to be substituted. The Soderberg electrode is a continuous self-baking electrode consisting of sections of sheet-steel tubing, fitted together as required, into which unbaked electrode material is rammed or even simply poured. The mixture is baked by the waste heat of the furnace, the gases escaping through perforations in the steel tubing. The tubes are fitted with radial fins or ribs, directed inwards, which serve to hold the baked section of the mixture and increase the area of electrical contact between the latter and the steel tubing. Since the conductivity of the "green" mixture of the electrode is very low, most of the current in the cooler sections is carried by the steel tubing and fins. As the electrode descends into the furnace, more and more of the current flows through the mixture, according to the degree to which the latter has been baked. The steel tubing melts away a short distance above the furnace end of the electrode, leaving the completely baked electrode mass free.

The advantages claimed are that the consumer makes his own electrodes, and is therefore independent of the electrode manufacturer. The necessary anthracite calcining, grinding, and mixing plant for preparing the green electrode mixture is robust, simple and easily run. Calcining is carried out in a continuous smothered arc-heated kiln. Electrode consumption is reduced owing to the complete absence of butts, and breakages and to the high degree of density of the baked mass, due to the fact that baking goes on under the pressure of the weight of the upper unbaked contents of the electrode. Further, the electrode is well protected against oxidation. Economies in electrode consumption costs varying from 50 to 80 per cent. have been reported in favour of the Soderberg electrode. The maximum current density permissible is high, exceeding 12 A per sq. cm., and the largest Soderberg electrode at present in use is 83 in. in diameter. A carbide or ferro-silicon furnace with Soderberg electrodes can be operated continuously at full load with no stoppage for changing the electrodes, as a fresh section of tube is fitted to the end of the electrode protruding from the furnace, and is filled with fresh electrode mixture. Soderberg electrodes taking over 350,000 kW are said to be in use in Europe, the United States, Japan, and in the Dominions.

The essential distinguishing features of the various nitrogen-fixation arc processes in successful operation to-day lie chiefly in the nature of the arc furnaces employed. There are six such different types of furnace—the Birkeland-Eyde, the Pauling, the Schonherr, the Moscicki, the Guye, and the Wielogaski. The first three all make use of h.p. arcs in which the rate of dissipation of energy is exceedingly high. The short l.p. arc cannot be employed, as it would not be possible to pass air at a sufficient rate through such an arc, and the high concentration of electrode vapours would accelerate the decomposition of any nitric oxide formed and result in a poor yield. Whilst the general efficiency of the Schonherr furnace is much the same as that of the Birkeland-Eyde and the Pauling, the nitric concentration is considerably higher, averaging as much as 1.8 per cent. of nitric oxide. That this is so, despite the fact that the gases only pass slowly along and through the arc, is strong evidence that the oxidation of nitrogen in the high-pressure arc is primarily an electrical process. The efficiency of the three types of furnace are much on the same level, although the Schonherr furnace undoubtedly yields the richest gas. From the point of view of first cost, the Pauling furnace is the cheapest and the Birkeland-Eyde the most expensive. On the whole, however, the latter was said to be the most successful, doubtless due to the fact that single Birkeland-Eyde units can be built to take, and be operated successfully under the enormous load of 5,000 kW, whereas the practical upper load limit of the Schonherr furnace is about 1,000 kW, and somewhat lower in the case of the twin-series Pauling furnace.

The electrical manufacture of steel may be divided into two stages—the electrothermic smelting of iron ores for pig-iron, and the electrothermic production of steels from pig-

iron and steel. Whether or not the electrothermal process can compete with the purely thermal process is largely a question of the relative costs of electricity and fuel. It has been calculated that the two processes will be on a par when the cost of 1 kW-year is equal to that of 3.1 tons of coke, *i.e.*, when 1 calorie can be generated electrically at a cost equivalent to only 3.3 fuel-produced calories. It is clear that this will be the case only in countries where fuel is scarce and electrical power cheap. At present the electric smelting of iron-ore is practically confined to Scandinavia and, to a lesser extent, California. In the former country, where the conditions are most favourable, the electrothermal production of pig-iron has advanced rapidly and now ranks as a leading industry. In the case of steel-making, however, the question of relative fuel and electricity costs are of far less importance, and the electrothermal production of steel is now well established as an important industry in most civilised countries. In electrothermal steel-making steels of any desired quality can be produced from either pure or impure materials.

The electrothermal refining of pig-iron is seldom carried out, the molten pig-iron being either first partially refined in a Bessemer converter, or in an open-hearth furnace with an oxidising slag, and then finished in an electric furnace with a basic reducing slag (duplex process); or the molten pig-iron is first blown in a Bessemer converter, then further refined in an open-hearth furnace and finally finished in an electric furnace (triplex process).

In America the electric furnace is widely used in conjunction with the Bessemer converter or the open-hearth furnace, or both, for the production of high-class rail-steel and steel for constructional and shipbuilding purposes from pig-iron of large phosphorus content. In this country the electric steel furnace is employed almost solely for the melting-up of high-grade scrap steel; refining is not carried out. The two chief uses to which the electric furnace is put are to melt pure materials to steel of crucible quality, and to refine Bessemer open-hearth or scrap steel of similar quality to steel of crucible quality.

The mechanism of the electrothermal production of steel from pure materials is relatively simple and resembles that of the crucible steel process. Scrap steel of suitably low-sulphur and phosphorus content is melted down in the electric furnace, and the carbon content is adjusted by additions of pure high-carbon iron and pure iron-ore, or better, low-carbon scrap. After melting, the charge is kept molten in order to enable occluded oxides and gases to escape to the surface. The reducing atmosphere and the high temperatures attainable render the electric furnace particularly suitable for the making of alloy steels, as the loss of costly alloying elements is low, and it is easy to incorporate in the steel difficultly fusible metals such as tungsten. Compared with the crucible process, the electric furnace possesses further important advantages. Operations can be carried out on a far larger scale, comparable with open-hearth treatment, and there is no risk of contamination of the steel with flue gases or the crucible material such as is liable to occur in the crucible process. The steel is at so high a temperature that it is possible to make intricate castings with a minimum liability to flaws. From the point of view of thermal efficiency, the advantage is overwhelmingly in favour of the electric furnace with its intense and localised heat production. Starting with cold materials, the energy consumption in the electric furnace amounts to about 500 to 600 kWh per ton of finished steel, equivalent to about 430,000 to 516,000 calories (electrically produced), as compared with 1½ to 2 tons of coke, equivalent to, say, 12,000,000 to 16,000,000 calories (fuel produced) per ton of steel made by the crucible process.

In this country the cost of generating electricity is so high that, in order to be on the safe side, it is necessary to put the cost of 1 calorie electrically generated at about 18 calories produced from fuel. Thus, expressed in terms of fuel-produced heat, the cost of making 1 ton of steel from cold scrap in an electric furnace lies between 7,740,000 and 9,288,000 calories, as against 12,000,000 to 16,000,000 calories required per ton of steel made by the crucible process. It is clear that on economic grounds alone the crucible process is to be considered as wasteful. The superb skill of the crucible steel-maker is worthy of a better tool than the scientifically unsound crucible. This is available in the shape of either the high-frequency electric furnace for the production of steels of the highest grades in small batches, or the arc furnace for larger batches of steel of, or even excelling, crucible quality. The electric furnace must have a basic lining, for the removal of phosphorous involves the use of an oxidising basic slag produced by the addition of iron-ore and lime. The high temperature attainable in the electric furnace permits of the use of extremely limey slags, thus ensuring a rapid and complete removal of the sulphur. Slags of similar basicity could not be employed in the open-hearth furnace owing to their viscosity at the relatively much lower temperatures of such furnaces. The frequently observed formation of CaO_2 in the electric steel furnace bears witness to the existence of the high temperatures and the reducing atmosphere so essential to the successful carrying out of this second stage of the process. Upon removal of the second slag, the steel is "killed," recarburised and alloyed. The resulting product is, in quality, fully equal, or even superior, to crucible steel, and certainly exceeds the latter in uniformity over large batches.

From the foregoing it is clear that pig-iron can be refined in the electric furnace to a steel of the highest quality. On economic grounds, however, this is seldom done. The refining of molten pig-iron, to which has been added the necessary quantity of cold iron ore, to open-hearth steel in an electric furnace calls for an expenditure of about 200 kWh per ton of steel. The further refining of this molten open-hearth quality steel to crucible steel requires only about 80 kWh. In an open-hearth furnace a ton of steel is produced with an average expenditure of about 6 cwt. of fuel or, say, about 450,000 fuel-produced calories, as against, say, 200×860=172,000 electrically-produced calories.

With regard to the future prospects of electrothermics in this country, there is ample opportunity for the improvement of the processes. The furnace and process efficiencies can be improved, and the concentration of nitric oxide contained in the arc gases can also be increased very considerably. It is not a question of the relative cost of water-power-generated and fuel-generated electricity. The disparity between the two is by no means so great as is sometimes thought. There are many water-power-generated supplies in Switzerland which are much more expensive than the average run of coal-generated electricity in this country. We have to consider that whereas coal-generated electricity is usually available precisely where it is wanted, water-generated current is usually remote from its markets. In comparing the cost of fuel-generated and water-power-generated electricity we must not forget the important item of transport of material to the site of the water power, and the transport of the products from that site to their markets.

In the future the engineer and the chemist will co-operate rather more than they have been inclined to do up to the present. The chemist has a great deal to do in the way of improving his processes, but he will turn to the electrical engineer and ask him to improve, for instance, his means of transmission. The day may come when it will be possible to import electricity into this country from other countries, such as Norway, Iceland, and perhaps even Canada. It is simply a question of the relative cost of transport of the goods made in Canada to this local market and of the transmission of electricity.

Trolley 'Bus Operation.

An Automatic Centrifugal Governor Switch Designed for Field Shunting at a Predetermined Speed.

IN 1922 the Associated Daimler Co., Ltd. (then the A.E.C.), first tackled the problem of the trolley 'bus built on automobile lines, and had of necessity to fit a standard tramway motor. It was decided to equip the vehicle with a single motor, with rheostatic control, which gave a 'bus speed of 14 m.p.h. with full field, but 18 m.p.h. could be obtained by shunting 50 per cent. of the field current. To put this advantage of extra speed in the hands of the driver meant the possible risk of burning out the motor by overloading, and it was decided to perform the function automatically. A centri-

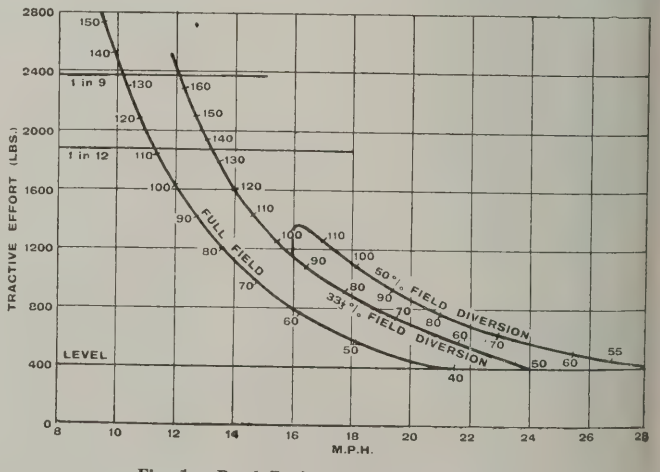

Fig. 1.—Road Performance of Trolley 'Buses.

fugal governor switch was designed to effect the shunting at a predetermined speed when the motor was not overloaded and when the acceleration of the motor was beginning to fall off. This had the desired effect of increasing the speed range and improving the acceleration of the 'bus without risk. The next step in the improvement of the trolley 'bus was the development of the lightweight motor of about 21 lb. per h.p., which was designed to run at higher speeds and with a characteristic giving higher speeds for the lighter loads, giving a greater road-speed range with a full field.

At first sight this would appear to curtail the usefulness of the governor device, especially as the new motors were capable of operating satisfactorily at all loads with 33⅓ per cent. field current shunted. The governor, however, can still further increase the speed by cutting in later and shunting the field current up to 50 per cent. The accompanying curve, fig. 1, shows the road performance of some trolley 'buses recently supplied by the A.D.C. to the Bradford Corporation. The maximum speed on the level at full load and with full field is 21½ m.p.h., and with 33⅓ per cent. field shunting the speed is nearly 24 m.p.h. These speeds are actuated through the controller and are under the control of the driver. When the vehicle reaches 16 m.p.h., the governor cuts in and increases the amount of field current shunted to 50 per cent., and thus

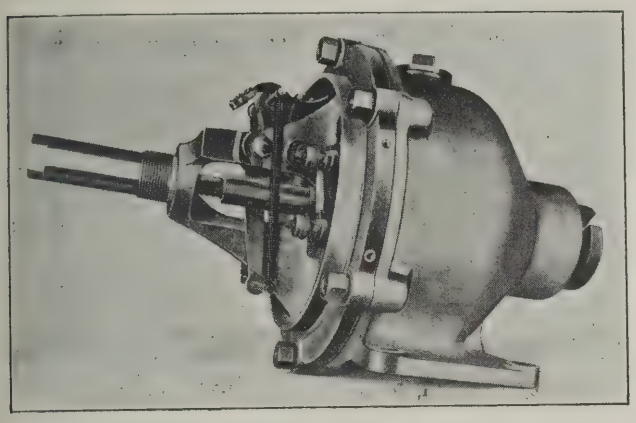

Fig. 2.—Trolley 'Bus Governor Device.

increases the speed to 28 m.p.h. During some road tests made recently at Bradford, it was found that the performance not only checked up with the curve, but that the acceleration was appreciably improved, and that the cutting in of the governor was hardly noticed. When the 'bus was lightly loaded it was found that on the worst gradient, about 1 in 13, the 'bus was 16 per cent. faster than when the governor was disconnected. With heavy loads the speed would not reach 16 m.p.h., and, therefore, the governor would not cut in and overload the motor. The governor can be switched off quite simply if desired by a 10-A switch, so that in cases where traffic conditions do not allow of extra speed it can be cut out until more suitable conditions obtain. Fig. 2 shows the governor device. The centrifugal portion follows the usual form of construction of expanding weights controlled by springs acting through levers on a push rod passing up the centre of the case. This rod in turn operates a quick break switch. The current controlled by this switch is about ¼-A at 500 V, and closes a contactor which cuts in the 5 per cent. shunt resistance.

Parliamentary News.

(By Our Special Parliamentary Reporter.)

County of London Electric Supply Co. Bill.

A Committee of the House of Commons (presided over by Sir John Ganzoni) commenced consideration of this Bill on May 9th. The main purpose of the Bill is to extend the company's area of supply to include the greater part of the county of Essex. It also proposes to confer further powers on the company with regard to its existing area of supply. There was opposition from the Colchester and Southend-on-Sea Corporations, Clacton and Shoeburyness Urban District Councils, the Essex County Council, and the Lea Conservancy Board.

Mr. W. E. Tyldesley Jones, K.C. (who appeared with Mr. Rowand Harker, K.C., and Mr. S. Turner, for the company), said that the company's Barking station was in a position to give a supply to the whole of the area. The proposal of the Bill was that the company should be allowed to supply in the greater part of the county, but where in any district there were authorised undertakers it should only be allowed to supply in bulk to those undertakers. At present the Southend Corporation had three generating stations, in which it used Diesel engines, and there was no question that it would have to get rid of these and embark on a new scheme. If the Bill were passed, the company would be able to supply electricity to Southend on terms better than those on which the Corporation could itself generate, and, in addition, electricity could be supplied in sparsely-populated parts of the county by means of the cable used for supplying Southend. It was provided that if, at the time of the company's application for the present Bill, other people had already made applications for Orders enabling them to supply in parts of the area and if those Orders were subsequently granted, the promoters were to be in the same position as if the Orders had been granted at the date of the passing of the present Bill. Several months after the company had given notice of the deposit of the Bill, the local authorities at Southend, Colchester and Clacton had applied for powers to supply in parts of Essex not supplied at present, and they were going to ask the Committee to extend the clause and to place them in the same position as that in which they would be if they had powers at the date of the passing of the Bill. A clause was inserted in the Bill making the undertaking purchasable at the end of 50 years by the local authorities. Another clause empowered the Electricity Commissioners to make an Order after the expiration of seven years, limiting dividends in relation to charges. There was also a clause providing that within two years from the passing of the Bill the company was to submit to the Electricity Commissioners a scheme for the development of electricity supply in parts of the area in which there was a demand for it. Subsequently such schemes were to be submitted to the Commissioners every five years, until the whole area was covered. If within the period prescribed by the Commissioners for carrying out the proposals approved by them, the company had not substantially commenced the works for the purpose of giving effect to the proposals, the Minister of Transport could order that the company's powers should cease as to the whole or any part of the added area comprised in the proposals. It was also provided that if applications were made or supported by the local authorities for powers to supply in any parts of the company's added area in which the company was not supplying, the company was not to oppose unless the applicants asked for power to erect, acquire, or use a generating station. An important difference between the company's 1924 Bill and the present Bill was that the former proposed to confer upon the company powers of a power company, whereas those powers were not sought in the present Bill. There was a clause, giving the company power to transfer any of its undertakings outside London to another company, with the approval of the Electricity Commissioners. Counsel explained that that was necessary on account of the special position of the London undertakings. It might be found desirable to vest the company's undertakings outside the County of London in a separate company, which would keep separate accounts, and so avoid the difficulties involved in making adjustments. The London and Home Counties Joint Electricity Authority was not deprived of any right exercisable by it at the date of the passing of this Bill to supply electricity in bulk in any part of the added area which was within its jurisdiction, and the consent of the company to any such supply was not necessary. Counsel then dealt briefly with the petitions against the Bill. He said that that of the Essex County Council related to the breaking up of roads, bridges, &c. The Southend Corporation was asking the Committee not to grant the powers which the company asked for, not only as regarded its own area, but also as regarded the whole of Essex. The Clacton U.D.C. raised the same kind of objection. The Colchester Corporation was trying to do on a small scale what the company proposed to do on a large scale. The erection of a small station by the Corporation was nearly complete, but it could not compete with Barking. There was no appearance on the petition of the Shoeburyness U.D.C., and that of the Lea Conservancy Board was left to be dealt with when the clauses of the Bill were finally settled.

Mr. C. H. Merz stated that the company had laid 300 miles of mains, 100 miles of which were in the County of Essex.

On May 10th, Mr. Merz was cross-examined by Mr. Ralph Bury (on behalf of the Essex County Council), and said that the offers made by the company in connection with the company's 1924 Bill, to supply in Chelmsford within two years and in Epping within three years, were not repeated now, because conditions had changed by the fact that the Central Electricity Board was now preparing schemes; any arrangements of this nature with individual authorities could quite conceivably conflict with schemes prepared by the Board.

Sir Harry Renwick (chairman of the company) said with regard to the clause in the Bill to empower the company to transfer that part of its undertaking which was outside London, that the Commissioners could be trusted to ensure that the terms of transfer were fair and proper.

Sir Lynden Macassey, K.C., cross-examining on behalf of the Southend Corporation, asked why the company should put forward a scheme for dealing with Essex before the county had been considered by the Commissioners and the Board. Sir Harry replied that the scheme could only be carried out after it had received the approval of the Commissioners. If they waited until the Commissioners or the Board brought up a scheme to deal with a rural county such as Essex, he was afraid they would have to wait a long time. Before promoting the Bill he had consulted the Commissioners, and the Bill was largely framed on the advice given by them.

Mr. Jacques Abady cross-examined on behalf of the Clacton U.D.C. After securing the admission that, if this Bill were not passed, the company could apply for a Special Order to cover the whole of the added area, he pointed out that if the company did apply for a Special Order, that Order would include, as was always the case, the Section of the Electric Lighting (Clauses) Act which placed undertakers under an obligation to supply in certain districts within specified periods.

On Wednesday, May 11th, Mr. H. Hobson (joint manager of the County of London Co.) gave evidence with regard to the

details of the negotiations between the Company and the Southend Corporation for a bulk supply to the latter. An offer from the County of London Company for a bulk supply to the Corporation, based on conditions imposed by the latter, was not accepted. Subsequently a further offer of a bulk supply was made to the Corporation, but had neither been refused nor accepted. The erection of a generating station on the River Crouch would have necessitated a capital expenditure by the Corporation of £649,000, and the estimated cost of operation, including loan charges on the capital, was £174,615 per annum. Mr. Rider had reported that, carrying the comparison to the year 1930, the adoption of the bulk supply scheme would result in an apparent annual saving of £8,475, but if the comparison were carried to 1940, the advantage would be with local generation.

Mr. F. G. Thomas, K.C., for Colchester Corporation, said that rights of the character asked for should not be given without imposing definite obligations. In 1925, the Colchester Corporation had commenced the erection of a new generating station, but as the work had not proceeded very far, the formal application to the Commissioners for powers to supply in outside districts was not lodged until December of last year. Dealing with the clause under which the company was to submit schemes to the Electricity Commissioners for the development of the various parts of the new area from time to time, he pointed out that its effect was to leave the company, and not the Commissioners, to judge what work should be carried out.

Mr. W. C. C. Hawtayne gave particulars of the costs of the Colchester station designed to show that if electricity were obtained in bulk from the company, it would cost the Corporation more than if it were generated locally.

On May 12th, Mr. Hawtayne said that Colchester had no objection to the company's having distribution powers over the whole of that part of the county which Colchester did not want. Witness said that if the local authority at Wivenhoe wished to become the authorised distributor in its own area the Colchester Corporation would not seek distribution powers there but would supply in bulk. Arrangements were already made for that bulk supply. Negotiations were also in hand for a bulk supply to Brightlingsea. Witness quoted figures of costs for Colchester and Barking, but Mr. Harker contended that he had compared the figure of £26 5s. representing the capital cost per kVA installed at Colchester with the figure of £20 2s. representing the capital cost per kW of output at Barking.

Mr. Jacques Abady, for the Clacton U.D.C., said that although his clients had only a small station, generally speaking they were supplying electricity at a lower rate than that at which the County of London Co. supplied. If the development of the district was entrusted to the County of London Co., it should be through the medium of a Special Order, which would give the local authorities an opportunity to make representations and secure protection. The clause prohibiting the company from opposing any application made or supported by a local authority for an Order, unless the Order applied for included power to erect, acquire or use a generating station, would force such applicants to take a bulk supply from the company.

Mr. G. Broadhurst (electrical engineer to the Clacton U.D.C.) gave evidence to support Mr. Abady's statement, and spoke of the intended developments. He was of opinion that the Clacton station would continue to work for many years.

The hearing was continued on subsequent days and the Committee passed the Bill on Tuesday.

East Anglian Electricity Bill.

A Committee of the House of Commons presided over by Sir A. Shirley Benn on May 10th, began consideration of this Bill. The promoters are the East Anglian Electric Supply Co., who are asking for powers to supply electricity in the counties of Norfolk and Suffolk. There are 11 opponents to the Bill, the principal being the Norwich, Ipswich, Great Yarmouth, and Bury St. Edmunds Corporations.

Mr. H. P. MacMillan, K.C., who appeared for the promoters, said the company had a Special Order for an area in the southern part of Suffolk, bordering on Essex, and including a small part of Essex. It had the backing of the Greater London and Counties Trust, which had a controlling interest. Originally, the Bill included a large portion of the county of Essex, but as the County of London Electric Supply Co. had promoted a Bill which included Essex, the whole of Essex had been cut out of the Bill. The Ministry of Transport now offered no objection to the principle of the Bill. It had been said that the position of some of the authorised distributors in the area would be prejudiced, as a few of them were applying for extensions of their areas. The promoters, however, were willing to concede that those additional areas, if granted, should not be supplied by the promoters without consent, and the same provision was made to apply to any application for an increase of area by an existing authorised distributor made before the date of passing of the Bill. In addition, the promoters had included a clause providing that if after the end of three years from the passing of the Act, applications were made for Orders to supply in any part of the area, the promoters would not oppose. The promoters were compelled every three years, or more often if required by the Electricity Commissioners, to prepare schemes for dealing with areas not supplied in which a demand arose. Any Order made by the Commissioners in those circumstances would make it obligatory upon the company to give a supply within two years. A definite scheme might conflict with subsequent schemes of the Central Electricity Board. The Bill did not provide for a new generating station; it was hoped that bulk supplies would be available from large generating stations.

Mr. B. G. Drummond, general manager and director of the company, said that the policy of the company was to develop the rural demand. Before the Bill was promoted the Commissioners had stated that there was no necessity to make provision for a generating station in the Bill, because it would be the duty of the Central Electricity Board to supply the necessary energy. Should supply be required before these arrangements were made, supplies would be available from the Norwich, Yarmouth, or Ipswich Corporations, or from the North Metropolitan Electric Power Supply Co., and the Bedfordshire, Cambridgeshire, and Huntingdon Electric Supply Co. A clause enabled the company to take and give bulk supplies, and a scheme had been prepared involving a capital expenditure of just under £500,000 for mains. Mr. Craig Henderson, for the promoters, said that in order to meet a point raised by the chairman the Bill would be amended so that the first proposals should be put before the Commissioners within 12 months of the passing of the Bill.

Mr. William May (director of the Greater London and Counties Trust) said that the Trust was formed by some of his American friends to acquire interests in electricity and other public utility undertakings. The Trust was prepared to find £500,000 or more for the purposes of the promoters of the Bill. They would expect a 10 per cent. return on the capital, and they were satisfied that electricity could be profitably developed in the area.

On May 11th, Mr. F. M. Rogers, chairman of the company, and managing director of the Greater London and Counties Trust, Ltd., said that the Trust obtained control of the East Anglian Co. in March, 1926, and since then £15,000 had been found for extensions of the company's business, whilst a further expenditure of £30,000 was contemplated immediately. Any additional capital required would be provided by the Trust. Sir Philip Dawson was chairman of the Trust, and the new capital required would be found by American financiers. During the first year, if the Bill passed, the expenditure would amount to at least £150,000. The £30,000 was required for a trunk main between Braintree in Essex and Sudbury in Suffolk in order to give a more effective supply there. A scheme for carrying h.p. mains throughout the area had been prepared, and although Mr. May had stated that a return of 10 per cent. was anticipated, that would not be possible for a number of years. Mr. Wrottesley, K.C., said that the company would merely be distributing the current taken in bulk from the local authorities at a higher price than the local authorities could supply it. The profits of the company were not limited under the Bill. Mr. MacMillan, K.C., for the promoters, said that the Minister of Transport had suggested a sliding scale, and the promoters were considering that. Clause 16 of the Bill provided for the revision of prices. He also said that the Trust was not associated with any American or other manufacturing firm, so that there was no danger of orders going to America. Mr. Spencer Hawes said that the company's position must be regularised by being changed to a statutory one, otherwise capital could not be raised for extensions. It was the intention, if the Bill passed, to close down most of the local stations and take bulk supplies. The company undertook to prepare a scheme within one year, and to carry it out within two years. The company was prepared to erect a power house if the Commissioners decided that one should be constructed. Mr. Wrottesley commented on the fact that no inquiries had been made concerning the prospects of the area as a whole, and suggested that they should have been made before coming to Parliament. Mr. Hawes replied that the evidence was that supply was being given profitably in a large number of districts by the company under non-statutory conditions. The Bill had the same effect as if it were a Special Order as recommended by the Minister of Transport. The fear that the transmission cables from the Central Board in East Anglia would be in the hands of the company was removed by the fact that the Central Board could, if it thought fit, take over those mains.

Local evidence in support of the Bill was then called and the case for the promoters was closed.

On Thursday, May 12th, Mr. Wrottesley said that the promoting company would not generate electricity, and would be merely in the position of middleman between those who generated electricity in the area and those who used it, which could not be in the interests of the consumers. Looked upon as a power scheme the Bill was unnecessary, whilst the rough outline of a scheme of h.p. mains which had been suggested was premature because it was not based upon any inquiries as to the probable demand.

Mr. F. G. Thomas, K.C., for Stowmarket U.D.C. and some rural district councils, said that under the Bill it was left to the promoters to submit schemes to the Electricity Commissioners, and there was no means of compelling the promoters to put forward a scheme for the whole of the area.

The Chairman said that the Committee, having heard the evidence, was inclined to approve the preamble subject to certain conditions, but it was not satisfied that the financial resources of the company were sufficiently strong at the present time to justify such a large area being entrusted to it. He accordingly adjourned the hearing until the following day to give the promoters an opportunity to confer on the matter.

Mr. MACMILLAN, K.C., for the promoters, referring to the decision on the previous day, said that the Bill would not have been placed before the Committee had it not had behind it the support of the Greater London and Counties Trust, Ltd. That concern was prepared to enter into a contract forthwith with the company, to the effect that in the event of the Bill being passed the Trust would subscribe further ordinary shares to the amount of £150,000 at least for developing the area, and if so desired the contract would be produced to the Committee before the Bill was passed.

Mr. F. G. THOMAS, K.C., argued that if, after the Bill was passed, investigations showed that the area, or large portions of it, would not be remunerative there was nothing to prevent the contract being annulled. Mr. MACMILLAN reminded the Committee that the promoters had to submit proposals within a year, and if they were not carried out the powers under the Bill could be revoked within two years. Mr. THOMAS replied that to meet that obligation it would be necessary for the East Anglian Co. only to provide a scheme for an infinitesimal portion of the area.

The CHAIRMAN announced that the Committee would like to examine the proposed contract between the Trust and the East Anglian Co., and also that it was proposed to put in, as one of the conditions of passing the Bill, an obligation that the company should, within 12 months of the passing of the Act, submit to the Electricity Commissioners a general scheme of transmission throughout the whole area, costing not less than the £500,000 that had been mentioned during the proceedings. In order to give the promoters an opportunity of going into those matters the Committee adjourned until May 19th.

Electricity Schemes.

On May 10th, during a debate on the Ministry of Transport vote, Col. ASHLEY said that the Central Electricity Board had already received one scheme from the Electricity Commissioners, the Scottish scheme, and the scheme for Central England was in an advanced state of preparation and would be ready almost at once. There were two other schemes that were being investigated and that would in a few months come before the Central Electricity Board. The investigations with regard to the Severn barrage had reached a stage in which considerable hopes were raised that it would be a success.

Lt.-Col. MOORE-BRABAZON said that the cost of the Severn scheme would be about £8,000,000. It was said that whether it would ever prove a commercial success would depend entirely on the price of coal. If in future coal were to be more than 17s. a ton the scheme would be a commercial success.

Mr. T. WILLIAMS complained of the attitude of the Electricity Commissioners in refusing to sanction an application by the Mexborough Urban District Council for sanction for a loan under Section 11 of the Electricity Supply Act, 1919. The effect of that refusal was to place the Council in the unfortunate position of having to pay a much higher price for the purchase of power from the Yorkshire Electric Power Company. If the Minister concurred in such decisions of the Electricity Commissioners, it would mean that the small but highly efficient generating plants in the country were going to be handed over to the big electricity companies without any compensation.

Mr. ATTLEE expressed himself as strongly in favour of the concentration of generation in capital stations, but said that some of the big companies had taken very short-sighted and narrow views. They did not offer sufficiently attractive terms for bulk supply, and their attitude was militating against the success of the 1926 scheme. If the Minister approved of the reduction of the period for loan charges from 15 years to 10, he was not really benefiting the progress of schemes under the 1926 Act, but he was really weakening the bargaining power of local authorities and small supply companies to get reasonable terms of bulk supply from the big power companies.

Col. ASHLEY said that he could not interfere with the finding of the Electricity Commissioners regarding Mexborough. His information was that the Yorkshire Power Co. would be able to supply current cheaper than the Corporation.

The Mexborough Case.

On May 10th, Mr. T. WILLIAMS again raised the question of the Mexborough case. He asked if the Minister of Transport was aware that the Commissioners had based their calculations upon repayment of the necessary loan over a period of 10 years instead of the usual period of 20 years; that the facts were such that, without having halved the period of repayment of the loan, the saving was in favour of local generation, and if he would have the case reconsidered.

Col. ASHLEY said that it was the practice of the Electricity Commissioners to allow a period of less than 20 years for the repayment of loans for generating plant in cases where there was reason to anticipate that the utility of such plant might be superseded owing to the probability of bulk supply or other circumstances. Mexborough was in a provisionally determined electricity district, and he was not prepared to ask the Commissioners to reconsider their decision.

Electricity Loan Periods.

On May 10th Mr. T. WILLIAMS asked the Minister of Transport if he would state in how many cases, where a local authority had made application to the Electricity Commissioners to extend its plant, the period for repayment of loan had been calculated on the basis of 10 years; and whether, in view of Clause 14 of the Electricity (Supply) Act, 1926, he would state why that new basis was used.

Col. ASHLEY said there were three cases where the Electricity Commissioners had adopted 10 years as the appropriate period, and that in a number of other cases the calculations were being made on the same basis. It had been the practice of the Electricity Commissioners since 1920 to prescribe a period less than 20 years for the repayment of such loans where there was reason to anticipate that for any special reason the plant might be superseded during a shorter period.

The Ordinary Engineer and the Beama.

In my recent article on "The Ordinary Engineer and his Remuneration," I expressed the opinion that the subject of vital interest to the "ordinary engineer" is his salary. That is the touchstone with which he tests the various aspects of the industry which affect him. I do not suggest that his views are so narrow that he can only examine the immediate effects of any of these aspects upon his own position, but I do affirm that while he may view them in their correct perspective with regard to their effect on the industry as a whole, their main interest is, to him, how they affect him financially.

The Beama is, of course, the great hush-hush of the electrical industry, and it is a striking testimony to the integrity of the profession that it has escaped criticism for so many years. It was on this account that I refrained from referring to it in the article already mentioned above. Even now, although employed by a firm not in the Beama, I feel myself bound to some extent by the confidence reposed in me by previous employers who were members of it. Since, however, the Association has recently come into the limelight and has been defended by Mr. D. N. Dunlop and others, I feel myself at liberty to make some comments.

Speaking for the "ordinary engineer," I believe that the Beama, like the trade union, is a necessary institution. Like the trade union, I believe it has overshot its mark. Speaking from personal experience, I beg leave to doubt that Beama prices are seldom in excess of the prices which would be charged by the individual firms.

One of the great arguments of the Beama defenders is that it enables them to pay higher wages—and presumably salaries. The fact is that it is hardly possible for them to be lower—moreover, the wages paid by Beama firms are at trade union rates, just as are those paid by firms outside the ring. Salaries are higher, if anything, outside the ring than in it. Taking into account the index figure of the cost of living (published by the Board of Trade) salaries are lower to-day than ever before—lower even than in those dark days before the Beama saw the light of day. I do not deny that shareholders—and probably directors—have benefited by its birth, but I do deny emphatically that the benefits accruing to Beama firms are passed on in any way to the engineering staffs. For instance, since it has been admitted that the Association controls prices and distributes work, let it also be admitted that in very many cases—if not all—unsuccessful tenderers are reimbursed for their quoting expenses by the firm which obtains the contract. These bonuses are very considerable amounts and far in excess of the actual expenses of tendering. They are, nominally, to pay the costs of the engineering and sales staffs. I would like to hear from *any* Beama firm that it sets aside any proportion of such bonuses to augment the salaries of its staff. I should like to hear a denial that such sums are simply thrown into the general account for the ultimate benefit of shareholders—and directors.

We have all of us experienced that threadbare cry of "bad times" as an excuse for unjustifiable parsimony in the matter of salary increases. I should go weak at the knees and goosey all over if I heard of any engineering firm—Beama or otherwise—whose directors said to the engineering staff: "Gentlemen, we have had a jolly good year, and in so far as our success is largely due to the engineering staff, we have pleasure in raising your salaries 10 per cent. all round, so that you can eat butter instead of margarine and have meat three times a week instead of twice."

In conclusion, I throw down a definite challenge to any Beama firm, to show that they have given a definite percentage increase to their engineering staff in the same way that they give a definite percentage dividend to their shareholders.

The Bogy of 40.

In your "Situations Vacant" columns for the 29th ult., I noticed an advertisement inviting applications from experienced men who have specialised in commercial work, "Age not over 35," and I am tempted to ask why some employers,

especially those belonging to the electricity supply profession, should consider a man of over 35 years inferior in ability and efficiency to a younger man.

I am 45, and feel that my mental capabilities and powers of concentration and application were never so pronounced as at the present moment, whilst those extra ten years have taught me much more than I ever knew when I was 35.

Let us explode this "40 bogy" once for all. If a chief engineer of 65 is capable of conducting a supply undertaking, he is entitled to draw his £1,000 per year, but need it tax his sense of proportion or charity to suggest that his assistants of 40 and 45 are equally worth their £6 or £8 per week?

May 11th, 1927. **Live and Let Live.**

Sheath Losses in Cables.

All workers in this field will be grateful to Mr. Brockbank for bringing to notice the ingenious and simple method for measuring sheath losses described in his article in your current issue. From the point of view of ease in manipulation and rapidity in carrying out a number of tests the method will certainly commend itself for single-phase work, and if only the author can develop a simple adaptation for use with 3-phase currents on three single-core cables laid side by side he will deserve our further thanks.

Mr. Brockbank gives only one example of the application of the method, and in this he shows that the sheath losses in a short length of 66-kV single-core lead-covered cable with 6 in. between centres amount to 28 per cent. of the copper loss. As so much interest is being displayed in 66-kV cables just now, I think it is important to point out that the figure is not to be taken as indicating the normal sheath loss for transmission at this voltage. If the two cables (there were only two, of course, as it was a single-phase test) had been placed at 3-in. centres instead of 6 in., the value of the losses would have been considerably less than 28 per cent., and as I have shown in my recent paper before the Institution, if the three cables had been laid up close together under one armouring to form a 3-core S.L. cable the total sheath loss would have been reduced to a value less than 5 per cent. of the copper loss.

Cheap Electricity.

I read with considerable interest your review of Messrs. Ruston & Hornsby's pamphlet entitled "Cheapest Electricity," but I have not seen the pamphlet yet. I have also read Mr. R. Borlase Matthews's reply to that pamphlet, and I note that he refers to a pamphlet for which I am responsible, entitled "A Word in Favour of the Independent Power Plant," and states that Messrs. Ruston & Hornsby's pamphlet is a condensed version of mine. This may or may not be correct, but I note that Mr. Matthews states that I specialise in advising on small power plants, which is, of course, correct up to a certain point, but he must disabuse his mind of the idea that the pamphlet was written with an interested motive as regards myself; it was written at the time when the Electricity Bill was under consideration, and I felt that it was desirable that the advantages of independent power plants should be recognised, and that consumers who had waste heat, either in the form of unsaleable coal, gas from coke ovens or blast furnaces, or exhaust steam, should realise that they could produce power at a very low cost by utilising this waste heat in independent plants of their own. In support of my statement I would refer to my paper on "Electric Winding Considered Practically and Commercially," read before the Institution of Electrical Engineers on January 16th, 1906, which was very fully discussed at Manchester and in London. In winding up that discussion I made the following statement:—

> "In collieries generally, particularly those in which electric winding is adopted, colliery owners would be well advised to take their current from the supply companies, assuming that they can purchase it at a reasonable price, even if this price is slightly in excess of what they can make the current for themselves; the amount of capital required for generating plant being so heavy, it can usually be applied to much greater advantage in increasing the electrical plant or improving other machinery about the collieries."

During the last twenty years it has been my lot to consider on behalf of consumers the agreements suggested by power companies for the supply of current not only for collieries, but also for iron and steel works, engineering works, and manufacturers generally, and I have endeavoured to follow the advice which I gave in my discussion; but power companies generally do not realise, or at any rate they do not admit, their inability to compete with consumers who are producing their own current from waste heat, nor do they look in a sympathetic manner at all upon the small consumer who may desire to install his own power plant in the form of a steam, oil, or gas engine, notwithstanding the fact that he can do so generally at a much lower cost in all ways, that is, as regards first cost and running cost.

In my opinion, based upon a long experience in connection with agreements, the present form of agreement adopted by many power companies is far too complicated to be understood by the ordinary consumer, who is asked to accept a maximum-demand charge and unit charge, and, in addition, a minimum payment whether he uses current or not, an adjustment if the power factor falls below a certain limit, and other penalties, which make it very difficult to arrive at what the actual cost of the current will be per unit consumed.

I have listened to the arguments of the power companies as regards the fairness or otherwise of the maximum demand plus unit basis of charging, but I fail to see why, except in very special cases, a flat-rate system of charging cannot be adopted, the charge per unit being based upon the consumption monthly or annually.

I entirely agree with the views expressed by Mr. Matthews as regards the Electricity Commissioners taking an interest in the terms of supply to consumers, and, whilst it may be necessary to add to the Commission a certain number of business men who understand the consumers' requirements and the necessity of a cheap and abundant supply, and who would be able to deal also with any disputes that might arise between the consumers and the power companies in connection with the cost of supply, it would certainly inspire a great deal of confidence in the minds of the consumers.

W. C. Mountain.

Newcastle-on-Tyne, *May 5th*, 1927.

The Ideal Wiring System.

"C.T." says in your issue of the 13th inst. that "rubber sheathing is apt to crack on the outside of bends after it has been in position for some time, as rubber will do in tension." "C.T." is half correct. Some rubber sheathing may crack as he states, but C.T.S., when properly made, will not. We have dealt very thoroughly with this matter, ever since the very early days of our patent, when we discovered this fly in the ointment; and we defy "C.T." or anybody else to cause *our* C.T.S. to crack under any of the conditions mentioned by him.

"C.T." further says: "This fault is particularly noticeable in tropical climates, where great variations both in temperature and in dampness or otherwise of the atmosphere are experienced." The reply to this is as above, added to the fact that we have been sending our C.T.S. *for many years* (on the instructions of the most eminent Government and other consulting engineers) to all sorts of tropical places, mainly because it stands up to the severe conditions there which destroy other types of cable.

In conclusion, we thank you and "C.T." for giving us the opportunity of publishing this information in your widely-read columns, equally with your other contributor "C.T.S.," who has spoken so well of our "Baby."

St. Helens Cable & Rubber Co., Ltd.

D. Evans, *Secretary.*

Slough, *May 13th*, 1927.

I have read with interest Mr. H. R. Taunton's article, and can only come to the conclusion that the writer is not very familiar with the advertising columns in your journal. Mr. Taunton states that "a drawback to the use of cab-tire cable is that none of its makers have provided a cheap and simple joint box for use with it—or if they have, they do not seem to be *proud* of them, for we never hear of them."

While this statement may be partly correct, it does not prevent a non-cable manufacturer from inventing and manufacturing a box for use with cab-tire cable.

For Mr. Taunton's information I would state that the majority of the leading C.M.A. manufacturers "list" and "stock" the "J.C.W." universal connector box for use with cab-tire cable.

In conclusion, I would say that I am very *proud* of this connector box, particularly in view of the numerous unsolicited testimonials I have received from users and colleges.

J. C. White.

Manchester, *May 14th*, 1927.

Electro-Culture.

I beg to acknowledge my indebtedness to Mr. R. Borlase Matthews for the information he has given me on the subject. I am pursuing my investigations along the lines indicated by him.

Carnegie Awards for Gallantry.

In connection with the accident which occurred at the new works of the London Electric Supply Corporation at Deptford Dry Dock in January last, awards made by the Carnegie Hero Fund Trustees for gallantry were presented by the Mayor at a recent meeting of the Greenwich Borough Council to George Edward Thorpe, George Gaunt, John Henry Perkins, and Thomas John Taylor.

Legal.

Impex Electrical, Ltd., v. Norton Wireless Co., Ltd.

This action, which was adjourned from May 6th, came before Mr. Justice Tomlin in the Chancery Division again on May 11th. The plaintiffs claimed an injunction restraining the alleged infringement by the defendants of their trade mark "Dario" for radio valves.

Mr. Courtney Terrell further cross-examined Mr. Thomas Kelly, a member of the defendant company. In reply to counsel's questions he said his firm in 1925 received a parcel of "Radiomicro Special" valves made by La Radiotechnique, the French firm from which the plaintiff company obtained its supplies; they were not in cartons but in wrappers. Mr. Terrell asked if he had received, since 1925, valves from France in boxes bearing a French inscription. Mr. Kelly replied in the negative. The valves he received were made in Holland and came to him through France. A man in France named Sassoon had supplied him with boxes, but not, to his knowledge, with "Radiomicro" valves. Mr. Terrell then handed to him several Imperial Airways delivery sheets, dated in 1926, which, he said, showed deliveries to the defendants of parcels of "Radiomicro" valves, but witness denied all recollection of them and declared that the signatures on the sheets were not his. In one case, he said, it was his wife's, and another he could not identify.

The freight manager of Imperial Airways, Ltd., said that in 1926 he saw parcels of valves consigned from France to the defendants. The valves were packed in cartons bearing the word "Radiomicro" and other French words.

On May 12th, when the hearing was continued, Mr. Melville, K.C., for the defence, said that Mr. Kelly had been able to find four delivery sheets of last year, some of which related to the delivery of "Radiomicro" valves. Evidence was given by two employés of the defendant company that they had never sold valves bearing the word "Dario."

Mr. David Cartwright, a traveller for dealers in wireless goods, said he was in the defendants' shop when a man dressed as a chauffeur bought a valve. (This man is said to have been the employé of the plaintiff company who bought the alleged infringing valve). He did not know what he bought. He himself bought two "Radiomicro" valves, but he took no special notice of them.

The case was adjourned until May 18th to enable the plaintiff company's chauffeur, who was stated to have purchased an infringing valve, and another witness to be recalled.

Theft of Electricity.

Thomas H. Smith was fined 20s. at Worksop last week for stealing electricity from the Butterley Colliery Company. The company, it was stated, supplied electricity to houses in the village of Ollerton. Wires were found to have been fixed to Smith's caravan, and electric light was used nightly in the caravan. Defendant admitted running a cable from his mother's bungalow to the caravan, and having a light for a week, but "he thought there was no harm in it."

Taunton v. Tomlinson Lee.

In the King's Bench Division last week, before Mr. Justice Rowlatt Mr. H. Tomlinson Lee, formerly borough electrical engineer of Wimbledon, was sued by Mr. Hugh G. Taunton, solicitor, who sought to recover £868 as his costs for acting as Mr. Lee's solicitor. The defence was a denial that defendant retained the plaintiff as his solicitor, and alternatively it was said that the costs which defendant was to pay the plaintiff were limited to five guineas.

Mr. Hawke, K.C., for plaintiff, said that when Mr. Lee relinquished the post of borough electrical engineer he proposed taking legal proceedings. He discussed the matter with Mr. G. E. Bellingham, a solicitor, who was a member of the Wimbledon Council, and wanted Mr. Bellingham to act for him. Mr. Bellingham, however, did not wish to do so, and introduced Mr. Lee to Mr. Taunton, the present plaintiff. The first action was against the Wimbledon Corporation for wrongful dismissal; the Corporation paid £138 into Court in settlement. Then followed a series of four actions for slander, &c., two of which ended in verdicts for Mr. Lee, while in a third the jury disagreed, and in the course of the fourth Mr. Lee changed his solicitor. Mr. Taunton acted for Mr. Lee in all these cases, but there was no doubt that a great deal of assistance was rendered by Mr. Bellingham. It was not true that plaintiff agreed to accept only five guineas for his services.

Mr. Lee said that Mr. Bellingham told him that he would do the necessary work on payment of his out-of-pocket expenses. Witness understood that Mr. Taunton was merely lending his name for the proceedings, and he understood from Mr. Bellingham that he would have to pay Mr. Taunton only five guineas. Several witnesses were called for the defence, who said Mr. Bellingham told them he was doing the legal work and charging Mr. Lee only his out-of-pocket expenses.

His Lordship said that although Mr. Taunton did a great deal the real work was done by Mr. Bellingham. He thought that there was no promise by Mr. Lee to reward Mr. Taunton or Mr. Bellingham through him. He therefore gave judgment for Mr. Lee.

Published Specifications.

BEXLEY.—Nurses' home, Mental Hospital; L.C.C. architect.

BEXLEY HEATH.—School, Wickham Street, Welling, with electric heating, for Kent E.C.; education architect, Sessions House, Maidstone.

BOLTON.—Alterations, Rumworth Cinema; F. S. Hampson.

BRACEBRIDGE.—Extensions to mental hospital (380 patients), for the Visiting Committee; Harold E. Page, clerk, Lincoln.

BRISTOL.—51 houses off Whitehall Road; Bristol Housing, Ltd. 200 houses, Shirehampton; city engineer.

CARDIGAN.—Secondary school; Cardiganshire Education Committee.

CARLISLE.—Extensions, Central Hall, Market Street; H. E. Ayris, architect. Additions at Harraby Hills House for L.M.S.; E. H. Townshend.

CHESHAM.—Secondary school, for Bucks E.C.; C. G. Watkins, secretary, Aylesbury.

COBHAM (Surrey).—Additions, Fairmile Hatch, for Sir G. Rowland Blades, M.P.

DARTFORD.—Central schools (£21,000), for Kent E.C.; education architect, Sessions House, Maidstone. Engineering shop, Kent Road; Dartford Copper and Engineering Works. Additions, Hythe Street; Keyes Daren Mills, Ltd.

DERBY.—Catholic secondary school, Nottingham Road; Mgr. Payne, rector of St. Mary's.

DOVER.—Motor works and garage, for the Cambrian Motor Coaches Co.

DUDLEY.—Engineering shop, Pear Tree Lane; John Thompson, Ltd. Warehouse, High Street; A. Preedy & Sons.

DUNDEE.—Extension scheme at Ashludie Sanatorium (X-ray room, &c.), to cost £40,000; city architect.

EDINBURGH.—388 houses for Corporation; F. J. MacRae, city architect.

EPSOM.—Housing scheme (58), for the R.D.C.; F. A. Pratley, surveyor, Ashley House.

FALKIRK.—Church hall for Christ Church (£1,250); G. Smith, Christ Church Vestry.

GLASGOW.—Dance salon for Codanzo, Ltd. (£12,000); Denny and Blain, architects, 144, St. Vincent Street. Church in Beaconsfield Road for St. John's, Renfield and Hyndland Church (£2,500); Rev. James Muir, St. Andrews U.F. Church. Bakery and garages for Price Bros. (Bakers), Ltd., Clayton, Manchester; the manager. Garage, Kilmarnock Road, for Merryles Motors, Ltd.; J. Austin Laird, architect. Artificial light installation, Govan Town Hall centre; Medical Officer of Health.

GUILDFORD.—Extensions, County Hospital (£28,500); A. Preston, hon. secretary.

HARWICH.—17 houses at Rosebank, and 46 at Dovercourt; borough engineer.

HASTINGS.—Hotel, St. Leonards, with ballroom, garage for 100 cars and repair shop, and heating and electrical work; Callow & Callow, architects, 47, Havelock Road.

HEMSWORTH (Yorks.).—Infirmary, for the Board of Guardians; W. T. Lynam, architect.

LEEDS.—Corporation garage, Mansion Lane; S. Flockton.

LEICESTER.—Civic centre with municipal offices, and other public buildings; City Council Special Committee.

LONDON (Barking, E.).—Outfall works (£21,000); L.C.C.

(Becontree, E.).—2,221 houses for L.C.C.; C. J. Wills and Sons, Ltd.

(Islington, N.).—134 tenements, George's Road area; L.C.C. architect.

(Peckham, S.E.).—Reconstruction, 138a, 140, 142 & 144, High Street; Selfridge & Co., Ltd.

(Fulham, S.W.).—Buildings for Macfarlane, Lang & Co., Townmead Road; Troy & Co. Buildings for Hammersmith Distillery, Chancellors Road; J. W. Faulkner and Sons.

LONDON.—*Continued.*

(Wandsworth, S.W.).—Factory, Merton Road; G. Mason and Co., Ltd.

(Westminster, S.W.).—Alterations, Army and Navy Stores, Victoria Street; Sir Aston Webb & Son. Building, 11-27, Artillery Row; G. Jeeves.

(Holborn, W.C.).—Club for the Holborn Boys' Club (£7,000), for the trustees of the Harpur Trust, Bedford; the clerk, Bedford.

MACCLESFIELD.—Bazaar premises, Mill Street, for F. W. Woolworth & Co., Ltd., Kingsway, London.

MAIDENHEAD.—Reconstruction of Queen Street cinema; the proprietors.

MAIDSTONE.—Grammar school for boys, for Kent E.C.; W. H. Robinson, education architect, Sessions House.

MERTHYR TYDFIL.—Cinema, Castle Hotel site, for Frank Taylor; O. P. Bevan, architect.

MILFORD.—Sanatorium (£211,000), with electrical work, for Surrey C.C.; Sydney Tatchell, architect; Chapman, Lowry & Puttick, Ltd., builders, Haslemere.

MORETON.—School (£17,851), for Cheshire E.C.; director of education, Chester.

NORTHAMPTON.—Two operating theatres, for the Hospital Committee; the secretary.

NORTHERN IRELAND (Belfast).—Extension to goods shed, Dufferin Dock, for Harbour Commissioners; T. S. Gilbert, harbour engineer.

(Newtownards, Co. Down).—Conversion of Regent House into secondary school; C. J. Love, architect, 11, Chichester Street, Belfast.

OLDBURY.—Housing scheme (116), for the U.D.C.; surveyor.

PENRITH.—Premises, Old London Road, for Hayton's Motors, Ltd. (£8,000); James Winskill, manager.

PETERBOROUGH.—Housing scheme (50), for the T.C.; city surveyor.

PLYMOUTH.—Secondary school, Pounds Estate; Education Committee. Museum extension; borough engineer and Carnegie Trust. Landing stages, Stonehouse Bridge and the Barbican; borough engineer. Completion of Burrator reservoir (£30,000); water engineer. Badminton Hall, Eggbuckland Road; W. G. Gingell.

PORTSMOUTH.—Stores and stables, Brunswick Street and King Street; Portsmouth United Breweries, Ltd.

RIPON.—Sewage pumping plant, city engineer. 46 houses, Aismunderby estate; Williams & Williams.

ROTHERHAM.—Electrical extensions, factory; Guest and Chrimes, Ltd.

RUSHDEN.—County school of boot and shoe manufacture, for Northants E.C.; the clerk, Northampton.

ST. AUSTELL.—Garage, South Street by-pass; John Williams and Sons, builders.

SLEAFORD.—Electricity installation, motor works, Northgate; Allen & Sons. Electricity installation, Waverley Hotel, Station Road; H. Baker.

SOUTHEND-ON-SEA.—Church, for Leigh Road Baptist trustees (£10,800); A. J. Arnold, builder.

SPONDON (near Derby).—Extensions to artificial silk factory for the British Celanese Co., 8, Waterloo Place, London, S.W.1.

STIRLING.—Electrical work at 96 houses, Bannockburn Road; Mr. A. H. Goudie, burgh engineer (returnable deposit of £1). Electric lighting scheme, Poorhouse, for the Committee of Management of Stirling Poorhouse; J. J. Inglis, consulting engineer, Glasgow.

TORQUAY.—156 houses, Barton estate; G. E. Tozer.

TRURO.—Improvements, municipal offices; city engineer.

WALSALL.—Houses (83), for the T.C.; W. T. Emery, builder.

WATFORD.—Library, Little Nascot; A. Gold, architect, 14, Bedford Row, London. Extensions, factory, Stanborough Park; Granose Foods, Ltd. Extensions, Chester Road; Standard Range and Foundry Co. Market, Road; Standard Range and Foundry Co. Market; borough engineer.

WELLFIELD.—Secondary school, for Durham E.C.; director of education, Durham.

WEYMOUTH.—Shops and restaurants, Royal Bath site; Gutteridge & Gutteridge, for Messrs. Edwin Jones.

WORKSOP.—Extension, Picture House, Newcastle Avenue; Picture House Co.

The

Electrical Review

VOL. C. MAY 27, 1927. No. 2,583.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The I.M.E.A. at Buxton.

GIVEN fair weather, such as we have been favoured with during the past month, the members of the Incorporated Municipal Electrical Association should find their gathering at Buxton particularly enjoyable; this year the technical programme is comparatively light, the meeting-place all that could be desired, and the omens wholly favourable. We look forward, therefore, to a highly successful Convention, though our sympathies may be extended to the President, Mr. R. W. L. Phillips, whose own town does not possess the accommodation necessary for some 900 visitors (we understand that the attendance this year will beat all previous records).

Let it not be supposed, however, that the meeting is merely a holiday occasion; in addition to the presidential address, there will be three papers to discuss, and various business meetings to be held. Mr. W. C. Bexon, chief engineer of the Ayrshire Electricity Board, will treat of "Methods and Capital Costs of Distribution over an Extensive Area," a subject on which he is an authority, for he has developed a remarkable distribution system linking-up several towns and supplying electricity to country dwellers. Mr. T. Roles, city electrical engineer, Bradford, will deal with "Recent Developments in Power Plant Design and their Effects on the Economy of Generation," matters of which he has made a special study, with the result that he is making a new departure (so far as this country is concerned) in the latest extensions of his plant. Lastly, Mr. H. H. Berry will read a paper on "Electrified Homes of Great Britain and Ireland, with special reference to the Heating Question"; we know that the author has very definite and original views on this subject, and that they will be found well worthy of careful consideration. The papers form a very appropriate and useful trio, raising questions of interest in relation to generation, distribution, and consumption, and with the discussions should furnish information of immediate and lasting value to station engineers and managers.

Further, it appears from the information that we have already collected that the exhibition of electrical apparatus, which gains in interest at each Convention, will this year again challenge past records. We look forward, therefore, to a Convention which will fully maintain the reputation of the I.M.E.A. for efficiency and usefulness, wisely combined with relaxation and social amenity.

Cheap Electricity for Farming.

In *The Times* and *Morning Post* recently Col. R. E. Crompton, R.E., has drawn attention to the necessity of reversing the flow of population by giving to our farms and villages a "cheap and abundant" supply of electricity, so that the land can be cultivated with greater efficiency at reduced cost and village industries can be established, enabling rural workers to employ their time profitably when weather or season puts a stop to outdoor occupations. He adduces the examples of Sweden and Switzerland in support of his case, and emphasises the great importance of the subject, pointing out that, with the aid of electric power, the useful output of the Swedish labourer has been doubled and the rate of wages in agriculture has been raised to the same level as in other industries.

We are glad to have the support of Col. Crompton—the first to use the term "load factor"—in our contention that filling up the load curve is the most urgent need; in his own words, "there is only one certain way of distributing electricity at low cost, and that is by prolonging as far as possible the hours of user. Technically, we term this increasing the off-peak load." We are not quite so optimistic as he appears to be with regard to the Central Scotland scheme, which, he says, makes accessible to large districts of the best agricultural land in Scotland electrical energy at exceptionally low rates; we shall hope to see that end attained some five years hence, but it cannot be, as he says, "soon." Nevertheless, on the general question of rural electricity supply we agree with him that it can be done, and we base this conclusion on the indisputable fact that in some of our country districts electricity is already available at reasonable prices and is cordially welcomed by the residents. Replying to Col. Crompton in *The Times*, Mr. W. W. Blair-Fish, director of the Rural Industries Bureau, in doleful mood pours cold water on his cheerful forecast, appropriately quoting Mr. Dampier Whetham to the same effect; but that gentleman for some years has held somewhat pessimistic views on the subject of electric power in agriculture. The rapid development of rural electricity supply not only in Sweden and Switzerland, but also in France, Germany, Denmark, Holland, and Italy, cannot always be ignored, and a time must come when even our unbelievers realise the facts. So recently as last week, visiting the Bedford Corporation undertaking, it was borne in upon us once more that the country folk needed electricity, were getting it, and were extremely glad to have it.

The Importance of Distribution.

In a letter to-day in our "Correspondence" columns, Mr. R. Borlase Matthews, referring to the notice issued by the Electricity Commissioners with regard to distributing mains, draws attention to the scandal of repression of demand by electricity supply undertakings, on the ground of inadequate capacity of cables, or worse still, the neglect to lay them. Many instances of this grave dereliction of duty have come to our knowledge from time to time, and the Commissioners' action is doubtless based upon similar information. We read of American undertakings which connect up new consumers almost before the ink is dry on the application forms, but anyone who has become or tried to become a customer of some of our own undertakings knows the difficulties and delays that have to be overcome before the supply is available. Some station managers seem to regard such applications as savouring of impertinence. To such, a period of service with a gas company would afford a wholesome lesson. We are glad to see that the Electricity Commissioners are turning their attention to this end of the chain of electricity supply. Some of the heads of our undertakings are apt to forget that it is their business to *sell electricity*, not merely to make it. As Mr. Matthews remarks, and as we have urged *ad nauseam*, the production of cheap power is of little use unless it is effectively distributed. The market must be cultivated. E.D.A. has done far more than any other organisation to that end, and given adequate support it will do better still.

The Generation of Electricity Statistics.

On Friday last the Electricity Commissioners issued their fuel consumption returns for the year ending March 31st, 1926, explaining that the delay in their publication had been due to the exceptional pressure of work during the past year. On this occasion the returns have taken a more comprehensive form than formerly, a complete list being given of all the 584 generating stations from which returns were received, with a summary of the technical results of working, except where this was not feasible; 20 stations were shut down, but 20 others came into operation.

Whilst the "group classification" according to output is retained, the main table is in alphabetical order of names, so that it is not easy to effect comparisons, the tables giving the best results in each group having been omitted; the data are provided, but not in order of merit, so that the table of 584 stations has to be scrutinised to pick out interesting records. This appears to us to be regrettable; tables 3, 4, and 5 in previous returns were particularly interesting. Some of the statistics are quoted elsewhere in this issue.

Naturally we turn first to the Barton station of Manchester Corporation, which is to be congratulated on an output of 269 million kWh generated at an average consumption of 1.36 lb., and with a thermal efficiency of 21.51 per cent. This is, we believe, the best record yet established for a British power station, and is worthy to rank with the best in any country. The load factor was 41 per cent.; Stuart Street station, with an output of 104 million kWh, a consumption of 2.14 lb., and a thermal efficiency of 13.92 per cent., was obviously robbed of load for the sake of Barton, its load factor being only 13.2 per cent.—quite sound practice, of course, but a little hard on the older plant.

Next in order of merit is the North Tees station of the Newcastle-on-Tyne Electric Supply Co., Ltd., which had an output of 167 million kWh, and a fuel consumption of 1.51 lb., with a thermal efficiency of 18.75 and a power factor of 47.1 per cent. The Lancashire Electric Power Co.'s Radcliffe station again made an excellent showing: 131 million kWh, 1.67 lb., 17.45 and 31.8 per cent. The average for the five stations each generating over 200 million units per annum was 1.89 lb. of coal per kWh.

The "Electrical Retailer" Supplement.

The fourth monthly issue of our Supplement prepared for the assistance of the electrical retailing section of the trade accompanies this number of the "Electrical Review." It contains the usual editorial notes and comments, illustrated articles on "Summer Window Displays," "Some Domestic Electric Fans," a contribution by Mr. E. N. Simons on "Stock-keeping for the Electric Shop," illustrated descriptions of a number of "Selling Lines for Retailers," and a page of trade notes and news. Once again this Supplement will reach all our regular readers and many thousands of electrical traders and contractors of the smaller class, and new business for our manufacturers and traders should result.

Electro-Farming.

The ultra-violet ray treatment of live-stock on a commercial scale; some particulars of the apparatus available for the purpose, and of the results obtained.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

(*Concluded from page* 788.)

3.—*Mercury-Vapour Lamps.*—The working cost of this type is usually less than that of the arc type. The modern patterns consist of short quartz tubes in which the arc is formed. In the case of the atmospheric type (see fig. 2) an orifice, closed by a ground-in quartz stopper, is provided at one end for cleaning purposes. It is started by the heat of a coil fixed on one side of the tube, which vaporises some of the mercury. The running current of the normal atmospheric quartz mercury vapour burner is 2½ to 3 amperes, while the starting current is about 4½ amperes.

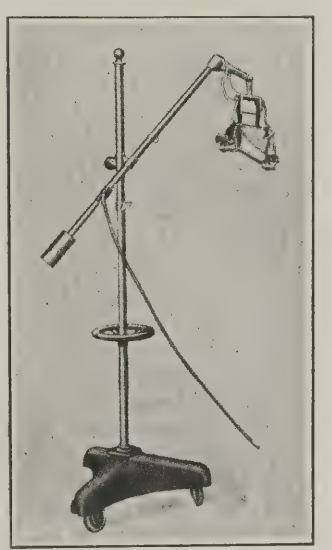

Fig. 2.—Kelvin, Bottomley & Baird Atmospheric Mercury-Vapour Lamp.

The vacuum type (fig. 3), although similar in appearance, is naturally totally enclosed; the arc is started by tilting the tube and thus allowing the mercury to connect the two electrodes momentarily; on breaking this contact the arc is formed. Two sets of aluminium cooling fins are usually fixed at the negative (*i.e.*, the bottom) end of the burner.

Both the atmospheric and vacuum types of lamp fall off in efficiency in the course of time. This is due to the formation of a film on the internal surface of the arc tube. In the case of the atmospheric pattern, this film can be washed off with concentrated nitric acid, then rinsing with distilled water and finally with alcohol. The mercury should be filtered before it is replaced. This work is really beyond the limit of skill of most users, so that in the case of either form of lamp, it will have to be returned to the makers. Cleaning is usually required after 500 to 1,000 hours, though sometimes the period may be as long as 2,000 hours.

Results of Experiments.

The experiments conducted on animals have been carried out chiefly to determine the changes which irradiation produces in the blood and the effect of the absorption of lime and phosphorus which the ultra-violet rays cause.

Experiments carried out on pigs have shown that during the period of treatment the amount of calcium and phosphorus which the pigs were able to retain was considerably increased, and an analysis of the bones of the animals showed that those of the irradiated pigs contained a higher phosphorus and calcium content than did those of the control pigs living under exactly similar conditions but not irradiated. These findings are of great importance, for it is known that in the case of young pigs, owing to their very rapid growth, there is always a danger of rickets, as the result of a breakdown of the pig's calcium and phosphorus metabolism. The application is of special importance in the winter time, when little sunlight is available. Experiments carried out on young pigs at the author's farm seem to indicate that the mercury-vapour lamp is not very effective for this purpose. However, the tests are being continued, and it is hoped that more definite information will be available in the course of a few months (fig. 5). The prevention of the loss of calcium and phosphorus from the body has also been found to be of value in the case of lactating animals. For instance, in the case of a heavy milk-yielding cow, there is a tendency to lose more calcium and phosphorus in the first half of the lactation period than she can absorb in her daily ration, so that a supply has to be drawn from the store in her skeleton. This loss often causes a reduction of the milk yield, a loss of breeding capacity and abortion. By irradiating the animals it has been possible to decrease the net loss of calcium at the height of lactation, and in one case the net loss was actually converted into a net gain. One firm of manufacturers is now producing a lamp specially for the treatment of horses and cows.

While the treatment of animals in this way is probably only in the experimental stage, it is claimed that the treatment of poultry (fig. 4) is already of commercial value both in dealing with young chicks and egg production. Young chicks, especially in the early part of the year, are very susceptible to leg weakness, which is closely related to rickets. Results already obtained show that the ultra-violet ray treatment, acting as a supplement to the antirachitic factor of foodstuffs, minimises this tendency. In the case of laying hens, experiments demonstrate that the number of eggs laid during the winter months can be considerably increased by irradiating the birds. An experiment conducted

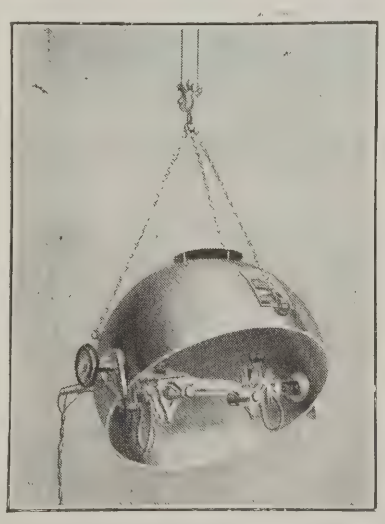

Fig. 3.—"Hannovia" Suspended Tilting-type Vacuum Mercury-Vapour Lamp.

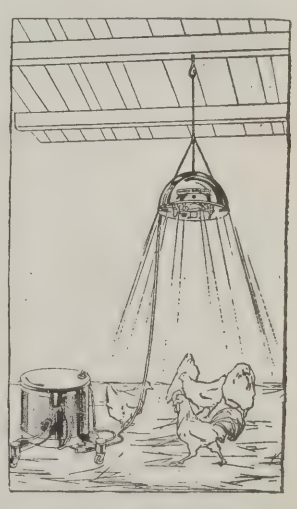

Fig. 4.—"Hannovia" Tilting Lamp in Poultry House.

at the Agricultural University of Wisconsin, U.S.A., was carried out as follows:—

Four groups of hens were confined in coops, out of which natural daylight was shut, artificial light being the only source of illumination. All the birds were treated alike, except that one group was given a daily ten-minute exposure to ultra-violet rays. Tests com-

menced in January and those birds receiving the rays continued to lay abundantly, while the egg production of those not receiving the rays decreased to practically zero. No doubt one of the reasons for this decrease is that laying birds require large quantities of calcium and phosphorus—one egg weighing 56 grammes contains three grammes of calcium—and, as in the case of animals, it is believed that irradiation increases the absorption of calcium and phosphorus from the intestines of the hen. The hatchibility of the egg is also affected. In the case of the irradiated group, the hatchibility was sustained and improved, while that of the eggs from the untreated pens gradually diminished as time went on. Another important fact brought to light was that the quantity of lime in the shell of the eggs, which is an important factor in their value for marketing purposes, was much greater in the eggs of the irradiated hens than in those from the non-irradiated groups.

Interesting results have also been obtained with chickens by using the specially manufactured glass, already referred to, in the windows of the chicken

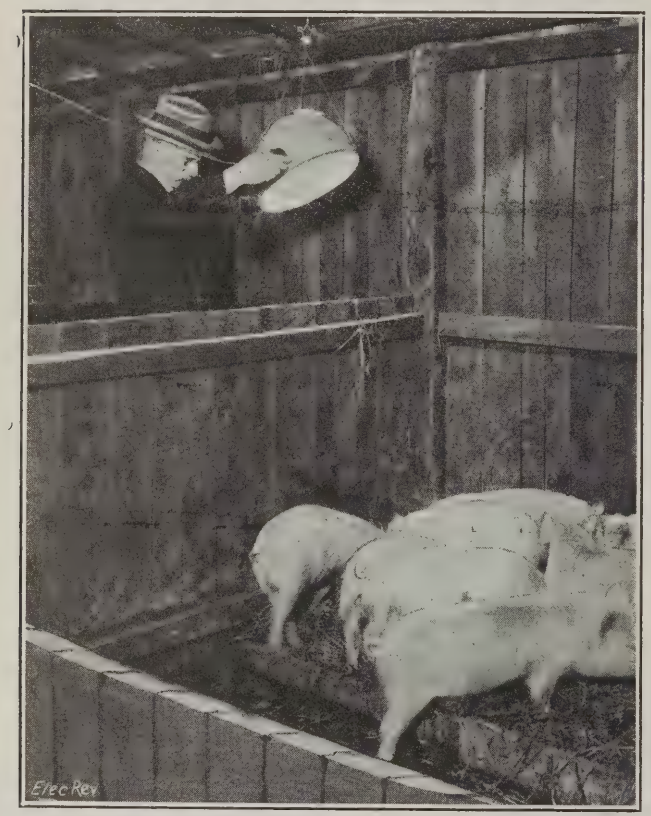

Fig. 15.—Treating Young Pigs with a Quartz Mercury-Vapour Lamp on the writer's Farm at Greater Felcourt.

houses. Chickens reared under this glass have been found to grow more quickly and develop into finer birds than those reared in the ordinary way, although when there is no sunlight about, the artificial lamp must be used. Tests seem to show that black-feathered poultry do not gain much benefit from mercury-vapour lamps; their feathers apparently act as an effective screen.

Dr. Percy Hall, in his book on "Ultra-Violet Rays in the Treatment and Cure of Disease" (Heineman), states "that the absence of sunlight last summer and the preceding winter had more than a little to do with the epidemic of foot-and-mouth disease." By the way, this book deals principally with the use of tungsten arc lamps for treating human beings.

Another interesting book of reference, which deals rather with the use of the mercury-vapour lamp for human beings, is Mackenzie and King's "Practical Violet Light Therapy" (Benn Bros.). Fig. 3 is reproduced from this book, and the writer is indebted to Messrs. Benn Bros. for the loan of the block.

Some recent practical tests in Scotland on well-grown calves did not show any very marked result, though the treated animals certainly did slightly better. One that had ring-worm was cured of it.

So far as the farmer is concerned, the ultra-violet treatment must not be considered as a medical one. It is rather a toning-up of the nervous system, which enables the birds or animals to assimilate their food better and take a more lively interest in life. Mr. J. W. Beauchamp has aptly expressed it as comparable to an aperitif rather than a food.

Foodstuffs.

The effect of treating the food of farm livestock has also been investigated, and it has been found that the animals consuming certain foodstuffs which have been irradiated derive a similar benefit to that which results from the direct treatment of the animal.

Treatment.

There does not seem to be available any convenient practical way of determining the dosage of animals. In the case of human beings the dosage differs with the individual, and it is generally determined by the erythema (or burning) effect on the appearance or pigmentation of the skin. The best plan seems to be to undertreat, so as to be on the safe side, and to adopt, as a rule, ten to fifteen minutes' exposure twice a day at a distance of 3 ft. With a tungsten arc the time should be about ten minutes, and with the impregnated or mercury-vapour lamp, fifteen minutes. The latter time should be more than doubled with an ordinary carbon arc lamp.

The ordinary laws of light must be observed, *i.e.*, the intensity of ultra-violet rays varies inversely as the square of the radius (the law of inverse squares). In other words, if the distance is halved, the intensity of radiation is four times as great. The intensity of radiation is at a maximum along the normal (or perpendicular right-angled) rays. They fall off as the angle of incidence increases. The intensity of inclined rays can be calculated by the "cosine law." As an example, at an angle of sixty degrees the intensity will have fallen to one half that of the "normal" ray. Hence the importance of placing the bird or animal to be treated as close to and in as direct a line as possible with the origin of the radiation. One excellent method of doing this when using arc lamps is to make a hole in the floor, so that the lower part of the mechanism of the lamp sinks below the level of the ground, thus bringing the light on a level with the poultry, pigs, &c. All inflammable matter should be swept away and a wire netting or iron railing guard placed around the lamp.

In the case of milking cows, the writer found that the best results were obtained by placing the lamp on a level with the udder, and directing the rays on to the udder.

The rays between 2,600 and 2,300 Å tend to oxidise some oils and fats, hence a slight smell of burning fat may sometimes be noticed during treatment. Also the waves absorbed by the air produce ozone, which can always be detected when a lamp is in operation by its characteristic smell.

From practical observation, the writer believes that the best months to apply the treatment are November, December, January, February, and March, for at this time of the year the birds and animals suffer through lack of sunshine under the best conditions, while even the small amount of sunshine they do receive usually passes through window glass; further, in winter the sun is so low that the atmosphere cuts off most of the ultra-violet light. The most satisfactory time to apply the treatment is at feeding time, as the animals and birds are together and are not so likely to wander away from the lamp, though in the majority of cases the light seems to attract them.

Protection of the Eyes.

Care should be taken to see that the operator's eyes are protected by goggles from the ultra-violet rays, because,

as these rays are invisible, and no immediate pain is experienced, the harm is done before the operator is aware of the danger. Any ordinary glass (which always contains soda or lead) will serve, but an additional precaution, on account of the strong visible rays, is to use a tinted glass. Fortunately, the eyes of birds and animals, due to their thicker cornea, do not seem to be affected, so the humorous spectacle of a flock of chicks or a herd of cows running around, each fitted complete with goggles, is never likely to be seen.

It is possible that in the near future ultra-violet rays will be used on the farm for many other purposes, such as the purification of water and the sterilisation of milk and butter. This method of treating drinking water has been carried out for some years now. At Amiens, France, about four million gallons of water are sterilised daily in this way, while the French Army has done a great deal of research work in an effort to devise a portable plant of this type for field use.

Practical Results.

In farming operations it takes a very long period of time to establish results, as there are so many variables over which the experimenter has no control. Ultra-violet work is no exception to this rule. However, the treatment of young chicks and young pigs can now be safely recommended. In all probability reliance can also be placed on the treatment of calves and the udders of milch cows. There is more corroboration wanted concerning the treatment of laying hens and fully-grown animals. Also the treatment of foodstuffs is a matter that must still be considered as in the experimental stage.

Examples of ultra-violet lamps intended for the treatment of farm livestock will be demonstrated at the Electro-Farming Exhibit which the writer is arranging on behalf of the Electrical Development Association at the Royal Agricultural Society of England's Show at Newport, Mon., July 5th-8th inclusive.

Mains Engineers' Problems.

A consideration of the methods of, and the advantages to be derived from, duplicating the cables and apparatus used for the supply of electricity to outlying districts.

By D. P. SAYERS, B.Sc.

THE rapid development of electricity supply for domestic heating and cooking of late years, whilst but indirectly felt by generating staffs, has introduced many new difficulties with which the harassed mains engineer has to contend. Not the least of these is the greatly increased difficulty of interrupting the supply to domestic consumers in residential districts. In the past, before the advent of the electric cooker and other electrical domestic appliances, the daytime load in these districts was extremely small. Portions of the l.p. networks could be shut down for an hour or two in the daytime for any special switching or jointing operations without any risk of undue disturbance or public inconvenience. Even where a small industrial load was mixed with the domestic supply, it was generally possible to make the mains dead on Sundays without bringing the mains department into unwelcome notoriety. Now, unfortunately (?—EDS.), those good times have gone for ever; experience shows that a cooking load occurs chiefly during the mornings and in some cases the morning load exceeds the evening lighting peak. Further, of all days in the week, Sunday generally provides the highest cooking peak. Hence, no longer can the mains engineer design a single-line supply to outlying districts and rely on Providence and the quiet of the Sabbath for carrying out any special jointing operations, or odds and ends of routine work, such as cleaning down sub-station switchgear and distribution pillars. The centre and industrial portions of the system have, of course, always been regarded as inviolable in this respect, and have been designed accordingly. The remarks in this article are intended to apply more particularly to outlying suburbs and remote housing estates, of which every undertaking has examples, which are provided with l.p. networks supplied from isolated sub-stations on the h.p. mains.

Generally speaking, it is an economic impossibility to design new distribution networks to the outlying districts in duplicate, or to duplicate the cables and other apparatus of existing networks; such a policy could only result in an enormous amount of idle copper and would give rise to considerable complication in operation. That practice is adopted, necessarily, in areas of heavy industrial load where the revenue is sufficient to justify a certain amount of standby gear; the problem is to provide the same facilities in sparsely populated residential districts.

Dealing first with the l.p. distributors, general practice is almost standardised in the use of multicore cables laid direct in the ground, with service cables of a similar kind. Given these conditions, service connections can be made on the distributor mains without making the cable dead, and "live" jointing is a recognised feature at the low and medium pressures used for distribution. Owing to the extra cost which would be involved, it is not usual to lay sub-distributors along the route of the main distributor. Services are connected direct to the main, and it is therefore not uncommon to find a main distributor anything up to a mile in length, with perhaps sixty or seventy service connections on it. Every joint must be regarded as a possible source of trouble, and a fault occurring on such a main is exceedingly difficult to locate, and the quickest method in the long run being the old-fashioned way of "cut and test." For this purpose it is a great advantage to have permanent disconnecting points at frequent intervals. If there is a main laid along each side of the street, each main can act as a duplicate supply to the other. The ideal arrangement is to lay an interconnecting cable across the street between the corresponding disconnecting points on the two mains. In the event of a fault occurring on either main, only a small number of consumers need be left without a supply whilst repairs are in progress, and only one section of main between two disconnecting points carries more than its normal share of load during this time. In the case of the sub-distributors up side streets, where the ends nearly meet in another road, it pays to extend those extra few yards, if by so doing the distributors can receive an alternative feed in emergency. With regard to the disconnecting points, there appears to be scope for the development of more suitable disconnecting apparatus. Whilst many designs of multi-way link boxes for use in underground pits are avail-

able, they are, for the most part, costly, complicated to install, and when once installed, are not easily altered or added to. The alternative method of fitting the cables with sealing ends and rubber-covered tails which can be connected with screwed or sweated fittings, provides a cheap and flexible job. This arrangement is, however, crude and untidy, and the rubber tails do not give satisfactory service in damp pits. Further, the job of making or breaking heavy currents on two bare cable ends in the cramped conditions of a street manhole does not evoke much enthusiasm in the average workman, especially with the chance of getting a dead short, should tails of opposite polarity be brought together inadvertently.

The question of duplicating sub-stations and high-pressure cables necessarily becomes a matter of greater importance than that of the l.p. networks. In the type of system employing parallel feeders, the principle of duplication is fulfilled immediately; but with the ring-main interconnected type of system, this is not always the case. Economy demands that the load factor of the cables shall be kept as high as possible, and when an extension of the e.h.p. mains is contemplated, it often forms a part only of a scheme which will mature eventually into a ring-main system. This may not be completed for some considerable time, and in the meantime, how is the extension to be safeguarded against breakdowns? A method which is acceptable in many schemes is to make a point of laying a l.p. distributor of a moderate size with the e.h.p. main. This will then become a l.p. interconnector between an existing network and the new distribution point. With the present-day progress, building occurs in the most unexpected places, and it is seldom indeed that such a distributor does not meet the needs of a number of consumers in the course of a few years, and so justify its inclusion in the original scheme. In the meantime it provides an exceedingly useful link for emergency working. It should be remembered that low-pressure mains in a residential district must be designed to keep the voltage-drop within reasonable limits and that the actual loading is much below the ultimate capacity from the point of view of heating. Thus the aforesaid main may well be able to carry the whole of the load of the high-pressure main in an emergency, and even a red glow in the lamps will go some way towards appeasing the consumers' wrath when the e.h.p. main goes down. How many mains engineers to-day, faced with high excavation costs, do not regret the parsimony of their predecessors who failed to lay the low-pressure main with the e.h.p. feeder through the barren wastes which are now budding into respectable suburbs?

Modern e.h.p. switchgear, particularly of the armour-clad type, is fairly immune from serious break-down. Faults have occurred on the older type of sheet-steel cubicle gear, through rain leaking into the sub-station and through faulty alignment, broken porcelains, and so on; on the whole, however, it can be said that this part of the system is not responsible for many breakdowns. On the other hand, modern automatic oil circuit breakers contain so much costly and intricate mechanism that wherever possible they are dispensed with. Duplication is an unwelcome refinement. There are instances of the provision of duplicate busbars being an advantage, and in important switching stations containing more than four or five units, it pays to split the switchboard into two sections with a busbar interconnecting switch. This arrangement allows either half to be shut down for repairs or additions, whilst continuity of supply is maintained on the other half. In the outlying sub-stations, however, everything points to the equipment being kept as simple as possible, ensuring a minimum of initial cost and upkeep. The provision of protective devices is a question on which considerable diversity of opinion exists. That some form of protection for both e.h.p. cables and transformers is essential goes without saying, but the degree is very varied, ranging as it does from simple overload protection with three current transformers to any one of the many developments of the Merz-Price systems with super-sensitive relays, compensated pilot cables, and special tripping batteries. The only rule capable of general application is that the protective gear must be of the most efficient and adequate type near the centre of the system, where shocks occasioned by faults are most heavily felt and the greatest public disturbance caused. The efficiency of the distributing system is greatly improved by a high degree of interconnection, but this can only be carried out safely if the protective gear is absolutely reliable and possesses the two qualities of sensitivity for operation and stability to withstand shock. In the outlying districts both these qualities assume a lesser degree of importance. The vagaries of super-sensitive tripping mechanisms are sufficiently well known to cause the average mains engineer to prefer to fall back upon the old-fashioned plain overload and earth leakage protection, which is at least safe and sure; and the increasing use of the kiosk type of sub-station, in which provision is made for only the most primitive forms of protection, makes this the only practical policy.

The duplication of transformers does not call for a great deal of consideration. This class of plant has now reached a high standard of efficiency and reliability, and the use of two units in place of one involves extra switchgear and entails higher running losses. It is, however, an advantage for an undertaking to keep to as few stock sizes of transformers as possible, and it then pays in large sub-stations to install two standard units in preference to one abnormally large unit, thus providing a measure of duplication and facilitating quick substitution of units.

Thus the problem of what is adequate duplication to ensure continuity of supply faces the engineer at every point between the central station and the consumers' service. In many cases he is handicapped by the lack of standardisation, and this is a point which cannot be stressed too greatly. Standardisation is an essential precedent to inter-connection and duplication; the presence of small networks, relics of earlier days, having non-standard voltages or polarities (frequency hardly comes within the scope of this article), even though they be self-contained, is a hopeless stumbling block to any comprehensive scheme for ensuring continuity of supply. They are pieces which will not fit into the jig-saw puzzle of the distribution system, and every year they go on developing. The only way out is to take the bull by the horns and ruthlessly change over, whether it be d.c. to a.c., 110 to 220 V, or single-phase to three-phase. The cost may be great, but in the matter of duplication, the economic laws are, as usual, at variance with the ideal; and because the benefits of duplication are potential rather than actual, the economic side too often has the last say in the matter. The cause of duplication is well worth fighting for, and to the mains engineer who has fought successfully the benefits become very real indeed when he is faced by a crowd of irate consumers who inform him in no uncertain language that the lights have gone out, the dinner will be spoilt, and the washing cannot be ironed.

A Redeveloped Water-Power Site.

Some particulars are given in *Power* of the 25,000-h.p. hydro-electric installation which has recently been completed at St. Narcisse on the Batiscan River, Canada, 20 miles from Three Rivers, Quebec, by the Shawinigan Water and Power Co. The site was originally developed in 1890 for a capacity of about 1,500 h.p. in three units, operating under a head of 80 ft., the power being transmitted to Three Rivers at 15,000 V by, it is claimed, the first h.p. line in the British Empire. The water is now carried to the new plant, some 4,200 ft. away, where a head of 160 ft. is obtained. The tunnel terminates in a reinforced-concrete surge tank from which two penstocks lead down to the 12,500-h.p. turbines. The generators are supported on concrete pedestals and the operating floor is level with the turbine deck. The project will have an ultimate capacity of 50,000 h.p.

Electricity Supply in Carlisle.

The new 17,000-kW power station of the Carlisle Corporation Electricity Department, which has recently been established at Willow Holme on the River Eden.

PUBLIC electricity supply was first introduced in Carlisle in 1899 as the result of a scheme drawn up in 1897, by Prof. A. B. W. Kennedy, for a generating and distribution system with a power station adjacent to the River Caldew at James Street. The system of supply adopted was three-wire d.c., 460-230 volts, and 500 volts for the tramway undertaking.

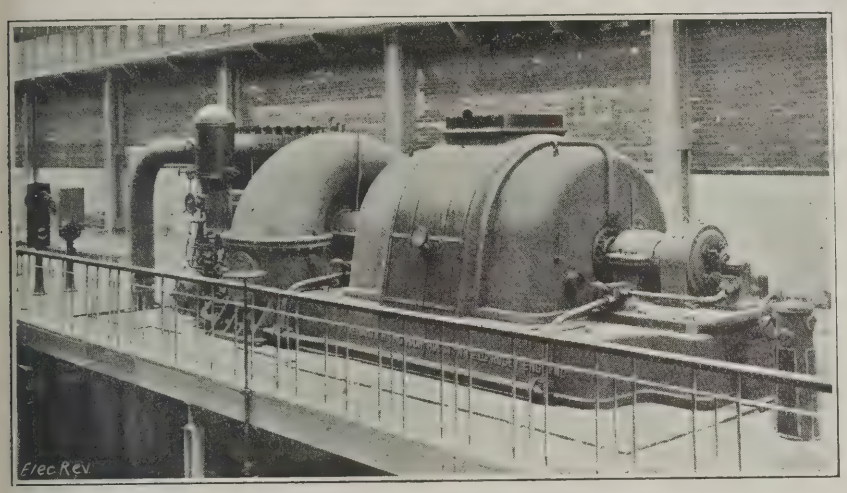

Fig. 1.—6,000-kW Turbo-Alternator.

The original generating plant consisted of two 60- and two 125-kW steam-driven dynamos. Extensions were made to the plant from time to time as the demand increased, up to 1919, when a 2,000-kW turbo-alternator was installed by the British Thomson-Houston Co., Ltd., at a cost of £16,000. This marked the full economic development of the James Street station and led to the building of the new generating works at Willow Holme, which was to be officially inaugurated on Thursday this week. It was in the same year that Mr. C. W. Salt, M.I.E.E., the present city electrical engineer, succeeded Mr. F. W. Purse, M.I.E.E., now engineer and manager at West Ham.

In 1913, a.c. 3-phase was introduced and further development of the old system was restricted. In view of the post-war demand for electricity in and out of the city, Mr. Salt was instructed to report on the situation. A scheme for the new generating station was drawn up by him and referred to the Council's consulting engineer, Mr. Arthur Ellis, who recommended that it should be proceeded with.

During the consideration of these matters the demand increased to an extent that rendered it necessary to install immediately a portion of the new-works plant at James Street. This included a 3,000-kW B.T.-H. turbo-alternator and a 25,000-lb. Stirling boiler.

The Willow Holme station is situated on the River Eden, at a point about 3,000 yards from the centre of the city, where, it is estimated, there is sufficient condensing water for an ultimate plant capacity of 100,000 kW. The general lay-out of the station is on the parallel turbine and boiler-house lines, the turbine room being 201 ft. long by 44 ft. wide, and the boiler house 181 ft. by 72 ft. Between the boiler and turbine houses is an annexe 15 ft. wide for accommodating the main steam headers, steam receivers, booster and feed pumps and other auxiliaries. There is also a 17-ft. annexe which accommodates the switchgear, a battery room, offices, and a repair shop.

The turbine house is designed to accommodate two 6,000-, one 3,000-, and one 2,000-kW turbo-alternators, generating at 3,000 V, 50 cycles, but at present only one new 6,000-kW set, fig. 1, has been installed. The turbine is of the Curtis impulse type, running at 3,000 r.p.m. It was supplied by the British Thomson-Houston Co., Ltd., and is constructed with 10 expansion stages Bleeding branches are provided, and a floating-header steam heater is being installed to work in conjunction with the set. The other machines are to be similarly equipped. The two smaller sets are to be transferred from the James Street works as soon as conditions permit. The turbine room is served by a 45-ton electric travelling crane, by Messrs. A. Jack and Co., Ltd., situated 37 ft. above the basement level,

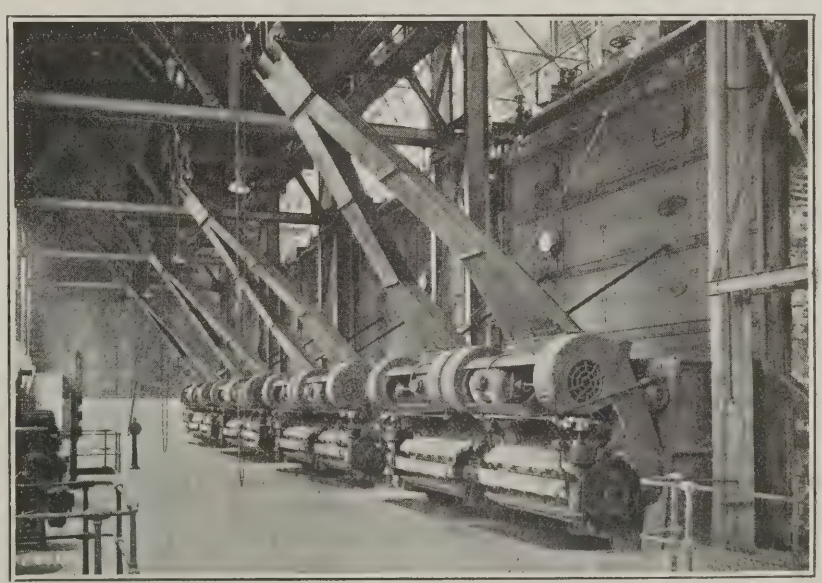

Fig. 2.—Boiler House, Carlisle.

so as to permit the handling of sets up to 20,000-kW capacity. The turbine floor level is 15 ft. 6 in. above the basement.

Ample space being available at the site at a low price, superimposing of the boiler plant has been avoided. The boilers, economisers, main flues, and chimneys are

built up from firing floor level, and a basement extends under the whole plant.

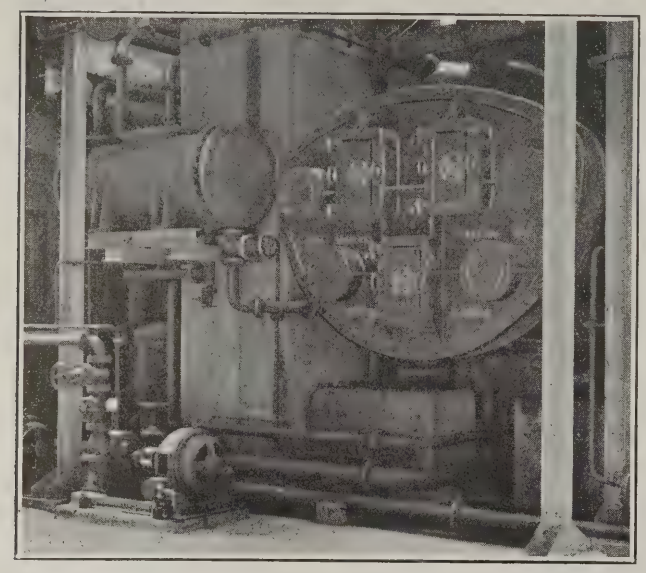

Fig. 3.—Condensing Plant.

With the moderate-sized units installed in the turbine room it was found possible to install boiler plant of sufficient steaming capacity on one side only of the boiler house, leaving the other side available for windows of ample proportions, thus giving good lighting on the stoker fronts and firing floor. Four Stirling boilers, fig. 2, each having an evaporating capacity of 30,000 lb. per hour are at present installed, and one boiler is to be brought from James Street. Provision is also made for the installation of three additional boilers. Two Weir steam turbine feed pumps meet the present needs.

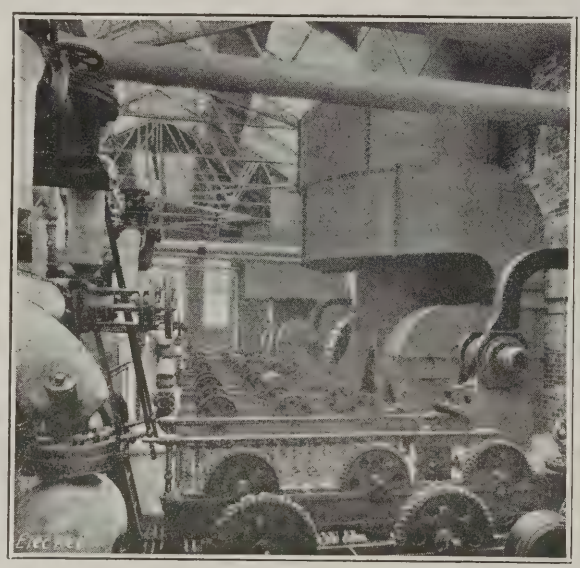

Fig. 4.—Economisers, Fans and Grit Arrestors.

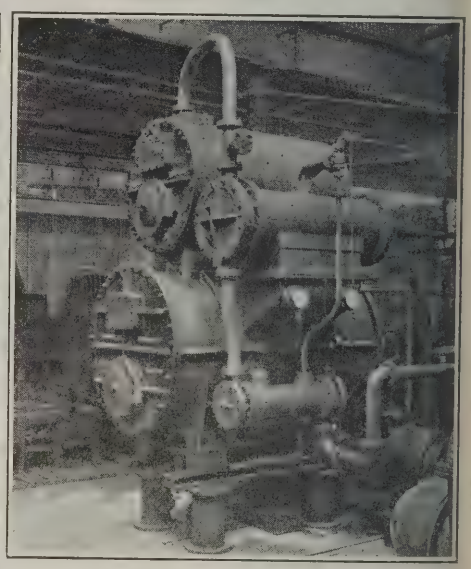

Fig. 5.—De-aerator Unit.

Overhead coal bunkers are provided, and automatic weighing machines check the coal consumption. Forced- and induced-draught fans are controlled from the firing floor, the forced-draught fan in each case being driven by the same motor as the chain-grate stoker; the motor is positioned above the front of the grate, as shown in fig. 2. The steam conditions are 270 lb./sq. in. and 650 deg. F. Each pair of boilers is served by one chimney and a Davidson grit arrestor, fig. 4.

The ashes drop through brick-lined hoppers with their open ends immersed in water contained in a reinforced-concrete trough. A scraper conveyor in the bottom of the trough collects the ashes and elevates them at one end of the boiler house to a ferro-concrete overhead bunker of 30 tons capacity. A stand-by ash elevator of similar design is provided for use when the main elevator is under repair.

Duplicate evaporators for the make-up feed are installed, each capable of dealing with 6,500 lb. of water per hour. They are of the vertical straight-tube pattern, and are equipped with doors just above the floor level to facilitate cleaning. The supply to the evaporators is taken from the river, a storage tank for the crude water being situated on the flat roof. De-aerators, also in duplicate, are installed at the turbine-floor level. Each will deal with 90,000 lb. of water per hour, and is internally lighted and equipped with inspection windows, fig. 5. The evaporators receive the exhaust steam from the boiler feed pumps direct; it is then passed into the de-aerators, where it is condensed by direct contact with the feed water before entering the degassing chambers. Covered feed-water surge tanks supported on rolled-steel joists above the de-aerators are steam sealed. Normally the whole of the water to the boiler feed pumps will pass through the de-aerators, but the system permits of either set being shut off for cleaning and also of the complete by-passing of the equipment. Modern oxygen-content instruments are provided.

The control room is on the upper floor of the switchgear annexe and generally provides for the remote control of the whole works. The main switchgear is of B.T.-H. manufacture and electrically and remotely controlled. It consists of stone cells fitted with steel doors, fig. 6, and is situated on the ground floor. A special interlock system is provided. A system of telegraphs and loud-speaking telephones allows communication between the control room and the turbine and boiler rooms. Remote indicating and recording CO_2 and temperature instruments are installed in the control room. A 230-V battery supplies the necessary energy for operating the switchgear and

Fig. 6.—E.H.P. Switch Cubicles.

protective equipment, and provides for emergency lighting in the station.

The condensing plant for the 6,000-kW set, fig. 3, which, with the evaporators and de-aerators, was supplied by Messrs. Mirrlees, Watson & Co., Ltd., will deal with 65,000 lb. of steam per hour, and is designed to give a vacuum of 29.1 in. with 9,500 gallons of water per minute at 55 deg. F. Duplicate condensate pumps are

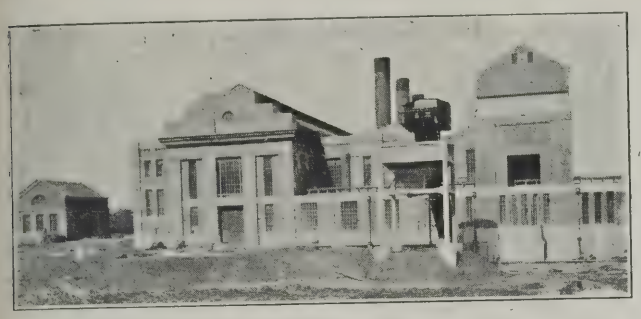

Fig. 7.—External View of Station.

installed, each capable of dealing with the full quantity of the condensate and driven by a 13-h.p. motor. A main supply header receives the circulating water from all the pumps. While the system is designed for siphonic assistance, the pumps will give sufficient head to prevent a shut down. Two circulating pumps are at present installed, each having a capacity of 588,000 gal. per hour. Their centre lines are 2 ft. below the level of the river bed, to ensure an immediate flow on starting, and they are driven by 120-h.p. vertical-spindle motors installed above the maximum recorded flood level of the river. The pump room has been erected immediately on the river bank. Two vertical-spindle service pumps, 27,000 gal. per hour, are also installed to provide a water supply for screen washing, the evaporators, and cooling bearings. The water is taken through two travelling, self-cleaning band screens, having a total effective screening height of 32 ft. because of the high flood level of the river. The pump-house equipment is remotely controlled from the power station. A L.M. & S. Railway siding, which terminates in the turbine room, allows coal to be brought direct to the works, a fireless steam-storage locomotive being used for this purpose. The coal is emptied into a 20-ton receiving hopper, and an endless chain of buckets elevates and distributes it to the overhead bunkers.

The transmission system consists generally of 24 main cables run from the power house, fig. 7, to various points in the city, including the James Street generating station, through earthenware ducts, protected from the road traffic by reinforced concrete where necessary. With the exception of the densely-populated area in the centre of the city, of about 1,000 yards radius, the system of distribution is 3-phase, 4-wire. The centre area is still d.c. and is supplied from rotaries at James Street, where the old generating station will be retained as a convertor sub-station.

An interesting development, which has only just been completed, is a supply to the Carlisle Plaster and Cement Works at Cocklakes, about seven miles south of Carlisle. The transmission is at 11,000 V by means of a simple overhead line. At the receiving sub-station the pressure is stepped down direct to 420 V by means of two 600-kVA J. & P. transformers, the e.h.p. supply being dealt with by a 2-panel, truck-type switchboard by Messrs. Ferguson, Pailin, Ltd., fig. 9. Provision is made in this sub-station for further extensions. Fig. 8 shows the h.p. pillar-type drawout switchgear (F.P.) which is being adopted in most of the sub-stations on the 3,000-V system. It is interesting to note that the same type of switchgear is being used on the l.p. side.

Considerable advance has been made by the under-

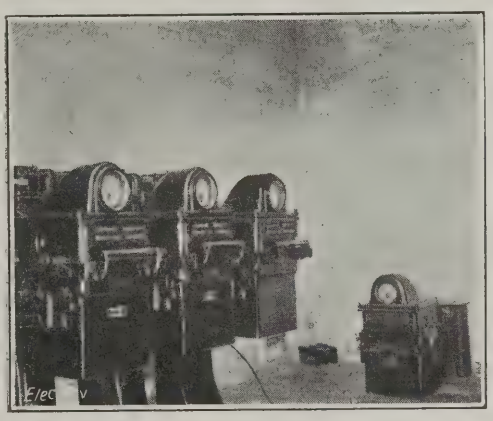

Fig. 8.—Standard Sub-station Switchgear.

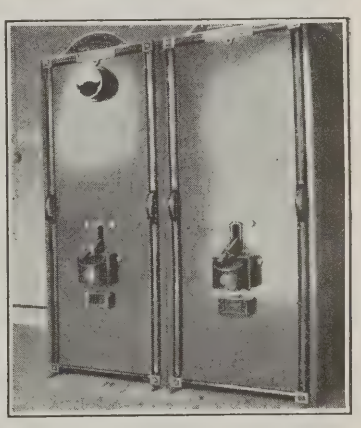

Fig. 9.—11,000-V Switchgear.

taking in the development of the domestic load, and an all-in domestic rate of ¾d. per kWh, plus a fixed ratable-value charge, has been established.

The Incorporated Municipal Electrical Association.—I.

Annual Convention at Buxton.

ON Tuesday next the 1927 Convention of the I.M.E.A. will be opened at the Opera House, Buxton, with a civic welcome by the Mayor, Councillor W. Goodwin, J.P., and the presidential address of Mr. R. W. L. Phillips, M.I.E.E., engineer and manager of the Bedford Electricity Department. In our issue of July 9th, 1926, we gave a portrait of Mr. Phillips, and a sketch of his career, and though the Convention will not visit Bedford, a few particulars of the undertaking which he has conducted with notable success for 26 years will be of interest.

When he resigned the post of deputy chief engineer at Bristol in 1901 to take charge of the Bedford undertaking, the latter was labouring under a cloud of annual deficits, but Mr. Phillips soon brought it into the sunshine of prosperity, by adopting a progressive policy, cultivating a day load, and embarking upon the electrification of the surrounding rural areas.

The generating station is situated on the River Ouse. Sidings of the L.M. & S. Railway are near at hand, and from these coal is transported by road to the works. Modern coal-handling plant is installed; belt and worm conveyors serve overhead bunkers from which eight boilers, with a total evaporating capacity of

170,000 lb. per hour are fed. One boiler, which was converted to oil-firing during the coal strike, still retains the liquid-fuel feature, and is used as a convenient peak-load plant. Two recently installed 40,000 lb. Stirling boilers are equipped with Davidson grit arrestors. It has been found advisable to separate the coal, using the nuts for the old plant and the fines for the new, and for this purpose a rotary screen is employed in conjunction with the coal conveyors.

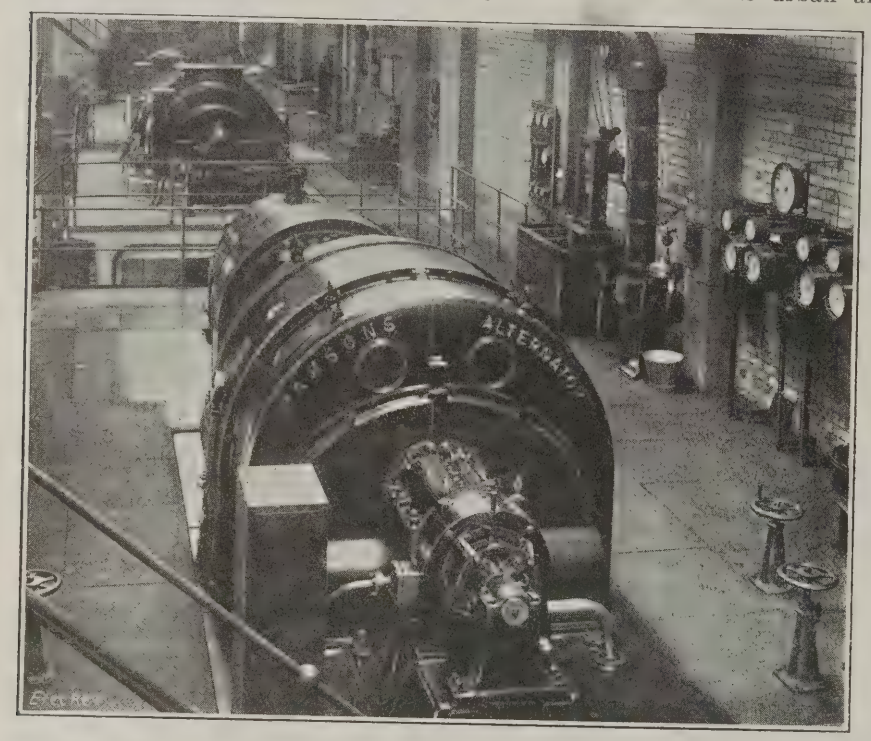

Fig. 1.—New Turbo-Alternators, Bedford.

An interesting feature is the ash-handling equipment. Two water reservoirs under the boiler house are fed with the cooling water from the condensers, and by means of tilting weirs, one at one end of each reservoir, the water is automatically and periodically emptied into troughs into which the ashes from the grates are dropped. The flow carries the ashes into a system of sumps, where they are screened, and the water is returned to the river. The ashes are cleaned in the process, with the result that sufficient revenue is obtained to cover the expenses incurred in removing the residue from the sumps, for which purpose an electric crane and grab are used.

Fig. 2.—Rural Supply Sub-station.

As recently as last year the system of generation at Bedford was changed from single-phase, 60 cycles, to 3-phase, 50 cycles. The first step in connection with this scheme was to install two new 6,600-V, 3-phase, 3,750-kW turbo-alternators, fig. 1, one by Messrs. C. A. Parsons & Co., Ltd., and one by Messrs. W. H. Allen, Sons & Co., Ltd. It was possible to put the whole load of the station on these machines, while two existing 1,500-kW single-phase machines, one Parsons and one B.T.-H., were rewound for 3-phase working. The four machines mentioned now constitute the whole of the active generating plant.

The urban area network is divided into two main sections, and these are supplied at 2,000 V, single-phase, from the two phases of Scott-connected transformer banks, which are fed at the generated pressure.

The authorised supply area of the undertaking now covers about 200 sq. miles, over which a great many tiny villages or hamlets are scattered. To some eleven of these the supply has already been extended, mostly by means of underground cables. In some cases, where further extensions are anticipated, or where ring-main systems to connect up with existing single-phase systems are contemplated, the 3-phase, 6,600-V supply is run out to suitable kiosk sub-stations and there converted to 2-phase, 2,000-V by means of Scott-connected transformer banks for single-phase distribution, or the pressure is reduced directly to that of the l.p. supply system, 365 V, 3-phase. Fig. 2 shows the type of kiosk employed; it is actually a special sub-station for supplying Sandy and district, about ten miles east of Bedford. It houses three 500-kVA transformers forming a 3-phase, step-up bank from 6,600 to 11,000 V for linking up with the mains of the Bedfordshire, Cambridgeshire and Huntingdonshire Electric Supply Co.

Touring the area, one sees small kiosks, approximately 3 ft. square by 6 ft. high, dotted about the countryside in all manner of places. These supply isolated houses or groups of houses at 210 V, single-phase, and are fed from the h.p. 2,000-V single-phase mains. The kiosks were all supplied by the Yorkshire Switchgear Co., Ltd.

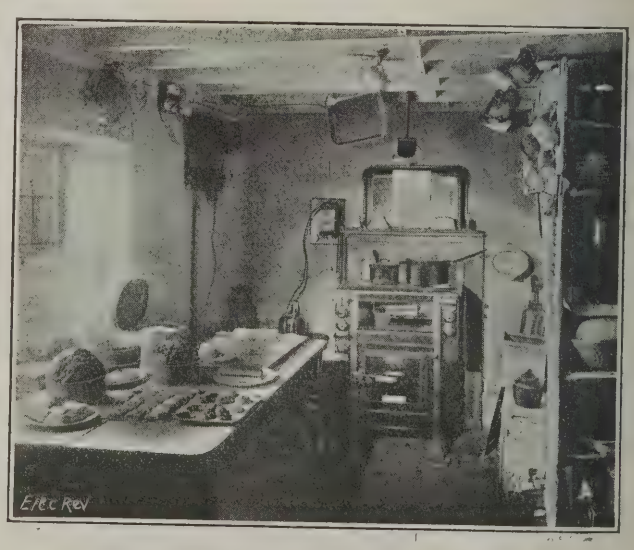

Fig. 3.—Electric Cooker in Country Kitchen.

It is encouraging to note that about 1,000 consumers in the rural areas have so far been connected up, out of a population of about 41,000. Somewhere about 70 miles of h.p. and l.p. cable have been laid in this connection.

While it has been in all cases a difficult problem to

cut the capital expenditure to the necessary fine limits to render the estimated limited revenue from the scheme remunerative, it has invariably been the case

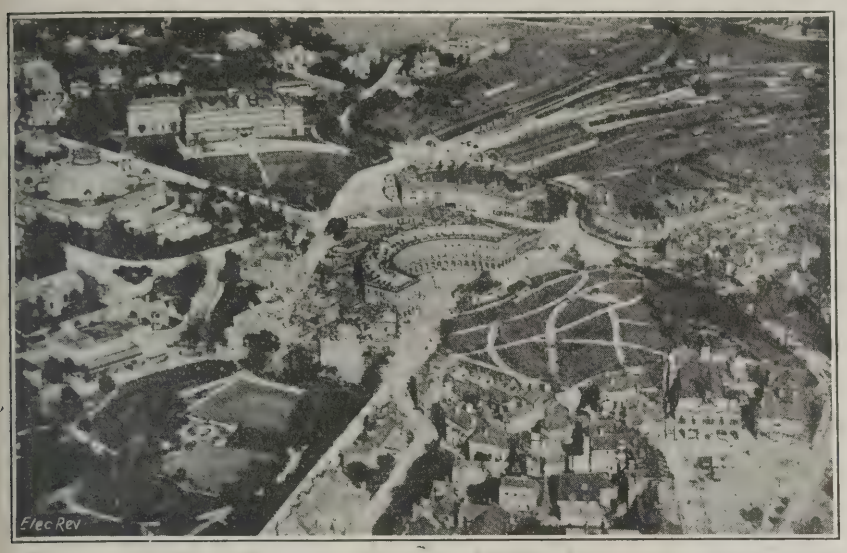

Fig. 4.—Buxton, Bird's-Eye View.

that the supply has resulted in increased building activities in the districts.

The country folk are very pleased with the supply,

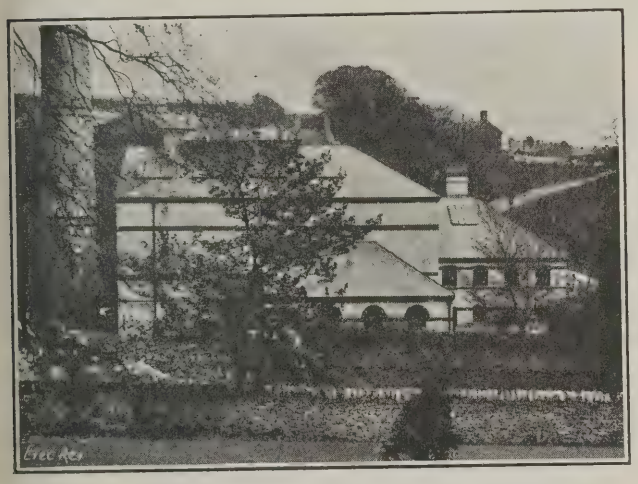

Fig. 5.—Buxton Power Station.

both for lighting and cooking, and take a keen interest in the modern methods and apparatus introduced. Fig. 3 shows a modern cooker in an old-fashioned country kitchen. The housewife of this establishment described the cooker as "wonderful," and said that her bill of 12s. 6d. for five weeks' consumption was considerably less than the figure for coal would have been. The tariffs for lighting and heating vary from 6½d. to 9d. and 2¼d. to 3d. respectively, according to the "zone" or distance from the generating station.

The maximum load on the station to date is 5,350 kW, and the energy generated during the year ended March 31st, 1927, was 15 million kWh. About 7,400 consumers are connected to the mains.

It will be seen that under the President's guidance the undertaking has steadily developed, and has successfully extended its operations far into the rural areas, thus again refuting the arguments of those who still maintain that such areas cannot be dealt with on an economically sound basis.

Apart from the routine business which is so efficiently handled by the Council of the I.M.E.A., Mr. Phillips's year of office, now drawing to a close, has been marked by the termination of the long conflict between the Association and the electrical contractors. Whatever good may eventually come from the main provisions of the Act of 1926, it can hardly be questioned that the one which will bear fruit most quickly and most effectively is the clause that was inserted at the last minute, embodying the agreement between the municipal undertakings and the contractors; and Mr. Phillips is to be congratulated on his share of the work which had so happy a conclusion.

In later issues we shall report the proceedings of the Convention, which this year will be less strenuous than on some previous occasions. A more delightful spot for a convention than "Beautiful Buxton" could hardly be imagined; unlike some watering places of comparatively mushroom growth, it traces its history as a health resort from Roman times, and has frequently entertained distinguished visitors, including Royal guests.

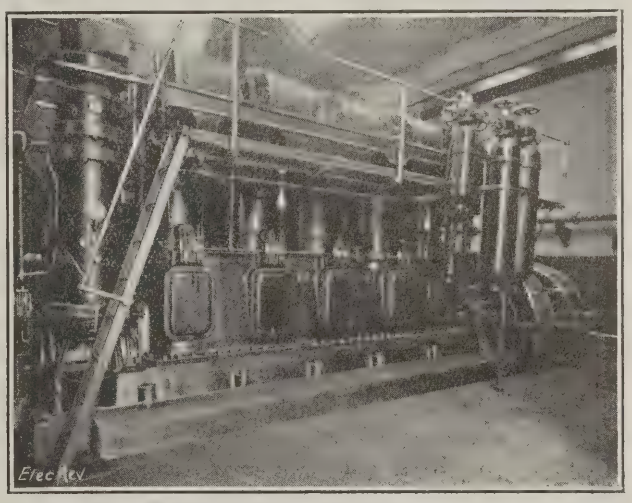

Fig. 6.—340-kW Diesel Set.

Buxton, fig. 4, is the highest town in the Kingdom, being situated 1,000 ft. above sea level, where the air is dry and bracing and fogs are rarely met with. It is noted

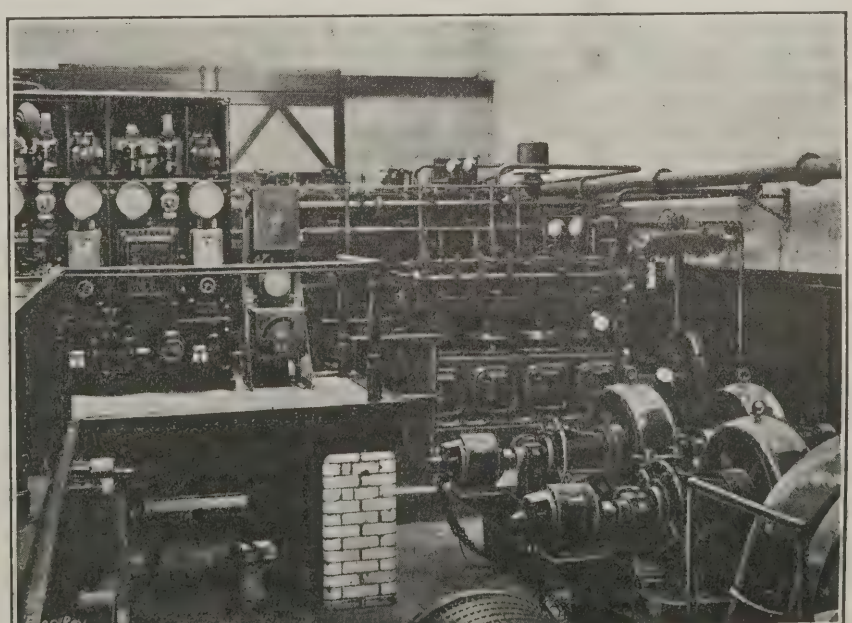

Fig. 7.—Engine Room, Buxton.

for its healing springs, nine in number, which yield a flow of half a million gallons a day at a temperature of 82 deg. F. The water is highly radio-active, and contains a variety of salts, besides an exceptional amount of nitrogen and other gases; abundant provision for its use, both internal and external, is made at St. Ann's Well and the "Natural" and "Thermal" Baths. The town offers other attractions to the visitor in the shape of charming gardens, provision for games, its Pavilion and Opera House, and other means of entertainment, and is itself a pleasant place provided with innumerable hotels; but it is also a centre from which an endless variety of excursions to places of interest and beauty can be made, being situated in the heart of the Peak District, amongst hills and dales that rival those of the Lake District.

The electricity undertaking is owned by the Corporation, and was inaugurated in 1900, giving a d.c. supply at 230/460 volts. The original plant was steam-driven, but the present borough electrical engineer, Mr. A. Bishop, in 1919, introduced a 100-kW E.C.C. dynamo driven by a four-cylinder Browett-Lindley gas engine, the success of which led the Council to sanction the replacement of all the steam plant with gas plant, and in 1920 a scheme was drawn up which, after the late Mr. C. H. Wordingham had been consulted, was adopted practically without modification. Two 200-kW Browett-E.C.C. sets were installed, and by the end of 1923 a profit of £3,500 was realised. Cooling water was provided by a cooling tower and a concrete tank holding 20,000 gallons. A large battery was supplied by the D.P. Battery Co., Ltd., with E.C.C. automatic reversible boosters and Tirrill regulators, by which means the running load factor was kept up to 90 per cent. Extensions proved necessary in 1924, and a four-cylinder Diesel engine by Messrs. Mirrlees, Bickerton and Day, Ltd., was installed, driving an E.C.C. 233-kW dynamo, with which the fuel cost was reduced from 0.94d. per kWh generated with gas at 2s. per 1,000 cu. ft. to 0.37d. with oil at 107s. 6d. per ton, the total working cost in 1925-6 amounting to 0.522d. The Diesel set ran for 4,065 hours, and generated two-thirds of the output, with an average consumption of 0.629 lb. per kWh, the lowest recorded for 37 British stations. In November last year a five-cylinder 340-kW set of the same make was installed, fig. 6, bringing the plant capacity up to 1,150 kW. Figs. 5 and 7 show respectively exterior and interior views of the station.

The total output (sold) in 1925-6 was 843,500 kWh; of this amount 240,160 kWh was used for power and heating, including 111,570 kWh for domestic purposes. There is no industrial power load in Buxton, which is becoming more and more a residential district for Manchester and other large towns. The power station is situated on the River Wye, about a mile from the centre of the town; Callender cables are used. The rates charged for lighting range from 6½d. to 5d., and for power and heating from 2d. to 1d.; a two-part domestic tariff is in contemplation. The capital outlay amounts to £104,800, of which £61,753 has been redeemed. There was a gross surplus last year of £7,949, and a net surplus of £2,086.

The Royal Society's Soirée.

Annual Exhibition and Demonstrations.

(*Concluded from page* 792.)

Mr. A. A. King (Albright & Wilson, Ltd.), with the aid of a mercury lamp and Chance filter, strikingly demonstrated the application of ultra-violet radiation to the detection of impurities in various substances. For instance, distilled water, including grades hitherto assumed to be free from foreign matter, when exposed to ultra-violet light fluoresces more or less according to its purity; in this manner imitation precious stones can be distinguished from true gems, diamonds can be graded according to quality, and the degree of purity of manufactured chemicals and other substances can be quickly and easily checked, whilst the method is also applicable to titration. As a means of detecting and estimating minute quantities it should be of considerable assistance to the chemist, besides its many other spheres of usefulness. For example, when filter paper which has been sensitised with pure mercuric chloride and prepared by the Gutzeit method for testing for the presence of arsenic is examined in ultra-violet light, the unchanged mercuric chloride fluoresces blue, whilst the yellow mercury-arsenic stain on it stands out as a black disk; this contrast is utilised to detect arsenic stains which are quite invisible to the eye in ordinary light, and a quantity of arsenic as minute as 0.00001 milligram may thus be estimated quantitatively. Ultra-violet light is, of course, also used for medical treatment of diseases, and Mr. King indicated how the difficulty of application to such inaccessible areas as the back of the nose, &c., can be overcome by the use of a suitably-shaped applicator; the latter is a quartz rod, curved or bent as required, into the straight end of which the ultra-violet light is directed, following the curve by reflection inside the rod, and emerging from the other end as a beam which impinges on the desired area which is being subjected to treatment.

The research laboratories of the General Electric Co., Ltd., had three exhibits illustrative of: (i) A method of measuring the vacuum in an electric lamp (Mr. J. T. Randall), due to Dr. P. Selényi, of the Forschungslaboratorium Tungsram des Vereinigten Glühlampen und Elektrizitäts A.G., Ujpest. Between the evacuation and "clean-up" processes the residual gas in the lamp is absorbed by the walls of the bulb under certain conditions, usually coincident with an electric discharge which takes place across the space between the two filament electrodes. Selényi's method of observing this discharge is to turn the lamp into a system of condensers by partially immersing it in water: one condenser is formed by the filament system and the inner bulb surface, the other by the inner and outer bulb surfaces. If an oscillating potential is applied between the water and one end of the lamp filament, a note characteristic of the capacity of the lamp condenser can be heard in a pair of telephones inserted at an appropriate point; the oscillating potential is supplied from the two terminals of a "flickering" neon lamp. If an adjustable voltage is now applied to the lamp filament and its value gradually raised, a point is reached when ionisation of the residual gas in the lamp sets in; the gas is now conducting and, therefore, forms a non-ohmic shunt across the condenser formed by the filament system and inner bulb surface; hence the effective capacity of the lamp condenser is changed and the note in the telephones decreases in pitch. As soon as absorption of the gas starts, the number of ions

decreases again and the note in the telephones rises in pitch; when the "clean-up" is completed, the note in the telephones remains at a constant pitch.

(ii) New methods of using photoelectric cells (Mr. N. R. Campbell). Hitherto gasfilled cells have always been used at voltages less than that required to pass a spark discharge; but if higher voltages are used, the discharge being stabilised by a thermionic current-limiter in series with the cell, the current through the cell is intermittent and the frequency of intermittence varies with the light incident on the cell; changes of this frequency are used to detect or measure light. Two methods depending on the principle just stated are: (*a*) the current through the cell is adjusted by means of the current-limiter so that the frequency of intermittence in the dark is about 5,000 per second; very moderate illumination will then cause the oscillations to cease. This method is thought to have applications in the transmission of pictures by radio-telegraphy, for in order to modulate waves of radio-frequency by light signals it is desirable to have those signals in the form of oscillations of about 5,000 per second frequency. In present methods some subsidiary device has to be introduced to convert the signals into this form, but by the new method the signals of the necessary form are produced by the cell itself and, moreover, there is probably some gain of sensitivity, and weaker light can be used. (*b*) The current is adjusted so that the frequency of intermittence is about 1 per second; very feeble illumination will then produce a change of frequency; the illumination can be measured by counting the rate of the clicks heard in a telephone in series with the cell. By this means it is possible to detect and measure, with extremely simple apparatus involving no delicate parts, illumination which otherwise would require a sensitive electrometer, constant batteries, perfect insulation, and other elaborations. It is thought that the method may have applications in astronomy, for the necessity of mounting the apparatus on a telescope makes it desirable to avoid so far as is possible all instrumental elaboration.

(iii) Thermionic emission from absorbed layers of barium on tungsten (J. W. Ryde and A. C. Bartlett). A spiral, which can be heated electrically, is coated with barium azide (BaN_6) which is decomposed, forming barium metal. The spiral surrounds a tungsten filament mounted axially; on heating the spiral, which acts as the anode, the barium slowly evaporates and forms a monatomic layer on the surface of the filament, which is run at a temperature of about 1,200 deg. K. If the supply of barium is relatively small, the emission gradually increases to an equilibrium value and then, if the supply is stopped, it slowly decays. If, however, the experiment is repeated with the spiral at a higher temperature, so that the supply of barium is increased, the emission rises to a maximum and then falls to a much lower equilibrium value. On stopping the supply, the emission current rises to another maximum, after which it slowly decays as the barium evaporates. If the relative rates of supply and evaporation are raised by changing the temperatures of the filament and spiral, either or both of the two maxima may be made to occur. This phenomenon appears to be due to the formation of a second monatomic layer on top of the first, the thermionic emission being due only to the uncovered parts of the first layer of barium. The nature of the second layer has not yet been settled, but it may be nitrogen. On the above assumption it may be shown theoretically that the first maximum will only occur if the supply of barium atoms is greater than the evaporation of those forming the second layer; also the second maximum will only occur if the supply of the atoms forming the second layer is greater than the evaporation of those in the first; this is borne out by experiment. The relation between the thermionic emission and the fraction of the filament surface covered by exposed barium atoms is being studied by these means. The method is also being applied to the study of the formation and evaporation of monatomic layers of barium.

Legal.

Workmen's Compensation Case.

At the Birmingham County Court recently Callender's Cable and Construction Co., Ltd., asked for a revision of the weekly award of £1 3s. 11d. compensation paid to Richard Brinsden, a labourer, who injured his back while lifting heavy slabs of stone on April 26th, 1926. The contention of the firm was that Brinsden was able to do light work. Two consulting surgeons stated that there was nothing to interfere with the man's working capacity, but his panel doctor stated that Brinsden walked in a peculiar and strained position. Judge Dobb took the view, having regard to the contradictory nature of the medical evidence, that the man's working capacity was so limited as to amount to total incapacity. It had been pointed out, on behalf of the employers, that Brinsden deliberately held himself in a strained position, but a man without any medical knowledge could not have adopted the well-recognised posture for abnormal curvature. He therefore gave judgment for the respondent.

Theft of Electricity.

At the Hendon Petty Sessions recently George Cohen, Golders Green, was summoned at the instance of the Hendon Electric Supply Co., Ltd., for the fraudulent abstraction of electricity from its mains and preventing a meter registering. It was stated for the prosecution that the defendant carried on business as "The Reliance Electric & Maintenance Co." One of the company's inspectors, on visiting the defendant's premises in February found that a number of lamps were connected by means of a heating plug, electricity thus being obtained at a lower rate than the correct one for lighting. Defendant, who pleaded "Not guilty," maintained that he had been overcharged for electricity on account of a defective meter, and it was admitted that when his meter was tested it was found to be over-registering to the extent of 5½ per cent. He also stated that the connection to the wrong meter was made by mistake by a boy. The mistake was made in the daytime and no current was used. The Bench imposed a fine of £2 for each offence and £3 3s. costs. The defendant said that he would appeal from the decision.

Action Against the Stepney Council.

It is reported that the action being brought by Messrs. Scammell & Nephew, a Spitalfields firm, against members of the Stepney Borough Council will probably be heard before the Long Vacation. The action is in the nature of a test of the legality of the Council's action in cutting off the supply of electricity to certain premises during last year's general strike. Sir John Simon, K.C., is said to have been briefed by the plaintiffs.

Electricity Finance and Distribution Corporation, Ltd.

In the Companies Winding Up Court on May 17th, Mr. Justice Eve made an order for the compulsory winding up of this company.

Impex Electrical, Ltd., v. Norton Wireless Co., Ltd.

Mr. Justice Tomlin, in the Chancery Division on May 18th, concluded the hearing of this action for an injunction restraining the infringement of the plaintiffs' trade-mark "Dario" for wireless valves.

Mr. David Cartwright, recalled after giving evidence the previous week (*vide* our last issue, p. 823), said he could not identify a man in court as the chauffeur whom he saw buying a valve in the defendants' shop. A man named Scott who went with Hill, but waited outside the shop, said he examined the valve he bought and found that it bore the trade mark "Dario."

Giving judgment, his Lordship said that the evidence of Hill and Scott had convinced him that there was no confusion of valves as had been suggested, and having regard to the evidence of Mr. Kelly, which was unsatisfactory to a high degree, and to the evidence from Imperial Airways, Ltd., and the documents, it was clear to him that in the summer of 1926 the defendants were importing and selling French valves bearing the mark "Dario." He granted the injunction asked for with costs, and said there would be an inquiry as to damages.

Esders v. Porn.

In the Mayor's and City of London Court, before Mr. Registrar Dell, on May 20th, Mr. C. F. G. Esders sued Mr. Marcel Porn for £8 7s. 6d., balance of commission said to be due on account of the sale of electric lifts. The plaintiff stated that the basis of his engagement was that he should receive 5 per cent. and 2½ per cent. on all orders obtained by him. Later the defendant paid him £1 a week salary, which was to go towards his expenses. The defendant maintained that that £1 per week was an advance in respect of commission. The Registrar held that that was so, and gave judgment for the defendant with costs.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The Department of Overseas Trade.

The British Engineers' Association has passed a resolution to the effect that, while it realises the urgent need for State economy, it shares in the widespread doubt and anxiety as to the effects of the termination of the separate existence of the Department of Overseas Trade. The resolution emphasises the vital importance of overseas trade to this country, and says that many of the services rendered by the Department are indispensable.

A deputation on the subject from the Association of Chambers of Commerce was received by the President of the Board of Trade on Monday last, when Sir P. Cunliffe-Lister promised to report the views expressed to the Government.

A G.E.C. Fan Campaign.

The General Electric Co., Ltd., is making a special effort to increase the sale of fans now that the summer season is imminent. While a good deal of national advertising is being done, the aid of dealers is also being enlisted, as the company recognises that manufacturers alone cannot achieve the desired results. To this end the company has produced special window display devices and attractive folders for the use of retailers. To further the sales of fans by demonstration (the best way), an extra discount is offered to dealers upon the first fan purchased.

A "Cosmos" Fan Display.

A seasonable display has been arranged by Metro-Vick Supplies, Ltd., in one of the windows of its Charing Cross

A "Cosmos" Fan Display.

Road premises. It consists of a simple arrangement of "Cosmos" fans, each of which bears a card announcing the virtues of the appliance. A large message in the centre of the window indicates the scope of the electric fan's activities.

Rugby and Cable Tenders.

The *Birmingham Post* reports that at last week's meeting the Rugby Urban District Council considered a recommendation from the Electricity Committee that the lowest British tender received for an electric cable should be accepted. A Liberal member of the Council moved the substitution of "the most suitable tender," in the place of "the lowest British tender." He objected to be tied down to the acceptance of British goods, and said that when the Council, some time ago, had accepted a Swiss tender it subsequently received "dirty treatment" from British firms. The amendment was not seconded, but Mr. H. Yates (chairman of the Committee) said that there was a cartel among cable suppliers, and there was very little difference between the tenders sent in by British manufacturers. "The same people tendered every time, and it was always the same firm which was the lowest, giving the impression that each firm had its own field of operation."

Receiver Appointed.

The Electrical Devices, Ltd., Newcastle-on-Tyne.—Mr. Sadler Forster, of County Chambers, Marton Road, Middlesbrough, has been appointed receiver and manager on behalf of the debenture holders as from May 19th.

Local Exhibitions.

Richmond (Yorks.).—Under the auspices of the Electricity Committee, an electrical exhibition was held on May 17th and 18th in the Town Hall, Richmond. A number of leading manufacturers participated, including the Metropolitan-Vickers Electrical Co., Ltd., the Edison Swan Electric Co., Ltd., and the General Electric Co., Ltd. There were also several local exhibitors, including Messrs. Wm. Sykes and Co., Spence & Co., A. Morton, R. Kirtley, L. Paxton, and W. Husband. Mr. A. Brand, chairman of the Electricity Committee, at the opening ceremony, said that, although the matter had been discussed for 20 years, electricity supply only became available in October last. At first there were 140 consumers, and 50 had since been added, and applications were being received daily. It was hoped that the exhibition would increase the demand and permit of a decrease in the charges.

Hammersmith.—During a recent "Health Week Campaign" at Hammersmith the Borough Electricity Department, in conjunction with the General Electric Co., Ltd., arranged a stand at the Town Hall. Upon this appeared a good display of "Magnet" electrical appliances for the home. A view of the stand is reproduced herewith.

An Electrical Display at Hammersmith.

Cheadle and Gatley.—The municipal Electricity Department (engineer: Mr. R. W. Willis) has adopted a cooker hiring scheme, and in support of this is arranging exhibitions and demonstrations in the three parts of its area, Cheadle, Gatley, and Cheadle Hulme, during June and July.

Threatened A.E.G. Strike.

The Berlin correspondent of the *Daily Telegraph* reported last week that differences between the directors and employés of the Allgemeine Elektrizitäts Gesellschaft seemed to portend a serious conflict. The trouble is due to the reduction of toolmakers' wages, coupled with a rise in the cost of living. The directors refused to meet the men, and the latter then demanded a 15 per cent. increase in wages. They were offered an increase of three pfennigs per hour but, declining this, left work. It was expected that the dispute would extend to other departments, eventually involving 50,000 workers, and perhaps to other undertakings. It is being maintained that the industrial "rationalisation" schemes are being carried out at the expense of the employés. It was reported later that a settlement had been reached, part of the demand being granted.

New Earthenware Pipe Works.

Messrs. DOULTON & Co., LTD., are establishing on a 25-acre site at Erith a new works for the production of earthenware pipes. The new works is exceptionally well situated for export, having a private Thames-side jetty and railway siding. The factory is equipped throughout with modern labour-saving plant for handling raw materials and finished products, and the whole of the manufacturing machinery will be driven by electricity produced at the company's own power house adjoining the factory.

Employment during April.

The May *Ministry of Labour Gazette* says that employment in the engineering industry during April was slack on the whole, although there was a further improvement in all sections. In the motor vehicle and electrical sections it was fairly good. The overall proportion of unemployed in the industry fell from 10.3 to 9.7 per cent., and in the electrical engineering branch the figure declined from 6.2 to 5.6 per cent. The other electrical industries also improved. The proportion of unemployed in the electric cable, wire and lamp manufacturing group fell from 8.6 to 7.7 per cent., and that of the electrical wiring and contracting industry from 7.9 to 7.4 per cent. The actual numbers of unemployed were as follows:—Engineering, 96,798; electrical engineering, 4,333; electric cable, wire and lamp manufacture, 6,790; and electrical wiring and contracting, 1,031.

Recent Contracts.

Among the orders recently received by members of the British Engineers' Association are the following:—A mechanical loading, handling and storage plant, for the British Phosphate Commissioners, for dealing with the huge deposits of phosphate of lime on Nauru and Ocean Islands in the South Pacific, which were taken over from Germany during the war. The plant will be electrically driven. Messrs. Marryat & Place, Ltd., have supplied eight two-head rivet heaters to Messrs. Cammell, Laird & Co., Ltd. A contract for an electrically-driven aerial ropeway ten miles long has been received from India by the British Ropeway Engineering Co., Ltd. The order for the hydro-electric plant for this work has also been placed in this country. Messrs. J. Blakeborough & Sons, Ltd., in addition to supplying the turbines for the Waikaremoana (N.Z.) hydro-electric undertaking, have also received an order for the necessary valve equipment. The same company is also supplying the water-controlling equipment for the 126,000-h.p. development at Komaki of the Nippon Electric Power Co. The Harland Engineering Co., Ltd., is providing six motor-driven high-pressure boiler-feed pumps (about 250 h.p. each) for the Bunnerong power station erected by the Sydney (N.S.W.) Municipal Council. Pumps, water-screening plant, circulating mains and pipework are being supplied by the Mirrlees, Watson Co., Ltd., for the Indian State Railways' power station at Kalyan.

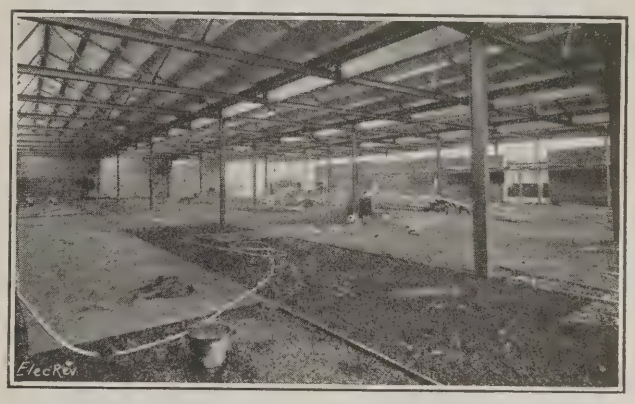
Electric Power in Industry.

Continuing its series of Preliminary Reports on the Census of Production, 1924, the *Board of Trade Journal* for May 19th contains particulars of further industries. It is shown that in the typefounding, electrotyping, engraving, process block making and die-sinking trades in 1924 there was only 65 kW of generating plant (as compared with 33 kW in 1907). The electric motors in use had an aggregate capacity of 2,952 h.p., power for 2,877 h.p. of which was purchased. The billiard table and sports requisites trades reported 450 kW of generating plant (against 239 kW in 1912) and 3,974 h.p. of electric motors (power for 3,144 h.p. purchased). The games and toys trades had 239 kW of generating plant and 1,571 h.p. of motors (power purchased for 1,363 h.p.). Generating plant of 2,062 kW was reported by the engine and boiler packing and asbestos trades (against 1,030 kW in 1912); there were 9,350 h.p. of electric motors, power for 7,360 h.p. of which was purchased.

Mansfield and Foreign Cables.

The Mansfield Town Council has received a letter from Sir John Corcoran, a director of the National Union of Manufacturers, in which that Council's action in buying foreign electric cable is criticised, and this was the subject of discussion at last week's meeting. The chairman of the Electricity Committee, Coun. F. Hardy, said he thought the Council's action was already having an effect, because one of the firms associated with the cable manufacturers had reduced its price between 25 and 30 per cent. Coun. J. Pollard hoped the Committee would continue to buy cable from Holland in order to break the "rings" among English manufacturers. Ald. Norris said the remedy was for the people of this country to take the matter in hand and formulate a policy to find work for British workers.

New Italian Companies.



Among the concerns recently formed in connection with electricity supply in Italy are the Società Illuminazione Elettrica Vetture, Milan, capital 60,000 lire; La Società Elettrica Buonalbergo Casalbare, Buenalbergo (Benevento), capital 300,000 lire; La Società Idroelettrica Val d'Agri di Missanello, Missanello (Potenza), capital 100,000 lire; and La Società Elettrica Rinascenza, Nicastro, capital 500,000 lire.

New Belgian Companies.

Eclairage et Force Motrice reports the formation of the following companies in Belgium:—Société Anonyme "Kalovik," Schaerbeek, capital 300,000 fr., to manufacture and deal in electrical appliances; Société Anonyme pour l'Exploitation d'Appareils Electro-pneumatiques, Brussels, capital 150,000 fr.; Ateliers de Constructions Electromécaniques de l'Est de Liége, capital 1,150,000 fr., to manufacture electrical machinery of all kinds, transmission apparatus, &c.; and the Société Franco-Belge de T.S.F. (Paris), capital 100,000 fr., to manufacture electrical and radio apparatus.

Berry's Electric, Ltd., and the McClary Cooker.

Some years ago we made the acquaintance of the McClary electric cooker—a Canadian production, which has attained wide popularity in that country and has been very well received on this side of the water, several electricity supply authorities having commended it highly. The cooker is enamelled inside and outside, and the oven is fitted with removable elements and racks, so that the whole of the interior can be cleaned with ease. The hotplates, which are of the totally-enclosed type, are also removable. We learn

Berry's Electric, Ltd., New Cooker Factory.

with interest that Berry's Electric, Ltd., which has not hitherto made cookers, has acquired the sole rights to manufacture and sell the McClary cooker in Great Britain and Ireland, and is erecting a large extension to its Birmingham works wholly for this purpose; the accompanying illustration shows the interior of the new workshops, which are being got into shape as quickly as possible, and will be completed by the end of June.

We have been requested by Messrs. Berry's Electric, Ltd., to pass on to members of the I.M.E.A. and E.A.W., and visitors, a cordial invitation to visit their Buxton showrooms at 2a, Station Approach. Among the outstanding attractions will be a replica of the "Magicoal" fire designed for the new residence of the Duke and Duchess of York, and approved by the Queen. There will also be continuous cookery demonstrations with the McClary cookers, and exhibitions of clothes washing, ironing, and refrigeration.

Social Event.

The Rugby team of the Chloride Electrical Storage Co., Ltd., has distinguished itself by winning for the second time the Workshops Cup Competition organised by the Broughton Rangers Rugby Football Club. The final was played on May 7th, when the Chloride team defeated the Salford Municipal Employés' team by 9 points to 2 points. The team previously won this cup in season 1924-25, while last season it reached the final.

United States Electrical Exports.

During March electrical goods to the value of $8,551,561 were exported from the United States. This was $34,781 less than the total for March, 1926, but $1,548,079 more than the February figure. The value of goods shipped during the first four months of this year was $23,200,000, about $600,000 more than in the corresponding period of 1926. The principal increases occurring in March, as compared with March, 1926, were for telegraph apparatus and railway signals, switches and attachments. The latter group rose in value by $103,841. The electric lamp class recorded a rise of $85,276. Other important increases occurred in insulated copper wire and cable electrodes for electric furnaces, mining and industrial locomotives, motor-driven household devices, batteries, switches and circuit breakers over 10 A, and portable electric tools. Among the decreases were transmission and distribution apparatus ($319,097), switchboard panels (except telephone) showing the largest fall ($238,196), transforming and converting apparatus ($227,773), electric motors, instruments, radio apparatus, domestic heating and cooking appliances, &c.

Unemployment.

The number of registered unemployed decreased by 23,428 during the week ended May 9th, and thus fell below the million mark. The actual total was 998,300, as compared with 1,021,728 on May 2nd and 1,875,899 on May 10th, 1926 (general strike period).

D

Wages in the Engineering Industry.

A further stage in the negotiations for increased wages in the engineering industry was reached last week. It will be remembered that the trade unions concerned originally asked for an all-round rise of 20s. per week. After lengthy discussions the employers decided that they were unable to accede to this demand, and offered instead an increase of 2s. 6d. per week, subject to certain conditions relating to overtime and night work. The unions considered that the offer left matters much as they were, and declined it. Then the general strike intervened and nothing further was done until early this year. Last week representatives of both parties met again in London. Sir Allan Smith, who presided, reviewed conditions in the industry, and on behalf of the Engineering Employers' Federation again offered a 2s. 6d. increase subject to conditions, with a proviso that the position and prospects of the industry should be reviewed again in July, 1928. The trade union representatives considered that this offer was identical with the previous one, and said that they could not accept it. As an alternative, they suggested an advance of 5s. per week to be made in two stages on July 1st and September 1st. The employers were unable to agree to this and, as a counter-proposal, offered a special advance to time workers of 2s. per week on the war bonus as from August 1st, wages then to be stabilised for 12 months. The union representatives declined this offer, and the conference broke up.

Trade Announcements.

MESSRS. L. WEEKES (LUTON), LTD., state that their business has not been amalgamated with, or absorbed by, any other similar business, nor is there any intention of this nature. They will continue to manufacture their "Safetee" ironclad switches, enclosed indicating cartridge fuses, &c., as hitherto.

The AUTOMATIC COIL WINDER & EQUIPMENT CO., LTD., has been appointed sole distributing agent for "Zeva" electric soldering irons and crucibles.

On and after May 29th the address of B.E.N. PATENTS, LTD., will be 92, Tottenham Court Road, W.C.1 (telephone: Museum 1761/2). The new premises comprise a showroom, a demonstration room, offices, a repair department and stores.

MESSRS. CUNNINGHAM, LTD., have had additional telephone lines installed; the new numbers are: Paddington 9001, 2 and 3.

MR. E. D. CHAPMAN has commenced business as an electrical and wireless engineer at 6, Station Parade, Croxley Green, Herts.

After serving with Messrs. Falk, Stadelmann & Co., Ltd., for seven years, Mr. L. E. FRASER is leaving on June 1st to take up agencies in the electrical and hardware trades. He has an office at 20-21, Finsbury Court, Moorgate, E.C.2. (Telephone: Clerkenwell 1003).

MESSRS. GREEN & SMITH, LTD., Meadow Lane, Leeds, have purchased the business of Messrs. Wallis & Watson, electrical contractors, Leeds; the business will be continued under the same name, and Mr. W. S. McGregor, the manager, and the whole of the staff have been retained. A brochure and leaflets dealing with the company's activities have been received.

ASCOG, LTD., has removed to Ascog House, 44, Theobald's Road, W.C.1. Telephone No.: Fitzroy 1537. Telegraphic address: "Oamcogeta, Holb-London."

MESSRS. BROWETT, LINDLEY & CO., LTD., have appointed Messrs. Green & Jackson, 12, Cherry Street, Birmingham, to be their representatives for the Midland District.

RADIO INSTRUMENTS, LTD., and the wireless section of the VARLEY MAGNET CO. have recently been amalgamated. Mr. J. Joseph, the managing director of Radio Instruments, Ltd., and Mr. J. M. G. Rees, of the Varley Magnet Co., are the directors of the new combination, which is known as R.I. and Varley, Ltd.

New Catalogues and Lists.

BROOK MOTORS, LTD., Empress Works, Huddersfield.—Catalogue No. 157, containing particulars and prices of "Brook" two- and three-phase loom motors. Also List No. 164, giving details of the company's hire-purchase system.

THE CONSOLIDATED PNEUMATIC TOOL CO., LTD., 170, Piccadilly, W.1.—Catalogue No. 14, containing illustrated details of portable electric tools, and three pamphlets advertising pneumatic tools.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, E.C.4.—An illustrated price list of "Siemens" electric fans.

SOLEX, LTD., 223-231, Marylebone Road, N.W.1.—A booklet dealing with engine efficiency and the remedying of troubles in automobiles.

MESSRS. RANSOMES, SIMS & JEFFERIES, LTD., Orwell Works, Ipswich.—A handsome brochure illustrating many examples of the company's lawn mowers, including electrically-operated types.

SIR W. H. BAILEY & CO., LTD., Albion Works, Salford, Manchester,—List No. 3,326, containing illustrated particulars of high-speed single-acting air compressors and vacuum pumps.

MESSRS. MAVOR & COULSON, LTD., 47, Broad Street, Mile End, Glasgow.—Lists Nos. 171/3, describing ironclad distribution panels, and 261/5, dealing with ironclad control pillars. Well illustrated.

THE UNIVERSAL MANUFACTURING CO., 7c, St. George's Circus, S.E.1.—A price list of electric fans, including desk and ceiling types.

THE LONDON ELECTRIC WIRE CO. & SMITHS, LTD., Playhouse Yard, Golden Lane, E.C.1.—A pamphlet announcing reductions in the prices of "Lewcos" two-pin inductance coils.

THE BRITISH TAP & DIE CO., LTD., Stirling Road, Walthamstow, E.17.—A leaflet containing prices and particulars of stocks and dies for screwing electrical conduits.

MESSRS. WINGROVE & ROGERS, LTD., 63, Queen Victoria Street, E.C.4.—A brochure illustrating examples of the company's electric locomotives, trucks and tractors, with full technical details.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—The "Osram-G.E.C. Bulletin" for May, containing illustrated articles and notes on "Osram" lighting installations, "Osram" radio valves, "Magnet" domestic appliances, &c. Also a circular letter dealing with "Geeko" moulded accumulators.

THE STURTEVANT ENGINEERING CO., LTD., 147, Queen Victoria Street, E.C.4.—A profusely illustrated booklet describing the construction and use of the company's industrial turbine vacuum cleaners. Many views of their applications are reproduced.

THE CAMPBELL GAS ENGINE CO., LTD., 73a, Queen Victoria Street, E.C.4.—A brochure entitled "The Price of Power," dealing in a non-technical manner with the advantages of independent internal-combustion engine sets for driving machinery and generators.

BURNDEPT WIRELESS, LTD., Blackheath, S.E.3.—An illustrated and priced booklet describing fully the company's five-valve portable receiver.

WELDRICS (1922), LTD., Station Road, Beeston, Notts.—A series of illustrated pamphlets describing the company's arc-welding plant, electrodes, &c.

MESSRS. NEWTON & WRIGHT, LTD., 471-473, Hornsey Road, N.19.—A comprehensive catalogue of apparatus for radiology, containing illustrated particulars of X-ray equipment of many types.

MESSRS. STUART TURNER, LTD., 43-47, Market Place, Henley-on-Thames.—Pamphlets dealing with a small plant for charging high- and low-tension radio batteries. Fully illustrated and priced.

MESSRS. J. J. EASTICK & SONS, 118, Bunhill Row, E.C.1.—A series of advertisements dealing with radio components supplied by the firm.

THE L. P. S. ELECTRICAL CO., LTD., Avenue Road, Acton, W.3.—A catalogue of magnet wires, giving prices and winding data.

THE SUPERHEATER CO., LTD., 195, Strand, W.C.2.—Pamphlets Nos. S.1 dealing with superheaters for power plants; S.2, a report on tests of a steam generating unit at an American generating station; and S.3, describing "M.L.S." bifurcated tube water walls. Well illustrated.

IRON AND NICKEL BATTERY CO., LTD., 17-19, Cockspur Street, S.W.1.—An illustrated pamphlet advertising "Ionic" (nickel-iron) batteries for yacht lighting, and also the company's hand lamp.

WAGNER ELECTRIC SUPPLIES, LTD., 66, Victoria Street, S.W.1.—List 24E, giving particulars and prices of single-phase repulsion-induction motors.

Bankruptcy Proceedings.

H. W. BAYLIS, company director, Aldwych House, W.C.2.—The affairs of this debtor, who died last December, came before Mr. Justice Astbury, sitting on May 16th as bankruptcy judge in the Chancery Division, upon an appeal against the rejection by the trustee of a proof of debt for £22,000. The receiving order was made against the debtor's estate on November 2nd, 1926, and accounts were lodged showing total liabilities of £17,752 (unsecured £13,460), against assets valued at £710, the failure being attributed to liability under a guarantee given on behalf of Radio Phonopore and Electricals, Ltd., of which company the debtor acted as director until it went into liquidation in June, 1926. Mr. Spens, K.C., said he appeared on behalf of Mrs. Anna T. Baylis (debtor's widow) and the Revd. O. F. Walton, who were the trustees under a deed of separation, and the appellants against the decision of Mr. F. S. Salaman (the trustee under the bankruptcy) rejecting their proof of debt to the extent of £22,000. They asked the Court to admit the proof for the full amount of the debt. Counsel explained that under a deed of separation the debtor covenanted that within 12 months from the date of his death a sum, *inter alia*, of £22,000 would be paid to the trustees under the deed. Mr. Clayton, K.C., intimated that the trustee would not further oppose the appeal.

His Lordship made an order for the proof to be admitted for the full amount.

BARNEY PACIFICO (trading as B. H. Pacy), late of Southampton Row, W.C., dealer in electrical fittings.—This bankrupt, who failed in January, 1921, applied on May 17th to Mr. Registrar Mellor at the London Bankruptcy Court for an order of discharge. The Official Receiver reported that the debtor commenced business in January, 1918, with £500 capital. He traded until the following December, when, owing to the business having been carried on at a loss, he closed it. The liabilities were returned at £395, and no assets were disclosed. The discharge was suspended for 12 month on statutory grounds.

A. A. Smethurst, trading as A. Smethurst & Co., 62, Bernard Street, Southampton, electrical and wireless engineer.—The public examination of this debtor was held recently at the Court House, Southampton. According to the statement of affairs the liabilities totalled £1,077, against assets of £315. Debtor stated that in 1905 he commenced business on his own account with £5, undertaking a certain contract. His business was very successful, and he was able to purchase the freehold of the premises, putting down £750 of the £1,250 required. During the war he did very well on Admiralty contracts for the provision of wireless apparatus to trawlers and other vessels, and received a claim for between £3,000 and £4,000 for excess profits duty. He found it inconvenient to withdraw the money from the business at the time, but he had since paid up to within £60 of the total claim. In 1921 he turned the business into a company. Subsequently, however, he had to assist the concern financially, providing about £2,500. As security for the loans which he made to the company, a debenture was issued for £2,100. Debtor said that his failure was due to the slump in shipping. He had been doing a turnover of from £10,000 to £12,000 a year. In 1924 the company was wound up, a receiver for the debenture holders having been appointed, and debtor was appointed to act as manager. At the beginning of 1926 debtor recommenced trading on his own account. He attributed his failure to excess profits duty payments and income tax, loss of work which he had been doing for a firm for years, and bad trade. The examination was formally adjourned.

H. A. S. Glenn, 95, Holderness Road, Hull, gramophone and wireless dealer.—The public examination of this debtor was held on May 16th at Hull. The statement of affairs showed liabilities of £667 and a deficiency of £474. Debtor attributed his failure to bad trade, wireless competition, and illness. The examination was closed.

A. L. Weekes, 13, Crescent Road, Luton, Beds., electrical engineer.—The receiving order in this matter was made on April 28th, on a creditor's petition. The first meeting of the creditors was held on May 17th, at the Official Receiver's Office, Northampton. The following are creditors:—

	£		£
Dryden, T. H.	153	Cumberland Brown	182
Peter Thomas & Clark ...	184		

L. Bell (C. Bell), mechanical and electrical engineer, Joseph Street, Leeds Road, Bradford.—Trustee, Mr. J. Lund, 2, Darley Street, Bradford, appointed May 10th.

J. Atkins (Atkins & Co.), electrical engineer, 59, Church Street, Tewkesbury, Electricity Works, Northleach, and High Street, Winchcombe.—Trustee, Mr. R. A. Rodgers, Coventry House, 3, South Place, E.C.2, appointed May 14th.

H. Milnes (H. Milnes & Son), plumber and electrician, 6, Trinity Street, Huddersfield.—Last day for proofs for dividend, June 1st. Trustee, Mr. A. Pontefract, 6, New Street, Huddersfield.

W. M. Horsfall, Heath Lodge, Hooton, Cheshire, electrical engineer, carrying on business in Liverpool.—Third dividend of 6d. in the £ payable at the offices of the Official Receiver, 11, Dale Street, Liverpool.

H. Robinson, 41, Wigan Lane, Wigan, electrician and wireless and cycle dealer.—Last day for receipt of proofs for dividend, June 4th. Trustee, Mr. E. D. Symond, 11, Dale Street, Liverpool.

W. R. Grigsby, trading as the Wenham Lighting Corporation, 184, Gray's Inn Road, W.C.1, electrical factor.—Trustee, Mr. E. H. Hawkins, 4, Charterhouse Square, E.C., released March 28th.

J. Turner, 62, Blackburn Road, Great Harwood, Lancs., electrician.—Trustee, Mr. J. P. Duxbury, 27, Richmond Terrace, Blackburn, appointed May 18th.

Company Liquidations.

Wireless Services, Ltd.—A meeting of members is called for June 20th at 4, Charterhouse Square, E.C.1, to hear an account of the winding up from the liquidator, Mr. E. H. Hawkins.

Radio Valves, Ltd.—A meeting of members is called for June 21st at 182, Temple Chambers, Temple Avenue, E.C.4, to hear an account of the winding up from the liquidator, Mr. W. H. Bevan.

Coughlan & Tyrrell, Ltd.—A meeting of members is called for June 20th at Bilbao House, New Broad Street, E.C.2, to hear an account of the winding up from the liquidator, Mr. A. T. Keens.

Interchangeable Electric Signs, Ltd.—Winding up voluntarily. Liquidator, Mr. C. H. Seaton, 62, Brook Street, W.1. —Meeting of creditors held on May 24th. Particulars of claims to be sent in by June 24th.

District Lighting Supply, Ltd.—Winding up voluntarily. Liquidator, Mr. C. S. Steel, 34-36, Gresham Street, E.C. Meeting of creditors to-day (Friday) at Cannon Street Hotel, E.C.4.

Private Arrangements.

R. F. Hearn, 9, South Wharf, Paddington, electrical and heating engineer.—A meeting of creditors was held on May 18th, when Mr. W. F. Baker, of Messrs. Haynes & Baker, 97, Mortimer Street, W.1, said that the liabilities amounted to £1,641, all due to trade creditors, with the exception of £100, which had been lent by a daughter. The assets, after deducting £40 for preferential claims, amounted to £1,054, but that amount was subject to realisation. The debtor had carried on business since 1915. He attributed his position to losses amounting to £1,700 in connection with contracts carried out for an architect; he claimed that that amount was due to him. It was decided that a deed of assignment should be executed in favour of Mr. Baker as trustee, together with a committee of inspection. The committee was empowered to negotiate for the sale of the assets for a sum sufficient to pay 10s. in the £. The following are creditors:—

	£		£
Ashby & Warner, Ltd.	70	Hartley & Sugden ...	60
Brooks, Phillips & Co. ...	37	Hearn, Miss	100
Boldings, Ltd.	48	Lichtwitz & Peasey ...	82
Crane Bennett, Ltd. ...	70	Matts & Co., Ltd. ...	82
Croggon & Co.	39	Matthews & Yates, Ltd.	40
Digby & Co., Ltd. ...	434	McDowall, Steven & Co.	40
Evered & Co.	80	National Radiator Co. ...	197
Garrod & Co., Ltd. ...	46	Walworth-Munzing, Ltd.	81

Acton Bros., electrical and wireless manufacturers, 33, Edmund Street, Camberwell, S.E.—A meeting of creditors was held on May 18th at the offices of Messrs. H. Rainsbury & Co., 65, Basinghall Street, E.C., when a statement of affairs was presented, which showed liabilities of £317, whilst there were rates and rent owing to the extent of £13. The assets were estimated to realise £196. Mr. H. Rainsbury reported that the debtors, Messrs. N. E. and E. O. Acton, started trading about five years ago at Walworth Road. They were successful, and in December, 1925, they moved to larger premises. Since that time, however, the business had declined, and from time to time they borrowed money from their father, who was now a creditor for £80. The father also guaranteed an overdraft of £86 at the bank. Efforts were made to sell the business as a going concern, but two creditors commenced proceedings, and it therefore became necessary to call a meeting. Mr. Rainsbury stated that no offer of composition could be submitted. The creditors decided that the estate should be realised by Mr. Rainsbury as trustee.

Dissolutions of Partnership.

Langham (Diamond Clear) Radio, wireless dealers, Albion House, New Oxford Street, W.C.—Mr. M. Baynes and Mr. H. H. Havercroft have dissolved partnership. Mr. Baynes will attend to debts.

W. T. Canning & Co., electrical, motor and general engineers, 47, Goldhawk Road, W.12.—Messrs. H. J. Blissett and W. Canning have dissolved partnership. Mr. Canning will attend to debts and continue the business.

Ranburn Magneto Co., 26, Seymour Place, Marylebone.—Messrs. C. W. Pizzey, G. F. Rance, and W. H. A. Wood have dissolved partnership. Debts will be attended to by Mr. Wood, who will continue the business.

The Enforcement of Wage Agreements.

Under existing conditions wage agreements arrived at by Joint Industrial Councils only apply to members of those councils, and as a consequence these organised employers are often undercut by other employers who are not bound by the agreements. Accordingly a Bill is being re-introduced into Parliament which seeks to empower the Minister of Labour to make applicable to the whole industry any agreement made by a Joint Industrial Council where the latter so desires. A group of Conservative Members of Parliament, headed by Sir Cooper Rawson, has issued a manifesto calling for the Government's support of this Industrial Council's Bill. It is stated that several councils have come to the conclusion that their continued existence will be useless unless legislation of the nature proposed is secured. As an example, the Whitley Council for the Granite and Roadstone Quarrying Industry is cited. This Council has made a wage agreement, but the parties to it are seriously affected by the refusal of local authorities and private firms which own quarries to fall in with the arrangement. Eight councils are said to have been disbanded owing to the lack of the powers asked for. It is pointed out that as a Whitley Council represents at least 75 per cent. of those engaged in a particular industry, the effect of the Bill would be simply to bring the majority into line. The Bill passed its second reading in 1924 by a majority of 220 and probably would have become law but for the dissolution. It is anticipated that the same support is available, and it is said that the National Union of Manufacturers and the Trade Union Congress both support the Bill in principle.

The effect of the legalisation of agreements upon the electrical industry is dealt with in the May *Journal* of the Electrical Trades Union by the general secretary (Mr. J. Rowan). He says:—"It has been made very clear to the Ministry that compulsory arbitration is not to be a condition of such enforcement, and that the present procedure of the various joint councils shall continue—namely, that before arbitration can take place both sides must voluntarily agree. There is no doubt that if some such legislation could be given effect to, it would make an enormous difference to electrical installation work. It would even have a good effect on electricity supply, as we have had the spectacle of authorised undertakings actually leaving the National Joint Industrial Council rather than comply with voluntary agreements entered into jointly by the Council."

Business Opportunity in Buenos Aires.

We have been asked by a company with offices in Buenos Aires to put it in touch with British manufacturers or exporters of electrical cables, trolley wire, other wires for electrical purposes, electric lifts, electric lamps, fires, instruments, meters (a.c. and d.c.), turbines, dynamos, motors, conduits, electric motor-cars, electrical accessories, and novelties. British concerns who are open to appoint agents for export trade with Argentina, Chile, Uruguay, and Paraguay, and wish to communicate with the company mentioned are asked to write to the Electrical Review "Service Department," 4, Ludgate Hill, London, E.C.4.

Book Notices.

"Central Station Voltages and Charges Throughout the United Kingdom, 1927." London: S. Rentell & Co., Ltd. Price 1s. net.—This booklet contains the latest information available at the time of printing as to the supply voltages, systems, and charges of the principal central stations in the United Kingdom.

"The New European Coal War" (29 pp.). London: Fleetgate Publications. Price 2d.—This is a report of the mission of miners' leaders to the Continent under the auspices of the *Daily News*, and is a concise and interesting review mainly of the German coal-mining and allied industries. The position of the electrical power industry is shown in its relation to other branches.

The Summer number of *Punch* (1s.) has been issued this week. It is full of fun and good humour, almost entirely pictorial.

"Underground Systems for Electric Light and Power," by T. C. Ruhling. Pp. viii+346; figs. 221. London: McGraw-Hill Publishing Co., Ltd. Price 20s.

"Automatic Telephony," by C. W. Wilman. Pp. vii+223; figs. 76. London: Crosby Lockwood & Son. Price 7s. 6d. net.

"Principles of Mercury Arc Rectifiers and their Circuits," by D. C. Prince and F. B. Vogdes. Pp. ix+233; 155 figs. Price 15s. "Properties and Testing of Magnetic Materials," by T. Spooner. Pp. xiv+385; 223 figs. Price 25s. London: McGraw-Hill Publishing Co., Ltd.

Electrical Patents in the United States.

Mr. Gerard Swope, president of the American National Electrical Manufacturers' Association, has appointed a committee of seven from prominent electrical concerns to investigate the situation regarding patents in the electrical industry, to determine whether some modification of the plan utilised by the National Automobile Chamber of Commerce may be made applicable to the electrical manufacturing industry. The committee comprises Messrs. Kebler, president, Ward Leonard Electric Co., chairman; A. G. Davis, vice-president, General Electric Co.; A. Atwater Kent, president, Atwater Kent Mfg. Co.; M. C. Rypinski, vice-president, Federal Brandes Co.; B. E. Salisbury, president, Pass and Seymour, Inc.; Harold Smith, general solicitor, Westinghouse Electric and Manufacturing Co.; and C. H. Strawbridge, president, Goodman Manufacturing Co. Messrs. A. E. Waller, managing director, and F. E. Neagle, legal counsel of the Association, are *ex-officio* members.

For Sale.

The South London Merchandise Mart will sell by auction on June 2nd, at 10, Red Lion Passage, Red Lion Square, W.C., the electrical and wireless stock of Claremont, Johnson, Ltd. (in liquidation). Bradford Corporation Electricity Department invites offers for one Babcock & Wilcox land-type water-tube boiler, with chain-grate stoker, &c., two Hall's boiler feed pumps, three induced-draught fans, two wrought-iron tanks, &c. Great Yarmouth Electricity Supply and Tramways Departments have for disposal one 600-kW single-phase Brush-Parsons turbo set, complete with surface condenser. (See our advertisement pages to-day.)

New French Company.

A new company has lately been formed at Clichy (149, Boulevard Jean-Jaures) (Seine), with a capital of 650,000 fr. and the title La Société des Etablissements de la Lampe Styx et Fragor Réunis, to manufacture telephone, telegraph, and radio apparatus.

German Materials for Victoria.

The Melbourne correspondent of the *Financial Times* reports that the Victorian State Electricity Commission has ordered material to the amount of £43,245 from German firms. Tenders for one lot of goods were received as follows:—One from England, two from America, and three from Germany. It was found that, allowing for the British preference from the tariff, the English price was 16.7 per cent. higher than that of Orenstein Koppel, of Berlin, which was accepted. The amount involved in this tender is £20,230. An order for six trucks of 20 tons each was given to Fried. Krupp, Berlin; a locomotive is to be ordered from Siemens Schuckertwerke, and cranes costing £1,983 from the Seyboth Co., Germany. The Commission claims that delivery by the Germans will be less than half the time mentioned in the British tender.

Scottish Electricians' Wages.

The Scottish District Joint Industrial Council for the Electricity Supply Industry has approved of an increase of wages to the extent of 1d. per hour to certain classes of employés in the industry.

The British Industries Fair, 1928.

We have received the prospectus of the next British Industries Fair, to be held at Castle Bromwich, Birmingham, from February 20th to March 2nd, 1928. This can be obtained from Mr. C. Stanley, the general manager, Birmingham Chamber of Commerce, 95, New Street.

Prices of Raw Materials.

In their weekly report on the lead market, Messrs. James Forster & Co. state:—"No new feature is apparent in the position. Stocks are considerable, supplies are ample, and consumption is still only moderate. It is rather astonishing that, in spite of the lower price for lead ruling this year, production actually shows an increase, one authority giving it as 33,000 tons over last year for the first quarter. Of course, this has already been discounted in present values, and it will be interesting to see what effect these values will have on present production. Unless producers curtail their output it seems certain that prices will fall still lower, until it becomes unprofitable for some of the more expensive mines to carry on."

Messrs. F. Smith & Co. and Messrs. James & Shakespeare report, May 24th:—No change in copper prices.

Messrs. James & Shakespeare report, May 24th:—English pig lead, £26, 5s. dec.

Messrs. Edward Till & Co. report, May 24th:—No change in the price of India-rubber, Para fine.

Lighting and Power Notes.

Blackburn.—Inquiry.—The Corporation General Purposes Committee has appointed Dr. S. L. Pearce to conduct an inquiry into the electricity undertaking, which is being held at the request of the electrical engineer (Mr. P. P. Wheelwright). The Committee has requested Dr. Pearce to examine the organisation and arrangement of the department, with its relations to other departments and to make any recommendation he may think proper to perfect the administration.

Bridgnorth.—Electricity Supply.—At a recent meeting of the Town Council and General Purposes Committee reported that it had had an interview with the chief engineer of the Shropshire, Worcestershire and Staffordshire Electric Power Co. regarding a supply of electricity to the town. The engineer stated that by the end of the year, or early in 1928, cables would be extended from the Stourport power station to Bridgnorth, and that the Corporation would have to incur no capital outlay.

Canada.—Hydro-Electric Development.—The Dominion Government has been devoting attention to power development on the Ottawa River, and the Minister of Railways and Canals announces that the charter of the National Hydro-Electric Company of Montreal, authorising it to develop electricity on a large scale at Carillon Falls will not be renewed. If the plans now being considered by the Federal Government are carried out, the Government itself will proceed with the Carillon Falls development for the benefit of Ontario and Quebec. It is estimated that 400,000 h.p. will be available at the Carillon rapids, incidental to the deepening of the Carillon and Glanville Canals from 9 ft. to 14 ft., at a cost of $40,000,000. There will have to be some negotiations with Ontario and Quebec, as both provinces may question the legal right of the Federal Government to develop power on the Ottawa River, and, failure to come to an agreement, may necessitate reference to the Privy Council.

Chesterfield.—Year's Working.—Mr. D. H. Davies, borough electrical engineer, informs us that the sales of electricity for the year ended March 31st last amounted to 8,199,676 kWh, an increase of 7 per cent., as compared with the preceding year. The cost of coal increased by over £7,000, and the cost per kWh sold from 0.21d. to 0.42d. The total working costs per kWh amounted to 0.99d., as against 0.77d., and the average price obtained was 1.60d. per kWh. Notwithstanding the heavy increases in the coal costs, the charges for electricity were reduced by ½d. per kWh for lighting, and by 10 per cent. for power, resulting in a reduced net profit of £2,522. This was done because at March 31st, 1926, the reserve fund had exceeded the statutory limit allowed. The connected load increased by 2,300 kW, the total now being 19,838 h.p. An addition of 21 miles of mains was made to the distribution system, bringing the total up to 134 miles. The sales of electricity for heating and cooking increased by 111 per cent., which was largely due to the opening of a new showroom during the year. Cookers, fires, wash boilers, &c., let out on hire during the year totalled 539.

Continental.—BELGIUM.—The reports that are being issued by the various electricity supply undertakings in Belgium show that steady progress continues to be made. The report of the Société de la Centrale Electrique de l'Entre Sambre-et-Meuse for the past year shows that it is now supplying electricity to over 30,000 consumers in the provinces of Namur, Hainaut, and Brabant, an increase of about 3,000, as compared with the preceding year. The load of the Société Intercommunale Belge d'Electricité, which controls eight power stations, increased to 256,000 kW, as against 227,000 kW, the sales of electricity showing an increase of 21 per cent. over 1925. During the past year the supply contracts secured by the Société d'Electricité du Bassin de Charleroi increased from 43,398 kW to 52,522 kW, to meet which 30 miles of new mains were laid. The Société d'Electricité du Nord de la Belgique is now supplying electricity to 115 localities in its area, as against 100 a year ago. The company has a total of 52,371 consumers, representing a load of 63,147 kW, to supply which the distribution system has been increased to a length of 1,165 miles.

The Société d'Electricité de la Region de Malmedy, in its report for last year, states that good progress is being made with the construction of the Beverce hydro-electric power station on the River Warch. The station will comprise three 5,500-h.p. turbo-generators, the foundations for which have already been completed. Pending the completion of the station, a steam-operated plant of 2,000-kW capacity has been established at Malmedy, a 15,000-V transmission line erected between Malmedy and Saint Vith, a distance of about 22 miles, and a similar line between Malmedy and Trois Fonts for the supply of electricity to the Compagnie d'Electricité des Ardennes.

FRANCE.—The Société de l'Union d'Electricité, of Paris, is augmenting its electricity supply in the Paris district by power transmitted from the Eguzon hydro-electric station, completed last year. The steam-operated station at Gennevilliers, near Paris, has now a capacity of 340,000 kW. During last year the output of the Union Co. amounted to 749 million kWh, as against 671 million kWh in 1925. Part of the increase is explained by the fact that the Union Co. is now supplying the electricity for all the electrified lines of the Paris-Orleans Railway Co.

AUSTRIA.—At the recent annual meeting of the Oberostereichische Wasserkraft und Elektricitäts Gesellschaft in Linz it was reported that the output of the O.W.E.A.G. hydro-electric power station at Partenstein had increased from 59,974,640 kWh in 1925 to 73,238,680 kWh last year. The third turbo-generator has recently been completed and put into operation, bringing the capacity of the plant up to 45,000 h.p.

El Salvador.—ELECTRICAL DEVELOPMENT.—A contract will shortly be placed for the installation of two electric light plants, either separately or as a whole, for Chinameca (Department of San Miguel), and for Jujutla (Department of Ahuachapan).—*Reuter's Trade Service* (San Salvador).

Guildford.—SPECIAL ORDER.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Corporation to supply electricity within parts of the rural districts of Guildford and Hambledon.

Hastings.—NEW COOLING TOWERS.—The Town Council has decided to erect new cooling towers at the Broomgrove power station, at an estimated cost of £6,974.

LOANS.—Application has been made for sanction to loans of £10,000 for services and £5,000 for meters.

Helensburgh.—LOAN.—The Town Council is to apply for sanction to the borrowing of £25,000 for the purpose of meeting capital expenditure incurred and to be incurred in connection with its Special Order.

Japan.—TOKIO.—The Tokio Denko K.K. has applied to the Government for permission to extend the capacity of its Tsurumi power station from 70,000 kW to 200,000 kW.

Leatherhead.—NEW PLANT.—The Leatherhead and District Electricity Co., Ltd., has received sanction to the installation of a 1,000-kW set at its electricity works. This is required to meet increasing demands, and will also enable the company to provide a bulk supply to any neighbouring undertaking requiring such a service.

London.—WATER WORKS PLANT.—The Metropolitan Water Board has prepared a scheme for the installation of new plant at its Hampton works. It is proposed to replace the existing two generators working at 100 V with two new sets generating at 200 V. The estimated total cost of installing two new generators with new motors, cables, &c., where necessary, and replacing the "Sheffield" engines with electrically-driven pumps, amounts to £9,000. There would be an approximate annual saving in wages of over £1,000, while the fuel charges would not be any higher. The question of the supply of electricity by the local company as against its provision by the Board has been considered, and it is found that by generating at Riverdale works the annual cost would amount to £4,000, a sum very much below that which would be charged by the company.

STEPNEY.—The Electricity Committee has received an application from Bermondsey Borough Council for a supply of electricity in bulk, and has recommended that terms be arranged and an agreement entered into for such a supply to Bermondsey.

Long Eaton.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £17,285 for the installation of two 500-kW transformers at the power station, the erection of two sub-stations, and h.p. cables.

Lowestoft.—ELECTRICITY AGREEMENT.—The Corporation has considered the draft agreement with the Great Yarmouth Corporation relative to the bulk supply of electricity to Lowestoft, and has agreed that the draft shall be submitted to the Electricity Commissioners to determine the points at issue.

Northern Ireland.—PORTSTEWART (CO. DERRY).—At a recent meeting of the Urban District Council the town surveyor submitted a draft plan of the proposed new generating station. The approximate cost of the station is estimated at £1,400, with manager's residence and office £750, and store £100, a total of £2,250. The clerk said the cost of the machinery, including new engines, switchboard, and generators, would be about £2,750, which would bring the total cost of the station to about £5,000.

BALLYCASTLE (CO. ANTRIM).—At a special meeting of Ballycastle Urban Council a communication was read from Mr. Dashwood, electrical engineer, Belfast, with reference to the valuation of the existing plant, mains, &c., of the electricity undertaking owned by the Ballycastle Lighting Co. Mr. Dashwood estimates the value of the plant, including goodwill, at £4,024. This sum does not include any fuel oil or other stores. An additional expenditure spread over the next five years of £1,500 would be required, part of which could be provided out of revenue. If the Council decides to move the station and provide new buildings, the cost of this work would be under £1,000. The Council has decided to make an offer of £4,024 to the Ballycastle Electric Lighting Co.

Prestatyn.—INAUGURATION OF SUPPLY.—An electricity supply for the district was formally inaugurated by the chairman of the Electricity Committee on May 14th. Electricity is obtained in bulk from the North Wales Power Co., Ltd., at 11,500 V, and reduced at the Council's sub-station for distribution. The charge for lighting is 8½d. per kWh.

Preston.—LOAN.—Application is being made for sanction to borrow £10,000 to meet the estimated expenditure for the assisted wiring scheme for the ensuing 12 months. The Housing Committee has been requested to take advantage of the system in connection with two schemes which it has in hand.

LOANS SANCTIONED.—The Commissioners have sanctioned loans of £82,151 and £48,000 respectively for the provision of mains, services, &c., and the installation of a fourth turbo-generator at the Ribble power station.

Sheffield.—ALL-ELECTRIC HOUSES.—A proposal to introduce electricity into 30 of the houses in course of erection by the Corporation on the Longley estate is to come before the next meeting of the City Council. The scheme provides for electric fires, cookers, boilers, &c. Previously all the Corporation houses have been fitted for electric lighting, but the occupiers have had to provide any additional appliances.

Shrewsbury.—YEAR'S WORKING.—The accounts of the Corporation electricity undertaking show a gross profit of £7,221, and after providing for capital charges, a net surplus of £2,931, of which £2,000 was placed to reserve account and the balance carried forward.

ELECTRICITY EXTENSIONS.—The Electricity Committee has recommended extensions at a cost of £1,230.

Stourport.—NEW POWER STATION.—The new power station of the Shropshire, Worcestershire and Staffordshire Electric Power Co., which will be inaugurated on June 2nd, will work interdependently with the Electricity Supply Department of the Birmingham Corporation, and for this purpose a cable has been laid between the company's station at Halesowen and the Corporation's undertaking. This is to be put into operation within the near future, and the stations of the company at Smethwick, Halesowen, Kidderminster and other centres will then be connected with the Corporation stations at Nechells and Summer Lane. The initial plant at the Stourport station provides for the development of 50,000 h.p., there being two turbo-alternators, each of 22,500 kVA, generating at 3-phase, 25 cycles, 5,500 V, which will be stepped up to 33,000 V for transmission. The station will eventually be enlarged to a capacity of 200,000 h.p.

Stoke-on-Trent.—EXTENSION OF SUPPLY.—At a recent meeting of the Electricity Committee an inquiry was received from the English Electric Co., Ltd., regarding an electricity supply required by Messrs. Wheatley & Co., at Springfield Tileries, Stone Road. It was decided to lay an e.h.p. main from the London Road sub-station, at an estimated cost of £6,500. The Committee is to extend mains at Pittshill, at a cost of £1,200.

SUPPLY FOR GAS WORKS.—The Corporation gas engineer is negotiating with the city electrical engineer for a supply of electricity to the Etruria gas works.

CHANGE-OVER.—The electrical engineer has submitted a report to the Electricity Committee on the proposed method of changing over the system of electricity supply in the centre of Tunstall from d.c. to a.c. The work will be carried out in three sections, and the cost is estimated at £6,200.

STREET LIGHTING.—The Corporation has asked the city engineer to prepare a scheme for the improved lighting of the main roads in the city.

All-Electric Houses.—The Corporation has deferred for six months a proposal to equip 200 houses on the Abbey housing site as all-electric houses pending definite information as to the costs, &c., from the eight all-electric houses erected in Avenue Road, Hanley.

Swansea.—Mains Extensions.—The Corporation Electricity Committee is to carry out mains extensions, at a total estimated cost of £3,856. The borough electrical engineer has recommended, for the purpose of ensuring continuity of supply to the Gellyceidrim and Brynamman collieries and other consumers on the Amman Valley line, that a by-pass overhead transmission line be constructed at Gellyceidrim, at an estimated cost of £1,500. The Committee has approved the proposal.

United States.—Electrical Development.—A new hydro-electric plant with a generating capacity of 56,000 h.p. will be erected immediately at Oxford Shoals, near Claremont, on the Catawba River, by the Southern Power Co. The plant will cost $5,000,000. Contracts have been let for the equipment of the new station, and much of the preeliminary work has already been done. It is stated that the plant will be in operation by June 1st, 1928. The Oxford Shoals hydro-electric plant will be the twelfth built by the Duke interests. The generating capacity of these plants will be, with the completion of the proposed station, 651,000 h.p.

Weymouth.—Street Lighting.—The Town Council has arranged with the Wyke Parish Council for public lighting in the village by 40 lamps for a period of 20 years, at a charge of £145 per annum.

Electricity in Bulk.—The Council has also arranged to supply electricity in bulk to Portland Urban District Council at £5 per kVA, plus 0.7d. per kWh. The minimum to be paid by Portland is to be £350 for the first year. £525 for the second year, and £700 for the third and succeeding years. The Corporation is to apply for a Special Order authorising the bulk supply.

Whitchurch (Hants.).—Electricity Supply.—The Rural District Council has decided to give its consent to an application by the Basingstoke Town Council for a Special Order to supply electricity in the district.

Tramway and Railway Notes.

Brighton.—Extension of Route.—The Tramways Committee has recommended the extension of the Lewes Road route as double track from the terminus to the existing borough boundary, at an estimated cost of £2,800.

Continental.—Poland.—The Société Chemins de fer Electriques Suburbains has obtained a concession for the construction and working of an electric railway, about 30 miles in length, between Warsaw, Grodzisk and Zyrardow. Work is well advanced on the construction of the line as far as Grodzisk, 20 miles, and this is expected to be put into operation in the near future.

Germany.—At the end of last year 585 miles of main-line railways and 70 miles of suburban lines had been electrified in Germany. Of the main lines 275 miles is in Bavaria, and of the suburban lines 50 miles is in the Berlin area. At the present time 190 miles of line is in course of electrification, including the Konigszell-Breslau mountain railway (30 miles), the Munich-Rosenheim-Kufstein line (62 miles), and about 100 miles of the Berlin city and local railways.

Belgium.—The electrification of the last section of the Brussels-Ninove local railway—that between Eyseringhen and Ninove—has recently been completed by the Société Nationale des Chemins de fer Vicinaux. To supply electricity for the new section an automatic transformer station, the first of its kind in Belgium, has been established at Eyseringhen.

Hull.—Tramway Supply.—At a recent meeting of the Corporation Electricity Committee it was reported that the Tramways Committee was considering the advisability of taking a supply of electricity for the tramway service from the general city supply instead of from the power station in Osborne Street. The matter was left over pending the receipt of a communication of the Tramways Committee on the subject.

Irish Free State.—Cork.—In consequence of motor-omnibus competition, the Cork Electric Tramways Co. has decided to extend its 1d. fare stage and to introduce a 2d. fare for the whole length of the route of five miles. If competition continues to increase, it is probable that the Corporation will supplement its tramway service by a 'bus service of its own.

Japan.—Tokio-Osaka Railway.—In connection with the proposed rapid transit electric railway between Tokio and Osaka, it is reported that the Osaka Municipal Assembly will shortly give its approval to the scheme. The total length of the line will be 299 miles, and there will be only eight intermediate stations.

New Zealand.—Auckland.—The Sydney *Sunday Times* reports that the proposed extension of the Auckland tramway to Point Chevalier, to Meadowbank Road on the Remuera line, and to Mount Albert Road on the Mount Eden, Dominion Road and Ebendale Road routes, as recommended by the tramway manager, Mr. A. E. Ford, has been approved by the City Council. The Council has also agreed to acquire 50 new trams and to add to the 'bus garage accommodation. The proposals are to come before the ratepayers in a loan poll to raise £500,000 to carry out the various works.

Southend-on-Sea.—Inquiry Result.—In connection with the inquiry recently held by the Ministry of Transport into the Corporation's application for a Provisional Order authorising it to introduce a railless-car service from Victoria Circus to the Priory, thence *via* Brook Road, East Street, and Sutton Road to Victoria Circus, the Ministry states that it is unable to authorise the introduction of railless cars on this route at present, except on that portion of the route now in operation. The Council has decided, subject to obtaining the necessary Order, to purchase the two railless cars which have been in operation on this route since January last, at a cost of £1,650 each.

United States.—Railway Electrification.—According to the *Electrical World*, the Pennsylvania Railroad has started to electrify the Octoraro branch of its system. This runs through Lansdowne, Morton, Media, Swarthmore, and West Chester. It is stated that the work will be completed early in 1928. Good progress is being made on the Pennsylvania's electrification between Philadelphia and Wilmington, which has been under way for a year.

Telegraph and Telephone Notes.

Radio-Telegraphy.—Colonial Links.—Wireless problems were discussed at the Colonial Conference in London on May 20th. The opinion was expressed that progress in the application of wireless-telegraphy was so rapid that the formulation of a definite general scheme for the Colonies would be premature. It was pointed out that the amount of work in the Colonies and Protectorates had not been very extensive. During the past 15 years about 30 small stations had been erected, and were utilised mainly for local requirements and communication with shipping, but they were regarded as the preliminary links in a chain of inter-Imperial communication which might ultimately be established. The adoption of a short-wave service between Singapore, Penang, and neighbouring States is contemplated by the Straits Settlements Government, and Kenya looks forward to being in a position to pick up short-wave transmissions from this country.

Switzerland.—Telephone Association.—A number of concerns which supply telephone material to the Swiss Post and Telegraph Department have lately formed a new association with the title "Pro Telephon" to carry through a campaign to develop the use of the telephone in Switzerland. The offices of the new body are temporarily located at those of the Swiss Union of Electrotechnical Specialists, 5, Cacilienstrasse, Zurich.

Transatlantic Telephony.—Extension of Hours.—The Postmaster-General announces that on and from May 23rd the transatlantic telephone service will be available from 12.30 p.m. to 11 p.m. (British summer time) daily, including Sundays.

Radio Notes.

Canada.—New Station.—One of the most powerful stations in Canada is to be erected in Red Deer, Alberta, by the Alberta Pacific Grain Co. Studios will be operated in both Calgary and Edmonton by remote control from the main station, says *World Radio*. It is also announced that Alberta is to have a permanent radio inspector to serve the entire province, whose headquarters will be at Calgary.

Empire Broadcasting.—Service Urged.—Since the end of 1925 the British Broadcasting Corporation has indicated its desire to co-operate in any practicable enterprise designed to interchange programmes between, or simply to make them available in, various parts of the Empire, but it has neither had the financial resources required for the necessary experiments, nor has it been convinced that any of the proposals so far made are likely to be productive of that degree of efficiency which would justify the expenditure involved. Nevertheless, it committed itself in May of last year to construct the necessary experimental apparatus and received Post Office permission to do so; it was proposed to test the opinion of representatives at the Colonial Conference this

week with a view to ascertaining the demand that may exist for such a service, and the extent to which they would be prepared to co-operate financially and otherwise.

Meeting in London on May 20th, the Colonial Conference delegates are reported to have expressed a desire for the formulation of a policy of broadcasting as a channel of communication and a means of entertainment, but stated that prolonged experiments would have to be made before a scheme of distribution throughout the Empire could be regarded as technically practicable in all respects. Ceylon took the lead in establishing a broadcasting service in 1924, and Hong Kong, Palestine, the Gold Coast, Cyprus, and Zanzibar have been considering the possibilities of setting up broadcasting services.

The Wireless League and the Wireless Association of Great Britain are urging the initiation of an Empire service, in which connection it is of interest to note that on the occasion of the relaying of the after-luncheon speeches from the Guildhall on May 18th, when the City of London entertained the President of the Republic of France, arrangements were made, on receipt of the speeches in the control room at 2LO, to transfer them to land lines so that they could be transmitted to Paris for simultaneous re-broadcasting from the French radio stations.

The Sydney (Australia) broadcasting station (2BL) successfully relayed the (5 to 8 p.m., May 20th) programme of the British Broadcasting Corporation's London station (2LO) between 3 and 6 a.m. on May 21st. The relay took place *via* the B.B.C.'s Daventry station (5XX, 1,600 m.) and the short-wave station of Messrs. Philips in Holland; it was relayed again by Broadcasters, Ltd., from Sydney to New Zealand, and in South Africa also from the Cape Town, Johannesburg, and Durban stations, while the programme was heard at Rangoon in India as well.

This feat of PCJJ, the Philips experimental station at Eindhoven, Holland, which broadcasts on a wave-length of 30.2 metres merits attention. Numerous amateurs in the Dutch East and West Indies have also testified to the excellence of the reception of this short-wave transmission. Holland has been one of the pioneers of the broadcasting industry; indeed, it was the old station at The Hague (PCGG) which English listeners were first able to hear long before the inauguration of the B.B.C.

Union Internationale de Radiophonie.—Annual Meeting.—The annual meeting of the Union, consisting of the Council and various Commissions, has concluded its sittings at Lausanne. Vice-Admiral Carpendale (Great Britain) has been re-elected president of the Union; Messrs. H. Giesecke (Germany) and R. Tabouis (France) vice-presidents; and M. M. Rambert, delegate of the Council. Agreement was arrived at on certain questions, with regard to which experience has shown the need of international collaboration, which are to be discussed at the coming international conferences at Washington and Rome. The Lausanne conference also discussed the adjustment of some of the wave-lengths allocated in the Geneva plan; the suggested modifications have yet to be approved by the respective Governments. It was decided, among other things, to establish a permanent central post where a check will be kept by nightly observations on the stability of wave-lengths from the technical point of view. The Commission which deals with social and cultural matters has been augmented, and the following broadcasters have been elected active members of the Union:—Polskie Radjo (Poland), Radiogenossenschaft Basel (Switzerland), and Nederlandsche Draadlooze Omroep, the Dutch organisation which will shortly work the Huizen station. Extra-European associate members have been elected as follows:—National Broadcasting Co. (U.S.A.), Nihon Hoso Kyokai (Nagoya, Japan), Indian Broadcasting, Ltd., Amalgamated Wireless (Australasia), Ltd., Cuban Telephone Co., the Peruvian Broadcasting Organisation, and General Broadcasters, Ltd. (Australia). The European broadcasting organisations which are members of the Union now direct 113 transmitting stations serving approximately 7,000,000 receiving sets.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Aberdare.—June 2nd. Electricity Department. E.h.p. overhead and underground main and branch transmission lines. (May 13th.)

Armagh.—June 7th. Urban District Council. Heavy oil engine generating plant, underground and overhead mains. (May 13th.)

A.c. switchboard and overhead travelling crane. (May 20th.)

Australia.—Melbourne.—July 5th. State Electricity Commission. One 15,000-kW steam turbo-generator and accessories. (B.X. 3369.)*

July 4th. 66,000-V and 22,000-V insulators for the Yallourn brown coal scheme. (May 6th.)

June 7th. Switchboard cable. (B.X. 3532.)*

June 28th. Postmaster-General's Department. Jacks, switchboard instruments, &c. (B.X. 3474.)*

August 15th. One 55-ton 3-motor-type electrically-operated overhead travelling crane. (A.X. 4727.)*

Sydney.—June 20th. Municipal Council. Turbo-alternators for Bunnerong power station. (B.X. 3443.)*

July 18th. Boiler-house equipment for the Bunnerong power station. (B.X. 3531.)*

Basingstoke.—June 7th. Corporation. Electrical installations at the Council's housing estate (approx. 1,015 wiring points). (May 13th.)

Castleford.—May 31st. Urban District Council. Electrical plant, switchgear, wiring, &c., public baths. D. Firth, engineer.

Chile.—Santiago.—July 18th. Chilean State Railways. Materials for electric lighting and power (Group 30). Materials for electric lighting of locomotives and coaches (Group 32). August 22nd. Signalling, telegraph and telephone supplies (Group 36). (C.X. 2271.)*

Grimsby.—June 4th. Electricity Department. Sub-station equipment. (May 13th.)

Hull.—June 16th. Electricity Department. Steel coal bunker and conveyor housing. (May 20th.)

Switchgear extensions. (See this issue.)

Ilford.—June 1st. Electricity Department. E.h.p. and l.p. paper-insulated cables. (May 20th.)

India.—June 14th. India Stores Department, Simla. Generating sets for Fyzabad power station. (B.X. 3486.)*

London.—H.M. Office of Works.—June 3rd. 5-ton gantry crane. (May 20th.)

Hammersmith.—June 1st. Electricity Department. Cables, transformers, h.p. switchgear and ironclad feeder switchgear. (May 20th.)

Manchester.—May 30th. Electricity Department. L.p. valves for circulating water system, two electrically-driven and one steam-driven boiler feed pumps. (May 13th.)

June 13th. Seven 250-kVA static transformers. Mr. H. C. Lamb, chief engineer and manager, Town Hall, Manchester.

June 1st. Education Committee. Electric lighting installation at Levenshulme High School for Girls. Specification, &c., from Education Offices, Deansgate.

Marlborough. — Electricity Department. Additional underground feeder and overhead feeder. (See this issue.)

New Zealand.—Auckland.—July 4th. Auckland Electric Power Board. Switchgear. (B.X. 3471.)*

Wellington.—August 9th. Public Works Department. 1,500 suspension insulator strings and 470 strain insulator strings. (B.X. 3533.)*

Oldham.—June 11th. Electricity Department. Water-cooling towers, foundations, tanks, and circulating water pipes. (See this issue.)

Portsmouth. — Electricity Department. Transformers. (See this issue.)

Pudsey.—June 14th. Electric lighting installation at the School of Art. Specifications from Education Department, County Hall, Wakefield.

Scarborough.—June 3rd. Corporation. Installation of electrical pumping plant in duplicate for the new Irton water scheme No. 2. Specifications (£5) from Dr. H. Lapworth, engineer, 25, Victoria Street, S.W.

Sheffield.—June 11th. Tramways and Motors Committee. Supply and erection of weighbridge. Mr. A. R. Fearnley, general manager, Division Street, Sheffield.

South Africa.—CAPE TOWN.—June 30th. South African Railways and Harbours Board. Gasfilled and vacuum lamps for 12 months. (B.X. 3518.)* Telegraph material. (B.X. 3519.)*

ELLIOTT (C.P.).—June 15th. Municipal Council. Electric lighting plant, including engines and dynamos, steel poles, copper wire, insulators, switchboard meters, house-service fuses and street-lighting brackets and suspension fittings.

EDENBURG (O.F.S.).—June 21st. Municipal Council. Electric lighting plant, including engines, dynamos, steel poles, &c.—*S.A. Mining and Engineering Journal.*

Switzerland.—BERNE.—June 4th. Swiss Federal Railway authorities. Three 3,000-kVA, 60,000/15,000-V oil transformers for outdoor use, &c., for the new transformer station at Gruze. Particulars for 5 fr. from the Abtheilung für Elektrifizerung C.B.B. Dienstgebaude, 43, Mittelstrasse, Berne.

Tynemouth.—June 11th. Electricity Department. One voltage regulating transformer. (May 13th.)

Whitley.—Electricity Department. One 1,000-kW turbo-alternator, with condenser, pumps, air filter, &c.; one 200-kW semi-Diesel or heavy-oil engine alternator. (May 6th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Belgium.—BRUSSELS.—The municipal authorities last week opened tenders for two 6,000-kW turbo-alternator sets and a 1,500-h.p. set for the Brussels municipal electric power station. Five tenders were received, the quotations ranging from £30,245 to £45,370, the lowest being that of the Belgian branch of the Brown-Boveri Co.

Bexhill.—Electricity Committee. Recommended:—
1,000 yd. cable (£346).—Enfield Cable Works, Ltd.

Glasgow.—Lighting Committee. Accepted:—
Electrical fittings and accessories.—Wm. Brown & Co.; Wm. M'Geoch & Co., Ltd.; British Electrical Mfg. Co.; Chalmers & Mitchell; Stella Conduit Co., Ltd.; John T. Cartwright; Bayliss, March and Newey, Ltd.; Lighting Trades, Ltd.; Electric Conduits, Ltd.

Government Contracts.—The following contracts were placed by various Government Departments during April, 1927:—

ADMIRALTY CONTRACT AND PURCHASE DEPARTMENT.

300-kVA alternators.—British Thomson-Houston Co., Ltd.
Motor alternators.—Small Electric Motors, Ltd.
W/T boards.—General Electric Co., Ltd.; Whipp and Bourne, Ltd.
Distribution boxes.—Hawkers, Ltd.; E. Holme & Co., Ltd.; Basebe, Sadler & Co., Ltd.; Engineering and Lighting Equipment Co., Ltd.; Pinnacle Switchgear, Ltd.; Telford, Grier & Mackay, Ltd.; Whipp and Bourne, Ltd.
W/T condensers.—Telegraph Condenser Co., Ltd.; Dubilier Condenser Co. (1925), Ltd.
Magazine lighting fittings.—Oliver Pell Control, Ltd.
Electric light installation.—Read & Partners, Ltd.
W/T panels.—Radio Communication Co., Ltd.
E.h.p. transmission line.—G. E. Taylor & Co., Ltd.
W/T valves.—Mullard Radio Valve Co., Ltd.

WAR OFFICE.

Batteries and cells.—Siemens Bros. & Co., Ltd.; General Electric Co., Ltd.; Edison Swan Electric Co., Ltd.

AIR MINISTRY.

Magnetic adaptors.—H. W. Sullivan, Ltd.
Direction finder land station.—Marconi's W/T Co., Ltd.
Magnetos and spares.—Simms Motor Units, Ltd.
Stripping magnetos.—British Thomson-Houston Co., Ltd.
Transmitters.—Gambrell Bros., Ltd.

POST OFFICE.

Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; Peel-Conner Telephone Works; Siemens Bros. and Co., Ltd.; Telephone Mfg. Co., Ltd.
Testing, protective, and miscellaneous apparatus.—Chamberlain & Hookham, Ltd.; Siemens Bros. & Co., Ltd.
Cable (various).—British Insulated Cables, Ltd.; Callender's Cable & Construction Co., Ltd.; Enfield Cable Works, Ltd.; General Electric Co., Ltd.; W. T. Glover & Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Pirelli-General Cable Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.
Loading coils.—Siemens Bros. & Co., Ltd.
Electric lamps.—Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.
Tungar rectifiers.—British Thomson-Houston Co., Ltd.
Copper wire.—E. & E. Kaye, Ltd.
Switchboard wire.—Connollys (Blackley), Ltd.
Manufacture, supply, drawing in and jointing cable.—London-Uxbridge; Callender's Cable & Construction Co., Ltd.
Lifts, Temple Bar Telephone Exchange.—W. Wadsworth and Sons, Ltd.
Radio station power plant, Humber (Lincs.).—Austin Lighting Co., Ltd.
Telephone exchange equipment.—Doncaster: General Electric Co., Ltd. Headingley (Leeds): Automatic Telephone Mfg. Co., Ltd. Walton (Liverpool): Standard Telephones & Cables, Ltd. Harrods, Ltd. (H.O.); Harrods, Ltd. (Estate Office); (London, S.W.); Cumberland County Council; J. & E. Hall, Ltd. (Dartford); Union Coal Storage Co., Ltd. (Liverpool): Relay Automatic Telephone Co., Ltd.

CROWN AGENTS FOR THE COLONIES.

Armatures.—Railway Signal Co., Ltd.
Cable.—W. T. Glover & Co., Ltd.
Electric welding sets.—Premier Electric Welding Co., Ltd.
Lamps.—General Electric Co., Ltd.
Motors.—Laurence Scott & Co., Ltd.
Switchgear.—British Thomson-Houston Co., Ltd.
Telephone materials.—Siemens Bros. & Co., Ltd.; Ericsson Telephones, Ltd.; W. T. Henley's Telegraph Works Co., Ltd.
Train lighting spares.—J. Stone & Co., Ltd.
Transformers.—British Electric Transformer Co., Ltd.

London.—LONDON COUNTY COUNCIL.—Education Committee. Electric lighting installation, Burghley Road schools, St. Pancras:—

Pinching & Walton. (Recommended.) ...	**£1,138**
A. Hawkins & Sons	1,189
A. Dean & Co., Ltd.	1,213
H. J. Cash & Co., Ltd.	1,249

CORRECTION.—By a printer's error, the tender of Messrs. Rashleigh Phipps recommended for acceptance by the Westminster Housing Committee, was incorrectly stated in our last issue. The tender was for an electric lighting installation at Regency Street Dwellings. Messrs. Bailey & Incledon, Ltd., received the contract placed by the L.C.C. Education Committee in connection with the Drayton Park School, as stated.

Highways Committee. Accepted:—
Conductor rails (£5,846).—Frodingham Iron and Steel Co., Ltd.
Track rails and fastenings (£31,837).—Dorman, Long and Co., Ltd.

The London County Council has placed a 12-months' contract for electric incandescent lamps with Siemens & English Lamp Co., Ltd.

HACKNEY.—Electricity Committee. Recommended:—
One 10,000-kW turbo-alternator (£25,300).—C. A. Parsons and Co., Ltd.
Converting plant and booster (£15,643).—Bruce Peebles and Co., Ltd.
Switchgear (£13,413).—Johnson & Phillips, Ltd.; (£6,394), A. Reyrolle & Co., Ltd.

STEPNEY.—Electricity Supply Committee.
Meters, &c., for 12 months:—
5 to 20 amps.—Measurement, Ltd.
Prepayment meters and 50- to 100-amp. meters.—Ferranti, Ltd.
Combined meters and demand indicators.—Aron Electricity Meter, Ltd.
Time switches.—Venner Time Switches, Ltd.
Conduits, troughs and covers.—Albion Clay Co., Ltd.

Hamilton.—Town Council. Recommended:—
Electric lighting work in connection with the re-housing scheme at Low Waters.—W. Y. M'Adam.

Kiveton Park.—Rural District Council. The Eastern Counties Electrical Construction Co., of Ipswich, has received a contract from the Kiveton Park Rural District Council, near Sheffield, for an extensive electrical development scheme in the Harthill district.—*East Anglian Daily Times.*

Tynemouth.—Electricity Committee. Accepted:—
Cable (£308).—Connolly's (Blackley), Ltd.; (£92), Hogan and Wardrop.

Forthcoming Events.

Institution of Production Engineers.—Friday, May 27th. 83, Pall Mall, S.W. 7.30 p.m. "Rate Fixing." Mr. J. Ronald.
Physical Society.—Friday, May 27th. Imperial College of Science, South Kensington, S.W. 5 p.m. Ordinary meeting.
Incorporated Municipal Electrical Association.—May 30th to June 4th. Buxton. Annual Convention.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the name and address of makers of the following:—

McDONALD hair waving machine.
Perkins' YANKEE switch.
ELECTRA curling iron.

Notes.

London's Tramways.

In a letter to the *Morning Post*, Sir George H. Hume, M.P., refutes some of the allegations that have been made with regard to the financial condition of the electric tramways of the London County Council. Referring to the statement that the loss on their working for the year ended March 31st, 1927, has been £302,114, he points out that that sum, in fact, represents the deficiency for the period mentioned after payment of interest on debt (£270,000) and repayment of debt (£234,500), a very different thing to a loss. "It would be well," he says, "for the public to realise that with all the deficiencies that have had to be faced, it only amounts to this: that the ratepayers will have had to pay, up to date, a little over a million pounds for a property which is maintained at concert pitch, and represents a capital expenditure of something like sixteen million pounds, a large part having been incurred at pre-war values.

"The actual loss during the general strike, and the additional cost of fuel as a result of the long stoppage in the coal industry, was £226,000, a loss which was unavoidable and abnormal. Allowing for this sum, the deficiency figure would be reduced to about £76,000, and, even then, it is fair to say that much of this resulting deficiency was due to the general disturbance of trade and the consequent depression of revenue."

The Chiswick Power Station.

The London and Home Counties Joint Electricity Authority has issued a 20-page booklet, containing a coloured map and reproduced photographs of a scale model of the buildings, dealing briefly with various aspects of the proposed generating station at Chiswick to serve the whole of the western portion of the J.E.A.'s area. The 44.5-acre site is on the River Thames, and served by the Southern Railway; it is proposed to construct a tidal dock and a drive and promenade along the river frontage; the station's ultimate capacity will be 325,000 kW, and its maximum sustained load 250,000 kW. Three boiler houses will contain 30 boilers, and the chimneys will be invisible, as they will not extend above the parapet of the walls, while poplar trees will be planted to screen the coal storage site. The J.E.A.'s No. 2 Parliamentary Bill is now being considered by a committee of the House of Commons, and Mr. J. H. Rider (consulting engineer to the Joint Authority), in evidence, said that the Chiswick site was that which he and the other engineers concerned had recommended to the Commissioners in 1921. In the Joint Authority's district the demand in 1919-20 was 308,822 kW, and in 1925-26 it was 577,317 kW. He now estimated that the demand in 1930-31 would be 878,590 kW, and 1,179,920 kW in 1935-36. Excluding railway plant, in the Joint Authority's district there were 62 stations, with a gross capacity of 1,327,784 kW of installed plant. The scheme put forward in his report to the Authority in 1926 provided for the retention of three primary and 20 secondary power stations, having a total plant capacity of about 1,245,000 kW, the three primary stations being those at Deptford, Brimsdown, and Barking. An installed plant capacity of over 1,500,000 kW would be needed to meet the estimated demand in 1935-36, with proper provision for stand-by, but it was likely that that estimated demand would be exceeded. The first section's installed capacity of 125,000 kW would serve a load up to 75,000 kW, leaving 50,000 kW for reserve. The ultimate capacity of 325,000 kW would consist of six 50,000-kW and one 25,000-kW sets; each boiler would have a normal evaporative capacity of 100,000 lb. of water per hour, and the ashes would be conveyed through water and dropped into trucks and carried to barges in the dock. Coal would come by railway; in addition to the service hoppers sufficient only for a day or two, there would be three silos, each having a capacity of 9,000 tons, and a reserve silo with a capacity of 100,000 tons; its top would be some 15 ft. below ground level, and this large stock of coal would be under water. When the station was going at full capacity it would require something like 16.8 million gallons of water per hour, which gave some idea of the absolute necessity for finding a site where ample condensing water could be obtained.

Mr. Rider said that on the basis of a 40 per cent. load factor and coal at 20s. per ton, the total cost per kWh sent out from the first section of 125,000 kW would be 0.4315d. When the station was completed the total cost would be 0.366d. per kWh. The total capital cost of the station, when completed, would be £13.9 per kW, or a total of just over 4½ millions sterling, whilst the capital cost of the first section would be £14.9 per kW. There was no doubt that the station at Chiswick, if passed, would become a "selected station" under the scheme of the Central Electricity Board. Referring to the opposition of the London Power Co., Mr. Rider said the fact that that company was applying to the Commissioners for permission to erect a large power station at Battersea would not affect the present proposal in any way, because he believed there would be need for two large stations of this character by the time they were both erected.

Industrial Electric Vehicles.

The Ministry of Transport has recently issued for the first time a return of the actual number of motor vehicles registered in this country at the end of September, 1926. A section of the return is devoted to electric goods-carrying vehicles, from which we learn that at the date mentioned there were 603 such vehicles in use in Great Britain, 552 being in England, 26 in Wales, and 25 in Scotland. Vehicles of an unladen weight up to 25 cwt. head the list with 156, those between 3 and 4 tons following with 150; 105 are between 2 and 3 tons, 101 between 4 and 5 tons, 75 between 25 cwt. and 2 tons, seven between 5 and 6 tons, six over 4 tons, but exact weight not stated, and three over 6 tons. Trailers are used in conjunction with 23 of the 603 machines.

E.P.E.A. Visit.

At the invitation of Mr. C. M. Shaw, M.I.E.E., chief engineer and general manager of the Worcester electricity undertaking, over one hundred members of the Birmingham and North-West Midlands Sections of the Electrical Power Engineers' Association paid a visit to Worcester on May 14th, when a motor tour was made of the extended area of supply. Some very interesting examples of overhead transmission and distribution schemes were inspected, and also the hydro-electric power station. In the evening the party inspected the plant at the city power station. At a meeting which followed Mr. Shaw gave a historical survey of the undertaking's development.

Electrical Association for Women.

On May 16th members of the Birmingham and Midlands Branch of the above Association attended a lecture-recital on the "Duo-Art Pianola Piano," at the invitation of Messrs. W. H. Priestley & Sons, Ltd., at Queen's College, Birmingham. The lecture took the form of an explanation of the uses of the "Duo-Art Pianola Piano," and was followed by a recital.

Electrification of Aberdeen Sawmills.

Messrs. W. Fiddes & Son, Ltd., Aberdeen, whose factory is equipped with the latest sawing and box- and barrel-making machinery, have recently adopted individual motor drives for each machine; the round logs are placed on a continuously moving chain, by which they are automatically fed through circular saws which square the logs on four sides. The squared logs then automatically travel forward to re-saws, which cut them rapidly into boarding. The slabs which fall from the round logs are simultaneously carried to edgers, where they are sawn to breadths at a speed of over 200 lineal feet per minute. Thereafter they are rapidly sawn into thin boards by circular saws, some of which run at speeds as high as 2,900 revolutions per minute. Conveyors carry the timber from one stage to another.

Each machine, or bench, is provided with suction tubes which branch off from a large overhead duct, through which all sawdust from the saws is conveyed direct to the furnaces, where, consumed as fuel, it generates steam for driving the electric generating plant, no coal being used. Thus, the factory, which is quite free from dust, is run with the utmost economy, efficiency and cleanliness, with a total absence of sawdust accumulation about the benches, or the floors or pits adjacent to the saws. All the motors are pipe-ventilated, each pipe being connected to either of two main air ducts. The lighting installation consists of some 30 "Geco" dispersive type vitreous enamelled steel reflectors, used in conjunction with 300-watt "White Osram" bowl sprayed gasfilled lamps; uniform illumination of high intensity, free from glare or dazzle, prevails everywhere in the factory. The lighting scheme was designed by the Illuminating Engineering Department of the General Electric Co., Ltd., which, in determining the height spacing ratio, had to take into consideration the necessity of rendering the saws absolutely free from shadow; this was deemed to be of the utmost importance from the point of view of safety.

The Earthing of Portable Domestic Appliances.

We are gratified to see that the article upon this subject by Mr. R. H. Rawll in our issue of February 11th has attracted attention in Belgium. Our Brussels contemporary, *Eclairage et Force Motrice*, published the greater part of the article (in French) in its May issue, but, apparently by an oversight, omitted to mention its source.

Local Societies.

On May 20th members of the Birmingham Electric Club visited the Preston works of the English Electric Co., Ltd., and the Siemens and English Electric Lamp Co., Ltd., at Preston, where they were entertained and welcomed by Mr. W. Marshall and Mr. W. H. Le Marechal, the managers of the two concerns, respectively.

Irish Free State Electricity Supply.

The Free State Government's Electricity Supply Bill last week passed through the Senate of the Free State Parliament, and has now received the Royal Assent. In the closing stages in the Senate, a Government amendment was adopted to relieve the Shannon works from liability for rates. The Minister for Industry and Commerce, Mr. McGilligan, said that the undertaking would be in the position of a municipal undertaking. Senator Kenny protested against the non-inclusion of a fair wages clause.

At a meeting of the Irish Centre of the Institution of Electrical Engineers, the question of rural distribution of electricity under the Shannon scheme was discussed. Mr. C. P. Coote Cummings expressed the view that price was the factor that would determine whether the farmer was to become a customer of the Board. If the scheme did not become a reasonable success it would be a definite set-back to the country. He did not think it would be a great success in a short number of years. It was a great pity that it should be handicapped at the outset by the antagonism of a very large proportion of the electrical industry of the Free State. Dr. Lothman, Free State Government expert, urged the necessity for having the co-operation of electrical engineers in educating the farmer in the uses of electricity. He mentioned the difficulties experienced in this respect with the Canadian farmers, who had now, however, been convinced.

A meeting of the Executive branch of the Surveyors' Institution has completed arrangements for a visit of the Institution to the Shannon works early in June.

Tramways and Light Railways Association.

The annual congress of the Association will be held on June 30th and July 1st, at Bath. The headquarters will be at the Grand Pump Room Hotel. The following papers will be read on Thursday, June 30th: "Some Aspects of Local Passenger Traffic," by Mr. W. E. Hardy, and on Friday, July 1st, "Modern Tramway Equipment," by Mr. A. V. Mason.

Appointments Vacant.

Temporary clerk of works (£5) for the Hazel Grove and Bramhall Urban District Council Electricity Department. Assistant engineer in the Mains Department, for the Portsmouth Corporation. Mains assistant for the Wolverhampton Corporation Electricity Department. Probationary assistant telegraph engineer for the Government of Nigeria. Visiting teacher of carpentry and joinery, and visiting instructors of acetylene welding, electrical installation, engineering workshop practice and engineering economics, for the L.C.C. School of Engineering and Navigation. (See our advertisement pages to-day.)

An Electric Thrashing Demonstration.

A successful demonstration was recently carried out at Messrs. S. & J. M. Podmores's Deeside Farm, Chester, where a 7-acre oatcrop was placed at the joint disposal of the Chester Corporation Electricity Department and Messrs. Ransomes, Sims & Jefferies, Ltd., to demonstrate the utility of modern electric thrashing machinery. With a 25-h.p., 3-phase, 400-V portable Ransomes motor, driving a medium-finishing thrashing machine, fitted with a drum 4 ft. 6 in. wide and 22 in. in diameter, and a Ruston & Hornsby straw-pressing machine driven by belt from the main shaft of the thrashing machine, the crop was thrashed in 8 hours 38 minutes; 199 cwt. of grain and 282 bales of straw, weighing 191 cwt., were produced. The consumption of electricity amounted to 90.6 kWh, or .45 kWh per cwt. of grain, or 12.93 kWh per acre. The charge for electricity for power

Electric Thrashing at Chester.

purposes is 1¾d. per kWh, making the total cost for power 13s. 3d., .79d. per cwt. of grain, or 22.65d. per acre. During the first hour no attempt was made to work the thrashing machine to its full capacity. The machine was fed by several different people who wished to have personal experience of feeding the machine and testing its capacity. A large number of farmers witnessed the demonstration, and without exception the opinion was expressed that electric power offered great advantages over other methods of driving.

A Cheap American Toaster Banned.

The *Electragist* for May contains the following note:—The ordinance against the sale of unapproved electrical appliances in Portland, Oregon, was recently invoked in causing the arrest of the manager of the Woolworth store there who was offering a toaster for 15 cents. Deputy Electrical Inspector Caine was the complainant, and the court imposed a fine of $25 for the offence with an order to cease selling these appliances at once. He further ruled that all who had purchased the contrivances might recover their money upon application at the store, and that the failure of the store managemnt to return it would result in further fines. Caine said that the toaster was the most dangerous life and fire hazard he had ever seen in Portland.

An Electrical Relay.

A new electrical relay, invented by Mr. D. D. Knowles, research engineer of the Westinghouse Electric and Manufacturing Company, is known as the grid-glow relay, and resembles a radio vacuum tube in appearance. When properly connected, a billionth of a watt is sufficient to control the flow of a current which, in opening or closing another relay, can control currents as high as twenty-five amperes. Though exhausted of air, the tube contains neon, argon, or some similar gas which is chemically inert; the parts within are an anode, a cathode and a grid, but there is no filament. When the anode and cathode are connected to the two terminals of a circuit of about 440 volts no current flows, because an electrical charge is built up on the grid which blocks it, so long as the grid is insulated; but if the grid be earthed, the current will flow and operate any device connected in the circuit. In demonstrations to show how jewelry may be protected, a watch was laid on a plush cover under which was a piece of tinfoil connected to the grid of the relay tube; as soon as the hand was brought near the watch (and the tinfoil) the grid being discharged, the 440-volt current flowed through the tube, and operated any device in the circuit.

National Illumination Committee of Great Britain.

We have received a copy of the report for the year 1926, which was presented at the special annual meeting of the Committee on February 1st, 1927. The chairman (Lt.-Col. Kenelm Edgcumbe) states that the Sectional Committee on Illumination, of which members of the above Committee form the nucleus, set up by the British Engineering Standards Association, has made very satisfactory progress, and five specifications dealing with important illumination materials or problems have been issued, or are on the point of completion. The Committee has supported a proposal to standardise miners' lamp bulbs, which has been considered favourably by the British Engineering Standards Association.

The proposed plenary session of the International Commission on Illumination has been postponed provisionally until 1928. In the meantime meetings of the executive and technical committees are being arranged in Rome for September, 1927. The International Commission now includes Belgium, France, Germany, Great Britain, Italy, Japan, Switzerland, and the United States of America.

The progress of the work of the Illumination Section of the British Engineering Standards Association during the past year is summarised by Mr. Percy Good, who states that the Sub-Committee on Illumination Glassware has practically completed its first specification for an illumination fitting of translucent glassware for interior lighting. The Committee has had the benefit of the assistance of five or six of the leading glass-makers during the past six months.

The Sub-Committee on Industrial Reflector Fittings, as was reported last year, completed the Specification No. 232, "Industrial Reflector Fittings for Direct General Lighting, No. 1 (Dispersive Type)." Since the issue of this specification the Committee has agreed to alter the table to show the gauges of metal instead of the thicknesses of steel, and the note to Clause 6 has also been altered to read: "This figure is *based upon* and complies with the recommendation of 20 degs. from the horizontal for light sources at distances of not less than six feet, contained in the second report of the Departmental Committee on Lighting in Factories and Workshops, 1921."

The Sub-Committee on Street Lighting has completed its draft specification, which was presented for discussion at the Institution of Electrical Engineers and the Illuminating Engineering Society in March.

The session at Bellagio, mentioned in our last issue, is solely for the Executive Committee and sub-committees, preparatory to next year's plenary session; it will be under the presidency of Dr. E. P. Hyde, and the arrangements are being made by the Italian National Committee on Illumination.

Tale of a Rat.

The Times reports that a failure of the electricity supply at Brentford on May 18th was found to have been caused by the gnawing by a rat of one of the main cables of supply. The rat was killed. This is the second time in 12 days that the Brentford electricity supply has been cut off in this manner.

Institution Notes.

Institution of Electrical Engineers.

NORTH-WESTERN AND MERSEY AND NORTH WALES (LIVERPOOL) CENTRES.—On May 14th, at Chester, a party of 136 members, ladies, friends and guests spent the morning viewing the works of Brookhirst Switchgear, Ltd., whilst the ladies of the party toured Chester. The luncheon at the Grosvenor Hotel was a happy gathering, and in the afternoon the Chester Corporation's hydro-electric station was visited. There followed a trip up the River Dee in motor launches to Iron Bridge, where tea was served, the party returning through the gardens of Eaton Hall (by permission of the Duke of Westminster) to Eccleston Ferry, and there joining the motor launches for Chester. The meeting was a decided success and was very much appreciated and enjoyed.

WESTERN CENTRE.—The week-end summer meeting of the Western Centre took place from May 20th to 23rd at Plymouth, where the annual meeting was held on the Friday evening. On the Saturday morning a motor coach trip was arranged to Bodmin, where the "beam" radio-telegraph station of the Post Office was inspected; after luncheon the drive was continued, tea being served at Downderry and dinner at Plymouth. On the Sunday morning facilities were provided for viewing the historical parts of Plymouth; during the afternoon there was another drive, and Mr. W. G. Heath (chairman of the Centre) entertained the party to tea at his house on Crown Hill. On the Monday morning the Royal Naval Engineering College Laboratories at Keyham were visited, the meeting terminating at noon.

There was an attendance of 80 members, with their wives and friends. The chairman referred to the fact that since the last meeting was held in Plymouth four years ago the organisation had grown considerably in membership, and was in a flourishing condition. Notwithstanding the scattered area which comprised the Western Centre, the attendance had been well up to the average, and compared most favourably with those of other Centres. It was reported that the total membership amounted to 632, made up of 88 members, 247 associate members, 7 associates, 114 graduates, and 176 students. The ballot for filling vacancies on the Committee resulted in the election of the following:—Messrs. R. D. Archibald (Devonport), A. F. Coates (Bristol), L. A. Hards (Cornwall), J. W. Spark (Bath), and T. J. Plevin (Cardiff).

WIRELESS SECTION.—The following gentlemen have been nominated by the Wireless Section Committee to serve from October 1st, 1927:—*Chairman*: Lieut.-Col. A. G. Lee; *ordinary members*: Mr. J. Hollingworth, Mr. E. B. Moullin, Mr. G. H. Nash, and Mr. C. E. Rickard. The following will continue to serve as members of the Committee: The president, I.E.E., the chairman of the Papers Committee, I.E.E., a nominee of the Council, I.E.E., a nominee of the General Purposes Committee, I.E.E., Major B. Binyon, Mr. P. R. Coursey, Capt. P. P. Eckersley, Dr. R. V. Hansford, Prof. E. Mallett, Mr. S. R. Mullard, Mr. E. H. Shaughnessy, and Mr. G. Shearing, together with one representative each to be nominated by the Admiralty, Air Ministry, General Post Office, and the War Office.

Institute of Transport.

The Council has elected the undernamed to take office on October 1st, 1927:—*President*: Mr. Roger T. Smith, B.Sc., M.I.E.E.; *Hon. Treasurer*: Sir Henry P. Maybury, C.B., K.C.M.G.

American Röntgen Ray Society.

The twenty-eighth annual meeting of the American Röntgen Ray Society will be held in Montreal on September 20th to 23rd, 1927, under the presidency of Dr. A. Howard Pirie, of Montreal. This is the first occasion on which the Society has met outside the United States; and, to acknowledge the honour paid to a British radiologist by his election to the presidency of the Society, a party of radiologists from this country will take part in the proceedings. Dr. G. W. C. Kaye has been invited by the Society to give the Caldwell lecture.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements

Mr. R. E. KIMENS, Commercial Secretary at Warsaw, will be in attendance at the Department of Overseas Trade, 35, Old Queen Street, S.W.1, from June 1st to 4th inclusive. Applications for interviews by representatives of United Kingdom firms interested in Polish trade should be made to the Comptroller-General of the Department.

The Islington Borough Council has confirmed the appointment of Mr. ALEXANDER P. MACALISTER as borough electrical engineer in succession to the late Mr. Albert Gay, at a salary of £1,050, rising to £1,250. Mr. MacAlister was educated privately and at the City of London School, leaving there in 1894 to serve an apprenticeship at the Engineering and Locomotive Works of the London and South-Western Railway Co., at Nine Elms. After passing through all the departments, Mr. MacAlister went, in 1899, to the Croydon Electricity Department as draughtsman, and was in succession charge engineer, mains engineer, and technical assistant in charge of extension work. In 1903 he became mains superintendent to the Battersea Electricity Department, and was later chief assistant engineer, acting as chief engineer pending the appointment of Mr. Bond. He went to Islington in 1907 as chief assistant and deputy electrical engineer, and during his service there has been largely responsible for the extension and other work in connection with the modernising of one of the original London stations.

Messrs. Merz & McLellan announce the introduction of members of their engineering staff into partnership as follows: Mr. H. H. BAKER with Mr. C. H. MERZ and Mr. W. MCLELLAN in the firm of Merz & McLellan; Mr. F. LYDALL with Mr. C. H. MERZ in the firm of Merz & Partners; and Messrs. R. NELSON and A. H. HUMAN with Mr. W. MCLELLAN in the firm of McLellan & Partners.

Mr. BERNARD SLEATH has resigned the position that he has held with Messrs. Chamberlain & Hookham, Ltd., for the past 16 years, and has joined the staff of Venner Time Switches, Ltd., in whose interests he will visit South Wales, the Midlands, the West of England, and other parts.

The *Manchester Guardian* says that Mr. C. W. LOVERIDGE has resigned his post on the engineering staff of the Manchester Ship Canal Company to take up an appointment at the headquarters in London of the Central Electricity Board.

According to the *Review of the River Plate*, Mr. JAMES DALRYMPLE, late general manager of the Glasgow Corporation Tramways, who has been on a special mission with reference to street traffic in Sao Paulo and Rio de Janeiro, was to leave for England on the *Arlanza* on May 15th.

Mr. SINGER, whose new appointment was mentioned here last week, asks us to state that his initials are M. W.

Obituary.—Mr. W. E. Hardy.—The death is reported, following an operation, of Mr. William Eversley Hardy, managing director of the Bath Tramways Co. Mr. Hardy had been with the company for 24 years, having previously served with the City of London Electric Lighting Co., Ltd.

Mr. J. B. Malpass.—We regret to note the following announcement in *The Times* "Deaths" column:—"On May 17th, 1927, in Calcutta, of pneumonia, John Bernard Malpass (late Capt. R.E.T.), of Metropolitan-Vickers, Ltd., only son of Capt. A. Malpass (Indian Army, retd.), in his 43rd year."

Wills.—Sir J. S. Harmood-Banner, Bt., left £449,279 gross and £232,451 net personalty.

Mr. Walter Leaf, chairman of the Central Electric Supply Co., Ltd., and the St. James' and Pall Mall Electric Light Co., Ltd., left £124,186 (net personalty £117,640).

The late Mr. A. R. Hardie, a director of the Eastern Telegraph Co., Ltd., left £13,027 gross, and £12,044 net.

The late Mr. J. C. Phillips, of C. D. Phillips, Ltd., Newport, left £22,793 gross and £22,385 net personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Catton & Coates, Ltd.—Private company. Registered May 16th. Capital, £2,000 in £1 shares. To acquire the business of manufacturers' agents carried on by E. F. Catton and W. Coates at 13, Chapel Road, Southampton, as "Catton and Coates," to manufacture heating and cooking appliances, and to carry on the business of electricians and mechanical and electrical engineers, &c. The permanent directors are:—W. A. Hammock, 135, Above Bar Street, Southampton, insurance manager (chairman); L. Phillips, 49a, London Road, Southampton (director of L. Phillips (Southampton), Ltd.); W. H. Stone, 23, Windsor Terrace, Southampton, hotel proprietor; E. F. Catton, 63, Violet Road, Southampton, manufacturers' agent; W. Coates, 2, Middle Street, Southampton, manufacturers' representative. Remuneration, £100 per annum divided between them. Registered office: 13, Chapel Road, Southampton.

Perring-Thoms Wireless Syndicate, Ltd.—Private company. Registered May 16th. Capital, £525 in 500 ordinary shares of £1 and 500 founders' shares of 1s. Objects:—To acquire the business of a wireless, telephone, and telegraph engineer and manufacturer of wireless apparatus, &c., lately carried on by P. Perring-Thoms at Brighton. The subscribers (each with one ordinary share) are:—G. C. Wilkinson, 148, Hatherley Gardens, East Ham, E.6, registrar; R. Backer, "Ivydene," Holyrood Drive, Westcliff-on-Sea, clerk. Solicitors: Vallance & Co., 8, Union Court, E.C.2.

W. Baron & Co. (London) Ltd.—Private company. Registered May 16th. Capital, £2,000 in £1 shares. Objects:—To carry on the business of manufacturers of articles of all kinds from vulcanised fibre, fibre, ebonite, bakelite and/or other like substances, &c. The first directors are:—S. T. Tracey, 59, Kingsway, Wembley, Middlesex (director of Domestic Supply Co., Ltd.); J. T. J. Hollom, 28, Croftdown Road, N.W.5 (director of Hillier, Hollom & Co., Ltd.). Secretary: F. C. Munt. Solicitor: C. H. Wright, 34, Clement's Lane, E.C.4. Registered office: 1-3, Red Lion Court, E.C.4.

Microfuses, Ltd.—Private company. Registered May 14th. Capital, £100 in £1 shares. Objects:—To execute an assignment by R. H. D. Barklie to the company for the purchase of patent No. 265,263, dated February 7th, 1927, granted to him for improvements in the manufacture of electric fuses, and to carry on the business of mechanical and electrical engineers, manufacturers of, and dealers in wireless and all other electrical apparatus, &c. The directors are:—C. D. Barklie, Penton Lodge, 47, Old Lodge Lane, Purley; R. H. D. Barklie, Penton Lodge, 47, Old Lodge Lane, Purley, research chemist. Qualification, 1 share. Secretary: C. D. Barklie. Solicitors: George L. Barnett and Co., Balfour House, Finsbury Pavement, E.C.2. Registered office: 3, Finsbury Square, E.C.2.

Sydney W. Bussell, Ltd.—Private company. Registered May 17th. Capital, £500 in £1 shares. Objects:—To carry on the business of electrical and general engineers and contractors, manufacturers of, and dealers in machinery, appliances, instruments, apparatus, metals, &c. The first directors are:—S. W. Bussell, 91, Hawthorne Road, Willesden Green, N.W.10, mechanical and electrical engineer; Mrs. H. M. Bussell, 91, Hawthorne Road, Willesden Green, N.W.10. Solicitors: Kennedy, Lindo & Co., 79, Coleman Street, E.C.2.

Radio Service (London), Ltd.—Private company. Registered May 17th. Capital, £1,000 in £1 shares. Objects:—To enter into a contract with Rotax (Motor Accessories) Ltd., for the purchase of the business known as The Radio Service Co., and carried on by it at 105a, Torriano Avenue, Camden Town, N.W., and to carry on the business of hirers, maintainers, and repairers of accumulators and batteries, manufacturers of, and dealers in wireless broadcasting and receiving sets, &c. The first directors are:—G. D. Le Lievre, 8, Beverstone Road, Brixton Hill, S.W.; F. W. Larner, 48, High Street, Camden Town, N.W.1; E. A. Minter, 68, Park Street, Camden Town, N.W.1. Secretary: R. B. Marler. Registered office: 105a, Torriano Avenue, Camden Town, N.W.

Leeds Sunlight and Electrical Clinic, Ltd.—Private company. Registered May 16th. Capital, £500 in £1 shares. Objects:—To carry on the business of medical and general electricians, masseurs, radiologists, &c. The first directors are:—Mrs. I. Collins, 39, The Drive, Adel, Leeds; Mrs. E. G. Blackburn, 106, Westfield Road, Leeds. Qualification, £100.

C. D. Bond & Son, Ltd.—Private company. Registered May 19th. Capital, £2,000 in £1 shares. Objects: To acquire the business of manufacturing and general engineers carried on by C. D. Bond and V. C. Bond, at 43, Johnson Street, Westminster, as "C. D. Bond & Sons," and to carry on the business of electrical, mechanical, motor, telephone, and general engineers, manufacturers of and dealers in electrical goods and accessories, &c. The permanent directors are: C. D. Bond, Runnymede, Charlton Road, Shepperton-on-Thames, engineer (director of Marpole & Bond, Ltd.); V. C. Bond, Runnymede, Charlton Road, Shepperton-on-Thames, engineer. Qualification, £50 shares. Registered office: 43, Johnson Street, Westminster, S.W.

Official Returns of Electrical Companies.

Rapinet, Ltd.—S. Sharpe, of Balfour House, Finsbury Pavement, E.C., ceased to act as receiver or manager on May 10th, 1927.

Brighton Lighting and Electrical Engineering Co., Ltd.—Particulars filed of £2,000 debentures authorised April 23rd, 1927, charged on the company's property, present and future, including uncalled capital (subject to mortgage on 10a to 10c, St. Martin's Place, Brighton, securing £1,000), the amount of the present issue being £1,250.

International Electrolytic Plant Co., Ltd.—Debenture dated April 22nd, 1927, to secure £550, charged on the company's undertaking and property, including uncalled capital. Holder: H. Rowlands, Bremesgrave Chase, Barnt Green, Worcs.

Chislehurst Electric Supply Co., Ltd.—Satisfaction in full on April 12th, 1927, of debentures dated February 23rd, 1900, and July 2nd, 1906, securing £10,000.

Lithanode Co., Ltd.—Particulars filed of £5,000 debentures authorised January 27th, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £2,900.

Nefa Co., Ltd.—Capital, £1,000 in £1 shares. Return dated January 14th, 1927. 999 shares taken up. £999 paid. Mortgages and charges, £500.

Aberayron and District Electricity Supply and Power Co., Ltd.—Capital, £3,000 in £1 shares. Return dated November 16th, 1926 (filed March 29th, 1927). All shares taken up. £2,998 considered as paid. £2 calls unpaid. Mortgages and charges, £1,400.

Stella Conduit Co., Ltd.—Capital, £20,000 in £1 shares. Return dated January 14th, 1927. All shares taken up. £20,000 considered as paid. Mortgages and charges, nil.

High Salvington Electric Supply Co., Ltd.—Capital, £1,300 in £1 shares. Return dated January 5th, 1927. 1,122 shares taken up. £722 paid. £400 considered as paid. Mortgages and charges, nil.

Interchangeable Electric Signs, Ltd.—C. H. Seaton, of 62, Brook Street, W., was appointed receiver on May 5th, 1927, under powers contained in first debenture, dated February 26th, 1926.

Gwynedd Trust, Ltd.—Capital, £10,000 in 9,500 7 per cent. cum. preference shares of £1 each and 10,000 ordinary shares of 1s. each. Return dated March 14th, 1927. 2,002 preference and 10,000 ordinary shares taken up. £2,502 paid. Mortgages and charges, nil.

International Hydro-Electric Development Syndicate, Ltd.—Capital, £10,000 in £1 shares. Return dated January 14th, 1927. 2,254 shares taken up. £2,254 paid. Mortgages and charges, nil.

Mackallen Heating Co., Ltd.—Capital, £99 in £1 shares. Return dated January 6th, 1927. All shares taken up. £99 paid. Mortgages and charges, nil.

Attaix, Ltd.—Mortgage dated May 5th, 1927, to secure £1,000, charged on 106, High Street, Southampton. Holder: S. Rogers, 4, Rotunda Terrace, Cheltenham.

Callington & District Electric Supply Co., Ltd.—Issue on April 27th, 1927, of £250 debentures, part of a series already registered.

City Notes.

Siemens Brothers & Co., Ltd.

The annual meeting was held on Tuesday last, Mr. G. Mure Ritchie presiding. In moving the adoption of the report (ELECTRICAL REVIEW, May 20th, p. 810), the chairman, after referring in detail to the balance sheet which, he said, showed that from the point of view of capital resources the company was in a stronger financial position than at any time since the shareholders acquired the undertaking nine years ago, remarked that at the beginning of 1926 he was hopeful that the year's profits would have exceeded £400,000. The lamentable coal strike dissipated that prospect, but, nevertheless, the net profit amounted to £358,990, an increase of £2,109 over 1925, which could be regarded as satisfactory. During 1926 there was some slackening in orders for public telephones. They completed the conversion of four exchanges in the Edinburgh area to automatic working, 12,000 lines being cut over successfully in October last, while in March this year the whole of the Sheffield area was converted and brought into service, having nine automatic exchanges with approximately 15,000 subscribers connected. These two systems now represented the two largest automatic areas in Britain, while the Sheffield transfer represented the largest number of exchanges ever simultaneously transferred to automatic working. Among overseas telephone contracts might be mentioned a telephone installation in the City Hall, Cape Town, public exchanges for Salisbury (Rhodesia), Vina del Mar (Chile), Nutana (Canada), as well as six exchanges in the Brisbane (Australia) area, the last totalling upwards of 12,000 lines. They had specialised, among other things, in the manufacture of the loaded type of submarine telephone cable for long-distance transmission. In addition to the supply and laying of another such cable between England and Belgium, which had provided greatly improved telephone facilities for the Continent, they also supplied a similar cable to British Columbia, connecting the mainland to Vancouver Island. There were good reasons for expecting business in this highly specialised type of cable to continue, as there were many parts of the world which, sooner or later, would want telephonic connection by means of submarine cables. Their plant for submarine telegraph cable was well occupied throughout 1926. In addition to the manufacture and laying of a submarine cable for connecting Bilboa, near Panama, and Santa Elena, Ecuador, they made a high-speed loaded cable of 2,143 nautical miles for the Pacific Cable Board, to connect Fanning Island and Fiji. In underground light and power cable their plant was again fairly well occupied, although many schemes requiring this class of cable were awaiting the passing of the Electricity Bill. Now that this measure had become law, power transmission schemes were being pushed, and at the present time their plant was well occupied with orders. During 1926 arrangements were completed for manufacturing a new type of e.h.p. cable (the "H" type), which it was believed would overcome many of the difficulties which had been experienced, and they had just been successful in securing a very important contract for supplying and laying a cable of this type for connecting the new station at Portishead to Bristol. That contract was of considerable interest, inasmuch as it was probably the first of such magnitude that has been placed in this country for "H" type cable. They had also secured the first important contracts to be placed for this type of cable in Australia, New Zealand, and Greece. The Australian contract was of considerable interest as it consisted of the supply and laying of a number of 33,000-V jointless submarine power cables across Sydney Harbour. Mining and marine apparatus showed an increased turnover. Progress on the technical side was being maintained. Excellent reports had reached them in regard to their direction-finding apparatus. He would also call attention to their short-wave apparatus, and in particular to the installation on the Cunard liner *Carinthia*, the first to be employed in the British Mercantile Marine, proving most satisfactory. Their overseas business had shown a notable expansion, mainly due to their having secured the orders previously mentioned for telephone exchanges. Business in South Africa carried out by their branch had shown steady progress, and they had recently registered a local company under the title of Siemens Bros. and Co. (British), Ltd. Regarding their prospects for the current year, he said that although the orders so far received in 1927 were in excess of those received in 1926, it would be too optimistic to assume under current conditions that the volume of orders for the remainder of the year would be sufficient to absorb their manufacturing resources. Competition was getting keener, and the margin of profit was consequently reduced. However, their products were chiefly required in connection with utility services, and there was every reason to expect that in course of time the demand for those services would again increase. The report and accounts were adopted.

Brush Electrical Engineering Co., Ltd.

The annual meeting was held on May 23rd. Mr. E. Garcke (chairman), who presided, in proposing the adoption of the report (*vide* our last issue, p. 810) said that the past year had not been very notable from the general point of view; the business done had been of a normal character, and the progress was satisfactory, having regard to all the circumstances. The company, among others, was prejudicially affected by industrial events, and but for those events the profits would have been larger. It was very satisfactory, however, that the net result was approximately the same as for 1925. The gross profit was about £10,000 less, but the total expenses were nearly £9,000 less; the net result was about £700 better than in the preceding year. The company's liquid resources were now over £300,000, compared with the share and debenture capital of about £750,000. Although the accounts showed considerable financial strength, it was not the best economic position to have over £300,000 of liquid resources earning only about 5 per cent. It was prudent, however, to keep those resources liquid, because they hoped for improvement in engineering prosperity, and then the spare cash resources would be available, and needed, for carrying a much larger volume of business than at present. All the main departments were kept well occupied throughout the year. Important contracts were carried out for turbo-generators and transformers for both home and abroad. Their Brush-Ljungström turbine plant continued to hold its own in competition with other turbines. Recently they booked an order for Hull for two 12,500-kW turbo sets immediately upon the completion of a previous contract for two 7,000-kW sets for the same authority. The rolling stock department was taxed to the fullest capacity on tramcars and omnibuses. A marked improvement had taken place in the view held by municipalities and companies owning tramway undertakings with regard to the renewal of rolling stock, and substantial contracts had been carried out for corporations, among others Birmingham, Leeds, Bournemouth, Cardiff, West Ham, and East Ham. Their present order list compared favourably with that for the same period last year. Extensions to the buildings and machine tools were in hand, to enable them to deal with larger units and with increased demand. The intense competition, to which previous reference had been made, did not show any sign of slackening. That applied particularly to overseas contracts. The company had no intention whatever of joining in suicidal competition to the extent of carrying out orders without a moderate profit or, as some firms were doing, at a ruinous loss. Mr. Garcke then went into some details regarding the co-partnership scheme which was dealt with in the report, and said that it was a question for the shareholders to decide how the increase in the undivided profits account derived from the allocation of surplus profits should be dealt with. The directors intended to take the matter into careful consideration and submit a recommendation at the next meeting. In respect of the surplus for 1925, the employés unanimously agreed to receive their bonus in ordinary shares. A certain number of those shares were sold on the market by the recipients, but the proportion of the shares sold was, he considered, less than was to be expected in the circumstances. So far as their short experience extended, the co-partnership scheme had had a beneficial effect. The report and accounts were adopted.

Anglo-Portuguese Telephone Co., Ltd.

The *Financial Times* states that with the change in the chairmanship of this company—Viscount St. Davids retiring and Sir Alexander Roger taking his place—there has been a change in the control of the company. Our contemporary says:—"In this deal it is understood that Sir Alexander Roger brought together trust companies and individuals specialising in telephones to purchase the undertaking from the existing interests—mainly companies in which Viscount St. Davids is interested. While the price paid for shares is not known, it is believed to be substantially over par. Debenture stock has also been secured. This deal is an answer in part to the well-known attempt by important American interests to obtain control of international telephone communications."

Our contemporary quotes an "authority" very closely in touch with international telephone matters, to the effect that the deal will keep control out of the hands of important American interests which are endeavouring to secure a hold on all telephone companies, and will be of great advantage to Britain. "With control in British hands, all orders for

new plant will come to this country." Extensions to the Anglo-Portuguese system anticipated during the next ten years are expected to represent an expenditure of £1,500,000 to £2,000,000. "The acquiring group has all the necessary expert and financial resources to enable the company to function to its utmost capacity."

Pernambuco Tramways and Power Co., Ltd.

The annual meeting was held on May 17th. Mr. W. Higgins, O.B.E. (chairman), who presided, said that the expansion of business and the improvement in the exchange had produced satisfactory results. The number of electricity consumers had increased, and the new 6,000-kW set was put into operation on April 24th last. After reviewing the accounts and mentioning that £8,000 had been placed to reserve, the chairman spoke of the decree for the stabilisation of the exchange at 6d. That, he said, militated against the chances of the improvement which was expected from the rising exchange, and the receipts for the current year showed a decrease. The Brazilian Government should realise that foreign capital could not be remunerated with such a low rate as the current one. The tramway fares remained the same whether the exchange was 6d. or 1s. When the original concession was obtained, the exchange was 15d. or 16d. The company would also be adversely affected by the withdrawal of the abatement of duties on material imported by the company; it would probably mean an additional annual outlay of £10,000. There was no question of protecting home industries, and he hoped that the Government would see its way to modify its action. In conclusion, Mr. Higgins said that the company was considering the running of an experimental omnibus service.

New Issues.

Thomas Bolton & Sons, Ltd.—On Monday last this company offered for subscription £300,000 of 6 per cent. first mortgage debentures of £100 each at £98 per cent. The debentures are repayable at £102 per cent. on April 1st, 1947, or at £104 on six months' notice, after 1932, at the company's option. The liquid assets of the company are said to exceed by over £500,000 the amount of the issue. The bulk of the proceeds (£216,360) will be used to redeem the existing debentures of the company and the balance for working capital. The issue was over-subscribed and the lists were closed on Monday.

Metropolitan District Railway Co.—The *Financial Times* reports that arrangements are understood to have been completed for the issue of £500,000 5 per cent. debenture stock, redeemable in 1943, or earlier at the option of the company. It is stated that the stock has been sold to a financial group at 95 per cent., free of stamp duty.

Madras Electric Supply Corporation, Ltd.

After providing for debenture service the net profit for 1926 is £58,061, and to it is added £5,550 brought forward, making £63,611. It is proposed to pay a final dividend of 5½ per cent., free of tax, on the ordinary shares, making 8 per cent. tax-free for the year (as for 1925); to transfer £5,124 to general reserve; to devote £2,736 to additional remuneration to directors; and to carry forward £5,907. In November last the capital was increased to £800,000, and an issue of 110,000 ordinary shares was made to existing shareholders at the price of 25s. 6d. each; the premium after deducting expenses has been credited to the general reserve. The new shares rank for dividend from July 1st last. The tramways show an available balance of £13,166, as against £21,515. The dividend on the 6 per cent. preference shares has been paid and £7,166 carried forward. Meeting: May 30th.

Shanghai Electric Construction Co., Ltd.

The net profit for 1926 was £122,410, as compared with £72,159 for 1925. Adding the balance brought forward, the amount available is £127,570. Of this £40,000 has been allocated to renewals, £5,000 for taxation, and £1,831 to staff provident fund. In view of the unsettled conditions in Shanghai the directors propose to restrict the final ordinary dividend to 6 per cent., making 10 per cent., as in 1925; £30,739 is carried forward. It is the directors' intention, when conditions are more favourable, to pay off bankers' advances and make an issue of capital. The first year of operation of the Singapore Traction Co., Ltd., resulted in the company receiving £10,000 in respect of its half share of profits. The Singapore company's revenue from lighting came to an end upon the opening of the municipal station in October last. Meeting: June 1st.

British Electric Traction Co., Ltd.

As we briefly reported in our last issue, a proposal for the issue of a bonus of 10 per cent. to ordinary stockholders, in the form of deferred ordinary stock, was approved at an extraordinary meeting last week. Mr. J. S. Austen (chairman), introducing the resolutions, said that under the proposed arrangements the preference stock would receive a cumulative dividend of 6 per cent.; then the ordinary stock, which would be known as 8 per cent. non-cumulative preferred ordinary stock, would receive 8 per cent.; then the preference stock would participate with the new deferred stock until the former had received 8 per cent., the deferred stock at the same time receiving what would otherwise have gone to the existing ordinary stock, being also entitled to all the remaining profits. That method was adopted on account of an agreement which precluded the issue of ordinary stock as a bonus. The amount of 10 per cent. was fixed as a basis on which they could reasonably expect to make a satisfactory distribution. Referring to the results of the past year, Mr. Austen said that they were practically the same as those of the previous year, and were much better than had been anticipated. In conclusion he asked the ordinary stockholders to regard the new stock as a means by which they would recover not only all the capital which had previously been lost, but something more.

Cawnpore Electric Supply Corporation, Ltd.

The surplus on the past year's working was £61,761, and after deducting debenture interest and adding £3,700 brought forward there is an available amount of £52,721. From this £10,000 is transferred to depreciation and renewals reserve, £2,000 to general reserve, and £6,778 to sinking fund; £3,671 is written off share and debenture issue expenses, and after paying the preference dividend and a final dividend of 7 per cent. (making 10 per cent.) on the ordinary shares, £2,512 is carried forward. The report was accompanied by a striking view of the company's Riverside station, Cawnpore. Meeting: May 30th.

Yorkshire (Woollen District) Electric Tramways Co., Ltd.

The report for 1926 states that the receipts were £193,972, and after meeting all expenses, including £27,900 for renewal fund, there remains £21,083, to which is added £29,271 brought forward, making £50,354. It is proposed to pay a dividend of 6 per cent. on the ordinary shares for the year and to transfer £10,000 to reserve, leaving £27,154. The directors aim at maintaining the 6 per cent. dividend, and accordingly propose to pay a further 3 per cent. on the ordinary shares (as last year), making up the full dividend for 1921 when no distribution was made. This reduces the balance to be carried forward to £21,874.

English Electric Co. of Canada, Ltd.

The report presented at the annual meeting at Montreal on May 9th, showed that the company had materially improved its position, profits being much in excess of those of any previous year. The company benefited particularly from the expansion which took place in the pulp and paper industry, as well as from activity in the mining industry, and the extensive water power development. Profits for the year were $203,156, as against $74,003 in 1925, and $94,092 in 1924. After paying 3½ per cent. on the cumulative preference stock amounting to $70,000, as compared with $50,000, the balance carried forward to profit and loss was $384,311, as against $293,848 a year ago.

Stock Exchange Notices.

The undermentioned have been ordered to be officially quoted:—

Atlas Light and Power.—£889,757 5 per cent. debenture stock.

Consolidated Gas, Electric Light and Power of Baltimore.—82,794 common shares of no nominal or par value.

Application has been made to the Committee to allow the following to be officially quoted:—

City of London Electric Lighting.—400,000 ordinary shares of £1 each, fully paid, Nos. 1,500,001 to 1,900,000.

Chloride Electrical Storage Co., Ltd.

The profit for the past year was £158,666, as compared with £157,395 in the preceding year. A final dividend of 5 per cent., free of tax, making 10 per cent., free of tax, for the year, has been declared on the ordinary shares, together with a bonus of 2s. per share, also tax free. A similar distribution was made in respect of 1925. £50,000 is transferred to general reserve (making £225,000); £25,000 is put to depreciation reserve; £10,000 to employés' benefit fund; and £47,352 is carried forward.

Weston-super-Mare and District Electric Supply Co., Ltd.

The net revenue for 1926 was £34,448, as compared with £34,881 for 1925. After meeting all expenses, including £14,000 for renewals, there is a surplus of £10,721 (against £12,247). To this is added £6,204 brought forward, making £16,925. It is proposed to transfer £4,000 to reserve and to pay a dividend of 10 per cent. on the ordinary shares, leaving £4,525 to be carried forward.

Iron Trades Employers' Insurance Association, Ltd.

The report for 1926 shows a premium income of £508,962 and total receipts of £627,577. From the surplus of £160,918 the directors propose to return 10 per cent. on the Workmen's Compensation premium paid for 1926, together with a bonus of 15 per cent., for which income tax has already been paid.

Merthyr Electric Traction and Lighting Co., Ltd.

The net revenue for the past year fell from £27,337 to £24,072, and the net surplus from £7,230 to £4,648. It is proposed to pay the 5 per cent. preference dividend and carry forward a balance of £3,148. The adverse results are attributed to last year's industrial troubles. Meeting: May 30th.

British Thomson-Houston Co., Ltd.

The annual meeting was held on May 24th, Mr. H. C. Levis presiding. In moving the adoption of the report (Elec. Rev., May 20th, p. 809), the chairman, after referring with regret to the deaths of Messrs. C. A. Coffin and A. W. Burchard, directors, said that Mr. C. H. Minor had been appointed a member of the board since the last meeting. During the year under review the company again had to face keen competition. In addition, the general industrial conditions arising from the prolonged coal dispute affected them seriously, and resulted in a smaller input to their factories of orders which could be completed during the year; that in turn meant a smaller amount invoiced to customers, with the result that the profits for the year were decreased, and they were unable to recommend the payment of a dividend on the ordinary shares. Now that the effects of the coal strike were beginning to disappear and the uncertainty regarding the Electricity Bill had been removed, the position with respect to new orders had improved, and they had on hand to-day a considerably larger volume of orders than they had at any time during the past year. The outlook for the present year was favourable provided they did not again suffer from disturbed industrial conditions. The orders, beside those for use at home, included many important ones from every part of the Empire, from Japan and China, practically all of the countries of South America, Mexico, Cuba, Egypt, and Siam. Some of those orders, on account of their size or of the special engineering features involved, were unique in the history of British electrical engineering. Mr. W. C. Lusk, the managing director, seconded the motion, and the report was adopted.

West Gloucestershire Power Co., Ltd.

Presiding at the recent annual meeting, the chairman (Mr. J. Davidson) said that, in spite of the mining dispute, the sale of energy and the revenue had increased. During the year special campaigns had been carried out by the company and schemes for the assisted wiring of small premises and the hire of appliances had been instituted. The prospects were favourable; the receipts during the first three months of this year had shown a satisfactory increase as compared with the first quarter of 1926.

Lewes and District Electric Supply Co., Ltd.

The net receipts for last year rose from £9,545 to £10,683, and the net surplus from £3,550 to £3,868. It is proposed to repeat the dividend of 10 per cent. on the ordinary shares, to place £2,000 to reserve (against £1,000), and to carry forward £3,667.

Auckland Electricity Loan.

The Auckland (N.Z.) Electric Power Board has decided to borrow £150,000 in Australia for electrical development. The net interest is £5 10s. per cent., while the best London offer was £5 12s. 6d. per cent.

Veritys, Ltd.

The directors state that they hope to put forward this year proposals for dealing with the arrears of dividend on the cumulative preference and preferred ordinary shares.

Doulton & Co., Ltd.

A dividend of 6 per cent. has been declared on the ordinary shares (against 7½ per cent.).

Swiss Companies.

The *Société d'Exploitation des Câbles Electriques (Berthoud, Borel & Co.)*, Cortaillod, reports a net profit of £52,132 for the past financial year, as compared with £40,964 in 1925. The position of the company is unique in that the balance sheet shows no liability for capital, this having been entirely returned to the shareholders in 1920, to whom were then issued 5,000 participating certificates. After making provision for depreciation, &c., a sum of £36,000 is being distributed to the certificate holders at the rate of £7 5s. per certificate, as against £6 8s. in 1925.

The *Société Franco-Suisse pour l'Industrie Electrique*, Geneva, reports a net profit of 1,092,917 fr. for the past year, as compared with a loss of 3,920,410 fr. in 1925. A dividend of 4½ per cent. is being paid on the preference shares.

Austrian Company.

The *Felten and Guilleaume Company*, of Vienna, whose relations with the German parent company in recent years have become closer, reports net profits of 1,360,000 schillings, as compared with 890,000 schillings in 1925, and a dividend of 9 per cent., as against 6¾ per cent. in the previous year, has been declared. The production of long-distance cables, which was taken up as a new branch, afforded activity for the Vienna works during the whole of the year, while an improvement at the Styrian wire works only took place after the increase in the import duties. The export trade was difficult and was not profitable.

Swedish Company.

The *Nya Luth & Rosens Elektriska A.B.*, which acquired most of the assets of the former concern of the same title last July, states that it was not possible to work at full capacity. The turnover was considered satisfactory, however, although the sale prices were on a very low level.

German Company.

Voigt and Haeffner, Frankfort-on-Main, report that in general the electrical industry was not employed in proportion to its capacity so that extremely keen competition took place. The net profits declined from 664,000 marks to 521,000 marks, and the dividend is reduced from 8 per cent. to 6 per cent. An improvement is reported to have taken place in the current year.

French Company.

The *Compagnie Radio-France* proposes to pay a dividend of 46.80 fr. per share for 1926, as compared with 30 fr. for 1925.

Stocks and Shares.

Monday Evening.

Most people who are interested in stocks and shares have felt a tinge of disappointment at the Bank Rate being retained at 4½ per cent. instead of its falling to 4 per cent., as it was expected to do last week. Gold has been going out of the country so freely as to quench the hopes of any early drop to the level 4 per cent. in the rate, though as the money position changes with kaleidoscopic rapidity, there are still optimists who look for an early cut to the level 4 per cent. The disappointment has had a somewhat depressing effect upon prices of stocks and shares all round, in addition to those which are immediately affected through their close association with the money market.

New issues have gone back a little, and a good many others which were projected are postponed for the time being. This postponement is by no means a bad thing, because the new issues had been rushed out so precipitately as to arouse talk of possible indigestion in the stock markets. A pause to the flood of new borrowing will give time for the recent comers to settle into more permanent hands than those of the underwriters and stags, who, it may be, still hold a good part of certain offerings made lately.

The County of London Electric debenture, the price of which touched 1¾ premium, remains at 1¼ premium quoted a week ago. The Electrical Finance and Securities 5½ per cent. debenture stock, offered at 92½ is about ¼ premium, and the 7 per cent. cumulative preferences, which changed hands at a very small discount, strengthened to their par price, and attracted buyers. B.A. Lacroze 6½ per cent. debenture stock can be obtained at the issue price of 96½ or a little cheaper, free of stamp and fee, the yield being 5¾ per cent. outright, and 4s. per cent. more, allowing for redemption. The first interest payment is a partial one, due in November.

Another new issue of interesting character is the Metropolitan District Railway 5 per cent. debenture stock, redeemable 1933-1943, which has just come into the market for sale at 95 ex dividend. Interest payments are due in December and June. The yield, at the present price, is £5 5s. 3d. per cent. Taking redemption into account at the longer of the two dates, the return is raised to 5½ per cent. on the money. Not many years ago District debenture was a security tinged with speculative flavour, but in view of the remarkable manner in which the company has gone ahead, the new stock can be characterised as a first-rate investment, carrying in it the probability of a quiet rise to the neighbourhood of three figures as the stock becomes settled down into investment hands and as money grows cheaper.

There is very little prior-charge Tube Railways' stock offering at present, apart from a small amount of District 6 per cent. debenture obtainable at 114¼, January and July dividends, paying £5 6s. per cent. on the money, and about £2,000 of the same company's 4 per cent. Power House Rent Charge at 77, yielding £5 5s. 6d., also with interest due in January and July. Metropolitan Railway 3½ per cent. debenture, a full trustee stock, can be bought at 70¼, though the yield in this case is barely 5 per cent. on the money, and an oddment of the railway's 5 per cent. preference might be bought at 91¼, February and August dividends, at which price the return would be 5½ per cent. The debenture stocks of the steam railways pay between 5 and 5¼ per cent., the higher yield being offered by the London & North-Eastern Railway issues.

Metropolitans have dropped to 62½, and Districts, at the same price, are half a point down, the decline in the latter being due to the appearance of the new debenture stock. Underground Electrics are steady. British Electric Traction

ordinary has shed a couple of points, the 6 per cent. preference stock, however, being the fraction up at 120½. London United Tramway debenture advanced to 52½. The British Electric Traction Company has declared its usual dividend of 5 per cent., making 8 per cent. for the year, and the preference, as already announced, will receive an extra 2 per cent., also making 8 per cent. for 1926. The bonus of 10 per cent. on the ordinary stock is to be satisfied by the distribution of a new deferred ordinary stock to be created, and at the same time, steps are being taken to convert the ordinary stock into preferred.

The cable market is good, and fresh rises have been secured by the Eastern group. Eastern Telegraph is up 1½, Eastern Extensions 10s., and Westerns 2s. 6d. The Eastern Extension report shows a profit for last year of £1,116,000, an increase of £110,000 over the previous twelve months. The Eastern company made a profit of £1,098,000, a reduction of £330,000 on the year. This result is attributed to an increase in the expenses. The dividends on both companies continue at 10 per cent. free of tax for the year, and the financial position of the undertakings remains exceedingly strong. The Eastern Telegraph has reserves amounting to £3,230,000. Its issued capital is £7,000,000 in ordinary and £2,000,000 in debentures. The Eastern Extension's capital is 4¾ millions, and the company has nearly £4,000,000 in reserves.

The feature in the telegraph and telephone group is the manner in which South American telephone shares have gone ahead. For weeks past there have been steady rises in United River Plates, and a fresh gain of 2s. 6d. has lifted the price to 9⅜ Chili Telephones are 10s. up at 7⅞, and Orientals retain their rise of last week at 53s. 6d. With each week's rise in prices, curiosity becomes more piqued as to the reason which lies at the back of the buying that has brought about these substantial gains, and gossip grows stronger as to the possibility of the companies being taken over by some other group whose presumed purchases for control have brought about the handsome price appreciation.

Great Northern Telegraphs are easier at 28¼. Anglo-Portuguese Telephones are 1, showing a trifling decline.

Mexican utility issues are reactionary after their recent remarkable rises. Mexican Light & Power preferred, which went up to 115 a fortnight ago, have gone back to 110, and the common stock is a little easier at 44. On the other hand, Mexico Tramway bonds continue their rise at 81½. The reaction in Mexican Light preferred follows the ordinary course: the satisfactory news which had been expected in regard to a reorganisation of the capital having been published, people who had bought the stock on the anticipation of this announcement are content to take the excellent profits that they can secure by selling. Brazilian Tractions after a somewhat abrupt dip, shot up to 146½, which left the prices better on the week, but Barcelona Tractions, Sidros and others in this class, are disposed to droop by reason of the superior attractions offered by American Celanese and certain other shares which have recently sprung into popularity.

Changes in the prices of electricity supply shares are few and far between. The disappointment felt at the retention of the Bank Rate at 4½ per cent., when 4 per cent. had been commonly expected, became reflected in a slight dulness which crept into investment securities. This affected a wide area of stocks and shares, and it was accompanied by the talk of financial accommodation becoming contracted as the end of the first half of the year gets nearer. Bournemouth and Poole are weaker at 55s. 6d. Newcastle-on-Tyne ordinary eased off to 23s. There are no changes at all in the ordinary shares of the London electricity companies, but Charing Cross preference at 17s. 6d. have gained the pennies. Urban 5½ per cent. debenture came into demand at 99½.

Telephone Manufacturing shares have been sold with persistence, and the price dropped to 6s. International Automatics are better at 38s. 9d., while Automatic Telephones have not changed from 45s. Marconi shares touched 20s., then went back to the previous price of 18s. 9d., but the market is a good one and it is considered, in serious quarters, that the price is likely to harden. The argument rests upon the impression that, free from internal troubles and with a reorganised capital account, the Marconi Company is at last in a position to take advantage of the opportunities and the experience that lie at the command of the undertaking. But the day-to-day speculator knows that disappointment dogs the heels of the gambler in Marconi shares. Marconi Marines are higher at 27s. The rise of 1¼ per cent., to 8¾ per cent., in the dividend has encouraged anticipations of 10 per cent. for the current year. Canadians keep closely to 4s.

Manufacturing shares are disposed to be dull for choice. Cromptons make an outstanding exception with a half-crown gain at 12s. 6d. Henley's, Callender's and British Insulated have surrendered a little of their recent advances. The reason is to be found in the report of the British Thomson-Houston Company, showing a reduction of £111,600 in the profit, to £355,400, as compared with £467,000 in 1925. The ordinary share capital, of two million pounds sterling, then received 6 per cent., but is to go dividendless for 1926. General industrial conditions and the strike are blamed for the contraction in the company's earnings The preference shares stand at 22s. 6d., the 4½ per cent. debenture at 88, and the 7 per cent. debenture, redeemable, at 103½. Ever-Ready shares have gone back to 83s. 9d. The engineering list is listless and somewhat heavy, Babcock receding to 53s. 9d. The rubber market presents no points of fresh interest.

French Foreign Electrical Trade.

Distribution of Imports and Exports.

THE French Government has now published a detailed statement of the foreign trade of France, by countries, for 1925. From this the following figures relating to imports and exports of electrical and allied material have been extracted. Comparative figures for 1924 are given and a note is added of increases or decreases. The metric quintal = 220 lb.

Exports.

Electric Ploughing in France.

A party of members of the Société Française des Electriciens recently visited Puiseux (Seine et Oise) to inspect a new system of electric ploughing which has recently been introduced there by the Société des Travaux Electriques. The electric power available is 15,000-V, three-phase, which, by means of a country-type transformer station, is stepped down to 500 V. A flexible cable conducts the power at this pressure to a winch operated through reduction gearing by a 60-h.p. three-phase motor. The winch cable lies on the ground and passes round four pulleys fixed at the corners of the field to be ploughed, so that the plough connected with the cable can reach any part of the field. The Travaux Co. states that the consumption of energy is about 100 kWh per hectare of ploughed land.

The Electrical Imports of Egypt.

THE following statement, showing the imports of electrical and similar goods into Egypt during the year 1926 is taken from the recently-issued trade statistics. The figures for 1925 are added for purposes of comparison, and notes of any increases or decreases are given :—

Electricity Supply in Great Britain.

Fuel Consumption Returns for 1925-26.

THE summarised monthly returns made to the Electricity Commissioners were published last week (H.M. Stationery Office, price 1s. 6d. net), and on this occasion the Return contains a complete alphabetical list of all the generating stations from which records were received, and in most cases a summary of the technical results of working, though in some instances the latter are not available for publication. The returns relate to 584 stations.

The lowest fuel consumption recorded was at Barton (Manchester Corporation), namely, 1.36 lb.; the output was 269,036,130 kWh generated, thermal efficiency 21.51 per cent., maximum load 74,790 kW, and load factor 41.0 per cent.

North Tees station (North-East Coast companies) came next with 1.51 lb., the output being 167,194,850 kWh, with a maximum load of 40,500 kW, and a load factor of 47.1 per cent. The thermal efficiency was 18.75 per cent. Carville produced 250 million kWh for 1.69 lb. per unit, at an efficiency of 18.95 per cent., the maximum load being 54,000 kW and the load factor 52.9 per cent.

The Radcliffe station of the Lancashire Electric Power Co. generated 131,315,948 kWh for 1.67 lb. per unit, with an efficiency of 17.45 per cent. and a load factor of 31.8 per cent. Other stations which used less than 2 lb. per kWh were Grove Road (Central Electric Supply, Ltd.) 1.81, Mersey Power Co. 1.81, Dalmarnock (Glasgow Corporation) 1.85, Valley Road (Bradford Corporation) 1.85, Whitebirk (Blackburn Corporation) 1.91, Bow (Charing Cross Co.) 1.91, Thornhill (Yorkshire Electric Power Co.) 1.91, Dunston (North-East Coast) 1.92, Clyde's Mill (Clyde Valley Electrical Power Co.) 1.96, Prince Rock (Plymouth Corporation) 1.96, and Prince of Wales (Rotherham Corporation) 1.98 lb. per kWh.

The average consumption of five stations in Class A (over 200 million kWh per annum) producing 1,241 million kWh, was 1.89 lb. coal per kWh. Nine stations in Class B (from 100 to 200 million kWh) produced 1,355 million units, with an average consumption of 2.11 lb., and 32 stations in Class C (50 to 100 millions) produced 2,237 million kWh, with a consumption of 2.21 lb. These 46 stations therefore generated 4,833 million kWh, at an average consumption of 2.1 lb. per kWh; the aggregate output of all the steam stations was 7,804 million kWh, with an average consumption of 2.4 lb.

Of the oil-driven stations, the lowest consumption was recorded by the Bognor Gas Light and Coke Co., and Felixstowe (East Anglian Electric Supply Co.), 0.64 lb. per kWh. Both stations had, roughly, 600,000 kWh output, a thermal efficiency of 27½, and load factors of 17 to 19 per cent. The aggregate output of 101 oil-driven stations was 45½ million kWh, at an average consumption of 1.05 lb. per kWh.

The only gas power station in Group G is that of Guernsey, which produced over three million kWh with a consumption of 1.61 lb. of coal, and a thermal efficiency of 17.23 per cent. Nine stations in Groups H and I generated 8.3 million kWh, with an average consumption of 3.1 lb., but the lowest consumption was recorded at the Littlehampton station of the Sussex Electricity Supply Co., Ltd., namely, 1.48 lb. The total output of 57 gas-producer stations was 20½ million kWh, and the average consumption 2.60 lb. of coal.

Metal-Clad Draw-out Switchgear.

A comparison of the horizontal and vertical types.

By THOMAS CARTER, M. Inst. C.E., M.I.E.E., Fel. A.I.E.E.

I HAVE had an opportunity lately of examining the question of metal-clad draw-out switchgear from the point of view of comparing the horizontal with the vertical types, to see if there is really any such inherent advantage of either type over the other as various manufacturers assert there is. Whether the conclusions I have come to are sound may be a matter of opinion: I have no doubt about them. It appears to me that the subject is one that should be looked at very broadly, because it has in some respects an international bearing, and is not merely something for one maker to outdo another in by devising a variation in design with the object of having something different to talk about. What I mean is that metal-clad switchgear is the result of intense British thought and concentration on an ideal (the word is not too strong, as those who know even a few of the facts are aware)—the ideal of making British standard switchgear a pattern for the world to follow.

It is well known that the originators of the metal-clad draw-out type refused to be turned aside from their conviction that this was the right thing, to be pushed day after day through thick and thin until it went home everywhere; and in the end their view prevailed, and people at home and abroad realised that they could not afford to be without this good aid to security in operation. Many manufacturers, in this country and out of it, now make metal-clad draw-out switchgear, and the vertical type, which was made on a very small scale many years ago, has recently cropped up again. Claims have been made for it as though it were on a level in merit with the horizontal type: these claims appear to me to be unjustifiable. I am thinking of the vertical type in which the draw-out is downwards; there is a large vertical type in which the draw-out is upwards, and special needs have led to the development of that type to fulfil a particular purpose. It does not enter, therefore, into the present discussion, which relates to gear of small and moderately large sizes only. What must be most carefully safeguarded is that metal-clad draw-out switchgear of any type made by a British manufacturer shall continue to be, as it certainly has been, in advance of gear made anywhere else; and it is thus essential that British practice shall be founded on a desire to give the world (including, of course, Britain itself) the type that from the most unbiassed point of view can be said to be the best. While I cannot pretend that a statement of the conclusions of one person will settle the question once and for all, I venture to think that the expression of a carefully-arrived-at opinion, with some definite knowledge behind it, may at least provoke further thought on the subject, the great importance of which will not be disputed by anyone. I feel quite sure that when the advantages of one type are carefully weighed against those of the other, the horizontal will not only hold its own, but will be found to be really very much superior to the vertical in all important respects.

It seems to me that the horizontal type is the one that would naturally be chosen because it embodies an obviously superior mechanical principle, namely, that of pushing something along on the level, and so having to overcome friction only, instead of lifting or lowering its whole weight vertically. The horizontal type supports the moving parts on its framework in precisely the same way at every point during the whole range of their travel; the framework itself forms the guide for the movement; and the gear for effecting the withdrawal is, to my mind, much simpler in the horizontal type. We have, in fact, an example of the same kind of contrast when we compare a vehicle moving on the level on a simple pair of rails with a lift working in a vertical shaft where it has to be provided with all kinds of safety devices and special guides to keep it in the desired position while it is moving upwards or downwards, not to speak of a suspension strong enough to carry the whole weight, and yet capable of being itself moved in such a way as to communicate its motion to the whole mass of the moving parts. It is claimed that it is much easier to remove the circuit-breaker and the oil-tank, or the oil-tank alone, from the vertical than from the horizontal type of gear, because the movement in the latter is first horizontal and then vertical, as compared with only vertical movement in the former. There is really much less in this than might appear, the fact being that, at any rate when a number of units are combined into a whole switchboard, a horizontal motion is required after the vertical lowering in the vertical gear if the part removed is to be taken out into the passage-way. Since, therefore, motion in two planes is necessary with both kinds of gear, neither of them is markedly superior to the other in this respect; but, if there is anything in it, the horizontal type seems to me to have the advantage in that the part to be removed is clearer of the rest of the gear if it is first racked out horizontally than if it is first lowered vertically, because it is then more accessible, and easier to place on a truck for removal.

The shape of horizontal gear, and the relative disposition of its several parts, are such that they quite clearly suit the convenience and promote the comfort of the people attending to it much better than vertical gear does. It is very much easier to stand and inspect horizontal orifices at approximately the ordinary level of the eyes than to put oneself into the rather contorted position necessary when vertical orifices have to be looked into; switchgear, in a word, should be made for man, and man ought not to be expected to have been made for switchgear. Again, when alternative busbars are provided, and the simplest method, namely, the plug method, of changing from one to the other is in use, the ease and rapidity with which a change-over can be made in horizontal gear certainly tell in favour of that type. Another point in its favour also is that should a complete circuit-breaker have to be exchanged, the process, for reasons already stated, is simpler in horizontal than in vertical gear, and is probably rather quicker too, because racking out and racking in are more rapid operations than lowering and raising.

The removable parts of horizontal gear, being always supported on permanently fixed structures, are easily pushed home to their full-in position, and equally easily locked there. Vertical gear, on the other hand, is more complicated in this respect, because the movable parts must have their weight taken on hangers of some kind, and these have obviously to be removed or got out of the way somehow before the gear is lowered, and must be replaced securely when the movable parts are put into their working position again. A further great advantage of horizontal gear is that when its movable parts are in the withdrawn position, and the tank is lowered away, it is possible to inspect all the

working parts adequately, just because they are well away from the rest of the gear, whereas the corresponding parts of vertical gear are no further away when they are withdrawn than when they are in the working position, and thus the rear parts cannot be made as fully visible. The operating mechanism of horizontal gear is very accessible, and although it certainly sticks out a little beyond the front of the main part of the gear, the projection is a very small one, and the convenient position of the mechanism far more than compensates for the slight amount of additional room required. The cable box is ordinarily mounted near the top of vertical gear, and is usually in such a position that it is less accessible when the movable parts are withdrawn than the cable box of horizontal gear, which takes a natural place underneath, and so is snugly housed and yet quite easily got at when necessary.

It has already been mentioned, but is worth mentioning again while the question of space required is being dealt with, that horizontal as well as vertical motion takes place during the process of completely removing either a vertical or a horizontal tank or circuit-breaker. It is therefore clear that a certain width of passage-way is required for each type, and the advantage claimed for vertical gear, that space is saved in this respect, is really largely illusory. Again, now that there is a growing tendency to use basements for housing switchgear in, the amount of headroom required is becoming exceedingly important, because it is so much more costly to provide by excavation than sideroom, and under these conditions the smaller height of horizontal gear gives it an advantage over vertical gear already great, and likely to increase.

If a short-circuit occurs in a large supply system, while both the vertical and the horizontal types of switchgear are ordinarily robust enough not to be strained, the stresses set up are occasionally so great that some parts are damaged. The disposition of the internal conductors in vertical gear is such that any occasional fault so bad as to lead to a wholly abnormal strain may quite easily do considerable damage to the bus-bars, because they are situated directly above the circuit-breaker and its tank, and the mechanical displacement resulting from the fault is reasonably certain to be an upwards one, and to do damage in an upwards direction. In the horizontal type, on the other hand, the part of the gear likely to move when the circuit-breaker is strained is well in front of the bus-bars; any displacement in a vertical direction will simply raise it more or less from its mechanical supports; and no possible risk of damage to the bus-bars can arise from such a movement. This is so important from the point of view of continuity of supply that it makes it one of the great advantages of horizontal gear over vertical that in the event of a short-circuit violent enough to strain the circuit-breaker unduly, and so, consequently, to damage the bus-bars of vertical gear, the bus-bars of horizontal gear will remain quite unaffected. Bus-bars are so vital a nerve-centre of any supply system that if they are damaged no one can tell how serious the consequences may be; they must be preserved in security, therefore, at all costs; and it is just because horizontal gear is in the last resort slightly flexible mechanically, in such a way as to confine whatever damage may be done to a part less vital than the bus-bars, that it is so undoubtedly superior to vertical gear in this essential particular. Accidents in horizontal gear, resulting in the putting out of commission of an individual unit, obviously cannot interrupt more of the supply than the part that was controlled by that unit, whereas the much more probable destruction of bus-bars in vertical gear, arising out of, say, the explosion of a tank, may cause wholesale interruption.

Duplicate systems of bus-bars are required in many switchgear equipments, and I do not think it is seriously questioned that the horizontal type is much more suitable than the vertical for the two undoubtedly simplest methods of selecting alternative bus-bars, namely, those using either removable plug contacts or oil-immersed change-over switches mounted in the hoods, in which there is ample room for them. A third method of selecting alternative bus-bars is to have complete duplicate circuit-breakers. These may be quite satisfactory if they are entirely separate, and each has its own tank, but even then elaborate interlocks are required to prevent the closing of both circuit-breakers together, and the gear is thus made more complicated, even under the best conditions, when this method is used. Owing to the ease with which the simpler selecting appliances can be mounted, the standard tendency is to use one or the other of these in gear of the horizontal type. The difficulty of applying them to vertical gear, for lack of room, leads to the more frequent adoption of the double circuit-breaker; and the necessity for keeping the overall size small has actually caused some makes to be designed with both the circuit-breakers in one common tank. The futility of this as a means of achieving anything except increased damage in a breakdown will be realised after a very little thought. There is the greatest possible danger, if a fault should occur, that the trouble may spread in the tank to the contacts of the circuit-breaker nominally out of commission, and may thus actually involve both sets of bus-bars, even when only one circuit-breaker has been mechanically closed. It seems to be beyond doubt, therefore, that the horizontal type of switchgear is quite definitely better than the vertical in respect of facilities for the selection of alternative bus-bars.

The last point I want to refer to is concerned with weather-proofness. At first sight, it might appear that the vertical direction of the orifices in vertical gear would make that type much less likely to suffer from dripping water than the horizontal type, with its horizontal orifices; and, so far as that comparatively simple point matters, it is true that a vertical shield is in itself more directly rainproof than a horizontal shield. There is, however, far more than that to be taken into account. It is, incidentally, not difficult to make a weather-proof and rain-tight joint between the fixed and the moving parts of horizontal gear; but the real point is that the ordinary humidity of the atmosphere and sweating are sources of much greater danger than dripping water ever is, and the care that has to be taken in making horizontal gear water-tight is also effective in making it thoroughly proof against insidious damp from any source. The need to protect insulating surfaces against this real danger makes it equally essential to provide complete water-tightness and damp-proofness in both kinds of gear, and unless this is seen to in vertical gear (for example, by immersing the isolating contacts in oil and avoiding the use of air as an insulator, the possibility of doing which is in truth practically the only inherent virtue of the kind of vertical gear we are considering), any idea that it has an advantage over horizontal gear in this respect is an entire fallacy. Indeed, the very fact that a vertical orifice looks safer may result in the giving of less care to the joints on the assumption that drip-proofness is all that is required, and thus a false sense of safety may be created.

If I have succeeded in expressing myself as I have wanted to do, I will have made it clear that the balance of advantage lies with the horizontal type for small and moderately large units. This is a matter in which experience counts enormously; and I am, therefore, encouraged to believe that my conclusion is sound by the fact that the manufacturers who have been making metal-clad switchgear for by far the greatest number of years still stick closely to their original horizontal type in the sizes for which it is obviously the most suitable. There are many sufficient proofs that this is not due to mere narrow conservatism, and my own view is that it clinches the argument in a way that brings one unavoidably to the conclusion that the interests of switchgear users (here I get back to the international point of view) will be best served if British manufacturers concentrate on still further perfecting horizontal-type switchgear, which has already done so much to establish a prestige for them in all parts of the world.

Electricity Tariffs.

A special two-part tariff in combination with an automatically-operating peak meter-switch device, introduced by the South Swedish Power Co., which has proved very successful in stimulating the domestic use of electricity for heating purposes, &c., during "off-peak" periods.

By ALFRED EKSTRÖM, Sc.D.

FOR the encouragement of the use of electricity on as large a scale and over as large an area as possible, a low price of energy is a *sine-qua-non*.

The bulk of the cost of the production and transmission of electrical energy is a fixed charge; the variable charge, that in proportion to the kWh sold, is only a fraction of 1d. per kWh. Therefore the more thoroughly the plant can be utilised, the greater will be the number of kWh upon which the fixed charge can be distributed; thus the problem involves not only the framing of tariffs, but also the stimulation of fresh demands for electricity and the introduction of suitable metering devices.

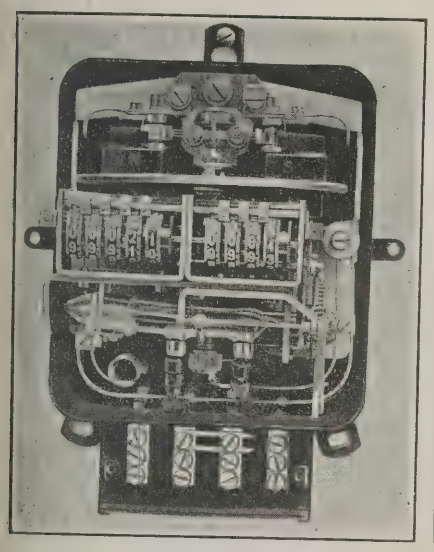

Fig. 1.—Peak Meter without Cover.

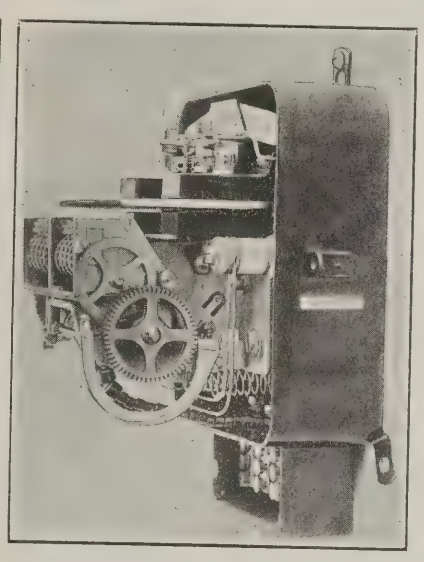

Fig. 2.—Side View of "Subtraction" Meter.

Fixed Annual Price per Kilowatt.

In Norway a certain number of kilowatts per annum has hitherto generally been contracted for. In Oslo, for example, a subscriber pays £10 per kilowatt per year, and is then able to make use of it for as many hours as he wishes. For measuring, simple "current limiters" are used which, so soon as the amount of power subscribed for is exceeded, periodically disconnect the supply, alternately extinguishing and switching on the lamps. This tariff presupposes a supply of cheap water-power; even in Norway, however, a commencement has been made to depart from this system, as it not only encourages a waste of energy (it is considered that about 40 per cent. is wasted through the subscribers not having any economic interest in saving energy), but also possesses many drawbacks.

A Purely Kilowatt-hour Price.

In Sweden a certain price is charged per kilowatt-hour to a large extent: in many places a higher price is charged for lighting than for motor power, special meters being used for the different purposes; in other places a higher price is charged during the lighting periods than during the rest of the day, in which case only one meter is necessary, but it must be fitted with two registering devices for measuring the current according to both the high and low tariffs, as well as a clock, which (as a rule monthly, according to daylight conditions) resets the periods during which the energy consumed shall be registered at the one or the other tariff.

In Switzerland there has even been introduced a third tariff for stimulating the night consumption of energy. Multiple-tariff meters, however, are not quite reliable, and also entail a great deal of work on account of the monthly re-settings, for which reason these tariffs are not very popular.

The Two-Part Tariff.

So far as only large consumers of electricity are concerned, this form of tariff may be considered satisfactory. For small consumers, such as agriculturists, households, and handicraft, however, such a tariff is inappropriate. They will probably be far from anxious to make a purely temporarily occurring maximum load the basis for the calculation of an appreciable portion of the energy cost; further, the electricity meters necessary for this purpose are far too expensive to make them suitable for small consumers of energy. For this reason other methods of calculation have to be made the basis for the fixed charge. In agricultural cases the number of hectares of arable land is therefore often used as a basis for this purpose; in the case of dwellings the number of lamps fitted, or the number of rooms, &c., being the criterion. A medium fixed charge in Sweden is 11 shillings per hectare, and for non-agriculturists two lamps are generally taxed similarly to one hectare.

The variable charge has hitherto generally been a purely kilowatt-hour charge. In order to encourage the use of energy during non-lighting time double-tariff meters with a low kilowatt-hour charge have frequently been retained, but if this is to achieve any success, the charge must be exceedingly low. Such a tariff is nevertheless not without its risk: in America, for example, such cases have revealed the surprising fact that on every Sunday morning so many people used electricity for heating their bath water that there were difficulties in the transmission of power.

The Peak-Meter System.

Of late, however, a peak-meter system has been introduced in Sweden which, to judge from all appearances, will assume great importance as regards the use of electricity in the home. This tariff is based upon the fact that the energy subscribed for can be divided (i) partly into a certain optional load, for which the fixed annual charge is made per kilowatt per year, no matter how many hours the subscriber makes use of it, and (ii) partly into the energy consumed *beyond* that load,

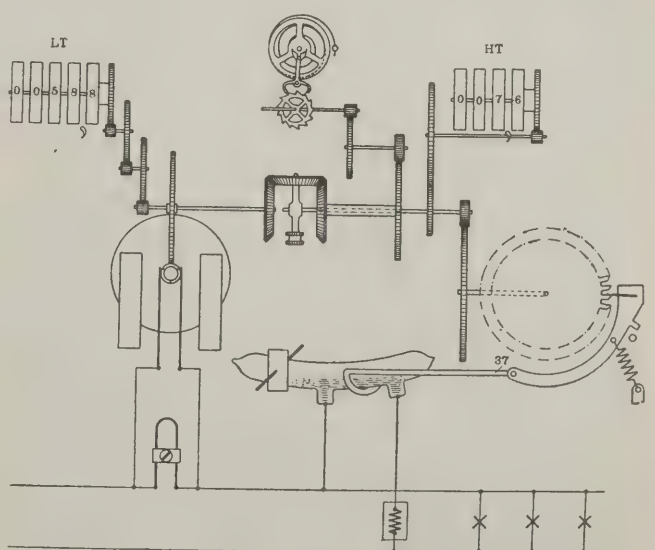

Fig. 3.—Diagrammatic Representation of Ericsson Meter and Switch.

for which a certain charge is made for each kilowatt-hour consumed. The energy consumed *below* the optionally-limited load is called *basis energy;* that consumed *over and above* the former is called *supplementary energy*. The basis energy is paid for, by way of example, at the rate of £14 per kW per year, and the supplementary energy at the rate of 1½d. per kWh. As experience has shown that a longer period of use of the basis energy than 7,000 hours per year is never reached, £14 per kW therefore corresponds to a price of at most ½d. per kWh. The choice of such a tariff depends upon the availability of a comparatively simple and reliable so-called " subtraction " or peak meter. The City of Stockholm

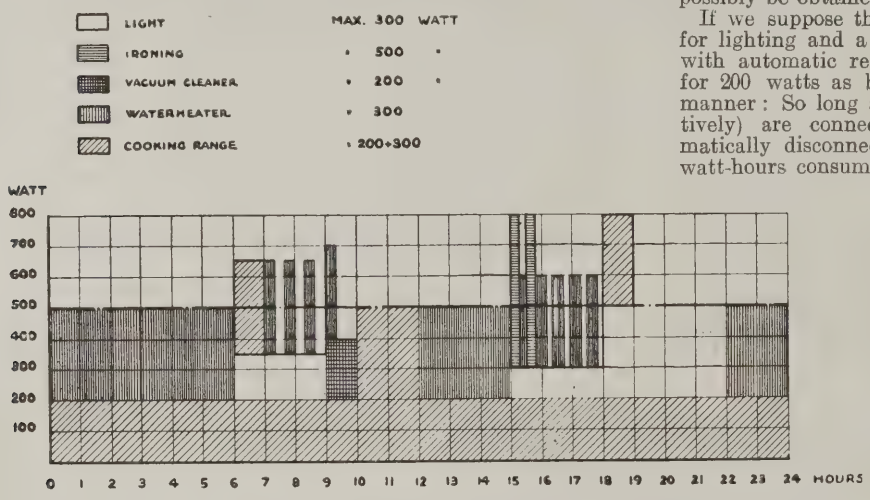

Fig. 4.—Load Curve, Lighting and Domestic Apparatus.

electricity works have designed an excellent meter of this kind (figs. 1, 2 and 3), which measures and registers *both* those kilowatt-hours consumed below a certain optionally-adjustable load (the so-called *basis load*) and also those kilowatt-hours consumed over and above that load (the so-called *supplementary energy*). This meter is manufactured by the L. M. Ericsson Company, and it might be considerably simplified if only the kilowatt-hours consumed as excess energy were to be measured, for it is really unnecessary to measure the kilowatt-hours consumed as basis energy, inasmuch as a fixed charge per kilowatt per year is made for it, no matter how many hours in the course of the year it is utilised.

The meter is combined with an automatic connecting and disconnecting device, by means of which the basis energy can be automatically rigorously utilised when it is not used, for instance, for lighting or by other devices. The electric water heater for family use is especially advantageous for such a purpose, enabling the electrical energy to be stored in the form of heat whenever it is not used by other devices which have priority in the utilisation of the basis load. It is desired to emphasise the advantage of the bulk of the power subscribed for being consumed as basis energy at the comparatively low price, whilst the subscriber is entitled at any moment whatsoever to exceed this on payment of the higher price for energy consumed on such occasions. This is also a great advantage for the consumer, as compared with the current-limiters employed in Norway, which do not permit of a temporary use of a higher load than that for which one has subscribed. In so far as the price of basis energy is reduced as mentioned above, the use of electrical energy for heating water in households and farm dairies becomes important. How essential the price for basis load in this connection is becomes apparent from the following examples:

Examples of " Subtraction " Meter Operation.

Lighting and Water Heating.—Assume the sale to various subscribers of basis energy at £17, £14, or £12, respectively, and excess energy at the rate of 1½d. per kWh; the maximum consumption for lighting has been found to be about 50 watts for each person, with an annual period of use of 800 hours. If by means of suitable automatically-regulatable apparatus, such as the above-mentioned L. M. Ericsson meter, a hot-water tank is automatically connected in circuit so soon as the maximum amount ceases to be consumed, it will probably be possible with advantage also during some days in December and January, when lighting is most called upon, to utilise for the heating of water an average of 50 watts for about 18 hours per day, or 0.050 by 18=0.9 kWh. For this from 7 to 8 litres of water could be heated from 10 to 90 deg. C. with an efficiency of 80 per cent. of the water heater.

The cost of lighting current would, if the maximum load consumed during 800 hours is consumed as excess energy, be $0.050 \times 800 \times 1\frac{1}{2}/100 = 5$s. per head. Furthermore, a fixed annual charge will have to be added; this, however, is levied only for the lighting subscription, not for water-heating, for which reason it can be omitted from the comparison.

Should, however, a water heater be connected which consumes electrical energy only so far as the maximum load is not used for lighting, and obtains from 7 to 8 litres of warm water per day for 300 days per annum, the energy-consumption for the heating of the water would be $300 \times 0.9 = 270$ kWh. With a basis price for power at the rate of £17, £14, or £12, respectively, the whole subscription for 0.050 kW would cost 17s., 14s., or 12s., respectively. If we still calculate the expense for lighting at 5s., then 12s., 9s., 7s., respectively, would be on account of water-heating, or about 0.5d., 0.4d., or 0.3d., respectively, per kWh.

Possibly it is only at the last-mentioned price that a fairly general use of electrical energy for heating water can be considered. To this price, however, must be added the cost of a water-heater and automatic switching apparatus with appurtenant meter. These may, when in general use, possibly be obtained for £8 for a family of five to six persons.

If we suppose that the family has ntted six 50-watt lamps for lighting and a water-heater of 200 watts, a meter fitted with automatic regulation (adjusted to a fixed subscription for 200 watts as basis load) would operate in the following manner: So long as 4 to 6 lamps (200 or 300 watts, respectively) are connected, the water-heater will remain automatically disconnected; the meter registers only those kilowatt-hours consumed by the lamps exceeding four in number. If, on the other hand, fewer than four lamps (*e.g.*, three lamps, or 150 watts) are connected, the water-heater will be disconnected or connected for periods of a couple of minutes' duration according to the diagram reproduced in fig. 5. During the first period both the water-heater (200 watts) and three lamps (150 watts) are connected, 350 watts being consumed. During the second period the water-heater (200 watts) is disconnected, and only three lamps (150 watts) are connected; this period lasts so long that the shaded surface in period 2 becomes as large as the shaded surface in period 1. During periods 3 and 4 the same course is repeated, and so on, the average consumption being thus only 200 watts. During period 1 there will no doubt have to be added a certain number of kilowatt-hours as excess energy, but these are again deducted during period 2, so that the final result in this case is that no excess energy is registered by the meter.

Lighting and Sundry Household Apparatus.—The diagram reproduced in fig. 4 shows the consumption of energy of a subscriber who uses electrical energy for—

	Watts.
Lighting, six 50-watt lamps, maximum	300
Ironing	500
Vacuum cleaner	200
Electric cooking range, one resistance-coil of 200 watts being permanently connected, and one of 300 watts on occasions when the cooking plate is made use of, maximum	500
Water heater, maximum	200

The water heater is automatically disconnected as soon as the load for other purposes exceeds the basis load subscribed for, for instance, of 500 watts, and is automatically switched in as soon as the load for other purposes is less than 500 watts. Fig. 4 shows that the 200-watt element of the range

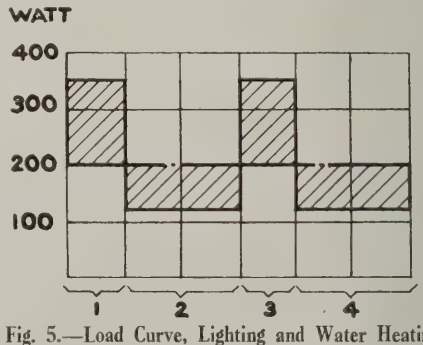

Fig. 5.—Load Curve, Lighting and Water Heating only.

is permanently connected during all the 24 hours of the day*; from midnight to 6 a.m. the water heater is also connected; the subscription for 500 watts is then fully utilised, and no excess energy is drawn upon.

From 6 to 7 a.m. there are, besides the 200 watts of the range, also connected three 50-watt lamps and the 300-watt cooking plate of the range; the whole subscription is made use of, and besides that excess energy of 150 watt-hours.

From 7 to 9 a.m., besides the 200 watts of the range and 150 watts for lighting, the water-heater is periodically connected, so that its average load during this time is 150 watts; the whole subscription is used, but no excess energy.

From 9 to 10 a.m. the 200 watts of the vacuum cleaner are continuously connected, besides the 200 watts of the range; the water-heater is periodically connected, so that its average load during this period is 100 watts; the whole subscription is used, but no excess energy.

From 10 a.m. to 12 (noon) the two resistance coils of the range (200 and 300 watts) are continuously connected; it is

*See Elec. Rev., September 17th, 1926, p. 473, for description of " Seves " cooker.

assumed that during this time luncheon is being cooked; the whole amount subscribed for is used, without any excess energy.

From 12 (noon) to 15 o'clock the water-heater is continuously connected, besides the 200 watts of the range; the whole subscription is used, without excess energy.

From 15 to 16 o'clock the flat iron of 500 watts is connected during two periods of 15 minutes each, besides the 200 watts for the range and 100 watts for lighting; besides this, the water-heater has automatically been connected when the flat iron was disconnected; the whole amount subscribed for is used, and excess energy of 150 watt-hours.

From 16 to 18 o'clock, besides 200 watts of the range, there are connected 100 watts for lighting and periodically the water-heater; so that the average load of the latter during this time is 200 watts; the whole amount subscribed for is used, without excess energy.

From 18 to 19 o'clock there are connected the 300-watt coil of the range, as well as the 200-watt coil for the range, and 300 watts for lighting; the whole amount subscribed for is used, and, furthermore, excess energy of 300 watt-hours.

From 19 to 22 o'clock 300 watts for lighting are connected, besides the 200-watt coil for the range; the whole amount subscribed for is used, without excess energy.

From 22 to 24 o'clock 300 watts for the water-heater are continuously connected, besides the 200-watt coil of the range; the whole amount subscribed for is used, without excess energy.

Total amount of excess energy is 150+150+300=600 watt-hours. Besides the ½ kW subscribed for as basis load, there is being used 0.6 kWh excess energy; assuming that this curve is repeated on 300 days, the cost for a family of six persons will be :—

Fixed charge for local distribution for six lamps at 5s. 6d. each	£1 1 1
500 watts at £11 per kW per year	£5 10 0
180 kWh at 1½d.	£1 1 10
Total	£7 12 11

Therefore, for this price is obtained light from six 50-candle-power lamps, heating of about 40 litres of water to about 90 deg. C., as well as all the electrical energy required for cooking, vacuum cleaning, and ironing.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

A Large Hospital Receiver.

What is probably one of the largest receiving sets in England is to be installed in St. Giles' Hospital, Camberwell, London, and is on view at Messrs. Holdrons', Ltd., Peckham. It was made by the Oxford Wireless Telephony Co., Ltd., and has been built into one container, not formed of a multiplicity of units, and is the one hundred and forty-second instrument turned out by this firm for use in British hospitals and institutions. There are 12 valves only, so arranged that the 1,100 pairs of headphones it is required to supply, never less than 550 at a time, are equally fed from the central source, and are arranged in banks which can be switched on or off at will by the authorities in charge of a particular ward, or group of rooms, but the set is capable of energising double the number of headphones in use, and there is therefore an ample reserve of power. In addition, the apparatus can deliver adequate volume to 50 loud-speakers, and a microphone attachment has also been fitted whereby a concert held in one of the rooms of the hospital will be heard throughout the wards, 2LO and Daventry being cut out. The control panel is so arranged that, once the set has been installed and adjusted, it will be necessary only to push a switch from its central position to a position marked "London" to switch on the entire equipment, no tuning adjustment being required; if the programme from Daventry is wished for, the same switch is pushed to a position marked with the name of that station, and again all tuning is completed by that action. The whole of the wiring is readily accessible by raising the glass-panelled lid; there are six separate and distinct headphone circuits, each one separately controlled at the set. "Bottom-band" rectification without reaction of any description is used, and inter-action is guarded against by the fact that all components which could cause the set to oscillate are enclosed in non-magnetic nickel screens. The whole of the cost of the instrument, together with that of the wiring of the hospital and the supplying of headphones, is being borne by voluntary subscription; at present over £500 has been raised, but £100 more is wanted to complete the work, one of the objects of exhibiting the set being to give the charitable minded an opportunity of contributing.

A D.C. Battery Eliminator.

A new product of Messrs. Philips Lamps, Ltd., is an anode battery eliminator for operation off d.c. domestic supply mains at from 200 to 250 volts. The output is regulated by two controls: one is marked "det," and provides 14 mA at a voltage variable from 20 to 60 V for the h.f. and detector valves, whilst the other is marked "volt," and furnishes 20 mA at 120 V, which is variable to about 40 V. The device is neat in appearance and, if the instructions are carefully followed, there should be little risk of short-circuiting the mains through the earth connection of the receiving set.

An "Individual-Gang" Condenser.

A major improvement in the "ganging" of condensers appears to have been achieved by Messrs. Arthur Preen and Co., Ltd., who have produced a "Formo" triple-gang condenser which operates on a new principle. It consists of three condensers, each having the usual rated capacity of .0005 mfd., but instead of being mounted with their axes in alignment the condensers are mounted side by side. Each separate condenser is provided with its own dial; the centre dial will, however, operate the three condensers simultaneously, and all three are "ganged" together by an ingenious arrangement of two moulded bars, each condenser spindle being attached to these by means of a specially shaped metal bracket; by means of a friction arrangement either of the two outer condensers may be adjusted independently of the others so that any variation in the tuning of its circuit may be counteracted by altering its own dial. Mounting the new instrument is simplified by the provision of a template and special bolt; if a centre hole be drilled to accommodate the spindle of the centre condenser, the bolt may be used to clamp the template to the panel so that the outer holes for the other two spindles may be drilled correctly. The new condenser should considerably simplify the tuning operation, the aim of the design being to overcome the difficulty of the condensers "falling out of step" at some part of the range.

"Hunt" Specialities.

Messrs. A. H. Hunt, Ltd., have secured the sole selling rights for the United Kingdom of the range of hydrometers produced by the ALA Manufacturing Co., of Chicago, U.S.A. They are made in a variety of types to meet different requirements, the sample sent us (fig. 1) having been designed for radio purposes; the substantial rubber bulb is fitted with a perforated stopper, whilst a perforated hard-rubber nozzle plugs the lower end of the glass barrel, acid being drawn up into the latter through the extension tube, which can be inserted into quite small cells. The float contained inside the glass barrel is moulded, which process is claimed to result in a stronger and more accurate article than the hand-blown variety. The "B" pattern illustrated is 10.5 in. long and its bore is 9/16th in.; it is well made, and sold at a modest price.

Fig. 1.—The 'ALA' Hydrometer.

When rooms are being wired for loud-speaker extension Hunt wall jacks can be conveniently incorporated to provide definite contact. Following the usual design, the jack is mounted on a small erinoid panel only ¾ in. wide so that the device can be unobtrusively fitted; contact points are more widely spaced than usual to increase insulation, and it will accommodate any standard plug, the total projection being 1 in. only sideways; a nickel-plated cover is provided.

A Thermo-electric Generator.

We are informed by Messrs. Attaix, Ltd., that they are placing an instrument on the market which they claim will enable users of receiving sets to dispense with accumulators, whether they have electricity in their houses or not. A compound of metals is employed to produce electricity when heated, either electrically or otherwise, and the generator is to be made in 2-, 4- and 6-volt types; its output is said to be from 0.3 to 0.6 ampere and the instrument begins to function at 100 deg. F.

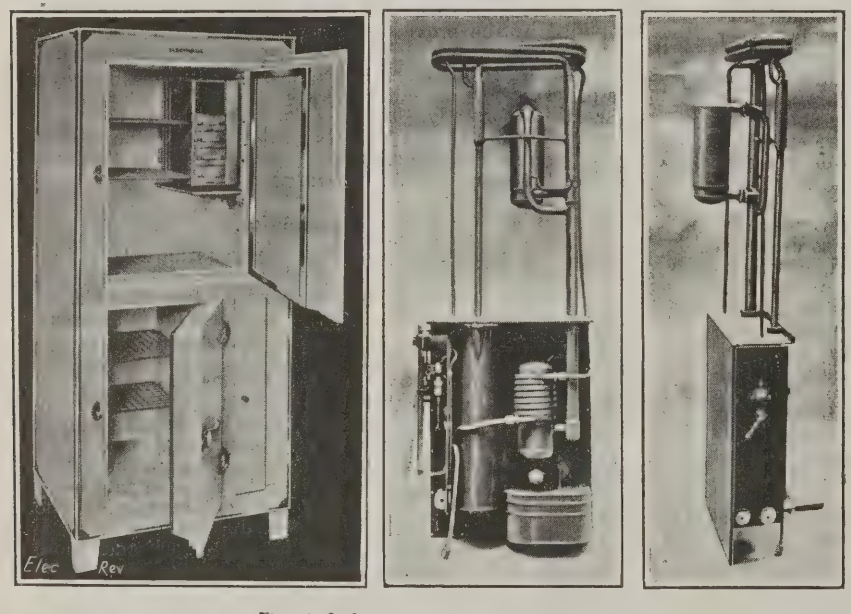
New Marconi-Osram Valves.

We have received samples from the Marconiphone Co., Ltd., and the General Electric Co., Ltd., of their recently-marketed 2-volt, 0.1-amp. filament valves. The DEH.210 type is a high-magnification pattern suitable for resistance-capacity coupled l.f. amplifiers, or as a detector followed by an r.c. stage, but may also be used in h.f. stages when some form of stabilising device is employed. Its amplification factor is 35 and it has an impedance of 75,000 ohms, which, for a valve of such small filament wattage, gives a "steep slope"; high amplification per stage will be obtained by the use of an anode resistance of ½ megohm and applying 150 volts to the plate with grid negative bias of 1½ volts.

The type DEL.210 general purpose valve, when transformer coupled in an l.f. stage, needs 120 anode volts with 6-V negative grid bias to operate a loud-speaker at medium strength. Its amplification factor is 9 and impedance 17,000 ohms. Its 120-volt curve is perfectly straight for almost its entire length, and the bottom bend is so short and slight that it is almost included between minus 12 and minus 14 grid volts in a horizontal direction and between zero and 5 milliamperes in a vertical direction.

A New "Ediswan" Valve.

The Edison Swan Electric Co., Ltd., has sent us a sample of its latest valve, the RC.610, which is intended for resistance-capacity coupling. Of the 6-volt 0.1-A filament type, it has a lower impedance (100,000 ohms) than the RC.2, with a consequently higher amplification factor of 40. Its filament is longer and anode of larger area; the anode voltage is 120 V and the slope 0.4 mA per V. The correct power valve to use in combination with it is the PV.5.



The "Electrolux" Refrigerator.

Some Noteworthy Modifications in its Design.

SINCE we previously described the Platen-Munters system* the refrigerator has been modified in several respects, consequently improving its efficiency of operation. It is, of course, important that the water vapour contained in the ammonia gas as it leaves the generator should be removed before the gas reaches the condenser. For this purpose a water separator has been incorporated (see fig. 4): as the gas and water vapour leave the boiling liquid they are at a comparatively high temperature, and the water is removed partly by the effect of the baffle plates within, and finally by the cooling effect of the ammonia in the annular space around, the separator. The warm gas passing through the separator (raising the temperature of the ammonia liquid in the annular space a few degrees) causes this liquid to evaporate, the gas so formed passing straight back into the condenser where it is again cooled and recondensed. No further rise of temperature of the liquid ammonia takes place, the liquid being thus kept at a constant temperature by its own evaporation. The inner wall of the annular chamber thus forms a surface at a fixed temperature for pre-cooling the ammonia gas and so purifying it before it enters the condenser; the water thus condensed drips back over the baffle plates and finally falls into the generator. It will be realised that only so much of the liquid ammonia as is necessary for depriving the gas of its water-vapour content passes into the separator, the balance passing into the evaporator. This device is a material improvement on the previously used air-cooled radiator which it has displaced; consequently more heat can be applied to the generator, which fact has led to the addition of a switch for 3-heat control. Further, a safety switch, in the form of a tilting glass tube containing mercury, is now employed to interrupt the heating circuit in the event of the failure of the flow of cooling water.

Another modification is the incorporation of a gas-temperature exchanger, through the central tube of which the intensely cold mixed gases from the evaporator pass; the temperature of the warm hydrogen gas from the absorber is thereby lowered before it enters the evaporator. The exchange of heat therefore results in an increase of the cooling effect, otherwise the hydrogen entering the evaporator would be comparatively warm, and the evaporating ammonia would have to cool this gas in addition to cooling the cabinet; in other words, the "coldness" in the mixed gases which would otherwise be wasted is transferred to the pure hydrogen. The object of the vent pipe which is shown in the interior of the vertical tube connected to the lowest part of the condenser is to provide a direct passage to the absorber, through which any hydrogen gas which may have found its way into the condenser can pass. When the apparatus is not in use, it is possible that some hydrogen may find its way into the condenser, where it would be detrimental to the working of the apparatus: as soon as heat is applied to the generator, ammonia gas flows into the condenser, driving the hydrogen gas down the vent pipe into the absorber or evaporator. The pipe is bent down to prevent any possibility of the liquid ammonia from the condenser falling down it.

It should also be explained that all steel pipes which are liable to corrosion are now provided with an inner tube of copper. Moreover, the evaporator is no longer encased in a brine tank, which has been eliminated. In its stead an aluminium casting (not shown in the diagram), having fins like a radiator, is fixed around the evaporator so that it also is cooled to a similarly low temperature, the icy cold surface of the aluminium fins, in turn, cooling the air in the cabinet. The latter is of all-metal construction, with the exception of wooden inner door frames, white enamelled outside and in, the interior surfaces being porcelain enamelled.

Figs. 1, 2, 3 and 4.—"Electrolux" Refrigerator Cabinet, Cooling Element and Circuit Diagram.

* See Elec. Rev., February 26th, 1926, p. 327.

The Works at Luton.

On Wednesday, May 18th, the works of Electrolux, Ltd., at Luton, were visited by a large company of ladies and gentlemen connected with the electrical industry and the newspaper and trade Press, the occasion being their formal opening by Sir Robert Horne, K.C., M.P. The various departments of the works where the "Electrolux" vacuum cleaners are being turned out at the rate of 1,200 or 1,300 per week, and electrical refrigerators in considerable and increasing numbers, were inspected from the receipt of stores and parts to the assembling, welding, porcelaining, testing, and other processes, and the packing of the finished article ready for dispatch. The factory buildings cover an area of 200,000 square feet with considerable extensions in prospect; 200 additional acres have been acquired and workmen's cottages will form a model Electrolux village, while canteen, tennis, and other welfare and sports facilities have been provided; it is even stated that a bonus system has been introduced for the employés. It is understood that since the inauguration of the company at the Savoy Hotel, London, over a year ago, 1,200 additional persons have been employed either at the works, or on the road in selling activities. At the function last week, Major H. A. Wernher, the chairman, referred to the large orders that the company and its Swedish associates had placed for British raw materials to be used in the production of their refrigerators here and on the Continent. The present output of refrigerators and cleaners was far short of what it eventually would be. The new works started a new British industry and their equipment included British plant made to special specifications. Sir Robert Horne, the Mayor of Luton, and the Member of Parliament for Luton, followed. The cheapness of electricity at Luton as an inducement to such companies to start manufacturing operations in the area, was frequently alluded to.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The County of London Bill.

As briefly mentioned in our last issue, the Bill promoted by the County of London Electric Supply Co., Ltd., principally to confer powers with regard to the county of Essex, was passed by a committee of the House of Commons on May 17th A short report of the last two days' proceedings follows:—

On May 16th Mr. R. BURY, for the Essex County Council, asked that the Bill should be rejected as no definite scheme had been put forward by the promoters. The company should be made to proceed by means of a Special Order, for if the Bill were passed other authorities would be unable to develop the area, although their extension might be desirable. When the Central Electricity Board had prepared a scheme, the company might be allowed to bring forward a Bill. Alderman H. E. BROOKS (Essex County Council) said that all the large towns in the county proposed to supply large rural areas around their boundaries. If those orders were not granted the company should be asked to give guarantees. He could not agree that the clause allowing local authorities to apply for Special Orders after the passing of the Bill was effective, for the erection of generating stations was precluded.

Sir LYNDEN MACASSEY, K.C., for Southend Corporation, said his clients had decided to apply for a Special Order for an increased area of supply and to erect a power station at Canvey Island. The company should, therefore, not be given powers which would prejudice that application. Sir Harry Renwick had stated that the Bill was largely framed upon advice received from the Electricity Commissioners. Counsel deprecated that, and said that it would create grave misgivings in the minds of local authorities, who looked to the Commissioners to be impartial. Sir Lynden Macassey also said that Mr. Merz, the promoters' chief technical witness, had stated that his firm had prepared the schemes upon which the Central Board was proceeding. Moreover, Mr. Page, who was until recently general manager of the company, was now engineer to the Central Board, and would have been called to give evidence for the promoters if he had been in London. It might be that the Bill was promoted with advance knowledge of the Board's intentions. If that were so the local authorities had equal right to know what those intentions were. He argued that the correct procedure was by Special Order, which would receive the same attention as Orders applied for by local authorities. While maintaining that the Bill should be rejected, counsel asked that in the event of its being passed a clause should be inserted protecting the Southend Corporation from competition in the extended area applied for in its Special Order.

When the proceedings were resumed on May 17th the chairman announced that the Committee found the preamble of the Bill proved subject to the insertion of a clause providing that within 12 months of the passing of the Bill, and within each succeeding 12 months, the company should submit to the Electricity Commissioners proposals for giving a supply in all parts of the added area in which there was a demand and in which there were no authorised distributors. The proposals were to be carried out within two years of approval, or such period prescribed by the Commissioners, failing which the powers in such parts of the added area could be annulled. The time for the lodging of applications by local authorities was also extended to April 1st, 1927.

Mr. ROWAND HARKER, K.C. (for the company), referring to observations made the previous day by Sir Lynden Macassey, which had been reported, had been taken by the Commissioners to mean that the company was in some way attempting to detract from their jurisdiction and powers, and that the company could ignore them. Sir John Snell had interviewed Mr. Merz, and the latter would like to explain his position. With regard to Mr. Page, the Bill was ready before he left the company, but he took the view that it would not now be proper for him to give evidence for the company. Therefore, Mr. Merz, who was familiar with the company's work, was called upon instead. The chairman said that Mr. Harker had taken a proper course, and the Committee thought that nothing which had been done was in any way reprehensible. Later, Mr. HARKER, replying to a point raised by Sir Lynden Macassey, stated that there was a clause in the Bill giving local authorities power to purchase the parts of the undertaking in their areas. He also asked for a provision that when applications for Special Orders were made by local authorities the company should have the right to be heard. The chairman said that the Committee would agree to such a provision in connection with the applications of Southend, Colchester, and Clacton. Beyond that the decision already given must stand.

Subject to the insertion of clauses giving effect to the Committee's decisions, the Bill was then passed for third reading.

On May 19th, the Committee approved clauses which were submitted to give effect to its decision. The Lea Conservancy Board asked for the insertion of a clause giving it power to impose conditions with regard to the execution of work by the company upon its property, and providing for a reasonable payment to the Board in respect of wayleaves.

Mr. S. G. TURNER (for the company) contended that the matter was covered by the general law, but after discussion the Committee decided to insert the clause.

London and Home Counties Bill.

A committee of the House of Commons, presided over by Sir A. Shirley Benn, commenced the consideration of the London and Home Counties Joint Electricity Authority (No. 2) Bill on May 18th.

Mr. CRAIG HENDERSON, K.C., for the promoters, dealt with the circumstances leading up to the formation of the Joint Electricity Authority, and said that the object of the Bill was to secure power to erect a generating station at Duke's Meadows, Chiswick. The Brentford Gas Co. had twice endeavoured to secure the site for the erection of gasworks, but had not succeeded. The erection of a generating station, however, would not interfere with the amenities of the district. The Ministry of Health had expressed the opinion that the site should not be used unless the use of another site would raise the cost of electricity. Mr. J. H. Rider, the Authority's consulting engineer, had been unable to find another suitable site. The Authority had arranged to exchange a larger and better site for the one in question, and so the public would benefit. The London Power Co.'s opposition to the Bill was due to a fear that it would prejudice the company's application for powers to erect a station at Battersea, but the Authority's station was required to serve an area in which none of the constituents of the London Power Co. operated and there was room for both stations. The promoters had no desire to "side-track" the Electricity Commissioners; indeed, the latter had already said that the site was suitable, and in any case the equipment of the station would be under their control. If, however, the promoters proceeded under the Electricity Act of 1919 there would be further delay. Mr. Rider gave evidence for the Authority, and said that the estimate of the demand in the London Electricity District in 1925-26 was 441,795 kW, but the actual demand was 577,317 kW. He now estimated that the demand in 1930-31 would be 878,590 kW, and in 1935-36 1,179,920 kW. Mr. Rider dealt in some detail with the existing plant in the area, and said that the gradual shutting down of smaller plant would necessitate additional plant in a few stations. He recommended the retention of three primary and 20 secondary stations (out of the 62 existing), having a total capacity of 1,245,000 kW, the three primary stations being Deptford, Brimsdown, and Barking. The CHAIRMAN said that the Committee would be guided by the Electricity Commissioners' decision that a riverside station in the West of London was necessary, and would merely want to know which was the best site. Mr. RIDER said that, after thorough investigation, he had no doubt that the Chiswick site was the most suitable. It was proposed that the first section should have a capacity of 125,000 kW. On May 19th, he dealt very fully with the details of construction of the proposed station, and dwelt particularly upon the arrangements which would be made to prevent any nuisance arising from the combustion processes. He then gave particulars of the generating costs, and said that with a 40 per cent. load factor and coal at 20s. a ton, the total cost per kWh sent out would be 0.4315d. When the station was completed the cost would be reduced to 0.366d. per kWh, and the total capital cost would be 4½ millions sterling, or £13.9 per kW. At the end of seven years, he said, the Authority would be called upon to supply

64,590 kW of the total demand of 112,590 kW, not taking into account any supplies which might be required by the North Metropolitan Company or the Central Electricity Board. Questions were put by Mr. Wrottesley, K.C., for the Barnes Urban District Council, suggesting that the smoke from the station would be a nuisance, but Mr. Rider said that a thoroughly modern station would not offend in that respect. The Committee adjourned until May 24th.

East Anglian Electricity Bill.

When the Committee of the House of Commons, presided over by Sir Arthur Shirley Benn, met again on Thursday, May 19th, Mr. Craig Henderson, K.C., mentioned the steps which had been taken to meet the Committee's requirements. He stated that a resolution had been passed by the board of the company to the effect that the capital would be increased by £150,000 with the sanction of the shareholders, and there was little doubt that this sanction would be obtained. Counsel also produced a draft contract between the East Anglian Co. and the Greater London and Counties Trust by which the Trust agreed to subscribe the whole of the additional £150,000, at the same time undertaking to subscribe or procure additional capital to the extent of £500,000, as and when called upon by the company. Moreover, the Trust agreed to exchange its debenture holding in the company for ordinary shares. After the Bill had been approved by the Committee the contract would be produced in its executed form. With regard to another suggestion by the Committee, counsel produced clauses providing that the company should, within one year from the passing of the Act, and at such other times at intervals of not less than three years as it might be required to do by the Electricity Commissioners, submit proposals for the supply of electricity in those parts of the area where there was a demand for electricity and there was a reasonable prospect of the supply being remunerative. It provided that the question of the existence of a demand in any area should be determined by the Commissioners. Further, the clause provided that in submitting the first proposals the company should submit a general statement of further proposals for the ultimate development of the whole area at a cost of not less than £500,000.

The Chairman said that the Committee would consider the proposals, but it occurred to him that in such a rural area there was hardly a place where supply would be remunerative at first. The Committee wished to see that the area was provided with transmission lines whether the districts through which the lines passed were remunerative or not.

Mr. Craig Henderson said that until the promoters knew what the national scheme was going to be it would be impossible to draw up a scheme of transmission lines of a definite character.

The Chairman then asked for some evidence as to the financial standing of the Trust. Mr. F. M. Rogers, chairman of the Trust and also of the company, said that there was cash available at present to provide the £150,000 new capital, and there was no doubt whatever that the £500,000 would be forthcoming as and when required. He agreed that there would not be much prospect of an immediate return, and the policy of the company would be to stimulate the demand and gradually build it up.

Mr. Wrottesley, K.C., cross-examining for a number of local authorities in the area, suggested that the proposed contract did not bind the Trust if, on further investigation, the area was shown likely to be unremunerative. In the meantime, the local authorities now supplying would be prevented from extending their areas of supply into the surrounding districts. Further, the new proposals put no compulsion on the promoters to bring forward schemes. Mr. Craig Henderson replied that there was nothing to prevent local authorities from bringing forward schemes if they could show that a supply was needed and the company was not giving it.

Mr. Rogers said that the capital of the Trust was £300,000. Already it had provided £250,000 for various schemes, and its reserves were about 40 per cent. of its nominal capital.

In reply to the Chairman, Mr. Craig Henderson said that it was obvious that the districts in which the greatest demand was likely to arise must be developed first, and the less likely districts would follow. The latter could only get a supply by the development in the first place of the former.

Mr. Moon, appearing for various local authorities, said that the clauses now produced would have the effect of holding up indefinitely the development of supply in the whole of the area included in the Bill and preventing districts getting supplies which could be given from the power stations belonging to local authorities. He contended that the clause compelling the promoters to bring forward a scheme within one year did not do what it purported to do, and that while nebulous schemes were being prepared by the promoters, the Electricity Commissioners could not consider schemes from the local authorities. The proposed contract between the company and the Trust would have no force.

The Chairman, referring to the clause binding the promoters to bring up schemes for areas where there was a reasonable prospect of the supply being remunerative, asked whether the promoters would agree to alter this to "a prospect of the supply being remunerative within a reasonable period." Mr. Craig Henderson said that the promoters would accept the amendment.

The Chairman subsequently said that the Committee found the preamble of the Bill proved subject to the financial arrangement being carried out, and also subject to the clauses being so worded as to ensure that the whole area would be supplied in a reasonable period with an adequate supply of electricity. The Committee then adjourned until May 23rd, when clauses were considered.

There was some discussion as to the form of the latter part of the clause dealing with the provision of an adequate supply within a reasonable time. As passed by the Committee, it provided that the proposals to be submitted should be so framed as to provide, to the satisfaction of the Commissioners, for an adequate supply being furnished within a reasonable time in those parts of the area of supply within which the company was empowered to distribute; that the scheme to be submitted should be so framed as to provide, to the satisfaction of the Commissioners, for transmission lines to be laid down throughout the area of supply; and that the proposals and scheme should be on such a scale that the estimated cost of carrying them into effect would be not less than £500,000. When the scheme had been approved by the Commissioners, it should be carried into effect within such reasonable time as determined by the Commissioners.

Coal Research.

On May 17th, Mr. Tinker asked what was the quantity of oil extracted per ton of coal treated by the Dr. Bergin's process; and asked for a comparison between that method and the low-temperature carbonisation process.

The Duchess of Atholl said that the crude oil and spirit obtained from one ton of suitable coal treated by the method amounted to from 110 to 135 gallons. In addition, a further unknown amount of coal was necessary for power and hydrogen production. The highest yields of dry tar and spirit, observed by the Fuel Research Staff, as obtained from the low-temperature carbonisation of ordinary coal in a large scale plant, was about 21 gallons, but the average bituminous coal would probably not yield more than about 15 gallons. Good quality cannel coal, of which, however, there was only a limited supply, might yield 50 to 60 gallons.

North Metropolitan Electric Supply Bill.

The Bill promoted by the North Metropolitan Electric Power Supply Co., authorising it to raise a further £1,000,000 of capital, together with further loan capital of £500,000, was considered by the Unopposed Committee of the House of Commons on May 19th, and was ordered to be reported for third reading.

Mr. W. Sidgwick said that the present authorised share capital of the company was £2,000,000, all of which was issued, and the authorised loan capital was £1,000,000, of which nearly £550,000 had been issued. He asked the Committee to report the Bill that evening, because the company wished to obtain Royal Assent to it before the Whitsun recess.

Trade Facilities Act Guarantees.

On May 16th the Chancellor of the Exchequer gave Sir F. Wise a statement showing the distribution among the various important industries of the £75,000,000 guaranteed under the Trade Facilities Act. The statement showed that the construction and equipment of electric railways accounted for 17 per cent. (£12,583,000); hydro-electric construction for 9.5 per cent. (£7,000,000); and other electrical works 10.8 per cent. (£8,004,600).

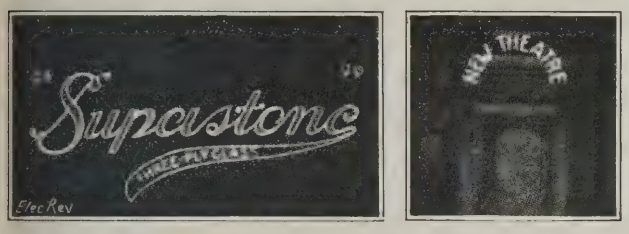
Hydro-Electric Works at Snowdon.

On May 19th Sir Robert Thomas asked the Minister of Transport whether his attention had been drawn to the fact that the hydro-electric works in the neighbourhood of Snowdon were causing disfigurement to the scenic beauties of the district by the erection of overhead transmission lines; and whether he would take steps to require the interests concerned to relay their cables in underground conduits.

Colonel Ashley said that such information as he had been able to obtain showed that the overhead lines were erected many years ago with the consent of the Board of Trade. In the event of any application being made to him for further overhead lines, the local authority would be given an opportunity of being heard before any such consent was given, but the desirability of securing all reasonable economy in the production and distribution of electricity was an important consideration, and he was not prepared to say in advance what his decision on any such application might be.

Electricity Schemes.

On May 17th, Colonel Burton asked the Minister of Transport whether he could give any information as to the progress of the preparation of schemes by the Electricity Board; if he could state whether any scheme was in preparation which would cover the rural areas of East Anglia; and, if so, when the publication of such scheme might be expected.



Colonel Ashley said that one scheme had already been prepared by the Electricity Commissioners, and published by the Central Electricity Board. He understood that a further scheme was in an advanced stage of preparation by the Commissioners and that they had other schemes in hand, but that the rural districts of East Anglia were not wholly covered by any of the schemes which the Commissioners were at present engaged in preparing.

Neon Electric Signs.

Varying Types of Neon Signs and some Interesting Data.

WE have received from Messrs. Philips Lamps, Ltd., some interesting data regarding neon signs, the salient features for which are claimed to be great penetrative power of the light obtained, small cost of upkeep, and an entire absence of anything approaching dazzle or heat. The vividness of the colour of neon lighting is such, it is claimed, that the sign stands out conspicuously from all other forms of illumination. It arrests attention and can be easily read from a great distance—even in foggy weather. The signs can be supplied in three different colours, red, blue, and green.

The efficient running is naturally a point of the greatest importance in exterior illumination, and in this respect Neon signs can be used with great advantage. The makers guarantee their tubes for one year, calculating a year to be equivalent to 1,800 burning hours. In actual practice this figure has been exceeded by 100 per cent. and more before it has been necessary to have the tubes re-filled with new gas. The patented construction and connection of the tubes assures, it is claimed, an absolutely steady light without the least flicker. Further, the tubes are not affected by continual incandescing and nigrescing, which is so detrimental to the apparatus, as special resistances are employed which give an efficient damping effect to the oscillations. The standard working pressure for the signs is 3,500 V, and the consumption of a 10-ft. length of 13-mm. tube is only 90 W. This diameter is normally used for the tubing, but special tubes are made of diameters varying from 7 mm. to 30 mm., the consumption varying accordingly. In addition to the ordinary type of neon sign, Messrs. Philips also manufacture box signs with tubes on one or both sides, as desired, in red, blue, or green, all the electrical accessories with the exception of the rotary convertor (if necessary) being contained in the box. Another form of sign is the "Mignon" Case sign, in which the tubes are worked off an induction

Neon Electric Signs.

coil connected to a 6 to 8-V supply. They will operate from an accumulator, or where an a.c. supply is available a low-pressure transformer is utilised. Here, again, tubes can be supplied giving red, blue, or green colours, in block or script formation as desired.

This form of sign is very much cheaper to produce than those previously mentioned, as no high-pressure transformers, resistances, &c., are necessary. Moreover the daylight appearance is greatly enhanced by the fact that the neon tubes are recessed in a wooden background, and all the necessary accessories are contained in the case, the whole forming an entirely self-contained sign.

The "Mignon" sign is particularly suitable for use above entrances to premises, shop windows, or show cases, and in all situations where a small and inexpensive sign is required. The accompanying illustrations show two types of neon signs which are produced by Messrs. Philips.

The Ideal Wiring System.

I have read with interest your numerous readers' views of ideal wiring systems, but I believe most will agree that the best system to be adopted depends, first, upon the premises to be wired; secondly, on cost; and thirdly, on efficiency.

For country houses and small estate buildings, lead-sheathed cables have proved a perfectly sound proposition; large numbers of contractors are using this method to-day, and are perfectly satisfied, except so far as bonding is concerned. The main objection, as some of your readers agree, has been the use of small screws and clips of various sizes.

To obviate this, some cable manufacturers recently have gone to the trouble of running a separate earthing wire under the sheathing, this wire being earthed to a common terminal on the base of the junction box. This, on the face of it, appears very well, and has possibly been thought out for use as their system, with their special junction boxes, but there is always the risk of the earth wire breaking through the insulation of one of the feed wires, on sharp bends, or the wire itself breaking, and I am convinced that most cable manufacturers will not adopt this unnecessary method of earthing lead-sheathed cables.

I have recently designed and patented a box eliminating the troubles mentioned by your readers, and although it is a recent production, it has met with favour from contractors generally, and I am receiving repeat orders. The "Bonfix" patent junction box was kindly described and illustrated in the ELECTRICAL REVIEW of March 25th, and the method adopted eliminates all screws. The adoption of spring clips, as part of the base, successfully bonds and fixes the cable in one operation by merely sliding the cable under the clips, the clips being made wide enough to accommodate a single-, 2- or 3-core cable.

If a cable with an earth wire is used, the earth wire is bound round the centre fixing screw under a washer, thus giving two independent bonds to each cable.

H. H. Leage,
SEFTON-FIDDIAN, LEAGE & Co.

London, *May 17th*, 1927.

We have followed the article on "The Ideal Wiring System" with much interest. As considerable users of C.T.S. and lead systems we have arrived at the conclusion that the most all-round satisfactory method is to combine the use of a liberal amount of slip tube with either. The conduit gives all the protection needed (and also the rigidity so desirable in various instances) when passing through walls and all hidden or doubtful places, and for protection from switches to ceiling we invariably use a length of conduit. Threading through joists does all the rest and enables the work to proceed expeditiously and safely. We think that C.T.S. treated thus, with a little careful planning, gets as near to the "ideal" as any reasonable person can require. Our opinion has frequently been endorsed by—among others—supply officials.

Watford, *May 20th*, 1927.

Safety First: Earthing Transmission-line Towers.

Having found that tests published in the United States, in the National Electric Light Association's *Proceedings*, 1926, pp. 663-5, Vol. 83, are not yet available in some of our London technical libraries, I am led to call attention to them as of more than passing interest.

To determine whether the voltage drop along the surface of the ground near a three-conductor 120,000-volt transmission tower would be dangerous to life at the moment that one conductor becomes accidentally earthed on the tower, tests were made at low voltage and the results applied as follows:—

Test number	1	2	3
Figure number	12	13	14
At power house, 1st tower	Earthed	Earthed	Earthed
do. 1st Condtr.	,,	,,	,,
2nd tower	Not earthed	not earthed	not earthed
Possible earth current at moment 2nd cond't'r is accidentally earthed at	1st tower	2nd tower	3rd tower
Amperes	5,700	5,700	2,375
Calculated volts to earth	2,650	19,350	6,175
Volts through person leaning against tower...	1,590	12,600	4,550 to 6,175
Volts between a person's 2 feet on ground ...	300	3,000	1,300
	ft. in.	ft. in.	ft. in.
Scale 1 inch stated on figure equals	4 0	4 0	10 0
Square tower, measures	10 3	1 6	9 0
Test recorded, East ...	11 0	9 2	14 0
West ...	—	9 9	14 0
North ...	4 0	5 6	14 0
South ...	—	1 0	14 0

Presumably the same tower is represented in each test, and I venture to think scale on fig. 13 unlucky.

A favourite question of mine has been:—What practical value have you discovered for earth wires (against lightning) on overhead transmissions?

Here is a very substantial reason for installing earth wires, also for the efficient earthing of every tower. Setting their feet in concrete insulates them.

Theodore Stevens.

London, *May 10th*, 1927.

Sheath Losses in Cables.

With reference to Capt. Dunsheath's remarks, he will be interested to know that a bridge method has been developed for measuring the losses in a 3-phase 3-core system, both for the flat and triangular spacing

It is hoped to publish details of the method in due course.

London, *May 21st*, 1927.

Electric Power in Agriculture.

A letter in *The Times* on May 19th from Mr. W. W. Blair-Fish states that there are some very cold figures and estimates in a report "Electric Power in Agriculture" which Mr. Dampier Whetham presented to the Royal Agricultural Society in 1925. I have again read this report; valuable as it is in stating the position in 1924, I venture to suggest that it does not form a basis, to quote Mr. Blair-Fish, "to wait until the rural demand has become sufficiently urbanised to be self-supporting." I do not think it was in the mind of Mr. Dampier Whetham that further progress could not be made in electric machinery for the agricultural industry. He states: "I regard lighting as the chief function of electric current in country districts, and power as subsidiary"; further he states: "experience shows that at present electric ploughing is not usually convenient or a financial success." However, his figures show a demand of 9,000 to 12,000 units per square mile which can be obtained if suitable electrical agricultural machinery is provided.

At last year's Royal Agricultural Show at Reading I inspected a rotary cultivator; at a later date I obtained the opinion of a well-known agriculturist, who said it was a splendid machine and its effect on the land was remarkable. Dr. A. Ekström in his paper "Twenty Years' Practice in Rural Electrification" (Sweden), states that in Germany, lately, rotary tillers have aroused great interest. Major McDowall's system of conveying current from a point in the field to travelling electrical apparatus shows great promise. Mr. Dampier Whetham states that the demand for electric power for drying crops is likely to be small. The account in your journal of April 8th this year shows progress.

I have followed the beet sugar industry as a means of improving the load factor. The present method creates a demand for a short period of the year, but again there are hopes of improvement. The report on the De Vecchis beet sugar progress working in Italy is very encouraging; the process can be extended over 300 working days, instead of about 90 days, and further, it can be carried on in small units over a wide area, which would provide another demand for electric power.

If rural electrification is to be subsidised, let at least some of the funds go to improving electrical apparatus which will increase the load factor and assist the agricultural industry in reducing cost of production, and not delay progress until the rural areas grow into urban districts.

E. A. Mitchell.

Cuckfield, *May 21st*, 1927.

The Adequate Distribution of Electricity.

I should like to comment on several matters arising out of your issue dated May 13th. The first is the importance of the point put forward by Mr. E. E. Hamar in his article on "Publicity for Supply Undertakings," *viz.*, that ordinary people do not really know for what, and to what extent, they can use electricity. In this connection, the E.D.A. ballot competition did a great deal of good educational work.

The second is the note on inadequate distribution mains (p. 783). It is astonishing what a large number of consumers are not "allowed" by their electricity supplier to connect up cookers and heaters of over three kilowatts capacity. Coupled with these starved consumers are an enormous number of would-be users, who cannot obtain a supply "because no main is laid."

I know of central-station engineers who proudly point to stacks of cards, on which are recorded the names of prospective consumers, to whom it has been agreed to give a supply—but the station staff is entirely unable to cope with the work for many months to come. Under such circumstances it would seem wise to call in the assistance of a contractor, for it is not merely a question of adding to the station load, but also one of moment to the electricity industry generally as a means of increasing the sales of materials and apparatus. Further, these unconnected "consumers" are made an excuse for delaying rural extensions (this is, of course, where the shoe hurts my hobby).

In referring to the first scheme of the Central Electricity Board (p. 754), you mention that the Central Scotland area includes 4,980 square miles. My comment is: how few of those square miles, comparatively, will see a supply of electricity during the next decade, *unless* some radical change is made in bringing about an effective distribution network. By the way, both Fifeshire and Ayrshire can show (thanks to the enterprise of Messrs. Thompson and Bexon, each in his respective area) a very good example to most of the rest of Great Britain in the way of rural electrification.

The Central Electricity Board has as its chief object the production of cheap power—but this is not of much use unless it is effectively distributed, and that to an educated public. The amount of power mentioned as being the requirement of the Central Scotland area is far too little, if that district were only properly developed.

Hence I venture to submit the problem to your readers: "What is the best method of ensuring an adequate and universal distribution of electricity in Great Britain?"

R. Borlase Matthews.

Greater Felcourt, East Grinstead, *May 20th*, 1927.

A Commutation Problem.

With reference to the inquiry by Mr. A. O. Griffiths which appeared in your issue of May 6th, since the generators operate satisfactorily when new and for a short time after turning the commutators, the trouble would appear to be electrical and not mechanical, as if it were the latter it would always have existed and been noticeable.

It is quite possible that after turning slight sparking existed, not noticeable, and in small high-speed motors of this class it is difficult at times to locate the trouble, but a consideration of the following may help to solve the difficulty, having regard to the particulars that are available:—

(*a*) Since the trouble is more apparent after turning, it may be that the reduced diameter of the commutator, although small, has reduced the brush-contact area; if the current density of this has been pushed to the limit and perhaps over in the new machines as may happen in these small generators, good conditions exist when new, but as soon as this area is reduced, if ever so little, the density will be increased and disintegration of the brushes will take place; sparking will occur at an earlier period of use and will become more marked each time the commutators are turned. The current density of this area should not exceed 30 amps. per sq. inch.

(*b*) The contact area being reduced, the speed may be such as to give insufficient time for good commutation, and a coil not under commutation comes under the brushes.

(*c*) If the rotation is such that the toe and not the heel of the brush is against rotation, it is possible for heating to take place due to the smaller brush section at this point.

(*d*) It may be that during turning operations the commutator has moved slightly on the shaft.

As the conductors are evenly spaced around the armature and average 7½ deg. from the neutral position, the commutator must have moved, otherwise this condition has always existed; this, however, should be checked up electrically with a new machine when loaded to get this doubtful point settled.

A remedy for these conditions and to keep the cost of the machines down at the same time would be to increase the size of the commutator and so get a larger contact area; this could be taken up with the manufacturers.

P. Oaks.

Blackheath, *May 12th*, 1927.

A Mysterious Occurrence.

Can any of your readers account for the following?

On going to inspect a transformer house one Monday morning, after the usual week-end stoppage, we were surprised to find that the floor was flooded to a depth of four inches with oil from the transformer. An examination of the drainage tap showed that it had not been turned on, and it had not been disturbed, as it was thickly coated with dust, and a plug in the end of the mouth of the tap was also intact.

The transformer was still found to contain thirteen inches of oil, which we eventually drained off. After lifting the interior out, and cleaning the container, we carefully examined and tested the container for a leakage, but failed to find any; therefore we put the interior back again, filled up with fresh oil, and coupled the transformer up. It has now been working three weeks, and there is no sign of any further leakage.

The top is bolted down tightly with a packing ring between the lid and the edges of the container. The transformer is of 250 kVA, primary 2,500 volts, secondary 550 to 525 volts, periods 50, and holds about 200 gallons of oil. The old oil had been in use about 10 years.

I should like to hear some views on how this oil—over a hundred gallons—got out.

W. H. M.

May 16th, 1927.

Cheap Electricity.

Our attention has been drawn to a letter from Mr. R. Borlase Matthews which appeared in your issue of April 29th last, on the subject of your review of our pamphlet entitled "Cheapest Electricity—How to Obtain It."

We cannot allow to pass unchallenged the following statement:—

"This is, of course, a condensed version of a pamphlet by Mr. W. C. Mountain, entitled 'A Word in Favour of the Independent Power Plant.'"

Also the implied suggestion that, because Mr. Mountain is not disinterested in power plants, our announcement that the booklet in question was written by an independent electrical engineer is inaccurate. Nothing could be further from the truth, and we shall be glad if you will let your correspondent know this through the medium of your columns, seeing that we now give you—in confidence and not for publication—the name and address of the independent electrical engineer whose opinion is printed in the pages of our booklet.

Ruston & Hornsby, Ltd.
J. A. Walker, *Advertising Manager.*

Lincoln, *May 16th*, 1927.

[We are satisfied that the pamphlet, "Cheapest Electricity," was written by an independent electrical engineer, of whose *bona fides* there can be no question.—Eds. Elec. Rev.]

Balancing Loads on Three-phase Services.

It would be of interest to know to what extent a supply authority can make regulations for balancing circuits on 3-phase supply. There appears to be some divergence of opinion on this point, and practice varies very much in different areas.

A case in point is one in which the supply company require all loads over 3 kVA to be balanced over the three phases, and on making inquiries the contractor was informed that the load on each phase must, for all practical purposes, be identical. The supply authority engineer even went to the length of asking that individual sections of the installation should be balanced in themselves, *e.g.*, both window and shop lights were to be balanced separately, and even a small load of 250 watts for use in lavatories and offices was to be divided over two of the phases. Further, as balancing is to be in watts, not points, will the supply company have the power, at a later date, to insist on a redistribution in the event of the ultimate wattage at various points differing from the wattage estimated during the erection of the installation?

Perhaps contractors or supply authorities, in districts where the distribution is three-phase, will state their experience on this point—though a legal opinion as to the supply authority's rights would be even more valuable.

E. Arthur Pinto.

Ramsgate, *May 16th*, 1927.

[Supply authorities have no legal right to make "regulations"; those issued by the Electricity Commissioners alone are valid. The only sound bases of refusal to connect an installation are (1) inadequate insulation resistance, and (2) reasonable ground for holding that the conditions obtaining on the applicant's installation would adversely affect the supply to other consumers. The official regulations have no reference to balancing loads.—EDS., ELEC. REV.]

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from the stated dates. In the case of foreign applications, the name and address of the British representatives are also given:—

May 11th.

Cadillac. No. 473,273. Class 6. Electric vacuum cleaning machines and parts thereof, and ventilating fans and parts thereof.—Clements Manufacturing Co., Chicago, U.S.A. (Lloyd, Wise & Co., 10, New Court, Lincoln's Inn Fields, W.C.2.)

Miniamp (lettering and design). No. 474,620. Class 8. Radio valves.—S. Hector, trading as the Miniamp Radio Valve Co., 32J, High Holborn, W.C.1.

Uniflex. No. 471,506. Class 13. Reflectors.—Holophane, Ltd.

Stegolith. No. 473,202. Class 50. Electrical insulating substances, and electric insulators made therefrom, namely, holders, plates, sockets, handles, or other switch parts.—Steatit Magnesia Gesellschaft, Berlin. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

May 18th.

Hætanic. No. 479,688. Class 5. Unwrought and partly wrought metals used in manufacture.—L.P.S. Electrical Co., Avenue Road, Acton, W.3.

Rotomag. No. 477,509. Class 6. Ignition apparatus for internal-combustion engines—Joseph Lucas, Ltd.

Tefag, Berlin (lettering and design). No. 472,327. All goods in Class 8.—Die Telephon Fabrik Gesellschaft vormals J. Berliner, Berlin. (Abel and Imray, 30, Southampton Buildings, Chancery Lane, W.C.2.)

Siemens & Halske, S. & H. (lettering and shield design). No. 474,996. Class 8. Physical and electro-technical instruments and apparatus, Pupin coils, resistances, accumulators, &c. No. 475,000. Class 15. Glass. No. 475,001. Class 16. Porcelain and earthenware. No. 475,002. Class 17. Manufactures from mineral and other substances, for building or decoration. No. 475,011. Class 40. Goods manufactured from india rubber and gutta-percha.—Siemens & Halske Gesellschaft, Berlin. (Hazeltine, Lake & Co., 28, Southampton Buildings, Chancery Lane, W.C.2.)

Celestion. No. 475,669. Class 8. Microphones, &c.—Electrical Manufacturing Co., Ltd., 29, High Street, Hampton Wick, Middlesex.

Noctoscope No. 478,273. Class 8. Optical apparatus and instruments.—Television, Ltd. Motograph House, Upper St. Martin's Lane, W.C.2.

Long Life Lithanode, Our Slogan for 45 Years (lettering and design). No. 476,603. Class 8. Electric accumulators (not for medical purposes).—Lithanode Co., Ltd., 190, Queen's Road, Battersea, S.W.8.

Monette (lettering and design). No. 478,287. Class 8. Apparatus for use in radio-telegraphy and telephony.—Bruno Becker, trading as George Becker, 203-205, Edgware Road, London, W.2.

Jupiter. No. 476,515. Class 13. Electric lamps (ordinary), lamp holders, switches (ordinary), wall plugs, and other similar electric fittings.—Die Jupiter Licht Gesellschaft, Keisern & Brasch, Berlin. (Chatwin & Co., 253, Gray's Inn Road, W.C.1.)

Repex. No. 476,331. Class 50. A composition of asbestos and bitumen for use in sealing accumulators.—Chloride Electrical Storage Co., Ltd.

Published Specifications.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ABRAM.—Electric light installation, 50 houses, Bickershaw, for the U.D.C.; W. Aspinall, clerk.

ASPATRIA (Cumberland).—Church, for the Wesleyan trustees.

AYRSHIRE.—Shops and houses at Troon (£3,300); Wm. Govan & Sons, builders, Prestwick.

BARNSLEY.—Business arcade; J. R. Wilkinson, architect, 15, Regent Street. Hotel, for John Smith's Tadcaster Brewery Co., Ltd.; Bertram Wilson, Architect, High Street, Tadcaster.

BEDWAS AND MACHEN.—Housing scheme (40), for the U.D.C.; surveyor.

BLYTH.—Central School, Plessey Road; Education Committee.

BOURNEMOUTH.—Business premises and flats, Holdenhurst Road; H. J. Holt, Ltd.

BRIGHTON.—Operating theatre, &c., Royal Alexandra Hospital, Governors. Synagogue, Middle Street; Brighton and Hove Hebrew Committee. Alterations, 28, St. James Street; F. W. Woolworth & Co. Housing scheme, North Moulescombe Estate (184); borough surveyor.

BULGARIA (Sofia).—New slaughterhouses for the Town Council (100,000,000 leva). An international competition for plans and projects will be held.—*Reuter's Trade Service* (Sofia).

BURTON-ON-TRENT.—Extension of board room block, for the B.G.; R. S. Litherland, architect, 10, High Street.

CHELMSFORD.—First part of £91,000 county office scheme, Duke Street; Essex county architect.

CHESTER.—Housing scheme (26), Hoole Lane; C. Greenwood, city engineer, Town Hall.

CHESTERFIELD.—Baptist church, Cross Street, with heating and lighting (£9,400); Jackson & Fryer, architects; W. G. Kirk, Ltd., builders.

DERBY.—Hospital (£33,999), Friar Gate; J. W. Wildgoose and Sons, Ltd., builders, Matlock.

DOUGLAS (I. of M.).—Loch promenade improvement (£60,000); Corporation and Harbour Commissioners. Hall, corner Hanover Street and Lord Street; Salvation Army.

EDGEHILL (Devon).—Extensions to Girls' College, with electrical work, for the governors (£15,000); Rowntree, architect; Ellis & Sons, builders, Bideford.

EDINBURGH.—Warehouse and garage in Leith Walk; Danish Bacon and Co-operative Trading Co., Ltd. Secondary school, Leith Academy (£66,000), for the Burgh E.C.; Reid & Forbes, architects, 7, Ainslie Place.

FALKIRK.—School for Stirlingshire Education Authority; Master of Works, Education Authority, Stirling.

FERRYHILL.—Primitive Methodist church, with electrical work; T. W. T. Richardson, architect, Stockton-on-Tees; G. W. Lazenby & Co., Ltd., builders.

GLASGOW.—Warehouses in Sauchiehall Street for Messrs. Woolworth; the manager.

GOUDHURST.—Central school; Kent Education Committee.

GRAVESEND.—Improvments, Technical Institute, at School of Art; Kent Education Committee. Club, Overcliffe; Gravesend Trades Hall, Ltd.

GRAYS.—Re-erection of works, Thames Road (electrically equipped), (£30,000); Drums, Ltd.

HARROGATE.—Re-erection of portion of the George Hotel (several thousand pounds); Mr. Edge, manager. Police headquarters; P. O. Platts, County architect, County Hall, Wakefield.

HASTINGS.—Reconstruction of baths, with electrical work (£72,004), for the T.C.; borough surveyor. Entertainment hall, Gordon House, and lecture room, Buchanan Hospital; H. Ward & Sons, architects. Business premises, York Buildings, for McIlroy Bros., Ltd.; Callow and Callow, architects.

HAWARDEN.—Additional housing scheme (36), Penyffordd, for the R.D.C.; F. Barrett, surveyor, Wold House.

IRISH FREE STATE (Pembroke, Dublin).—Houses, Meleady's Field (77), Havelock Field (77), and Irishtown Road (29), for the U.D.C.

KEIGHLEY.—Secondary school for girls; West Riding Education Committee.

KEMPTON.—Filters and mains at Metropolitan Water Board works (£90,000).—W. Moss & Sons, Ltd.

KETTERING.—Dispensary and weights and measures offices, Market Street; Northants C.C.

KNARESBOROUGH.—Sanatorium, for West Riding C.C.; the clerk, County Hall, Wakefield.

LEEDS.—54 houses, York Road, 68, Meanwood Estate; city engineer.

LLAY (Denbighshire).—Housing scheme (200), for the Llay Main Colliery Co., Ltd.

LONDON (E.C.).—Extensions and alterations, engineer's department, Guildhall; City engineer. Extensions, Guildhall School of Music, for Corporation; L. & W. Whitehead, Ltd.

(Whitechapel, E.).—Buildings, 196-200, Commercial Road; A. T. G. Harbour for P. Young.

(Cricklewood, N.W.).—Aqueduct (£105,000); Metropolitan Water Board.

(Hendon, N.).—Bank and shops, Edgware Road and Station Road, Watling Estate; B. W. Blower.

(Bermondsey, S.E.).—Buildings, Saltpetre Works, Neptune Street, for Brandram Bros., Ltd.; J. Perkins & Sons, Ltd.

(Lewisham, S.E.).—Church and elementary school, Moorside Road, Downham; Roman Catholic authorities.

(Brixton, S.W.).—Trade school for girls, Clapham Road; L.C.C. Education Committee.

(Tooting Junction, S.W.).—Repertory theatre (£30,000), Mitcham Road, for the Furzedown Repertory Theatre Guild.

LUTON (Beds.).—Works extensions, for Vauxhall Motors, Ltd.

LYMINGTON (Hants.).—Additional 34 houses, for the T.C.; borough surveyor.

MANCHESTER.—Hospital for Manchester Northern Hospital for Women and Children; C. E. Marshall, secretary, 38, Barton Arcade. Infants' school, and alterations to Blackley Municipal School; S. Hey, director of education, Education Offices, Deansgate.

MUSSELBURGH.—Housing scheme (52), Monktonhall; burgh surveyor.

NEWHAVEN (Sussex).—130 bungalows, Telscombe and Saltdean, for the Peacehaven Estates Co.

NORTHANTS.—Mental hospital; County Hospital Committee.

OULTON.—Mental colony (£500,000); West Riding C.C.

PAISLEY.—Garage for J. McFadyen & Co., Ltd. (electric light and central heating); the manager.

PRESTWICH.—50 houses, Langley Estate, for U.D.C.; Titterington Bros. Housing scheme (76), for the T.C.; burgh engineer.

ROSS (Herefordshire).—Housing scheme (50), for the U.D.C.; E. R. Davies, clerk.

ROYSTON.—Extensions to hospital, with kitchen wing; B. Parker, architect, Norton Way, Letchworth, Herts.

SALISBURY.—Conversion of St. Edmund's College to municipal offices and council chamber (electric lighting); W. J. Goodwin, city engineer and surveyor, Municipal Offices.

SEVENOAKS.—Central school for boys; Kent Education Committee.

SHIRLEY.—66 houses and 52 garages, Wickham Road; Ivall Bros., Shirley Nursery, Wickham Road.

SIDCUP.—Secondary school; Kent Education Committee.

SITTINGBOURNE.—Grammar school, Borden, for Kent E.C.; W. H. Robinson, education architect, Sessions House, Maidstone.

SOUTHAMPTON.—Mental institution; medical officer of health.

STIRLINGSHIRE.—212 houses for County Council (£95,400); county clerk, Stirling.

STOKE-ON-TRENT.—44 houses, Goldenhill; city engineer.

SWANLEY.—Central school; Kent Education Committee.

SWANSEA.—Shops and cafe, Woodfield Street; D. Jones.

TAUNTON.—Five transformer sub-stations, for the T.C.; Ivor F. Shellard, borough engineer.

TENTERDEN.—Mental institution; Kent C.C.

TORQUAY.—Houses (238), Barton, for G. E. Tozer. Housing scheme (130), Windmill Hill, for the T.C.; borough surveyor.

TROON.—Housing scheme (104), with electrical work, for the T.C.; burgh surveyor. Shops and houses (£3,300), Dundonald Road; W. Govan & Sons, builders, Prestwick.

WALSALL.—Hospital (£30,890), for the T.C.; borough surveyor.

WARLINGHAM.—Nurses' home, Mental Hospital (£17,000), for Croydon Corporation; J. B. Edwards, Piccadilly.

WEDNESBURY.—Extensions, County Technical College, for Staffs. E.C.; education architect, Stafford.

WEST LOTHIAN.—Rebuilding Picturedrome after fire for Armadale Picturedrome Company; the secretary.

WREXHAM.—Additional 328 houses, for the R.D.C.; surveyor.

The

Electrical Review

VOL. C. JUNE 3, 1927. No. 2,584.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

Tariffs and Wayleaves.

WE venture to think that in refraining from using the Electricity (Supply) Act as a text for his presidential address to the Incorporated Municipal Electrical Association, Mr. R. W. L. Phillips was extremely well advised: the electrical industry has read, said, and heard enough on that subject to last for a long while to come; the working of the Act will, however, provide abundant material for comment and criticism when the machine gets into motion. We would congratulate Mr. Phillips also on his timely reference to the excellent Report of the Advisory Committee on Domestic Supplies of Electricity; as he says, that Report was overshadowed by the Bill, but it is too valuable a document to be pigeonholed, and thanks are due to the president for bringing it into prominence on so appropriate an occasion.

It will be observed that he tacitly accepts the two-part tariff as correct in principle, his comments relating mainly to the method of determining the fixed charge; this has always been a vexed problem in connection with domestic consumers, and as Mr. F. W. Purse recently demonstrated in our columns, it offers difficulties even in the case of bulk supply. The Advisory Committee itself was unable to arrive at a definite conclusion on the subject. We would suggest that so far as domestic electricity supply is concerned, it is undesirable to attempt to make assessments on individual installations; a broader basis should be sought, founded on averages, not on particular instances. Mr. Phillips almost committed himself to this view, hinting that the actual method adopted was immaterial, and that the practice followed in fixing the values of other forms of rating might meet the case sufficiently well. The universal adoption of a uniform principle of assessment, leaving the actual charge to be fixed by each undertaking for itself, would, as he says, be of immense benefit to the whole country. Even now, a large number of undertakings adhere to the flat-rate system, which discourages the development of the use of electricity in the household.

With regard to that other very important question—the cheapening of distribution—Mr. Phillips's comments on the difficulties and abuses of the wayleaves problem are abundantly endorsed by Mr. W. C. Bexon, in

his practical paper on "Distribution over an Extensive Area." Both these gentlemen have acquired extensive experience in the negotiation of wayleaves, and Mr. Bexon in particular is somewhat bitterly eloquent over the obstacles presented not only by landowners and tenants, but also by the too-stringent regulations of the Post Office and the Electricity Commissioners. It is a familiar subject, a grievance of long standing, but practically no progress has yet been made towards facilitating the use of overhead lines in rural areas; we hope that, as the result of the publicity given to it at this Convention, this very urgent question may receive the attention that is its due.

The All-Electric Home Competition.

In this issue we are able to give the results of the competition which formed a part of the recent E.D.A.-E.L.M.A. Campaign. We extend our heartiest congratulations to Miss Gardiner, who headed the list of prize-winners, as well as to the others comprising the list. It is peculiarly appropriate that a lady should secure the first prize, for the Campaign was primarily a ladies' affair, being directed towards the improvement of lighting in the home as a first step to complete domestic electrification.

It is noteworthy that so large a body of people took a practical interest in the Campaign; about 150,000 papers were received. The order of preference of the public for the given attributes of electric lighting should form a useful basis for future publicity.

We think that it can be said that this branch of the Campaign was successful, and there is no doubt of the excellent results obtained from the all-electric demonstration homes which were set up all over the country.

It may be possible in a short time to give some more definite information regarding the effects of the Campaign and the lessons to be learned from it, but in the meantime all concerned can rest assured that the money spent was well spent.

Electricity Used Dangerously.

In a leaderette under this title in our issue of September 19th, 1924 (p. 418), we drew attention to certain conditions under which the use of electricity might be attended with danger to person or property. Referring to the introduction of broadcasting, we said: "the wearer of a headphone which happens to be faulty may, in effect, have an earthplate clamped to his head, or hers, and on picking up an electric kettle or other device which is likewise faulty may have a very unpleasant experience." To avoid such an accident we advised occasional inspection. Unfortunately last week precisely what we had foreshadowed as a possibility was realised in fact; a woman wearing headphones apparently grasped an electric table-lamp fitting which was in a faulty condition, and received a fatal shock. It appears that the headphones, which were connected to a crystal receiving set, were likewise faulty, a not uncommon occurrence, so that the circuit to earth was complete. As we have pointed out, there is in bedrooms as a rule no means of making contact with earth, so that the chance of receiving a shock from a faulty fitting is infinitesimal, but the extension of the wireless circuit with its necessary earth connection changed the conditions.

It will be seen that two faults must occur simultaneously before the risk arises at all; in the present instance one of them was known to exist, for the lamp fitting was out of order and the family of the unfortunate lady, it was reported, "had been anxious about her making use of it." The fitting should certainly have been put out of commission or repaired directly it came under suspicion—and the same applies to all electrical apparatus, whether fixed or portable.

In view of the combination of circumstances necessary to bring about an accident of this kind, we do not regard the risk as one that calls for drastic action; it is no greater than scores of others to which we are constantly exposed in the daily round. But those wh care to take precautions can readily insert a tran former between the receiver and the listening circuit at small cost and without detriment to the reception It will then be necessary for faults to occur simulta neously in three separate apparatus— a contingency s remote that no one need worry about it.

A South-East Lancashire Scheme.

We have received from the South East Lancashire Electricity Advisor Board a copy of a document which is o considerable interest from severa points of view; a *résumé* of its con tents appears elsewhere in this issue. It is describe as "indicating a method by which the District coul be developed with general advantage, provided th Central Electricity Board could make the necessar arrangements for carrying it into effect," but th authors "expressly refrain from putting forward th scheme as a proposal or recommendation within th meaning of the South-East Lancashire Electricity Dis trict Order, 1923," yet it has been "approved by th South-East Lancashire Electricity Advisory Board," on May 24th.

The South-East Lancashire electricity supply authorities are noted for their enterprise and alertness; even before the Government took action in the matter of co-operation, some eleven years ago, they had formed a committee to prepare a scheme of interconnection for Lancashire and Cheshire, and on other occasions they claim to have been first in the field. Last year, when the Electricity Bill was passing through Parliament, a Special Committee of the Advisory Board proposed that the Board should be replaced by a Joint Electricity Authority, with a view to developing the District and securing a lower tariff within that area than the national tariff. The idea was, as we said (October 15th, 1926, p. 606), to secure exemption for the area from the collective operation of the national scheme; but the Board did not actually adopt the proposal. In the present instance, when it "approved" the Committee's scheme, the Board also adopted a resolution agreeing to afford facilities to, and to co-operate with, the Commissioners in the preparation of a scheme for the District by the latter.

Our reading of the circumstances is that the Board, through its Committee, is endeavouring to shape its ends and to lead the Commissioners in the direction in which it would have them go. Up to a point, this is a commendable policy, and it certainly does credit to the shrewdness of the authorities, to which we have already alluded. But, as the Commissioners indicated to a deputation from South-East Lancashire last year, an area under the national scheme may, and probably will, comprise more than one Electricity District—perhaps five or six of them. In the scheme before us we see no evidence at all of any recognition of this fact; the scheme relates almost solely to the one Electricity District, takes no account of interconnection with external areas, and provides no 132,000-V trunk mains. We gather that, as before, South-East Lancashire wishes to be left to work out its own salvation. Technically, we do not criticise that ambition; very probably the residents in the District would be better off if they could gain their end. But the Act has been passed, and *now we must all think nationally*. It is not in the national interest that South-East Lancashire, or any other area, should enjoy a selfish isolation; it has been decreed by Parliament that we must all pull together, even though some Districts gain nothing—or even lose a little—thereby. We think we see in this proposition the parochial policy again, on a larger scale, it is true, but still the same in essence. It will not do: broader views must prevail, and we have no doubt that the Commissioners, when they transmit to the Central Electricity Board a scheme involving S.E. Lancashire, will be found to have gone their own way, and to have dealt with the northern counties as a whole.

Deptford (East) Re-visited.

A brief outline of the extensions of plant carried out during recent years to meet the needs of electric railway traction, in addition to normal industrial load expansion.

THE Deptford (East) electricity generating station, the pioneer high-voltage plant of the world, is a lasting memorial to the directors of the London Electric Supply Corporation, Ltd., to Mr. G. W. Partridge, its managing director and engineer, and to Dr. S. Z. de Ferranti, whose genius gave it birth, always recalling to mind reminiscences of those stirring times of 40 years ago.

The last two original Ferranti generating sets are now being dismantled, and the remaining historic Partridge h.p. switchgear will soon be displaced, for the station now aggregates 100,000 kW, and forms one of the permanent centres of the production of electricity for the London area.

Since the station was last visited in 1919,* besides the normal growth of industrial load, it has added to its list of consumers the whole of the electrified South-Eastern section of the Southern Railway, together with considerable additions on the L.B. & S.C. section, the curves reproduced in fig. 2 indicating more eloquently than words the growth in output of the station, due largely to what is one of the most important railway electrification schemes so far carried out in Europe. The old reciprocating engines, some of which did duty for over 30 years, had of necessity to be scrapped, and the engine room which formerly housed 16,000 kW of plant is to-day occupied by turbo-generators which are capable of a combined output of nearly 10 times that capacity; a view of one bay of the engine room as now constituted is shown in fig. 1, in which eight turbines are installed, the other bay being similar.

The extension of the single-phase lighting system has been met by installing three 4,000-kVA and one 7,500-kVA turbo-alternators, generating at 2,500 volts, which pressure is stepped up by means of transformers to 10,000 volts. To meet the increase in the single-phase railway load and the growth of the industrial supply one 8,750-kW and one 15,000-kW three-phase turbo-alternators generating at 6,600 volts have been installed, while to supply the South-Eastern section of the Southern Railway, three 20,000-kW turbo-alternators generating at 11,000 volts have been installed, and a further 25,000-kW three-phase turbo-alternator for the latter purpose is to be built.

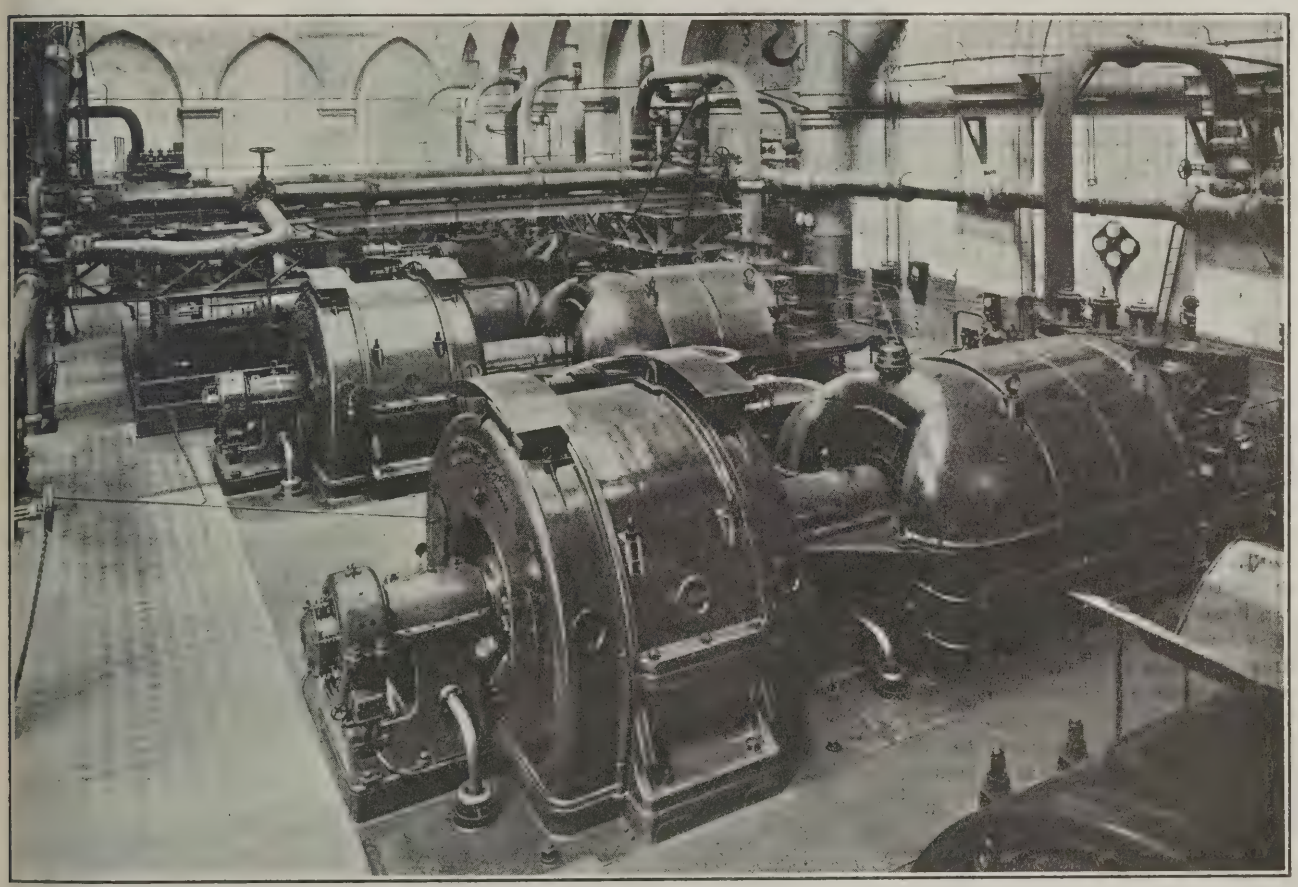

Fig. 1.—Part of the Turbo-generator Room at Deptford (East) Power Station.

With the exception of the machines which serve the lighting system proper, all the generators have been wound for three-phase working, but so built and arranged that any one set can supply the single-phase railway system. The turbines are all supplied with steam at 300 lb. per sq. in. pressure at 700 deg. F., and are bled at two stages: one high-pressure stage for water evaporators, of which one is connected to each main unit, and the low-pressure stage for working in connection with water de-aerators, one of which is used with each turbine for removing all oxygen from the condensate before it is pumped into the boilers through a closed-feed system.

* See ELEC. REV., August 9th, 1912, and July 11th, 1919.

When these extensions were commenced four or five years ago, no complete closed feed system was in existence, and the Deptford staff had to evolve a system which has proved its efficacy by limiting the oxygen content to an average of 0.05 c.c. and under. The condensate, after being removed from the condenser by the extraction pumps, is pumped through a de-aerator heater of the surface flash type wherein all air is removed by a connection to the main condenser from the water side, while at the same time the temperature is raised by means of the steam bled from the low-pressure stage of the turbine, the action being practically automatic, a constant temperature being maintained at all loads and the vacuum in the water space of the de-aerator corresponding to the temperature. The flow of water passing to the de-aerator is controlled by a float valve in the lower part of the vessel; a second, or booster, pump extracts the condensate from the de-aerator and delivers it under pressure to the suction side of the feed pumps that deliver to the boilers *via* high-pressure heaters which raise its temperature to 220 deg. F.

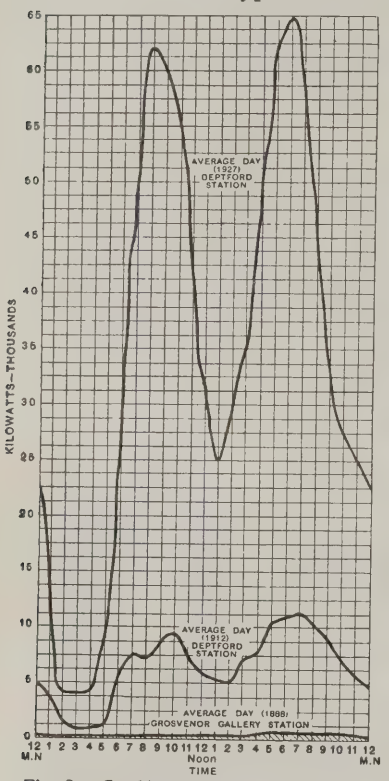

Fig. 2.—Combined Maximum Loads on Generating Station.

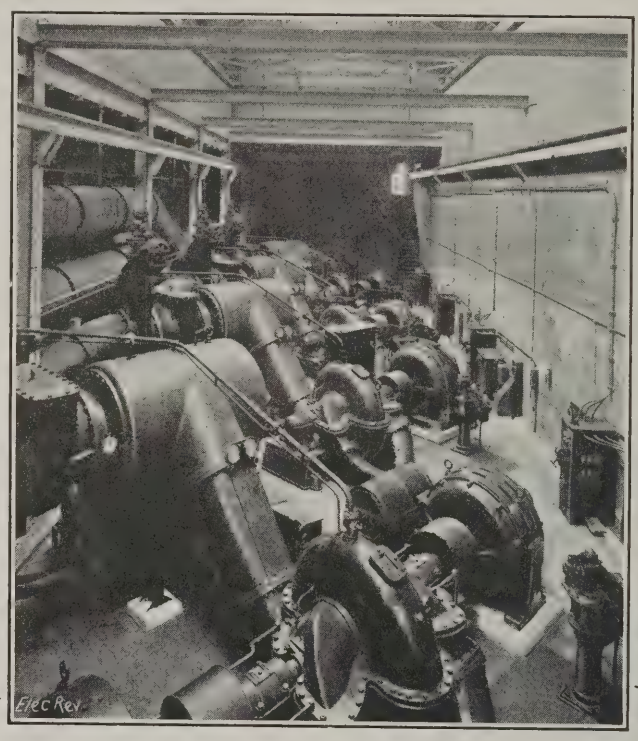

Fig. 3.—New Condenser Water Pump House.

An open surge tank is connected between the main condenser extraction pump and the de-aerator booster pump, into which any surplus condensate is discharged by the condenser extraction pump during such times as the boiler feed pumps do not require it; should the demand by the feed pumps be greater than can be satisfied by the main plant, then the pressure fall on the discharge side of the extraction pumps will allow the stored water in the surge tank to discharge into the de-aerator. An unusual feature is a connection between the surge tank and the suction eye of the feed pump, called the pressure head line, in which a non-return valve is inserted; normally, so long as the booster pump is working, this valve is kept closed by the discharge pressure of the booster pump, thus preventing the latter discharging to the surge tank; if however, the booster pump should fail, thus starving the feed pumps, the pressure head line will immediately come into action, due to the pressure on the bottom of the non-return valve being relieved, allowing the surge tank to discharge direct to the feed pumps, the tank being placed at a height above the feed pumps to ensure sufficient head on the suction side.

Each main turbine is provided with extraction and booster pumps in duplicate, one being steam driven and the other motor driven. Make-up water for the boilers is obtained from the town's mains, and is either treated in lime-soda plant, or passed through evaporators. The water, which is chemically softened, passes through an independent de-aerator before going to the boilers; that from the evaporators is either discharged to the surge tank, or otherwise mixed with the main condensate and is de-aerated along with it as described above.

To provide circulating water for the surface condensers, an entirely new pump house (fig. 3) was constructed and equipped with five motor-driven centrifugal pumps, each having a normal capacity of 1½ million gallons of water per hour. The water is drawn from the River Thames through a 10-ft. diameter tunnel, which is divided on its horizontal centre line, the top part forming the return, while the bottom suction part ends on the land side in an open 20-ft. diameter sump shaft, in which settles the larger and heavier *débris*, which is removed at intervals by grabbing; from the land shaft a 10-ft. diameter tunnel passes under the floor of the pump house to the suction side of the pumps. There are also removable screens in the land shaft which prevent floating material passing through, and for removing leaves and similar material each pump is provided with a "Deptford"

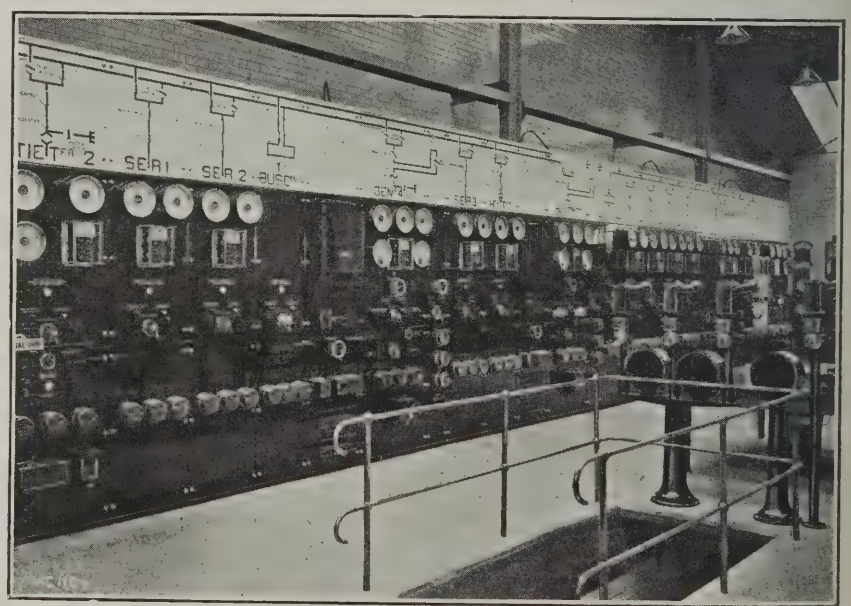

Fig. 4.—Control Room, showing 11,000-V Board.

rotary strainer on the discharge side, visible in fig. 3, after passing through which the water is discharged into two 48-in. diameter cast-iron pipes which carry it to the condensers, whence it returns through two similar pipes that converge a little beyond the land shaft into the top part of the tunnel leading back to the river; the system works on the siphon principle, and all valves on the pumps and condensers are so far as is possible electrically operated.

The cooling air for the main generators is circulated on the closed system, each having its own cooler, water for which is obtained from the circulating-water mains. Temperature-indicating and alarm devices are fitted.

The recent switch-house extension is a brick building 104 ft. long by 52 ft. wide, adjacent to the turbine room. The gear consists of 27 oil switches arranged on the top floor; on the floor below are the duplicate bus-bars, whilst on the same floor as the switches, but separated from it by a brick wall, is the main control room (fig. 4), which overlooks the turbine room. Of the cellular construction, each oil switch has a rupturing capacity of 750,000 kVA. Both the extensions on the 6,600-volt and the 11,000-volt systems are housed in this building, and to admit of both systems being connected together to suit the running conditions of the station, two 7,500-kVA banks of single-phase transformers fitted with tertiary windings have been connected in star-star; means are also provided whereby the forced oil-cooled transformers can be switched on to the single-phase railway bars to enable a supply to be given from the 11,000-volt generators, two phases of the three-phase windings being used for this purpose.

The control wiring is arranged so that it is impossible to open any main oil switch until the isolator is in the full "off" position, which avoids the danger of mistakes being made, and the main generators are protected by means of two oil switches in series, one directly against the bus-bar, whilst the other is placed by the machine, one of them being arranged for balanced protection and the other for overload only. The method of mounting the current transformers which operate the relays is to slip them over the lead covering of the cables, and they are as far away from the high-voltage gear as it has been possible to place them, so that any fault developing on the bus-bars, &c., will not involve the apparatus on which the clearing of the circuit depends. For the same reason, the control cables follow different routes to the main cables, and where they pass into the bus-bar cell structure.

The capacity of the station when the 6,600-volt and 11,000-volt three-phase systems are tied together by means of transformers has necessitated the installation of reactor coils in circuit with the transformers, and also with several of the feeders which serve the adjacent sub-station, to lessen the shock to the system in the event of a fault occurring. Some of the features of the special arrangement of the switchgear to meet the needs of the Southern Railway electrification scheme have already been dealt with.*

A complete new boiler house has been erected (fig. 5), each of the 14 boilers installed having a normal actual evaporation of 50,000 lb. of water per hour, and an overload rating of 65,000 lb. per hour, at 325 lb. pressure and a total temperature of 725 deg. F. A further 6 units are now in course of erection, each having a normal evaporation of 64,000 lb. per hour, and an overload rating of 80,000 lb. per hour. Each is fitted with a steel-tube economiser and an air heater (the gases being discharged from the stack at a temperature not exceeding 230 deg. F.), and two travelling grates, each 8 ft. 6 in. wide, of the compartment type arranged for balanced draught. Two coal shoots are fitted to each boiler to enable two different types of coal to be burnt on the "sandwich" system; each boiler is equipped with its own forced- and induced-draught fans, directly coupled to d.c. variable-speed motors, while a complete outfit of measuring instruments has been installed for each unit, there being an operating combustion engineer on duty during each shift. The seven feed pumps are all turbine driven, varying in capacity from 11,000 to 35,000 gallons per hour, the exhaust steam from them being discharged into the high-pressure feed heaters.

The ashes are discharged through a closed shoot from the hoppers into a concrete trough in the basement floor,

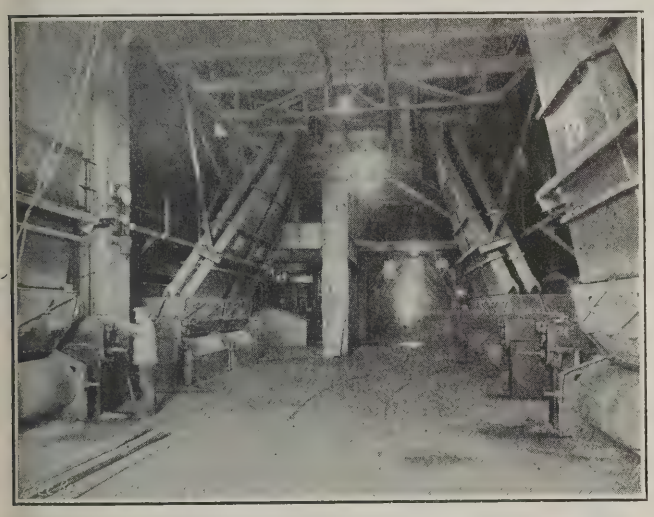

Fig. 5.—New Boiler House.

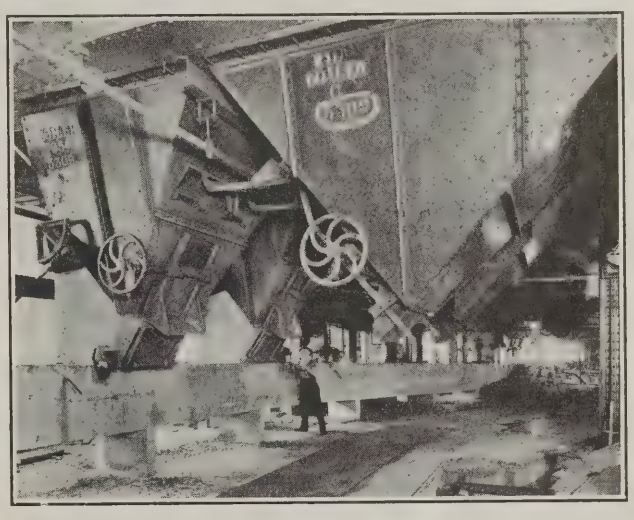

Fig. 6.—Ash Conveyor, Water-trough System.

and transported by means of a water sluice a distance of 350 ft. to a sump at the wharf front, where they can be handled by a grab crane, to be loaded into barge or wagon as required. The water is circulated by motor-driven centrifugal pumps in a pump house on the wharf front adjacent to the sump, the pumps drawing their water from the ash sump through a metal screen; a view of the sluice is shown in fig. 6.

The removal of the riddlings from the hoppers under the grates is by means of a system of ducts laid in the basement floor, whence they are blown by air to the top of the bunkers, at a height of 100 ft., where they mix with the fresh coal.

Coaling is done by two electric grab cranes of the horizontal luffing type on the wharf, which deliver into a hopper, whence the fuel is raised 90 ft. by a telpher and delivered to the bunkers, or deposited on the coal store as required, weighing being done by a track weigher, the rate of unloading being 150 tons per hour.

In conclusion, it may be remarked that work has already commenced on the adjacent site of the new Deptford (West) generating station, the contract for which was recently placed with Sir Wm. Arrol & Co., Ltd., by the London Power Co., which will in due course take over the Deptford (East) station, leaving the London Electric Supply Corporation, Ltd., to fulfil the functions of a distributor.

We are indebted to the company for the particulars and illustrations reproduced above.

Single-Phase Induction Motor Starting Devices.

A brief review of the methods employed for starting single-phase induction machines, and a description of the Ferraris-Arno method.

By G. WINDRED.

THE problem of obtaining an appreciable torque from the single-phase induction motor during the starting period is one which has occupied the attention of designers of these machines for a number of years, in fact, since the introduction of the machine, and the number of devices evolved during this period is an indication of the extensive use of this type of motor.

This does not agree with the generally accepted impression that the single-phase motor has long since become of small importance, but it is not proposed to enter here into a discussion of this point.

The object of the present article is to discuss the relative merits and otherwise of the known forms of starting device, and to describe briefly a starting arrangement giving greatly superior characteristics to any of those at present in use. It should be mentioned that the device in question was evolved in connection with traction work, for which the advantages of using only a single line for the supply of power need no elaboration.

For the purpose of comparison it will be advisable to briefly review the subject of starting single-phase induction motors, and to describe some of the better-known methods of starting and their characteristics.

Torque of Single-phase Induction Motor.

In the first place, it is instructive to examine the conditions existing in the single-phase machine at standstill and during the accelerating period up to full speed, when the machine behaves in a similar manner to a shunt d.c. motor, and is quite satisfactory for ordinary service.

It is comparatively easy to show* that no torque is produced in the rotor of an induction machine excited only in one axis by a pure alternating wave of flux, these conditions being analogous to those existing in a standard single-phase machine with only one stator winding. To produce torque in the rotor, it is necessary, of course, that an e.m.f. be produced in the rotor conductors, and for this purpose it is necessary that a rotating stator flux shall exist. The only practical means by which a rotating flux can be produced in the single-phase machine consists of the provision of an auxiliary winding on the stator, displaced mechanically usually by about 90 deg. from the main or running winding. If the two circuits comprising this stator system are excited from the single-phase supply, the stator field which results is, of course, the resultant of the addition of two approximate sign waves stationary in space and displaced in phase from each other. This resultant is a pure rotating wave of flux of approximately sine formation, its actual shape and magnitude being dependent upon the displacement of the component fluxes. In order to secure the necessary space-phase displacement of these two fluxes, it is usual to employ resistance and reactance external to the motor windings. By this means it is possible to arrange the required phase displacement experimentally and standardise for the particular type of machine concerned.†

When the rotor has attained its maximum speed under the action of this rotating field, the currents produced by self-induction in the rotor give rise to a magnetic flux which is carried out of phase with the flux producing it by the rotation of the rotor. This flux may be considered to exist under the same conditions as that produced by the auxiliary or starting winding, which may therefore now be disconnected, the rotor continuing to run under the action of a rotating field, which is the resultant of the flux produced by the main or running winding, and the flux produced by the rotor conductors themselves and carried into space phase by the rotation of the rotor.

The actual methods employed in practice for the production of an auxiliary flux are of considerable number, each being usually adaptable to a certain form of operation or for certain starting conditions.

In the case of fractional horse-power motors, such as are sometimes employed for the operation of fans, &c., the "shading coil" method of starting gives quite satisfactory results. In this method a portion of the active stator iron is enclosed in a copper coil, which may be either in the form of a few turns of comparatively heavy gauge wire or a single ring of copper. Only one stator winding in addition to the "shading coils" is provided, and the flux produced by this winding induces in the portion of the stator iron enclosed in the "shading coil" a flux which has a different space-phase owing to the different circuit constants of the magnetic system in which it is induced. Under these conditions, the resultant field approximates to a rotating sine wave, and a torque is produced in the manner already discussed above.

The limitations of the "shading coil" method of starting are at once obvious. It is impossible to obtain any appreciable starting torque with the arrangement owing to the necessarily small pole area enclosed by the "shading coil," while the starting and operating efficiency are low on account of the additional losses introduced by the "shading coil," which must remain in circuit all the time the machine is running. For these reasons the sphere of use of this device is limited to machines of very low output, where only a small starting torque is required and the operating efficiency is not of great importance.

A development of the "shading-coil" device has found some practical application in the case of small motors. In this method of starting the shading winding, of heavy gauge wire, is distributed on the stator iron in the form of a second stator winding. For starting, current is switched on to the main or running winding, while the ends of the shading winding, which are brought out to terminals for the purpose, are short-circuited, either directly or through resistance or inductance. The motor now behaves in a similar

* *World Power*, October, 1926.

† See article on "Single-Phase Induction Motor and the Starting Problem," by T. W. Davies, Electrical Review, January 4th, 1924.

manner to the "shading-coil" machine, except that in the present case the auxiliary or starting flux is produced by a distributed winding, and the field form is accordingly better. When the rotor attains its maximum speed, the shading winding is open-circuited, and the losses incurred in this winding are therefore eliminated while the motor is running.

The starting torque obtainable with this device is appreciable, but on account of the very low starting efficiency, it is not suitable for machines other than those of low output, of the order of about 1 h.p.

Perhaps the most frequently used method of starting in practice is the "split-phase" method, about which much has been written, so that it is unnecessary to dwell at great length on its characteristics here.‡ In this system the stator carries a starting winding of smaller gauge wire than the running winding. For starting, the two windings are connected either in series or parallel, and a suitable arrangement of inductance and resistance is employed in these circuits to produce the required phase displacement of the respective fluxes. When full speed is reached, the starting winding is disconnected from the mains, and the resistance or inductance withdrawn from the running winding circuit, the running winding being then connected directly to the mains.

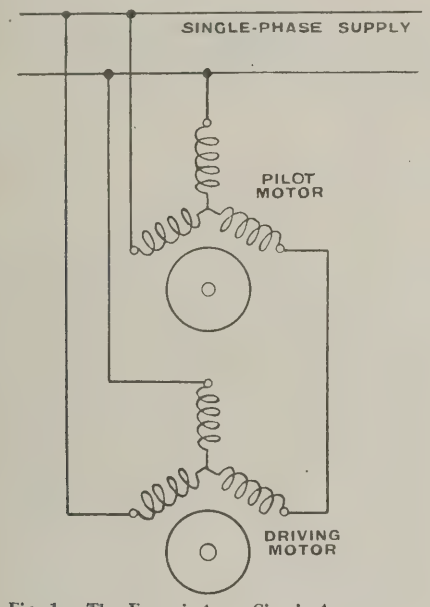

Fig. 1.—The Ferraris-Arno Circuit Arrangement.

The starting torque usually obtained with the split-phase method is of the order of 25 per cent. of the full-load value, with about twice the full-load current in the case of squirrel-cage machines, and about 50 per cent. of full-load torque on a twice full-load current in the case of slip-ring machines.

For small machines having rotors of small kinetic energy, and in cases where a starting current of from five to six times the full-load value is permissible, full-load torque at starting may be obtained by switching the motor direct on to the line. In this case the phase displacement of the motor fluxes is obtained by means of an inherently high-resistance starting winding.

It is seen, therefore, that this method of operation has sufficiently good characteristics to warrant its adoption in a number of cases where the required starting currents are permissible and the starting torques sufficiently high.

There are numerous practical cases, however, where the split-phase method of starting cannot conveniently be employed on account of the low starting torque corresponding to a reasonable starting current. In such cases it is usual to employ some form of single-phase commutator motor.

The commutator motor, however, for alternating current has not found the sphere of use in this country which its reputed features appear to warrant; while it is true that this state of affairs is largely due to engineers in general being loth to install a not thoroughly tried design, it cannot be overlooked that the existence of a commutator, particularly on an a.c. machine, presents practical difficulties.

‡ A recent paper on "The Starting of Single-Phase Induction Motors," by F. A. Lauper. *Journal* I.E.E., Vol. 65, No. 361, January, 1927, treats the subject exhaustively.

Operation by Ferraris-Arno Method.

The method of operation about to be described is entirely different from the majority in general use, and although practical examples of its application are comparatively few, if at all existent in this country, its operating characteristics are very much better than those of any of the better known methods. In this case also the small sphere of practical use may be attributed to the fact that the device has not been tried out to any extent in this country, so that consequently, as no test records and comparatively little descriptive matter are available, the reason for such a restricted sphere of use is apparent. In the Ferraris-Aruo system the main or driving motor is usually a three-phase machine, which may be of perfectly standard construction. Two of the stator terminals of this machine are connected to the single-phase mains, while the third terminal is connected to one of the terminals of a three-phase pilot motor whose remaining two terminals also connect to the single-phase mains. This circuit arrangement is shown in fig. 1. Means must be provided for starting the pilot motor from the single-phase mains, and this may be conveniently accomplished by some form of monocyclic device§, or alternatively by a commutator type auxiliary motor. The former method is, of course, preferable from the practical point of view.

When the pilot motor is running, the two stator phases connected to the single-phase supply provide the stator flux which, combining with the quadrature flux produced in the motor, as previously explained, gives rise to a rotating field analogous to that of an ordinary polyphase machine.

Under these conditions of operation an e.m.f. is induced in the idle phase of the pilot motor. This e.m.f. is in quadrature with the single-phase line e.m.f. owing to the fact that it is produced through the medium of the rotor system which, at synchronous, imparts a 90 deg. (electrical) displacement to the e.m.f. induced in the idle phase.

The quadrature e.m.f. is a power e.m.f. capable of producing the necessary flux in the third phase of the driving motor to render this machine self-starting, since under these conditions it is supplied with an unbalanced system of e.m.f.'s which give rise to a rotating flux in the stator winding, producing conditions analogous to those existing in a polyphase motor under normal operation.

The starting arrangements necessary for the driving motor in this system of operation are very simple, and may take the form of either a triple-pole switch or a plain star-delta starter for connecting the driving motor to its polyphase system of e.m.f.'s.

The starting torque obtainable with the arrangement is very much larger than in the case of an ordinary split-phase motor, and as an example, the following test is of interest:—

A 5-h.p. three-phase squirrel-cage motor was used as a pilot motor, being connected by two of its stator terminals to the single-phase supply. The idle phase of this machine was connected to one phase of a 35-h.p. squirrel-cage motor, the remaining two phases of which were connected to the single-phase supply.

The starting torque was measured by a spring balance, and with the stator winding star connected, normal connection being mesh, a torque of 26 per cent. of full-load torque was measured.

This figure is approximately half the torque which would have been developed by the driving motor on a direct three-phase system, and could, of course, have been increased by using a larger pilot motor.

The current taken from the line during the test was

§ *Ibid.*

slightly in excess of the full-load value, and the current from the pilot motor was half this value.

In the case of ordinary split-phase motors of the squirrel-cage type, 25 per cent. of full-load torque at starting, with a current of about twice the full-load value, are average figures, from which the advantages of the pilot motor method are very obvious.

As a further example of the operating characteristics of the pilot motor method of operation, practical instances of its application to heavy duty work might be cited. The method has given satisfactory service in its application to the main drive of cranes and similar heavy-duty apparatus, and in view of this fact it is difficult to decide on the reason for its very small sphere of use in this country.

Several examples of the application of the method, with slight modifications, to traction work occur in America, where the Norfolk and Virginian Railways employ main-line locomotives working on this system with quite satisfactory results.

In view of the foregoing remarks, it is evident that the arrangement has not obtained the sphere of use in this country which its superior characteristics warrant, and it is with the object of bringing the arrangement to the notice of the engineers concerned that the present article has been written, giving, in the author's belief, a description of the method and its application hitherto unpublished in this country.

In conclusion, the writer wishes to record his thanks to the General Electric Co., Ltd., for the test figures and much of the information contained in the foregoing.

A Radio-Telephone Loud-Speaker.

So much interest has been evinced in the different types of large-diaphragm and hornless loud-speaker at present in use that a suggested new form of diaphragm, together with some details of the method of its construction, will be welcomed by user and manufacturer alike.

By ERNEST W. BRAENDLE, A.M.I.E.E.

THE broadcast radio-telephone loud-speaker of the present day is rarely, if ever, to blame for the appalling noises so often presented to the unfortunate listener as "broadcast reception." Horns and other parts may be, and often are, the cause of a "hard" or "soft" quality being imparted to the sounds emitted, according to whether the upper or lower register is accentuated, but they do not account for unmusical noises. By far the worst offender in the production of these sounds is the receiving set's last stage of amplification, usually so inadequately designed to deal with the power its owner would like to get out of it. However, it is not intended to dissertate on the causes of distortion in amplifiers, but to present to those who have already mastered the subject the means whereby they may reap even more enjoyment, both for themselves and others, by the production of even better results.

Let us then assume that satisfactory amplification has been obtained, and that therefore all we require is to deal with the finer points, such as "timbre," "balance," and the "final result": by "timbre" we mean the quality of a sound, as compared to the original; since this depends on the correct reproduction not only of the initial note itself, but also of all the harmonics and overtones of which the sound is built up, it is essential that correct "balance" over the whole audible scale be obtained. The "final result" is attained mainly by utilising a loud-speaking device suited to the acoustic properties of the room in which it is placed. Of one thing readers may be assured, and that is the fact that the average transmission from the London (2 LO) broadcasting station, although not perfect, is extremely good, and fully warrants a much wanted improvement in the many minor considerations of reception.

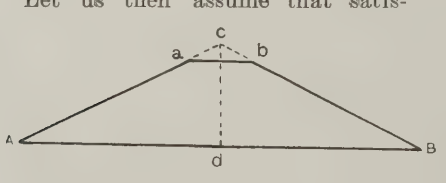

Fig. 1. - Sectional View of Cone.

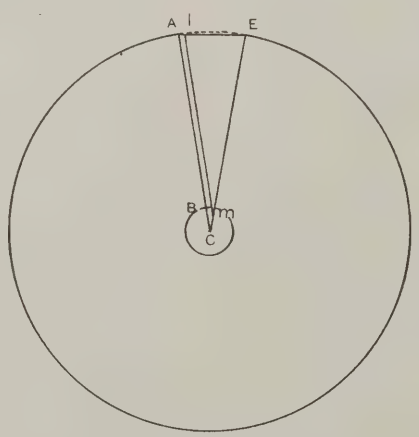

Fig. 2.—Method of Marking-out Diaphragm Sector.

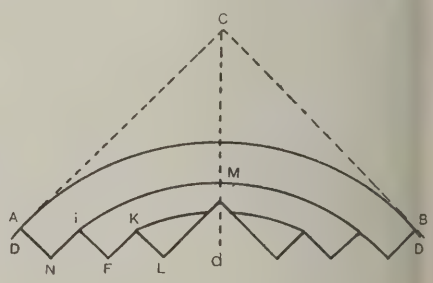

Fig. 3.—Sectional View of Pleated Diaphragm, Dotted Lines Represent Equivalent Cone.

In a search for these qualities, early experiments quickly eliminated the "horn" loud-speaker as never having satisfactory acoustic qualities without being both cumbersome and expensive. The "rigid cone" construction of paper diaphragm gave very good results, but, owing apparently to the large area over which "buckling" can take place, almost perfectly geometrical construction is necessary before it can be subjected to any great volume of sound. Another fault is that, although sufficiently "rigid," the cone lacks the "mobility" of its radially-pleated brother, which in turns lacks "rigidity." How then combine these two qualities? At first a "radially-pleated cone" was tried, but again, although sufficiently "mobile" and "rigid," it required too great care in construction to make it popular. The type at present in use consists virtually of a "cone" folded in upon itself, or a diaphragm pleated circumferentially (*i.e.*, in circles about the centre); it has given such satisfaction as to warrant its recommendation, despite the fact that

rather more work is entailed in its construction than in the case of the simple cone.

Since, in the final design, the pleated-paper diaphragm is backed by a cardboard cone, wherein is mounted the driving mechanism; and since it is advisable to understand the construction of a cone first before going on to the pleated diaphragm, a short description of cone design is as follows:—Fig. 1 represents a sectional view of a cone, wherein AB is the folded diameter, *cd* the height, and AC or BC the initial radius.

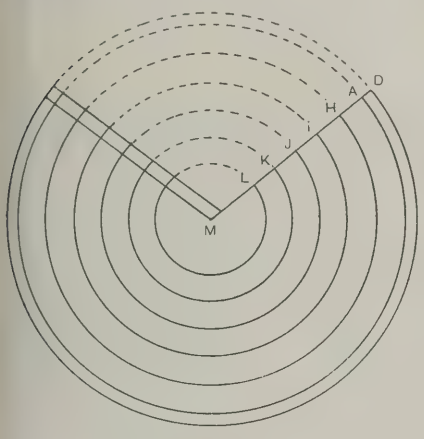

Fig. 4.—Diaphragm Marked for Folding.

To construct the cone, take a sufficiently large piece of paper (or cardboard) and describe a circle of radius equal to AC, which is given by the formula:—AC or BC $= \sqrt{(Ad)^2 \times (Cd)^2}$ or AC or BC = cosec $(\frac{1}{2} \wedge ACB) \times Ad$.

Next mark out a sector as in ACE (fig. 2), the arc AE being given by AE (fig. 2) $= 2\pi AC - \pi AB$ (fig. 1); or, since the angle of the sector to be removed is in the same proportion to the complete circle (*i.e.*, 360 deg.) as the length of the ARC removed is to the circumference, then AE/2πAC (fig. 2) = $\wedge$ ACE/360° (fig. 2), or $\wedge$ ACE (fig. 2) = 360 × AE/2πAC (fig. 1). Cut out the circle and remove the sector carefully, leaving a lip *lm* about $\frac{1}{4}$ in. wide for fixing; fold until the edge EC lies flat along AC, and glue firmly in place, thus forming a complete cone. Since, for the purpose of supporting the driving mechanism, it is necessary to remove the apex of the cone, thus leaving a hole of the diameter required, a circle with radius CB (fig. 2) is drawn before folding, and the resulting disk removed: the radius CB is given by CB (fig. 2) = $\frac{1}{2}$ (*a b*) × cosec $(\frac{1}{2} \wedge ACB)$ (fig. 1), where *a b* (fig. 1) represents the diameter of the movement to be inserted.

As previously stated, the circumferentially-pleated diaphragm is, in reality, nothing more than an ordinary cone folded back upon itself several times; some idea of it is obtained from fig. 3, which is a sectional view of the pleated diaphragm, the dotted lines representing the equivalent cone. From this figure it will be seen that the outer radius is still the same as for the cone, and is therefore found in the same way, but several other radii are now required to form the pleats at H, I, J, K and L. It was found convenient in practice to make the central apex M rather higher than the surrounding points A, I, K, and to decide first upon the height M*d* of the central cone and then upon the number of pleats to be formed. Fig. 4 shows a sheet of paper marked out with the various circles ML, MK, MJ, MI, MH, MA (MD is added as a fixing lip, the use of which will be explained later) which, when folded, will form the apexes M, L, K, J, I, H, A (fig. 3), there being two radii for each complete fold.

It has been pointed out that the radius MA (fig. 4) is equal to CA (fig. 3); hence, since the radius ML (fig. 4) is to CA (fig. 3) as the height *cd* is to M*d*, then ML = M*d* × CA/*cd*. Now H, I, J, K (fig. 4) are equal folds over the distance AL, and therefore this distance divided by five will give the remaining radii, the radius MD being $\frac{1}{2}$ in. longer than MA.

Draw the sector as for the cone, leaving the necessary fixing lip, and cut out; take a hard smooth-pointed pencil or stylus and go over each of the circles, pressing heavily, in order to bruise the paper along the lines, thus enabling the folding to be more easily dealt with. The actual manner of folding is a knack, and beyond pointing out that it is advisable to first lightly bend the folds in the directions required, helping them by lightly pinching them with the fingers, little more can be said to help the reader further; it will also be advisable to keep it on a clear flat surface whilst fixing.

There can be little use in attempting to describe the innumerable methods whereby the electrical mechanism may be attached to the diaphragm, nor is it necessary to discuss the different types of such mechanism at present on the market; therefore, only the particular method of mounting employed by the author in the final design will be described.

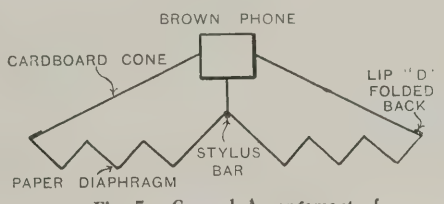

Fig. 5.—General Arrangement of Mechanism

The driving mechanism employed was a Brown A-type 'phone, with both diaphragm and anvil removed, mounted at the apex of a cardboard cone, on whose perimeter was mounted the pleated-paper diaphragm, the centre of the diaphragm being connected to the centre of the Brown reed by means of a metal stylus bar; some idea of the general arrangement may be obtained from fig. 5.

First make both cone and diaphragm separately, taking care that the folded diameter AB (fig. 1) of the cone is the same as the folded diameter AB (fig. 2) of the diaphragm. Drill out the centre hole of the ebonite ear-cap of the Brown 'phone to permit the free passage of the stylus bar, and insert the cap alone in the hole *a b* (fig. 1) of the cone; then fix in place with seccotine (thin carpenter's glue was used for all other fixings). Now fix the cone to the diaphragm in the manner suggested by the dotted lines in fig. 3, and allow the whole to set properly; the lip DD (fig. 3) is next slit radially about every half inch all the way round, an old safety-razor blade being employed, and the resultant pieces are

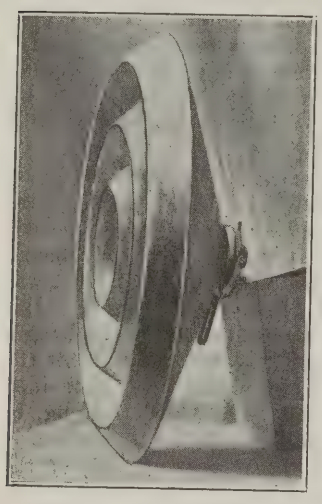

Fig. 6.—Impedance-frequency Graph.

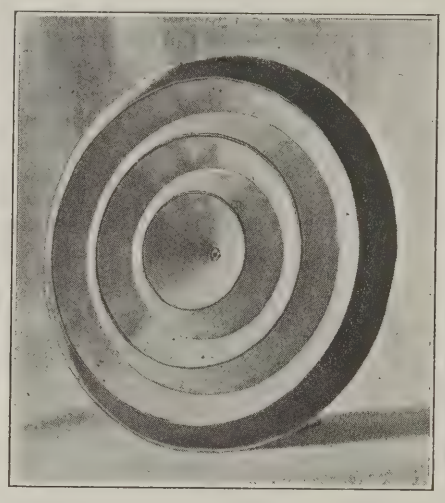
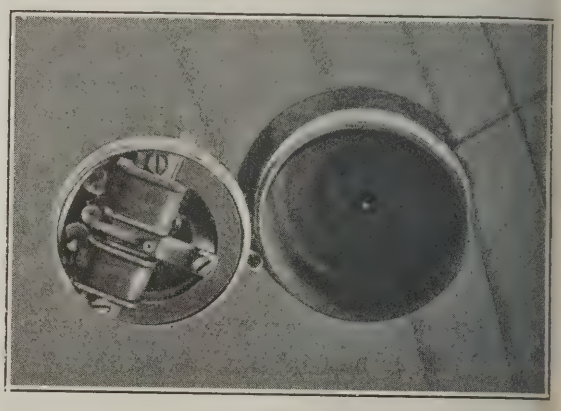


folded back over the cone and glued in place, thus making a firm airtight joint between the supporting cone and diaphragm. A piece of 18-gauge brass, or steel, wire is used for the stylus bar, which is fixed to the centre of the diaphragm by a small drop of glue, the other end of the stylus being held central in the ear-cap by pushing it through the centre of the now useless Brown diaphragm, which is temporarily inserted in the ear-cap for that purpose. Leave the whole for at least 24 hours to thoroughly set, then

remove the Brown diaphragm and screw in the movement until satisfactory contact is made between the stylus bar and the reed.



The loud-speaker is now ready for mounting and decorating in any manner desired, and if carefully made in the first place should amply repay the trouble expended on it. As regards suitable coatings both for decoration and preservation, the use of waterproof Indian ink decorated with gold or silver, or light transparent water-colours covered with a thin clear varnish, have proved quite successful.

Side view.

Front view.

Back view with mechanism removed, showing stylus bar.

Figs. 7, 8, and 9.—Braendle Pleated-cone Loud-speaker.

For the benefit of those who just wish to make one of these loud-speakers for themselves, without bothering about the methods employed to obtain the necessary measurements, those measurements required for the construction of a diaphragm and cone of 14 inches diameter are given in Tables I and II.*

Great care should be taken both in keeping carefully to these dimensions and in folding, since quite small errors will result not only in a poor finish, but in a quite unnecessary amount of trouble when fitting the cone and diaphragm together.

As regards the results obtainable with this form of loud-speaker, of the dimensions given, tests have shown that although sufficiently sensitive to compare very favourably with any first-class loud-speaker on the market, it is yet capable of handling sufficient volume to permit its use in a small hall without any deleterious effect. There is no "horn" effect and little or no directional quality, the sound in the room appearing to be quite general. One peculiar effect is that the intensity of sound, at the loud-speaker itself, appears weaker than when listened to some distance away; and it has been found beneficial to listen in the next room to that in which the loud-speaker is situated, not because of excessive intensity, but for the reason of obtaining both an acoustic blending and a psychological effect which go far in obtaining that "final result" mentioned earlier.

It is capable of reproducing a far greater range of audible frequencies with exceptionally good balance from top to bottom than any other type yet tried, and it is hoped that those readers who elect to try this form of loud-speaker for themselves will be as fortunate in their results as have been the author and those who have been kind enough to build models to his final design.

TABLE I.—Dimensions of Cardboard Cone.

Initial radius (AC fig. 1) = 7.725 inches.
Folded radius (*Ad* fig. 1) = 7.0 inches.
Initial radius (CB fig. 2) = 1.103 inches.
Folded radius = 1.0 inches.
Angle CAD radius (fig. 1) = 25° inches.
Angle of sector to be removed (ACE, fig. 2) = 33.7 deg.

TABLE II.—Dimensions of Pleated Paper Diaphragm.

Initial radius (MA, fig. 4) = 9.9 inches.
Initial radius (MH, fig. 4) = 8.49 inches.
Initial radius (MI, fig. 4) = 7.075 inches.
Initial radius (MJ, fig. 4) = 5.66 inches.
Initial radius (MK, fig. 4) = 4.245 inches.
Initial radius (ML, fig. 4) = 2.83 inches.
Angle of sector to be removed = 105.5 deg.

In conclusion, the author acknowledges his indebtedness to Messrs. Alfred Graham & Co. for the accompanying "graph" (fig. 6), and to others for their helpful suggestions.

* These are the dimensions of the loud-speaker shown in the accompanying illustrations, which is of a size suitable for indoor and outdoor use.

Electrical Manufacturing in Russia.

Alleged faulty construction of machines.

DESPITE the development of the electrical manufacturing industry in Russia during the past two or three years, as has been recorded in this journal at different times on the basis of information published in the Soviet newspapers, and as set forth by the reports of the growing value of the production year by year, the question has arisen whether or not this expansion has been accompanied by efficiency and the construction of reliable machines and plant. Many complaints have been made in the course of recent months concerning the shortage of certain inland raw and semi-finished materials on the one hand, while on the other, complaints have been expressed by customers respecting defects in machines and accessories supplied by the trusts. But it is only now that a collection of allegations has been published with regard to defective work and delays in the execution of orders, the information appearing in the *Ekon. Sjisn*, of Moscow, dated May 18th, and referring solely to the work carried out or intended to be executed by the "G.E.T." or State Electrical Trust, which now controls the whole of the heavy engineering branch. As the information throws

some light on the internal situation of this important branch, a few extracts from the newspaper in question will perhaps be of interest.

The Gus-Krustalny Combination, over two years ago, ordered from the G.E.T., transformers, motors, cables, &c., the prices quoted by the latter being comparatively normal, that is to say, double those of pre-war days. A considerable part of the equipment was not executed in accordance with technical requirements. As a consequence a batch of the 6,000-V motors (the general capacity of them exceeded 2,000 h.p.), which cost about 150,000 roubles, was rejected owing to faulty insulation of the windings. The same happened with 142 500-V motors, costing 120,000 roubles; these were refused on account of faulty bearings. No defects, however, were discovered in the remainder of the order.

Serious difficulties are said to have been caused by the non-execution of orders at the due time. The combination placed orders for 6,000-V motors to be delivered on May 1st, 1925. As those motors proved to be useless, the G.E.T. has promised to supply others by August, 1927, so that a delay of almost two years and a half will have taken place in the completion of the order. The unreliability of the trust is stated to have involved the combination in considerable loss. It had a contract with the Moscow supply undertaking (the M.O.G.E.S.) for the consumption of 8,000,000 kWh per annum, but in consequence of the absence of the equipment, it has been unable to fulfil the contract, and the supply authority is now claiming 151,000 roubles as a penalty. Moreover, the combination has suffered loss through having to use steam power instead of the cheaper electrical energy, and the total losses through the default of the Trust are put at over 300,000 roubles.

The Gospromtsvetmet, on December 9th, 1924, gave the Trust an order for the equipment for a transformer station of the value of 37,000 roubles, the period of delivery being fixed at eight months. The contract has not been carried out down to the present time, however. In March, 1925, this undertaking placed a new order with the Trust for delivery in ten months of two 300-h.p. motors, two liquid rheostats, &c. The motors and rheostats were delivered in March, 1926, but without any starting equipment, so that the plant was unserviceable. The order, however, was completed in April of the present year after representations had been made. The delays thus experienced forced the undertaking to purchase machines from abroad. As to the quality of the Russian machines, it is mentioned that the motors have a larger consumption of energy than is stipulated by technical rules; and cases are stated to have arisen when the motors at no load consumed more energy than when they were loaded. Complaints have also been made of the bad quality of the motor bearings, and of the construction of one uneconomical type of motor, as compared with the foreign practice of turning out special motors for particular purposes.

The Rezinotrest (Rubber Trust) is stated not to have ordered much from the Trust, as it has obtained considerable assistance from the equipment removed from Riga during the war period from the works of the Provodnik, including a large number of motors of different sizes. In a few cases, plant has been ordered from the Trust, but this has not always been delivered to time. Thus the Rubber Trust three years ago placed orders for oil-break switches, but the work has not been completed down to the present time, and the same applies to distributing boxes which were to have been supplied in March, 1926.

The Central Telegraph Office, according to a statement made by M. Rerberg, says that although machine construction is still a young branch in Russia, a number of reproaches has to be levelled at it, particularly with regard to motors. If small motors of up to 72 h.p. are ordered from the Trust, it is necessary to wait a year for delivery, which is excessive. Moreover, the prices of Russian motors are high. Thus, for instance, a motor of ½ h.p., which Berlin firms offer at 66 marks, is priced by the Russian Trust at the high figure of 250 roubles.

Results of the "W.O.B." Ballot.

A Bristol Lady wins the All-Electric Home.

THE announcement of the result of the ballot which formed the popular side of the E.D.A.-E.L.M.A. Campaign will set at rest the minds of those who have been building castles in the air, or imagining an all-electric home in the suburbs.

A Bristol lady (Miss E. Gardiner) was the winner of the first prize and thus had the opportunity to become the possessor of a well-designed all-electric house, but she preferred the alternative, a cheque for £2,000. Neither of these is to be scorned in these days of scarcity of houses and money. In accordance with the terms of the competition, Messrs. J. H. Winter & Co., Bristol, who supplied the booklet containing the ballot paper to Miss Gardiner, receive a cash prize of £25. In the same way the Mid-Cheshire Electricity Supply Co., Ltd., and the South Metropolitan Electric Light and Power Co., Ltd., receive £10 and £5 respectively for providing booklets to the second and third prize-winners. The shareholders of the South Metropolitan Co. can calculate what this means in the way of extra dividends.

If we are to be guided by the opinions of the 150,000 people whose ballot forms were tabulated, the merits of electric lighting in the home assume the following order:—It is convenient, clean, it saves work, is economical, safe, adaptable, reliable, simple to control, it preserves the sight, is fumeless, cheerful and artistic. However near cleanliness is to godliness, it is a long way behind convenience, securing only 28,299 votes against 44,787. Although Scotland was very active in the Campaign, sheer weight of numbers forced economy into the fourth place. The "highbrows" of the industry will derive gloomy satisfaction from the fact that the artistic value of electric lighting received only 943 votes.

We reproduce below the full list of prize-winners with the relevant details:—

FIRST PRIZE.

(A freehold house fully wired and equipped with electric lighting, cooking, heating and labour-saving devices; or, alternatively, a cheque for £2,000.)

Miss E. Gardiner, Bristol.

Booklet supplied by Messrs. J. H. Winter & Co., Bristol, who receive £25.

SECOND PRIZE.

(Electric lighting installation and/or electrical domestic appliances to the value of £200.)

Mrs. S. Gleave, Acton, near Northwich.

Booklet supplied by the Mid-Cheshire Electricity Supply Co., Ltd., which receives £10.

THIRD PRIZE.

(Electric lighting installation and/or electrical domestic appliances to the value of £100.)

Mr. H. G. A. Newman, Catford, S.E.6.

Booklet supplied by the South Metropolitan Electric Light & Power Co., Ltd., which receives £5.

OTHER PRIZES.

No. of Prize.	Nature of Prize.	Winner.	Supplier of Booklet.
4th	Appliances to the value of £50.	Miss J. Nicholson (Leigh, Lancs.).	Brown & Co., (Manchester).
5th	Appliances to the value of £25.	Mrs. Gardiner (Bristol).	J. H. Winter & Co., (Bristol).
6th	Appliances to the value of £10.	Mr. N. N. Spratt (Purley).	Croydon Electricity Supply Dept.
7th	Appliances to the value of £5.	Mrs. S. F. Spears (Wolverhampton).	B.E.D.A.
8th	ditto	Miss D. Dearden (Lr. Bebington, Ches.).	St. Helen's Electricity Dept.
9th	ditto	Mr. J. W. Ellison (Blackheath).	South Metrop't'n. E.L. & P. Co., Ltd.
10th	ditto	Mr. W. H. Hill (Bradford).	Bradford Electricity Department.
11th	ditto	Mr. D. L. Hughes (Bangor, N. Wales).	G. Tilston (Bangor).
12th	Appliances to the value of £2 10s.	Mrs. Hastie (Paisley).	R F. Cook (Paisley).
13th	ditto	Miss L. Montgomery (St. Helens).	J. Blaylock (St. Helens).
14th	ditto	Mr. E. Sparks (Teddington).	Bentall's, (Kingston-on-Thames).
15th	ditto	Miss S. Woods (Newnham, Cambridge).	Cambridge E.S. Co., Ltd.
16th	ditto	Mr G. S. Bullock (Shelton, Stoke).	Stoke-on-Trent Electricity Dept.
17th	ditto	Mr. A. S. Grice (Leicester).	Leicester Electricity Department.
18th	ditto	Mr. E. O. Mathias (Neath, Glam.).	Neath Electrical Co., Ltd.
19th	ditto	Mrs. Routh (Gt. Chesterford, Essex).	Baily, Grundy and Barrett, (Camb'ge)
20th	ditto	Miss I. W. Trace (Eastville, Bristol).	E. W. Palmer (Eastville, Bristol).
21st	ditto	Miss J. A. Patterson (Dalbeattie).	Dalbeattie E.L. and P. Co., Ltd.
22nd	ditto	Miss B. M. Housby (Ipswich).	Ipswich Electricity Department.
23rd	ditto	Mrs. A. Ashton (Prestwich, nr. M/R).	Manchester Electricity Dept.
24th	ditto	Mrs. F. M. Dodsworth (Heworth, Yorks.).	H. Etherington (York).
25th	ditto	Mr. S. R. Nixon (Sutton Coldfield, nr. B'ming'm.).	B.E.D.A.
26th	ditto	Mr. A. Weatherill (Doncaster).	Doncaster Electricity Dept.
27th	ditto	Mrs. A. Harwood (Maida Hill, W. 9).	Metropolitan E.S. Co, Ltd.
28th	ditto	Mrs. I. B. Jackson (Bickley, Kent).	E. Fellingham (Brighton).
29th	ditto	Mrs. McGardell (Glossop, nr. M/R).	Urban Electric Supply Co. Ltd.
30th	ditto	Mrs. E. C. Greaves (Palmers Green, N.13).	North Metropolitan E.P.S. Co.
31st	ditto	Major A. J. French (Chiswick, W.4).	Chiswick Electric Supply Co.
32nd	ditto	Mrs. Bryon (Basingstoke).	Basingstoke Electricity Dept.

A Lancashire Electricity Scheme.

Suggested application of the provisions of the Electricity (Supply) Act, 1926, to the South-East Lancashire Electricity District.

THE South-East Lancashire Electricity Advisory Board (Manchester), which commenced to function in 1923, controlling an area delimited by the Electricity Commission in 1920, in an endeavour to apply the general principles of the Electricity (Supply) Act, 1926 (so far as it understands them) to its own area, has drawn up a technical scheme for that purpose which it unanimously adopted at its meeting on May 24th, 1927, and at the same time adopted the following resolution:—"That the Board agree to afford facilities to, and co-operate with, the Commissioners in connection with the preparation of a scheme to be prepared by the Commissioners for this District."

From an integrated load curve prepared to indicate the maximum load on the whole of the undertakings within the S.E.L.E. District during the month November 27th to December 24th, 1925, and the calculated load factor at each undertaking, the following figures have been ascertained:—Maximum simultaneous demand on feeders (Tuesday, December 22nd, 4.30 p.m.)=313,823 kW. Energy delivered to feeders during the year ended December 31st, 1925 (annual load factor, 80.5 per cent.)=839,479,123 kWh. Energy sold=708,069,467 kWh. Summation of individual demand=323,839 kW. Diversity factor=1.032, or 3.2 per cent. If the normal growth of consumption continues, it will reach 525 kWh per head in 1940 (population, 3,559,500; kWh sold, 1,870,000,000). During 1923-24-25 the kWh sold amounted to approximately 80 per cent. of the total generated, on which basis the total generated in 1940 to provide for the above-estimated consumption will need to be 2,337,500,000 kWh; assuming a combined load factor for the generating plant of 31 per cent., the maximum simultaneous demand on the generating stations will be 862,000 kW.

The S.E.L.E. Advisory Board assumes that the potential demand in the comparatively large areas within its District of a rural character which have not yet been developed will be relatively small, and not materially affect its scheme; it has not taken cognisance of possible demands for railway supplies. It is suggested that the maximum demand should be allocated to 16 possible selected generating stations comprising: 14 existing ones of 450,000 kW total, 5 of which it is proposed to extend by 195,000 kW total; two new stations of 52,500 kW total are under construction, which it is proposed to extend by 75,000 kW total, and 4 new stations of 312,500 kW total are contemplated. Therefore, the plant installed would total 1,085,000 kW, and suggested extensions would mean a surplus of 223,000 kW, or 20 per cent. Of the 14 non-selected generating stations only 6 (50,000 kW total) would be utilised in case of emergency. The base load (172,400 kW, or 20 per cent. of the maximum) could, it is suggested, be allocated to 3 stations.

The total capital cost would be £12,878,307; the cost of 1,555,503 tons of fuel would be £1,244,402, or 1.57 lb. per kWh, while the total cost of delivery to the feeders in 1940 would be £3,064,335, or 0.3313d. per kWh.

In addition, the provision of 232.25 route miles of 33,000-volt transmission lines (of which 36.2 miles, costing £262,555, are already in existence) would be £1,677,033, and switchgear, transformers, protective gear, and cables would also cost £602,630. With few exceptions, the maximum transmission distance during the period of maximum demand would not exceed five miles.

Accordingly, the total annual cost of delivering energy into the areas of authorised undertakers in the S.E.L.E. District, omitting the administrative expenses of the Central Electricity Board, would be £3,064,335 (transmission accounting for £214,480), the energy delivered amounting to 2,108,975,000 kWh, of which 1,149,560,000 kWh would be for owners of selected stations; therefore, the cost per kWh to receiving undertakings would be 0.4023d.

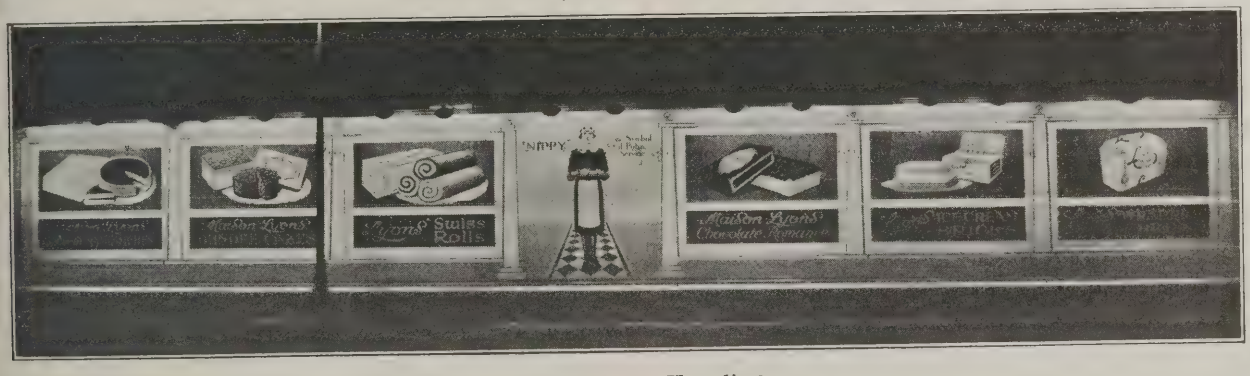
The scheme contemplates the standardisation of the frequencies of all undertakings in the district, but the cost of doing so is not mentioned.

Technical considerations only have been dealt with, the rights of individual undertakers, ownership of plant, existing bulk-supply contracts, &c., having been ignored entirely. The S.E.L.E. Advisory Board has expressly refrained from putting the scheme forward as a recommendation within the meaning of its District Order of 1923, regarding it rather as indicative of a method of developing the area, provided that the Central Electricity Board could carry it into effect and that any claims of authorised undertakers for relief or compensation under the Act were duly met.

It is not suggested how the S.E.L.E. District is to be linked with surrounding areas and the national network.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.



The A.E.U. Annual Conference.

The *Daily Telegraph* reports that Mr. J. T. Brownlie, president, speaking at the ninth annual meeting of the National Committee of the Amalgamated Engineering Union, recently, said he viewed with alarm the gradual falling-off in the membership of the union. Last year there was a decrease of 14,400. Referring to the Southern Railway contract going to Sweden, Mr. Brownlie said the company's explanation was that its action was directed against the ring in this country. He did not deny that rings existed, but they were part of the logical development of industry, and had to be recognised. He deprecated municipalities sheltering behind this action in buying in the cheapest market abroad, and giving the reason that they were spending ratepayers' money. He did not share that point of view.

The question of wages was discussed on May 25th, when the conference instructed the Executive Council to continue negotiations to secure an advance of wages in excess of the offer made by the employers on May 19th. It was provided that a ballot of members should be taken on any further offer. A resolution providing for setting up of a committee to examine the whole system of payment by results was rejected.

Hoarding Illumination.

By the courtesy of Messrs. J. Lyons & Co., Ltd., we are able to reproduce a night photograph of one of their hoardings. By means of floodlighting, this hoarding is made to give a 24-hour service. The installation comprises 14 "Benjamin" elliptical angle reflectors (two for each panel) with a 100-W lamp in each, spaced approximately five feet apart.

An Illuminated Hoarding.

French Radio Exhibition.

The fourth French wireless exhibition is to be held from October 28th to November 13th, in the Grand Palais, Paris. It is being organised under the auspices of the Syndicat Professionel des Industries Radio-Electriques, and the exhibits will be confined to members of that association.

A Report upon Esthonia.

The British Consul-General at Reval (Mr. H. Montgomery Grove) has prepared for the Department of Overseas Trade a report upon conditions in Esthonia (Stationery Office, 1s. net). Esthonia is a new republic with a rather eventful history; it is mainly an agricultural and pastoral country, and its population is only about 1,200,000. The last factor limits its importance as a market. In 1925 the imports of electrical machinery and apparatus were valued at 129 million Esthonian marks (about £645,000); of this Germany supplied goods to the value of 74 million E.mks. and Great Britain 9 millions, of which wires and cables account for 7 millions. Mr. Grove says that the use of electricity is increasing and also the demand for electrical goods. The question of the construction of the power station upon the Narva Falls is still not settled. Germany's trade with Esthonia is larger than Great Britain's for several reasons, but there is further scope for British goods, which are favourably regarded by the people of the country. The main obstacle to trade is the problem of credit.

Valve-making at Whiteley's.

For a period of 10 days, until June 10th, the GENERAL ELECTRIC CO., LTD., has transferred some of its radio valve-making machinery from the Osram Valve Works, Hammersmith, to the newly-opened wireless department at Messrs. Whiteley's. This will enable the numerous visitors to the stores to gain an idea of the delicate work involved in the production of valves.

A New Idea for the Window.

How often one hears such comments as "I didn't know that before" made by the user concerning some particular appliance which has caught the fancy! One can run through a list of domestic electrical appliances and find no difficulty in marking a round dozen about which a similar observation could be made by hundreds of the type whom it is our desire to interest in the all-electric home. Then why not the "Little Known Use" window? This opens up a new idea in display, with a considerable public interest at the end of it. There is plenty to put into the window, and one might start with the electric egg whisk, hot plate, massage vibrator, curling iron heater, millinery iron, shaving pot, pipe and cigarette lighter, and go on to the coffee percolator, hair dryer and dimmed night light. There should be plenty of space and no overcrowding, and an attractive background in colour as a set-off to the appliances. This is the place in which to describe the purpose of the display in a few words—"You can do *all* these operations electrically," or "Do it electrically in these delightful ways." The only other wording that is needed will be fixed to the inside of the window glass: "Your ideal domestic servants" will be found eminently appropriate and provocative. From this will depend a paper streamer directing the eye to each different appliance shown, the latter identified by name in each case, as "Egg Whisk," "Millinery Iron," and so on. In such ways will the required larger market be found for what are, comparatively speaking, little known applications of electric service. Hitherto they have been largely allowed to take care of themselves.

Electric Power in Industry.

The thirteenth preliminary report upon the 1924 Census of Production (*Board of Trade Journal*, May 26th), deals with trades connected with beverages. The brewing and malting trades reported 6,454 kW of generating plant (as compared with 2,884 kW in 1907) and electric motors aggregating 65,277 h.p., power for 57,530 h.p. of which was purchased. In the aerated waters, cider, vinegar, British wine and cognate trades there was 210 kW of generating plant (as against 191 kW in 1907), and there were motors totalling 7,886 h.p. (power for 7,555 h.p. purchased). The generating plant installed in the wholesale bottling trade rose from 144 kW in 1907 to 461 kW in 1924. The capacity of electric motors installed was 7,868 h.p., power for 7,502 h.p. of which was purchased.

Proposed French Tariff Revision.

The *Board of Trade Journal* for May 19th published a translation of the proposed revised tariff for goods imported into France. The new rates affect turbines, boilers, wires and cables, fans, electro-magnets, and other electrical apparatus.

Social Events.

The annual London G.E.C. social and athletic sports meeting will take place at the G.E.C. Sports Grounds, Wembley, on Saturday, June 11th, when amongst many other interesting items the various G.E.C. London championships will be decided.

The annual summer outing of the staff of the London Electric Wire Co. & Smiths, Ltd., was held on Saturday last, a very enjoyable day being spent at Worthing. The party travelled in three motor coaches.

Recent Contracts.

An important contract, covering the supply of all the outdoor and indoor switchgear required for the Perak River hydro-electric scheme in the Malay Peninsula, has been placed with the Metropolitan-Vickers Electrical Co., Ltd. The scheme, which is being undertaken by the Perak River Hydro-Electric Power Company, is a project for supplying electricity in the Kinta Valley tin mining district. It includes the provision of a main water-power station at Chenderoh with a 66,000-V transmission line extending about 65 miles to the South, fifteen sub-stations to distribute the power at 22,000 V and 6,600 V, and a stand-by steam power station at Malim Nawar near the southern end of the system. The switchgear to be supplied by the Metropolitan-Vickers Co. includes over a hundred oil circuit breakers and about 70 isolating switches for 66,000, 22,000 and 6,600 V, together with all the necessary constructional steelwork for outdoor installation. Twenty-eight of the 6,600-V circuit breakers, in seven sub-stations from which power will be supplied to consumers, will be motor operated and equipped with automatic reclosing devices for rapid restoration of service after temporary faults. The contract also includes the control board and switchgear for the station, accessories for the main power station and an 8-panel switchboard of 6,600-V metal-clad units for the steam power station at Malim Nawar.

The success of the electric cooking equipment installed by the General Electric Co., Ltd., in the M.S. *Pieter Corneliszoon Hooft* for the Stoomvart Maatschappij Nederland, has led to a further order to the company for a similar equipment for the sister ship *Chr. Huygens*.

A Profit-sharing Scheme.

MESSRS. HORACE GREEN & CO., LTD., Cononley, Keighley, held their fourteenth annual employés' meeting on May 6th, when 6 per cent. profit was distributed to the employés. Though this is less than in previous years, it is considered quite satisfactory under the conditions prevailing during the past year.

Radio Manufacturers and Wholesalers.

The Radio Manufacturers' Association states that it has received information which would lead to the inference that radio wholesalers in certain parts of the country are considering the formation of local wholesale associations. The R.M.A. is of opinion that any co-operative movement should be national and not local in character, as only in a national body can matters affecting the industry be viewed in their correct proportions. It adds that it would welcome the formation of a national body of wholesalers and would be willing to co-operate to the fullest possible extent.

A Successful A.E.G. Claim.

Before the Second Division of the Anglo-German Mixed Arbitral Tribunal on May 25th, the Allgemeine Elektricitäts Gesellschaft, Berlin, claimed the return of a sum of £414 deposited with the Government of Western Australia before the war as security in connection with a contract for switchgear, &c. It was stated for the respondents that owing to the non-fulfilment of the contract in consequence of the outbreak of war the Government was forced to pay £60,000 to get the equipment elsewhere, although the contract price was only about £13,000. It was urged that the claimants were not entitled to the return of the deposit because the conditions by which it would have become repayable never came into force The Tribunal held that the outbreak of war made it impossible for the claimants to carry out the contract and that there was nothing in the contract to justify the respondents retaining the deposit. It therefore awarded the amount claimed, with five per cent. interest from August 4th, 1914.

Canadian Order for Sweden.

The Allmänna Svenska Elektriska Aktiebolaget has recently obtained an order for two 16,000-h.p. generators for the extension of a Canadian hydro-electric power station to which the company had previously supplied complete machinery. The value of the order approaches Kr. 700,000.—*Reuter's Trade Service* (Stockholm).

New Municipal Showrooms.

Commodious new showrooms for the Electric Supply Department of the Birmingham Corporation were opened at Station Road, Solihull, recently, by Mr. H. K. Beale, the chairman of the Committee. At a luncheon following the ceremony, Mr. Beale said that the department had laid 37 miles of cable in the Olton, Shirley, and Solihull districts, representing an expenditure of £53,000, and there were now 570 consumers there.

Midland Building Trades Exhibition.

An exhibition which is being organised by the Birmingham and Midlands building trades is to be held at Bingley Hall, Birmingham, from September 5th to 17th next, during which conferences will be held on the most recent developments in the building and allied trades. An important part of the proceedings will be lectures and discussions upon electrical services for lighting, cooking, heating, the provision of hot water, &c.

Unemployment.

There was an increase of 8,710 in the number of unemployed during the week ended May 16th. The total at that date was 1,007,000, as compared with 998,290 on May 9th, and 1,612,740 on May 17th, 1926.

Trade Announcements.

To meet the requirements of expanding business the Glasgow branch of the three associated companies, the LONDON ELECTRIC WIRE CO. & SMITHS, LTD., the LIVERPOOL ELECTRIC CABLE CO., LTD., and FREDERICK SMITH & CO., have moved into more commodious premises at 74, York Street, Glasgow. (Telephone: Central 9002; telegrams: "Lewcos Glasgow.") Large stocks of all materials manufactured by the three companies will be available for immediate delivery.

MESSRS. F. THOMAS & CO. have opened larger showrooms at 189-191, Drummond Street, Hampstead Road, N.W.1, for the sale of lighting fittings, including glassware and alabaster bowls. Prices have been reduced as from June 1st.

The address of the CLARKSON THIMBLE TUBE BOILER CO., LTD., is now 613, Australia House, Strand, W.C.2. Telephone: Central 2882.

Mr. FRED G. CAVE, radio engineer, has opened new showroom premises at 102, Abington Street, Northampton.

MESSRS. BENNETT & BROWN, radio and electrical goods dealers, have opened new premises in Old Road West, Gravesend.

New Catalogues and Lists.

THE MILLNS ELECTRICAL CO., 17, Whitefriars Street, E.C.4.—Booklet P.669a, containing illustrated notes upon the firm's organ-blowing equipment and a long list of places in which it has been installed.

ALLOY WELDING PROCESSES, LTD., 14-16, Church Street, Islington, N.1.—Bulletin No. 52, describing the new "A.W.P." system of polyphase working, and illustrating the apparatus and its use.

MESSRS. HEYES & CO., LTD., Water-Heyes Electrical Works, Wigan.—Leaflets Nos. 8D and 8E, dealing respectively with a water- and gas-tight emergency switch, and a transformer switch plug. Illustrated.

BRITISH INSULATED CABLES, LTD., Prescot, Lancashire.—Catalogue P.209, for the use of electrical contractors, containing illustrated particulars of the "Helsby" twin wiring system, wires of various kinds, insulators, fuse-boxes, switch-fuses, jointing materials, &c.

MESSRS. WM. GEIPEL & CO., Vulcan Works, St. Thomas Street, S.E.1.—An illustrated pamphlet advertising Ward Leonard "Vitrohm" dimmers for theatre lighting.

The SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, W.C.2.—Supplement to the company's radio catalogue, containing revised prices, alterations, and particulars of new lines.

The CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Place, S.W.1.—Supplement to List No. 157, describing a new illuminated dial CO_2 indicator.

MESSRS. ROBERT HORNBY & CO., LTD., 77, Dean Street, Soho, W.1.—An illustrated catalogue and pamphlets dealing with "Siemens-Schuckert" electricity meters, including prepayment and time-switch types.

THE MACINTOSH CABLE CO., LTD., St. James's House, St. James's Street, S.W.1.—Three uniform lists, the first of a series, dealing respectively with "Maconite," trailing cable, and a bonding plate for lead-covered "Maconite." Fully illustrated and detailed.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, Tottenham, N.17.—An illustrated and priced folder describing the "Benjamin" electric fire, which embodies several new features.

VAMPIRES, LTD., 435-437, Oxford Street, W.1.—Two illustrated pamphlets advertising the "Vampire" suction cleaner and the "Dandy" floor polisher.

MESSRS. FERRANTI, LTD., Hollinwood, Lancs.—List Ma64, containing an illustrated description of the company's rotating standard testing set for a.c. meters. Priced.

HIGGS MOTORS, Witton, Birmingham.—May-June stock list of a.c. and d.c. motors. Priced.

The MULLARD WIRELESS SERVICE CO., LTD., 21, Denmark Street, W.C.2.—Pamphlets W.A.8, illustrating and describing the company's cone-type loud speaker; and W.A.9, dealing with "Mansbridge" condensers. Both pamphlets are priced.

POPE'S ELECTRIC LAMP CO., LTD., 5, Arthur Street, New Oxford Street, W.C.2.—A circular, dealing with the "Pearl Elasta" lamp.

Bankruptcy Proceedings.

PAUL J. WHITE (trading as P. J. White & Co.), 5, Dyers Buildings, Holborn, W.C.—The public examination of this debtor was held on May 24th, at the London Bankruptcy Court, before Mr. Registrar Mellor. The statement of affairs showed liabilities of £6,067, and assets of £40. Replying to Mr. Gaine, Official Receiver, the debtor stated that he was born in Bohemia, and was naturalised in March, 1913, changing his name from Weiss to White. In September, 1919, he registered P. J. White & Co., Ltd., to deal in goods obtained from the Ministry of Munitions Disposals Board; that company went into voluntary liquidation in January, 1924. In July, 1922, he formed Radio Equipment, Ltd., with a nominal capital of £100, and was appointed a director of the company at a fee of £500 per annum; a compulsory winding-up order

was made against this company in March, 1926, its liabilities amounting to £6,586, including £821 owing to him. In October, 1923, he caused to be registered Radio Works, Ltd., with a nominal capital of £100; he became a director of this company, which went into voluntary liquidation in February, 1926. In February, 1925, he obtained an order from Lighting, Heating & Glass, Ltd., he then acting as selling agent for a German company, for 5,000 gross yards of flex at £2,600, the flex being made by an Austrian company; the failure of the purchaser to take up the flex as arranged ultimately led to the present proceedings. The debtor further stated that only two shares in Radio Equipment, Ltd., were issued, one to himself and one to another person, so that the failure of that company was practically his own failure. He was to have had one-fourth of the share capital of Radio Works, Ltd., but the shares were never issued. He did not agree that Radio Works, Ltd., was merely another alias adopted to enable him to carry on business. Asked about six bills of exchange given to him by Lighting, Heating & Glass, Ltd., in payment for the flex, the debtor admitted that when he handed the bills to Radio Equipment, Ltd., that concern was overdrawn at the bank to the extent of £250 (which overdraft he had guaranteed), the result being that the proceeds of the bills were partly used to discharge the overdraft. The Official Receiver said that it was a very improper proceeding on debtor's part, and debtor admitted that it was irregular. With regard to a claim for £109 made by the liquidator of Radio Works, Ltd., the debtor stated that after that company went into liquidation, 547 headphones were sold for £109, which was used for his own purposes. He explained that he and another person really constituted the company. He had not returned that £109 as a debt in his statement of affairs for the reason that he regarded it as a matter between that other person and himself. He attributed his failure and insolvency to his inability to recover from Radio Equipment, Ltd., the proceeds of the bills of exchange which he endorsed to them. It was further due to the fact that his expenditure had exceeded his income by £887 during the last two years. The examination was concluded.

W. N. Smart, electrician, formerly of 181, Windsor Road, and 17, 19 & 19a, Cross Street, Oldham.—Trustee, Mr. H. Parker, Official Receiver, 11, Winckley Square, Preston, released May 16th.

D. E. Davies, wireless engineer, 19, Poulton Street, Kirkham, Lancaster.—Trustee, Mr. H. Parker, Official Receiver, 11, Winckley Square, Preston, released May 16th.

J. G. F. Rennie, electrical engineer, 19, Bridge Street, Andover.—Trustee, Mr. T. Barton, Official Receiver, City Chambers, Catherine Street, Salisbury, released May 16th.

Mrs. H. Spencer (Spencer & Son), wireless and cycle dealer, 30, Watergate, Grantham.—Last day for proofs for dividend, June 8th. Trustee, Mr. L. A. West, Official Receiver, 4, Castle Place, Nottingham.

A. H. Duffin and G. Kershaw (A. H. Duffin & Co.), electrical engineers and contractors, Provincial Buildings, Conway Road, Colwyn Bay.—Supplemental dividend of 9d. in the £. Payable at the Official Receiver's office, St. Peter's Churchyard, The Cross, Chester.

F. Leng (F. Leng & Co.), electrical and mechanical engineer, 12, Godstone Road, Rotherham.—Receiving order made May 20th, on debtor's own petition.

I. Stephenson (I. Stephenson & Son), plumber and electrician, 36 & 37, Flowergate, Whitby.—Receiving order made May 19th, on debtor's own petition. First meeting, June 9th, at the Official Receiver's offices, 80, High Street, Stockton-on-Tees. Public examination, June 16th, at the Court House, Bridge Road, Stockton-on-Tees.

F. C. Gross, electrical engineer, 32, Windsor Road, St. Andrew's Park, and 71, North Road, Bishopston, Bristol.—Discharge suspended until July 29th, 1927.

J. A. Bosher, 33, High Street, Aberdare, electrical engineer and contractor.—Trustee, Mr. S. E. Clutterbuck, 31, Queen Street, Cardiff, released March 30th.

W. E. Owen (trading as Emlyn Owen & Co.), 1, Senghenydd Road, Cardiff, and Maesteg, wireless dealer.—Trustee, Mr. Ellis Owen, Official Receiver, 34, Park Place, Cardiff, released May 20th.

C. H. Kitching, 20, St. Hilda Street, 172, Beverley Road, and 42, Chariot Street, Hull, plumber and electrical engineer.—Last day for proofs for dividend, June 14th. Trustee: Mr. J. E. D. Stickney, Official Receiver, 37, Scale Lane, Hull.

E. Mortimer Lancaster, the Younger, 41, Virginia Road, Leeds, electrical engineer.—Receiving order made May 25th on debtor's own petition.

Company Liquidations.

A. W. Knight, Limited, Basinghall Street, E.C., radio engineers.—A meeting of creditors was held on May 24th at 65-66, Basinghall Street, E.C., when the chair was occupied by Mr. Rickard, the liquidator. An approximate statement of affairs was presented which showed liabilities of £1,324 and net assets of £143, leaving a deficiency so far as the creditors were concerned of £1,181, or a total deficiency as regarded contributories of £2,761. The chairman said that at the time of his appointment there was a possibility of being able to dispose of the business as a going concern, for a sum which would have met with the approval of the unsecured creditors. He had since received an offer of £75 for the assets. No resolutions were passed, and the matter therefore remains in the hands of the present liquidator. The following are creditors:—

	£		£
Edison Bell, Ltd. ...	416	Stevens, Col.	100
Schneider, —	84	Wilson, H. W.	294
Knight, —	45		

Messrs. Yates & Thom, Canal Foundry, Blackburn, engineers and boiler makers.—It is recommended that this company should go into voluntary liquidation. Sir Wm. Thom, principal of the concern, says that if this step is now taken the assets of the company will be fully preserved. In a letter to the shareholders, he states:—"The steady advance in the use of electricity, and the numerous large power stations erected in various parts of the country, are making great inroads into our business. This competition will continue and become more severe. For some time we have found it impossible to keep our men and machines working at anything like a reasonable production. Every endeavour has been made to find new manufactures to increase output, but without success. A turnover to a new branch of engineering would entail a large capital expenditure, coupled with considerable risk and doubtful results. The company is financially sound, but the general trading is being carried on at such a loss that a few more years under similar conditions will result in a loss to the shareholders, which to-day can be avoided."

District Lighting Supply, Ltd., 87, Tottenham Court Road, W., dealers in electrical and radio appliances.—A meeting of creditors was held recently, at the Cannon Street Hotel, when Mr. C. S. Steel, C.A., 34-36, Gresham Street, E.C., the liquidator in the voluntary liquidation of the company, presided. The chairman said that it had been impossible to prepare an accurate statement of affairs, but he estimated that the liabilities due to the trade amounted to £810, and there were loan creditors for £654. The only asset, so far as he could ascertain, was the stock valued at £350, which might realise from £200 to £250 on a forced realisation. The company was registered on May 22nd, 1925, with a nominal capital of £1,000, to acquire a business formerly owned by Mr. B. Apple, who traded under the style of the District Lighting Supply. From the inception of the company to the end of May, 1926, there was a loss on trading of £113. Mr. Steel said that upon purchase the goodwill was put down at £50, fixtures and fittings £200, and furniture, stock, &c., £750. The total of £1,000 was satisfied by the allotment of 1,000 shares of £1 each. The trade liabilities taken over amounted to £700. The directors of the company were Mr. Apple and his wife. The liquidator said that the case was unsatisfactory in some respects, and required a good deal of investigation. Mr. E. H. Hawkins proposed that unless a guaranteed offer of 10s. in the £ was forthcoming within fourteen days the liquidator should be requested to apply to the Court for the compulsory liquidation of the company, and the resolution was carried. The following are creditors:—

	£		£
Freedman, L.	309	Bryan, G. A.	49
Anglo Trading Co. ...	176	S.M.T. Gramophones ...	38
Notting Hill Loan & Investment Society ...	171	Artistic Lamp Shade Co.	36
Brown Bros., Ltd. ...	130	Eaton & Son	31
London Commercial and Electrical Stores ...	63	Foot, R. W.	30
Johnson Talking Machine Co.	50	Simpson & Taylor ...	29
		Sanders Electrical Co....	20
		Heath, S., & Sons, Ltd.	20

Electrical and Radio Distributors, Ltd., 71, Monks Park, Wembley.—A meeting of creditors was held on May 25th, at the offices of Mr. F. E. Anderson, I.A., 20, Bedford Row, W.C., the liquidator of the company. No statement of affairs was presented, but according to a balance sheet as at March 31st, 1927, it appeared that the authorised capital was £500, in shares of £1 each, and the fully-paid issued capital was £265. The company was registered on October 22nd last, and from then until the date of liquidation, the purchases were £1,135, the sales were £1,150, and there was a gross profit of £37, and a net loss of £326. The matter was left in the hands of Mr. Anderson as liquidator. The following are creditors:—

	£		£
Barnard Accumulator Co.	38	Beaver Electric Supply Co.	40
Sel-Ezi Wireless Supply Co.	31		

British Electrolytic Zinc (Isherwood Process), Ltd.—A meeting of members is called for July 1st, at Pinners Hall, Austin Friars, E.C., to hear an account of the winding up from the liquidator, Mr. E. Fairweather.

Holbrook's Electric Service Co., Ltd.—A meeting of creditors is called for June 8th, at the offices of Messrs. Chantry, Button & Co., 61-62, Lincoln's Inn Fields, W.C.2. Claims to be sent forthwith to the liquidator at the above address.

D

UNITED ELECTRIC CAR CO., LTD., AND DICK, KERR & CO., LTD.—Meetings of members are called for June 28th, at Queen's House, Kingsway, W.C.2, to hear an account of the winding up from the liquidator, Mr. G. R. Freeman.

R.M.P., LTD.—Winding up voluntarily. Liquidator, Mr. N. A. Denson, 26, Corporation Street, Birmingham, appointed May 25th.

VEE CEE DRY CELL CO., LTD.—Winding up voluntarily. Liquidator, Mr. H. M. West, 1, Station Road, Reading. Meeting of creditors held June 1st.

HIGH SALVINGTON ELECTRIC SUPPLY CO., LTD.—Winding up voluntarily. Liquidator, Mr. R. Dixon. Meeting of creditors June 6th, at 37, Walbrook, E.C. Particulars of claims by June 3rd to Messrs. Marsh & Ferriman, Arundel House, Liverpool Gardens, Worthing, solicitors to the liquidator.

MEASUREMENT (AUSTRALIA), LTD.—Winding up voluntarily. Liquidators, Messrs. J. T. Fitz, Australia Street, Camperdown, Sydney, New South Wales, and A. Gordon, 7-17, Fitzalan Street, Kennington Road, S.E.11. Meeting of creditors held June 1st. (This notice is formal; all creditors have been, or will be, paid in full.)

Dissolutions of Partnership.

G. STARKS & CO., accumulator manufacturers, 22, Shirley Road, Southampton.—Mr. G. Starks and Mr. R. E. Jones have dissolved partnership.

SMITH & SNAPE, decorators and electrical engineers, 114, Devonshire Street, Sheffield.—Messrs. H. H. & S. Snape have dissolved partnership; the former is continuing the business.

H. G. HOAD, electrical engineers, Ashford, Middlesex.—Messrs. H. G. Hoad and F. R. J. Sears have dissolved partnership. Debts will be attended to by Mr. Sears.

ABINGDON WIRELESS SUPPLIES, manufacturers and dealers in wireless apparatus, Abingdon, Berks.—Messrs. E. S. Langford and A. E. Basford have dissolved partnership. Mr. Basford will attend to debts.

Book Notices.

"Kelly's Directory of the Merchants, Manufacturers and Shippers of the World." Two vols. (Pp. 4,541.) London: Kelly's Directories, Ltd. Price 64s., post free.—This is the 41st edition of the directory; it contains more than a million and a half names, and deals with over 20,000 places. Apart from this, all manner of commercial information is given, and reference is facilitated by a concise explanation of the arrangement of the matter. With the volumes is circulated a reproduction of a specimen proof page showing the great amount of revision which is necessitated by the changes of a year.

"The Marconi Short-wave 'Beam' System." Pp. 28; 25 figs. London: Marconi's Wireless Telegraph Co., Ltd.—This well-printed publication, though not containing anything new, is a useful *résumé* of the essential features of "beam" radio-telegraphy that should find a place in reference libraries. Written in a non-technical manner, it clearly outlines the system; the principal characteristics are illustrated by diagrams and photographs, and typical short-wave stations in this country are described.

"Faraday House Journal." Vol. XII, No. 3, Summer Term.—Besides news items, this number contains articles on "Super-tension Cables in Cast-iron Pipes," by Mr. G. W. Preston, and on "The Manufacture of Air-spaced Paper-covered Multiple-twin Telephone Cable," by Mr. E. N. Bronsdon, while Mr. D. W. Thorpe explains how one may add to one's income by "The Writing of Technical Articles."

"Science Abstracts (A. & B.). Vol. XXX. Part 5. May 25th, 1927. London: E. & F. N. Spon, Ltd. Price 3s. each.

"Scientific Papers of the U.S.A. Bureau of Standards." Vol. 21, No. 545. "Determination of the Magnetic Induction in Sheet Steel." Price 10 cents.

"National Research Council of Japan." Japanese Journal of Physics; Transactions and Abstracts. Vol. IV, No. 2. 1926-27.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLVI, May, 1927. New York: The Institute. Price $1.

"Theory of Machines," by L. Toft and A. T. J. Kersey. Pp. ix+408; figs. 272. London: Sir Isaac Pitman & Sons. Price 12s. 6d. net.

Wire Manufacture in Chile.

In order to render Chile independent of foreign markets for many manufacturing elements, including those used in the electrification of railways and the lighting services, a concession has been granted for a factory to manufacture copper wire. Raw materials (copper ore and sulphuric acid) abound in Chile, and the factory will be able to produce copper wire of greatest purity. Insulated and non-insulated wire will be manufactured, also copper and brass plates and bars, tubing, wire ropes and concentric bare or insulated cables for high-pressure transmission. The factory will contain rolling, tubing, insulating and cutting machines, and at least one large wire-drawing machine.—*Reuter's Trade Service* (Santiago).

Span-wire Suspension.

Referring to the report recently abstracted in this journal on "The Problems of Public Lighting by Electricity," by Lieutenant-Commander Haydn T. Harrison, touching the public lighting in the City of London, in which it is asserted that the main streets of the City of London are the best examples of lighting in the world, the London Electric Firm reminds us that the lamp-lowering gear (both electric and gas) was supplied by it in 1911 and has been in continuous use ever since, with the minimum of cost for maintenance and repairs, and immunity from accidents. The gear consists of the makers' well-known contact suspension gear and a self-sustaining winch by means of which the lamps are suspended in the centre of the road, where the highest efficiency is obtained, and are first traversed along the wire to the side walk and then lowered so as not to interfere with wheeled traffic.

New Belgian Company.

A company has lately been formed at Machelen, Brussels with a capital of 2½ million francs and the title La Société Independante de Construction et d'Exploitation Radio-Electriques, to manufacture radio apparatus.

Works Visit.

On May 20th, a party of members of the Birmingham Electric Club paid a visit to the Siemens lamp works and certain shops of the English Electric Co., Ltd., at Preston. After luncheon at the Victoria and Station Hotel the party proceeded by motor-'bus to the electrical and car works of the English Electric Co., and afterwards made a thorough inspection of the lamp manufacturing processes. The guests were then conveyed to the Ashton Park Club for tea, after which a photograph was taken of the group on the steps of the club.

Sequestration.

E. MACKINTOSH, 57, Broughton Road, Edinburgh, electrical engineer.—Meeting of creditors held June 1st. Solicitor, Mr. R. F. Calder, 12, Gayfield Square, Edinburgh.

A New London Sign.

Mounted on the side of a tall building at the Trafalgar Square end of Whitehall is a new electric sign erected for the CHLORIDE ELECTRICAL STORAGE CO., LTD. The sign is 40 ft. long by 8 ft. high, and contains 434 lamps. A novel method of operation has been arranged. The first portion to operate is a star which flashes out Morse signals, spelling the word "Exide." On completion of the message, the border appears in red, followed in white, by the word "Exide," which is in turn succeeded by the slogan "The Long Life Battery."

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

CHEMICALS, &c.	Price May 31st.	Fortnight's inc. or dec.
a Acid, Oxalic ... ... per lb.	5¾d.	...
a Ammoniac, Sal ... ... per ton.	£60	...
a Ammonia, Muriate (large crystal) ,,	£52	...
a Bisulphide of Carbon ... ... ,,	...	...
a Borax ... ... ,,	£25	...
a Copper Sulphate ... ... ,,	£25 10s.	...
a Potash, Chlorate ... ... per lb.	4d. to 4¼d.	...
a ,, Perchlorate ... ... ,,	5½d.	...
a Shellac ... ... per cwt.	£13 10s.	...
a Sulphur, Commercial ... ... ,,	£9 10s.	...
a ,, Roll ... ... ,,	£9 10s.	...
a Soda, Chlorate ... ... per lb.	3¼d to 3½d.	...
a ,, Crystals ... ... per ton.	£5 to £5 5s.	...
a Sodium Bichromate, casks ... per lb.	4d.	...
METALS, &c.		
b Aluminium, Ingots... ... ... per ton.	£107 to £112	...

An Anglo-American Telephone Appointment.

Dr. H. R. Wright, managing director of Siemens Bros. and Co., Ltd., has joined the board of the British Columbia Telephone and Telegraph Co. (a Delaware (U.S.A.) Corporation with offices in Chicago), in which Siemens Bros. & Co., Ltd., hold a substantial financial interest. The British Columbia Telephone and Telegraph Co. owns a controlling interest in the British Columbia Telephone Co., Ltd., which operates nearly 100,000 telephones in British Columbia, with headquarters at Vancouver.

New French Company.

A company has been formed in Paris (10 Rue de la Fidelité) with the title La Société Rurale de Distribution d'Electricité, to establish hydro-electric plant in rural areas.

New Swiss Company.

The Gesellschaft für Elektrothermische Industrie Liesberg is the name of a company which has been formed at Barschwil (Solothurn) to manufacture electro-metallurgical and electro-chemical products.

Portuguese Duty on Irons.

The Portuguese Customs authorities have imposed an import duty (to take effect on July 1st), upon "electric smoothing irons," ranging from 0.30 to 0.10 gold escudos per kg.

For Sale.

Southampton Corporation Electricity Department has for disposal one 60-in. Davidson "Sirocco" induced draught fan complete with cover, &c., but without electric motor. Stafford County Mental Hospital invites offers for an electric lighting generating set. City of Sheffield Electric Supply Department has for disposal oil-cooled and air-cooled transformers, 0.75 to 1,000 kVA capacity. Darlington Corporation Electricity Committee invites offers for a 220/280-kW steam generating set. Sunderland electricity department has for disposal a quantity of second-hand meters. (See our advertisement pages to-day.)

Lighting and Power Notes.

Beckenham.—New Plant.—The Urban District Council has applied to the Electricity Commissioners and to the London and Home Counties Joint Electricity Authority for sanction to install a 1,500-kW set, cooling tower, boiler, and accessories, estimated to meet the requirements for the next ten years, in place of the 3,000-kW set previously proposed, but not approved of by the Joint Authority.

Birmingham.—New Electricity Tariff.—The City Council is to be asked to approve a recommendation of the Electric Supply Committee to introduce the "telephone system," as an alternative to the present flat-rate system of electricity charges. Under the new system, which, if approved, will be put into operation in September next, there will be a quarterly rental based upon ratable value, plus a charge of ¾d. per kWh for electricity used for all purposes. One meter and one wiring system will be installed for lighting, heating, cooking, &c. The scheme will be confined to private residences.

Year's Working.—The accounts of the Electricity Supply Department for the year ended March 31st last show a surplus of £172,000, as compared with £184,000 in the preceding year, and it is proposed to contribute £31,000 to the borough fund. A record number of new consumers (10,300) were connected to the mains during the year.

Blackburn.—Inquiry.—With reference to the note which appeared in our last issue under this heading, we are informed that Dr. S. L. Pearce is unable to comply with the Corporation's request to conduct an inquiry into the electricity undertaking owing to pressure of other business.

China.—Shanghai.—A net profit of Tls. 2,205,490 was realised by the Electricity Department of the Municipal Council in 1926. The total sales of electricity for all purposes were 408,245,810 kWh, and the revenue from sales of electricity, hire of motors, &c., was Tls. 10,051,221. The gross profit, after allowing for depreciation, was Tls. 3,930,539. There were 43,378 consumers at the end of the year, as compared with 38,932 at the end of 1925, an increase of 4,446. A total of 226,190 lamps were in service within the Settlement at the end of 1926.

Clitheroe.—Extension of Supply.—The Corporation has instructed its consulting engineer to prepare a scheme for the erection of an overhead cable to the districts of West Bradford, Grindleton and Waddington, consequent upon guarantees having been forthcoming for the £5,000 estimated capital expenditure.

Continental.—Belgium.—An agreement has recently been concluded between a number of electricity undertakings in eastern Belgium, comprised in the Groupement des Centrales Electriques de la Region de Charleroi, and several of the leading metallurgical concerns in the area whereby plant is to be installed for the utilisation of the waste gases from the ironworks for steam-raising purposes at the power stations.

Portugal.—A message from Lisbon states that the Union Electrica Portuguesa is completing the installation of a thermo-electric works of 10,000 h.p. The concern hopes that it will now be able to attract large industries which were not willing to engage themselves before being sure of receiving sufficient power.—*Reuter's Trade Service* (Madrid).

Italy.—A new 135,000-V h.p. transmission line has recently been completed and put into operation by the Società Idroelettrica Piemonte from its hydro-electric station on the Marmore at Covalou along the Aosta Valley to Turin, a distance of about 60 miles. Later the line will also be connected to the station recently completed by the company at Lys, and to the one in course of construction at Evançon. At present the line is only being used to transmit power at 75,000 V, but the higher pressure will be brought into use by the end of the present year.

Dartmouth.—Laying of h.p. Cable.—W. T. Henley's Telegraph Works Co., Ltd., has laid an 11,000-V h.p. cable, 550 yards in length, across the River Dart for the supply of electricity to the district.

Darwen.—Price Reduction.—The Electricity Committee has decided to reduce the charges for electricity by 10 per cent. to all consumers with the exception of those supplied under industrial power contracts.

Fishguard.—Proposed Electricity Scheme.—At a recent meeting of the Urban District Council, Mr. Parkington, of Newcastle Emlyn, promoter of the proposed local electricity scheme, presented his report. He suggested that the company to be formed should be given a tenure of 30 years, the Council to have an option of purchase at the end of 20 years. It was proposed that the charge to consumers should not exceed 10d. per kWh, and it was anticipated that as the demand for supply increased, the charge would be reduced. The minimum charge would be 15s. per annum. Three methods of supply had been considered, *viz.*, from the G.W.R. power station at the Harbour, a water-power scheme, or a power station at Fishguard. The first was the most feasible at present and could be worked quite satisfactorily. The Council decided that Mr. Parkington should prepare a final scheme for its approval before submitting the proposal to the Electricity Commissioners. It is hoped that a supply will be available by next winter.

Glasgow.—Refuse Plant.—The Corporation has given notice that an application has been made to the Electricity Commissioners for consent to establish at Helen Street, Govan, a generating station in connection with the refuse disposal works erected by the Corporation.

Progress during April.—Under the three-years' scheme of the Corporation Electricity Department, 75 houses were wired in April, making the total to date 3,553. Under the 10 years' hire-purchase scheme 153 houses were wired, making a total of 401. Applications for the hire of appliances numbered 146, bringing the total up to 14,895.

Greenock.—Extension of Supply.—Two years ago the Corporation was granted powers to supply electricity to Inverkip, Wemyss Bay, and the intervening area, and a report has now been submitted by the engineer giving details of a scheme for carrying out this extension, which it is estimated will cost £10,000.

Hornsey.—New Plant.—The Corporation has arranged for a formal gathering in connection with the extension of generating plant at the power station, on Saturday, July 16th, and Councillor Mrs. Everington will start up the new turbine.

Ilford.—Loans Sanctioned.—The Corporation Electricity Committee has received sanction to loans of £6,000 for mains, £1,295 for plant and kiosks, and £2,000 for wiring installations.

India.—Rangoon.—The Rangoon Tramways and Electric Supply Co. has now practically completed the scheme for modernising its power station at Ahlone. The last turbine installed, which will shortly be ready for trial, brings the total capacity of the station to 16,500 kW at normal rating, and it is anticipated that the generating plant will suffice to meet all demand for some years ahead. The work of raising the pressure on the feeders to 6,600 V is now practically completed, and work is now about to be undertaken to raise the pressure of the distribution mains from 150 V and 200 V to 230 V and 400 V.

Japan.—Electrical Development.—The Tokio Municipal Electric Bureau has commenced work on the construction of a steam power station at Shibaura, which will be put in operation by the end of the year. The initial plant will have a capacity of 10,000 kW, which will eventually be doubled.

It is reported that the Tokio Dento K.K. has a scheme in hand for the erection of a power station at Senju with a capacity of 25,000 kW, and one at Tsurumi with a capacity of 50,000 kW.

Lancaster.—Electricity Supply.—At the meeting of the Town Council on May 25th consent was given to a proposal of the Electricity Committee to spend £45.000 on changing over the system of supply in the centre of the town from d.c. to a.c., and on a new sub-station, offices, &c. The expenditure includes:—Purchase and equipment of premises in North Road for sub-station, showroom and offices, £8,000; plant and switchgear, £5,000; h.p. and l.p. feeder cables, £10,500; distributing cables, &c., £16,500; services, £5,000. It is estimated that it will take from three to five years to complete the change-over.

Littleborough.—SUPPLY TO HOUSING ESTATE.—The Electricity Committee has recommended to the Urban District Council that cables be laid immediately to the Dearnley housing estate for lighting and power and street-lighting purposes.

Liverpool.—RAILWAY SUPPLY.—Negotiations have resulted in the Liverpool Overhead Railway Co. deciding to take a supply of electricity at 520 V d.c. from the Corporation from the end of June.

Llandrindod Wells.—LOAN.—The Urban District Council has applied for sanction to a loan of £3,000 for mains, cookers, meters, &c.

Llansilin.—HYDRO-ELECTRIC SCHEME.—The new hydro-electric plant of the Llansilin Electricity Co., Ltd., was inaugurated on May 17th by Mr. Watkin Richards. At the turbine house Sir Watkin Williams Wynn started the turbine and switched on the current to the battery house in the village. At the battery house there is a stand-by plant.

Maidstone.—EXTENSION OF SUPPLY.—The Electricity Committee has recommended the Town Council, subject to obtaining the necessary powers, to extend the mains to Leeds Castle, at a cost of £4,320, the owner bearing the cost of cable, transformer, &c., on his premises, estimated to cost £1,100. The minimum revenue will be £846 a year for five years.

Maryport.—ELECTRICITY IN BULK.—The Urban District Council, after considering a proposal to take a supply of electricity in bulk from the Risehow Colliery Coking and By-Product Co., has asked the company if it will be prepared to pay half the cost of a Special Order if applied for by the Council.

Mexico.—ELECTRICAL DEVELOPMENT.—The Mexican Light and Power Co., which is a Canadian concern, has announced its intention of spending $14,000,000 on developments in Mexico.—*Reuter* (Mexico City).

Mid-Lancashire.—ELECTRICITY SUPPLY.—A meeting was held at Accrington on May 27th of representatives of various mid-Lancashire electricity authorities to consider the request of the Commissioners for returns showing the cost and the lowest price at which the various authorities could sell electricity. The returns will furnish the Commissioners with a comprehensive review of the mid-Lancashire electricity supply position.

Northern Ireland.—LURGAN (ARMAGH).—The Urban District Council has decided to install an additional 200-h.p. engine at its electricity works to meet the increasing demand for electricity.

Skipton.—PROPOSED PURCHASE OF UNDERTAKING.—At a recent meeting of the Council a letter was received from the Electrical Distribution of Yorkshire, Ltd., offering to take over the Council's electricity undertaking. The company expressed the opinion that considerable economy would be effected if arrangements could be made to cover the rural and urban districts of Skipton together. The offer included payment by the company of the reasonable costs of obtaining the necessary Order, together with the costs of the Council's original Order, meeting the loss already incurred on the Department, payment to the Council of the capital expenditure of the undertaking, less sinking fund, making an immediate reduction in the charges for electricity in the town, and the institution of an assisted wiring scheme. The Electricity Committee recommended that the Council should not entertain the company's offer, and it was decided to discuss the communication in committee.

Sudbury.—ELECTRICITY SUPPLY.—The East Anglian Electric Supply Co., Ltd., is arranging to obtain a bulk supply of electricity from Braintree, and a supply will be available in Sudbury this autumn. The company is experiencing some opposition from farmers within the area through which the mains have to pass, and it is probable that it will have to request the Ministry of Transport to hold an inquiry.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by Electricity Distribution of North Wales and District, Ltd., authorising it to supply electricity in the urban districts of Buckley, and the Wisbech Electric Light & Power Co., Ltd., to supply in the urban district of Walsoken.

The Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them to be granted to the Urban District Council of Criccieth for the supply by the Electricity Distribution of North Wales and District, Ltd., of electricity in the urban district.

Tynemouth.—STREET LIGHTING.—The Corporation has decided to lay cables, at a cost of £1,850, for lighting by electricity the part of the coast road within the borough.

United States.—ELECTRICAL DEVELOPMENT.—According to *Electrical West*, two contracts covering four 33,333-kVA transformers and seven 25,000-kVA transformers respectively, for the Southern California Edison Co. have been placed with the Westinghouse Electric and Manufacturing Co. These units will be manufactured at the Sharon works for delivery during the coming spring and summer. The 33,333-kVA units are the largest single-phase transformers to be built from the standpoint of capacity. All of the units are to be single-phase, self-cooled, air-blast, for use on th 220-kV system of the Southern California Edison Co They will transform the voltage from 16 kV t 220 kV. Each transformer, completely set up, weighs mor than one hundred tons, and from the top of the high-voltag bushing to the ground measures 400 in. The seven 25,00(kVA transformers are for the Lighthipe sub-station and wi be used to connect 220-kV and 60-kV transmission systems They are similar in construction to the four larger units.

Tramway and Railway Notes.

Blackburn.—YEAR'S WORKING.—We have received fro Mr. J. H. Cowell, general manager of the Corporation tram way undertaking, a copy of his report, together with th statement of accounts, on the working of the undertakin for the year ended March 31st last. The total revenu amounted to £106,025, as compared with £113,156 in th preceding year. Working expenses were £79,294, as agains £83,667, leaving a gross profit of £26,731 (£29,489). Aft payment of capital charges and making contributions to th sinking and permanent-way renewals funds, there was a n surplus for the year of £10,590, as compared with £13,25 in 1925-26. A contribution of £5,000 was made to the boroug fund. The number of passengers carried fell from 16,994,8 to 16,152,313, and the car-miles run from 1,128,178 t 1,084,686, the falling off being almost entirely due to th general strike.

Cardiff.—PROVISIONAL ORDER.—The Unopposed Bills Com mittee of the House of Commons on Thursday last wee had before it for consideration a Bill to confirm a Provisiona Order granted by the Ministry of Transport sanctionin various small sections of tramway construction at Cardif The Ministry's representative stated there were four shor tramways proposed, one of which was a connecting line an the others extensions of existing systems. There had origi ally been two objections, but clauses had been inserted for th protection of the Cardiff Gas Co. and the Great Weste Railway Co. The Order was confirmed.

Japan.—TRAMWAY SCHEMES.—It is reported that the Oka yama Municipality is to establish an investigation departmen with a view to introducing a tramway service in the city The cost of the first section of the scheme is estimated a 1,500,000 yen.

Negotiations are in progress for purchasing the Enoshim electric tramway from the Tokio Dento K.K. by Messrs. Kadono and J. Yamamoto, who intend forming a compan with a capital of 5,000,000 yen for the running of the abov tramway, and then increasing the capital to 7,500,000 yen b amalgamating with Enoshima Dento K.K. It is also desire to further augment the capital to 15,000,000 yen with a vie to laying an electric tramway between Ofuna and Osaki.

London.—FARES.—The London County Council will, fro June 1st to September 30th, issue 6d. all-day tickets fo children under fourteen, which will entitle them to the sam privileges as those granted by the present 1s. tickets fo adults.

Manchester.—YEAR'S WORKING.—The report on the work ing of the Corporation tramway undertaking for the yea ended March 31st last shows that the traffic revenu amounted to £1,754,252, as compared with £1,783,484 in th previous year. The gross profit amounted to £305,863, an after meeting capital charges, &c., there was a net surplus o £45,327, as compared with £116,608 in 1925-26. The numbe of passengers carried fell by approximately 7,000,000. Th decrease in receipts, and the increased working costs ar accounted for by the general strike and the coal stoppage o last year.

Southern Railway Scheme.—Work is to commence im mediately on the widening of a portion of the main lin of the Southern Railway between Beckenham Junctio and Kent House station, including the raising and widenin of two bridges. The widening of the line for about half mile on the London side of Beckenham Junction will enabl four sets of rails to be provided to Kent House, and wil do away with the bottle-neck approach to the former station When the work is completed it will be possible to run a new service of electric trains between Victoria and Beckenham Junction, *via* Clapham Junction, Balham, Gipsy Hill, an Crystal Palace, which will form a link between Beckenham and the neighbourhood and many stations on the Central an Western sections of the Southern Railway. Alterations a Beckenham Junction station will consist chiefly in lengthen ing the "up" bay platform by about 200 feet to enable full length electric trains to be dealt with there. The tota cost of the scheme is estimated at £100,000.

Telegraph and Telephone Notes.

India.—PHONOGRAMS IN CALCUTTA.—It is proposed to introduce in Calcutta as an experimental measure a system which will provide facilities for telephone subscribers to send and receive telegrams in plain English by telephone. The subscriber will be required to pay an additional charge of two annas only per telegram transmitted, while received telegrams will be transmitted free of charge.

South Africa.—"BEAM" RADIO-TELEGRAPHY.—Marconi's Wireless Telegraph Co., Ltd., has completed preliminary tests with South Africa with the "beam" wireless stations which it is erecting at Bodmin and Bridgwater for the General Post Office. Further tests by the company under ordinary traffic conditions will commence immediately; should they prove satisfactory, the stations will be handed over to the General Post Office for the official seven days' trial. During the tests so far made by the Marconi Company, speeds of between 200 and 250 words per minute have been maintained over long periods daily.

United States.—SHORT-WAVE ARMY COMMUNICATION.—Short-wave transmitters are being used by the Army Signal Corps to circumvent static in the transmission of official messages over the Army radio net which connects the War Department with the Corps area headquarters and Army posts throughout the country. During the severe static months at least 75 per cent. of the Army telegraph business, both day and night, from Washington was transmitted by ten of the new sets that were installed, and they worked so well that more sets have been ordered, says *T. & T. Age*. The sets are crystal controlled and designed to operate in two frequency bands, one of approximately 4,000 to 4,500, the other of 8,000 to 9,100 kilocycles.

Radio Notes.

Austria.—NEW STATION.—After months of experiment and tests, the Innsbruck station is to be officially inaugurated on June 2nd. Normally it will relay the Vienna programmes.

Canada.—NEW STATION.—It is reported that the Ontario Government will shortly undertake the erection of a 1,000-watt broadcasting station near Toronto to be used by the Department of Agriculture for broadcasting lectures, weather reports, and possibly general entertainment.—*Reuter's Trade Service.*

United States.—TRANSMISSION PROBLEMS.—Developments in broadcast transmission are announced by the Westinghouse Electric Company, which claims that a system developed at KDKA eliminates three-quarters of the transmitting valves, permits of the broadcasting of a radio wave many times sharper than has heretofore been possible, and provides the same range and quality of transmission with less than half the usually required power input. The new system is regarded as important in offering solutions to many problems, including the possibility of a reduction of station interference and an opportunity to overcome static and local interference in receiver design, whilst an immediate effect noted by operators of receivers in the vicinity of KDKA is a lifting of the blanketing effect that usually surrounds high-power stations, due to the sharpness of the radiated wave. The new system is defined as "frequency modulation," instead of the present method of "power modulation"; heretofore the frequency band required for station operation has been 10 kilocycles, but in the new system the band has been cut to one-half kilocycle. It is explained that the 10-kilocycle separation between stations will still be required with present-type radio receivers, but the new system requires such sharp tuning as to eliminate the annoying interference set up by powerful stations operating on adjacent wave bands; also in transmission, instead of varying the amplitude or strength of the signal, as is present practice, Westinghouse engineers are maintaining constant strength of signal and are varying the frequency of the transmission by an amount usually not more than from 500 to 800 cycles, which they refer to as "frequency modulation." There has been a great reduction of the number of valves and power required; all modulator valves are eliminated, which (at KDKA) means 12 of the 10-kilowatt water-cooled type. In present-day methods of broadcasting, half the total energy supplied to the transmitter is absorbed and dissipated as heat, amounting to 80,000 watts; this energy is now saved and can be made available to increase the power of the transmitter if desired. So radical is the departure from present practice that engineers hesitate to forecast the improvements likely to result from the general application of the new system.

According to *Reuter's* agency, successful experiments indicate that approximately 1,900 stations can operate in exclusive channels at one time without sharing waves or "splitting" time, and the Company claims that the system will solve the congestion problem which the Radio Commission is now attempting to deal with, and will permit the operation of 300 applicants for licences in addition to the 680 stations already licensed.

RADIO INVESTMENTS.—The United States Department of Commerce has estimated unofficially that the total investment in radio in the United States was, on January 1st, 1927, approximately, $750,000,000, which figure is the estimated aggregate of the current value of the 6,500,000 receiving sets in use, and of the investment represented by the 700 or more broadcasting stations, the 2,550 manufacturing plants, and the 30,000 dealers, says *World Radio*.

POWER REDUCTION.—The Federal Radio Commission has directed all stations to announce their call letters and location once every 15 minutes at least. It has also ordered that all stations must not deviate more than half a kilocycle from the wavelengths assigned to them. Owing to constant complaints of interference caused by broadcasting stations using too much power within residential sections of Chicago, three of them have been directed to reduce their maximum power output to 500 watts, effective at once, and to use no more until further notice.

STATION NAMES.—A very friendly reception was given by members of the Federal Radio Commission to a suggestion of the National Association of Broadcasters that radio stations be named instead of merely listed by call letters. At the same time, members suggested that such a movement might come from the broadcasters and need not alter the present plan of classifying stations for licensing and regulation. A commissioner, Mr. Caldwell, said that there was a good deal of protest against the constant repetition of a combination of letters. He saw no objection to the use of a name by a station, though of course the licence would have to contain some method of registration by letter, or number. Radio inspectors were at present continuously testing the ability of each station to stay in its assigned radio channel and the announcement of the letters helped them to keep this check, but when the re-assignment of broadcasting channels had been made and radio transmission had settled down thoroughly the call letters might be dropped almost completely and the lawfully operating station use its name.—*Reuter's Trade Service* (Washington).

Reviews.

Electro-Organic Chemistry. By C. J. BROCKMAN, Associate Professor of Chemistry, University of Georgia, U.S.A. New York: John Wiley & Sons, Inc. London: Chapman and Hall, Ltd. Pp. xi+381; figs. 15. Price 25s. net.

The object of the volume under review is to give a critical and detailed account of the present position of the study of the vast number of organic reactions which may be accomplished by electrolytic methods, and to discuss the theories on which the practice is based. This illuminating volume offers an excellent and lucid survey of recent advances in this branch of scientific thought, and it also gives its readers the means of acquiring a really sound familiarity with the fundamental principles of the subject. Intricate electro-organic reactions are discussed, recording the degree of success which has been attained and the path whose pursuit offers the most promising results in extending the practical application of the science. The book is eminently practical, inasmuch as it informs those who are actively engaged in manipulative operations how certain results are obtained. Details of recently suggested operations are included, which, if brought into commercial use, would prove time saving, economic and of real utility. The treatment of the subject is remarkably complete, copious references being made to the original literature, including patent literature. The author has drawn his references from a very wide field, but the preponderance of American references is a very noticeable feature, which, no doubt, correctly reflects the activity of United States workers on this subject during recent years. The author meets the requirements of research workers and those who desire to make a more intensive study of the principles involved by adding hitherto unpublished information, numerous references to recent investigations, together with the sources of original contributions. A treatise of this nature, coming from such an authority as Dr. Brockman, who has himself played so important a part in the development of the subject, is an invaluable addition to the literature of electro-organic chemistry. The work has entailed a great deal of time and thought in its preparation, and is perhaps the most successful attempt that has yet been made to correlate the several theories and to deal exhaustively with the problems of the subject. The author is to be congratulated on his successful achievement.

The book is divided into two parts; the first part deals with reactions at the anode, being further divided into chapters on electrolytic oxidation, and the oxidation of ionised and non-ionised substances. The second part of the volume deals with reactions at the cathode, the individual chapters dealing, respectively, with electrolytic reduction, the reduction of aromatic nitro- and nitroso-compounds, the carbonyl group

and compounds containing arsenic, chlorine, sulphur, and mercury.

The passage of an electric current through an electrolyte either deposits a metal on the cathode or evolves hydrogen. The electrolytic hydrogen may become attached to an organic compound or it may remove oxygen or both. An example of the addition of hydrogen to a molecule is found in the case of the reduction of cinnamic and nitro-cinnamic acids, respectively. The best example of the removal of oxygen and in its place the substitution of hydrogen is in the reduction of nitro benzene. In the electrolytic oxidation of organic compounds in general, the materials to be oxidised consist of the depolariser; they are also poor conductors of electricity, hence they can seldom be used without the aid of an electrolyte. Since it is difficult to regulate the electrode potential for any one reaction, it is seldom that all the oxygen is absorbed by the depolariser; that which is not absorbed will therefore be evolved at the anode as a gas. The amount of oxygen absorbed by the depolariser depends on the nature of the depolariser, the current density, diffusion of the depolariser, dimensions of the anode surface, rate of agitation, the catalytic influence of added compounds, temperature, and the composition of the anode and the solvent. These factors may be considered as primary conditions, in that during the ordinary electrolysis, without any external changes brought about by the hand of the operator, they regulate the course of the electrolysis; the conditions of the operation may, however, be so changed as to modify the results very considerably.

Perhaps one of the most stimulating chapters in the book is that dealing with the subject of electro-chemical substitution, in which is found much useful information relating to the introduction of halogens into aromatic compounds, together with substitution in acid, neutral and alkaline solutions. The chapters devoted to the reduction of aromatic nitro-compounds are also to be commended for their clarity of statement, soundness of teaching, and admirable discussions of many imperfectly explained reactions. Evidently the whole problem interests the author very keenly. The concluding chapter reviews in a series of well-reasoned comments some special methods of electrolytic reduction of organic compounds containing arsenic, chlorine, sulphur, mercury, &c. The rapid advances that are being made at present in the chlorination of petroleum and the separation of the chlorinated products will probably lead to an entirely new group of intermediate compounds. With the development of new methods of preparation, commercial production may be in a position to accept electro-chemical methods for the treatment of some of these compounds; besides being valuable as solvents, these chlorinated compounds are also of use as intermediates in several industries.

The whole work is admirably condensed, modern aspects are included, and throughout the author has striven to explain intricate reactions in the simplest possible language. The book is replete with indications of probable lines of advance, and in this respect will make an appeal not only to the theorist, but also to the experimental worker. The volume is excellently paragraphed, written in a good literary style, is commendably free from inaccuracies, and is a valuable work of reference in both the theoretical and technical aspects of electro-organic chemistry. A comprehensive authors' and subject index is provided. The volume cannot fail to be of value to all organic chemists employed either in academic work or industry. The reader—like Jonathan in the day of battle, having tasted the wild honey in the wood—will find his eyes enlightened, and will pursue his studies in this wide branch of organic chemistry with added zest and pleasure.

Electric Switch and Controlling Gear. By C. C. GARRARD, Ph.D., M.I.E.E., A.Am.I.E.E. Pp. xiv + 783; figs. 649. London: Ernest Benn, Ltd. Price 63s. net.

The massive volume under notice is the third edition of Dr. Garrard's well-known book, which was originally introduced to the public in 1916, and which has now been revised and considerably enlarged in the process of being brought up-to-date by the inclusion of accounts of appliances and methods evolved since the original publication of the work. The general plan of the book remains unaltered, the numerous appliances described being grouped according to the functions they are designed to perform. Following a preliminary chapter dealing with materials, manufacturing methods and specifications, we find that appliances for breaking electric currents, such as switches, fuses and circuit breakers, are fully considered. The discussion of circuit breakers naturally leads to a consideration of means for the prevention of abnormal currents in circuits by the use of protective relays and other methods. In the new edition the work dealing with this branch of the subject has been enlarged by the inclusion of a considerable amount of matter concerning the biased systems of protection which have recently attracted attention. Chapters IV and V are devoted to a consideration of starting and regulating appliances, and these are followed by chapters dealing with the assembly of appliances for the formation of complete switchboards. A feature of the section dealing with switchboards is the consideration given to the circuit arrangements necessary for the control of the various types of machines, and we find that not only is due attention paid to the more common machines such as rotary convertors and balancers, but also to the less common appliances, such as phase advancers and rectifiers. The concluding chapter is concerned with appliances and methods for the protection of machines and circuits against abnormal conditions giving rise to excessive pressure. The book terminates with ten appendices concerned with the regulations issued by various controlling authorities so far as they relate to switchgear.

It would appear that a book on switchgear would be more difficult to successfully produce than one relating to almost any other branch of electrical engineering, since, on account of the number and variety of the appliances falling within its province, there must always be a great difficulty in preventing the text resolving itself into a mere description of the various pieces of apparatus concerned. Probably no one is better fitted to undertake the task than Dr. Garrard, who is able to draw upon his very large experience on both the technical and commercial sides of the subject in order to link together the descriptive parts of the book with useful and pertinent discussions concerning the principles involved. Thus, in the work before us, we find, for example, that the descriptions of the various appliances for the starting of squirrel-cage induction motors are accompanied by a very useful discussion, based on the scientific principles involved, of the relative merits of the several methods, and again, when dealing with protective systems, the degree of sensitiveness of each system is considered together with the reasons leading thereto.

The book is well printed, few errors being apparent, though one occurs in a prominent place on the loose cover, and the illustrations, both line and half-tone, are well chosen and reproduced.

The size and quality of the book have unfortunately resulted in a high price which we fear will tend to put it out of the reach of many students and junior engineers, and this is to be regretted since Dr. Garrard has done his work well and produced a book which is full of live and vital matters from beginning to end. It is likely to be a standard work of reference for many years to come.

The Director System of Automatic Telephony. By W. E. HUDSON, B.Sc. (Hon.), Whit. Sch., A.C.G.I. Pp. xii+157; figs. 73. London: Sir Isaac Pitman & Sons, Ltd. Price 5s. net.

This further contribution to the steadily growing literature on the subject of automatic telephony is designed for the use of linesmen, traffic officers, and telephone engineers, to enable them to obtain a knowledge of the system adopted by the British Post Office and now being introduced into certain of the larger towns. The author, who is a post office official, may therefore be assumed to write from practical experience of the system. The object of the book is to show how the principles of "step-by-step" selection are amplified to meet the requirements of large multi-exchange areas, in addition to which brief descriptions are given of the special facilities required for dealing with automatic-manual and manual-automatic traffic during the change-over period. In order to simplify the usually complex circuit diagrams the author adopts the "circuit element" drawing, in which "the contacts are separated from the relay coils and gathered up into a number of circuit elements, each element having one or more functions in the circuit operation." The advantage of this method is apparent when dealing with circuits having a large number of functions. The last two chapters of the book are devoted to "metering," and illustrations of exchange apparatus. Although the subject has been very greatly condensed, the book will prove a useful guide to those who are interested in the subject of the "Director" system of automatic telephony.

Données Numériques d'Electricité Magnetisme et Electrochimie. Edited by an International Committee. Pp. x + 143. London: Cambridge University Press. Price 77 fr. (bound), 56 fr. (stitched).

This is an extract from Vol. V of the "Tables Annuelles de Constantes et Données Numériques," and gives the data for the years 1917 to 1922 inclusive. It has a preface by Mr. G. Semenza, president of the International Electrotechnical Commission, who expresses the relief that the reader of a research feels nowadays when he is able to ascertain at once the very latest values that have been assigned for physical and chemical constants—contrasted with the uncertainty that so often hampered progress before these data were thus authoritatively brought together. Only by an international organisation could this end be achieved.

Without a collection of this kind the investigator could not possibly ascertain the state of knowledge of the subject in which he was interested, and consequently a great deal of overlapping would be inevitable. By cutting out this waste to a great extent, the work materially hastens progress; moreover, as Mr. Semenza remarks, it stimulates imagination and suggests new directions for exploration.

To review its contents is impossible; to commend them as indispensable to the research library is a duty, for they undoubtedly render valuable service to the scientific world.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Australia.—MELBOURNE.—August 15th. Postmaster-General's Department. One 55-ton 3-motor-type electrically-operated overhead travelling crane. (A.X. 4727.)*

SYDNEY.—July 18th. Municipal Council. Boiler-house equipment for the Bunnerong power station. (B.X. 3531.)*

August 15th. Generator neutral earthing resistance. B.X. 3550.)*

Barton-on-Irwell.—June 7th. Barton and Urmston Joint Electricity Board. Static transformer sub-station, plant and cables. Specifications from Mr. J. A. Robertson, consulting engineer, 20, Brazennose Street, Manchester.

Dublin.—June 8th. Port and Docks Board. Two 200-yd. lengths of 0.4 sq. in. single, lead-covered, armoured, submarine cable, 660-V quality, in accordance with B.E.S. specification No. 7-1926.

Greenock.—June 17th. Corporation. Supply and erection of 11,000-V overhead transmission line and transformers. (See this issue.)

Hull.—June 16th. Electricity Department. Steel coal bunker and conveyor housing. (May 20th.)

Switchgear extensions. (May 27th.)

London.—STEPNEY.—July 11th. Electricity Supply Department. Boilers and boiler-house accessories, turbo-alternator, condenser, accessories, and switchgear. (See this issue.)

H.M. OFFICE OF WORKS. June 13th. Fuseboards and fuses. (See this issue.)

Manchester.—June 13th. Electricity Department. Seven 250-kVA static transformers. Mr. H. C. Lamb, chief engineer and manager, Town Hall, Manchester.

Marlborough. — Electricity Department. Additional underground feeder and overhead feeder. (May 27th.)

New Zealand.—WELLINGTON.—August 9th. Public Works Department. 1,500 suspension insulator strings and 470 strain insulator strings. (B.X. 3533.)*

Nottingham. — June 21st. Electricity Department. General stores for 12 months. (See this issue.)

Oldham.—June 11th. Electricity Department. Water-cooling towers, foundations, tanks, and circulating water pipes. (May 27th.)

Portsmouth. — Electricity Department. Transformers. (May 27th.)

Pudsey.—June 14th. Electric lighting installation at the School of Art. Specification from Education Department, County Hall, Wakefield.

Sheffield.—June 11th. Tramways and Motors Committee. Supply and erection of weighbridge. Mr. A. R. Fearnley, general manager, Division Street, Sheffield.

South Africa.—CAPE TOWN.—June 30th. South African Railways and Harbours Board. Gasfilled and vacuum lamps for 12 months. (B.X. 3518.)* Telegraph material. (B.X. 3519.)*

ELLIOTT (C.P.).—June 15th. Municipal Council. Electric lighting plant, including engines and dynamos, steel poles, copper wire, insulators, switchboard meters, house-service fuses and street-lighting brackets and suspension fittings.

EDENBURG (O.F.S.).—June 21st. Municipal Council. Electric lighting plant, including engines, dynamos, steel poles, &c.—*S.A. Mining and Engineering Journal.*

Southend-on-Sea.—July 6th. Light Railways and Electricity Department. L.p. and e.h.p. cables for 12 months. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Aberdeen.—Housing Committee.

Installation of electric lighting at the new houses (1,000) at Cattofield and Hilton.—Andrew M'Robb.

Australia.—MELBOURNE.—State Electricity Commission of Victoria.

H.p. water-tube boiler and accessory plant (£17,382).—Babcock & Wilcox, Ltd. —*Tenders.*

Barking Town.—Electricity Committee. Recommended: Erection of showrooms and offices in Ripple Road (£4,580).—H. Newell.

Birmingham.—Education Committee. Accepted:—

Electric lighting installation, Sladewell Road school.—S. R. Hare.

Electricity Committee. Accepted:—

Laying cable between Summer Lane generating station and Halesowen.—British Insulated Cables, Ltd.

Switchgear for various sub-stations.—General Electric Co., Ltd.

Bromley (Kent).—Education Committee. Accepted:—

Installing electric lighting at Burnt Ash school (£804, including a provisional sum of £250 for fittings and fixtures).—R. E. Knight.

Erith.—Urban Council. Accepted:—

Joint boxes (£549).—Callender's Cable and Construction Co., Ltd.

Switchgear (£319).—Johnson & Phillips, Ltd.

Glasgow.—Corporation. Accepted:—

Renewal of the main switchboard of the Pollokshaws Burgh Hall (£90).—W. Draper & Co.

Guildford.—Electricity Committee.

Three-phase switchboard:—

New Switchgear Construction Co., Ltd.	(Accepted)	**£760**
Crompton & Co., Ltd.		886
General Electric Co., Ltd.		898
English Electric Co., Ltd.		895
Ferguson, Pailin, Ltd.		906

Kendal.—Board of Guardians. Accepted:—
Electric lighting at the Institution (£225).—R. Hadwin and Son.

London.—BATTERSEA.—Town Hall Committee. Recommended:—
Electric organ-blowing plant for Town Hall organ (£160).—William Hill & Son and Norman & Beard, Ltd.

METROPOLITAN WATER BOARD.—Accepted:—
Electrical fittings for Green Lanes pumping station; electric lighting conduit at Kempton Park station.—General Electric Co., Ltd.

METROPOLITAN ASYLUMS BOARD.—Works Committee.
Installation of electric power in laundry, &c.:—

T. Clarke & Co., Ltd. (Recommended.) ...	**£386**
Burdette & Co., Ltd.	433
E. Wendey	444
Douglas Electric Lighting & Power Co. ...	444
Smith & Hammond, Ltd.	447
Electracts, Ltd.	520
Alternative	573

Manchester.—Tramways Committee. Accepted:—
Trolley wire.—R. Johnson & Nephew, Ltd.
Tramway rail bonds.—Forest City Electric Co., Ltd.
Electricity Committee. Accepted:—
Replacement of 33,000-V cables and trifurcating boxes for the Barton house service transformers.—Pirelli-General Cable Works, Ltd.
Housing Committee. Accepted:—
Electric lighting of houses on various estates.—S. Dickinson and W. Spreadborough; Hanchett, Barratt and Currie.
Tramways Committee. Accepted:—
Maximum traction trucks.—Brush Electrical Engineering Co., Ltd.
Tramcar motors and controllers.—British Thomson-Houston Co., Ltd.
Tramcar motors.—General Electric Co., Ltd.
Tramway poles.—British Mannesmann Tube Co., Ltd.
Span wire brackets.—John Spencer, Ltd.
Steel girder tram rails.—Cargo Fleet Iron Co., Ltd.; Bolckow, Vaughan & Co., Ltd.

Salford.—Watch Committee. Recommended:—
Electric light installations at 16 firemen's dwellings at central station (£169).—Height Engineering Co.
Health Committee. Recommended:—
Electric light installation at Drinkwater Park hospital (£163).—Taylor & Son.

Seaham Harbour.—Housing Committee. Recommended:
Wiring 80 cottages for electricity (£266).—C. Doyle (Newcastle).

Stoke-on-Trent.—Electricity Committee. Accepted:—
Distributor wiring at the Abbey Hulton housing site (£327).—Barnett & Soans; Acres Wood housing site (£187).—Hawley & Ingram; and Tarleton Road housing site (£185).—Blackburn, Starling & Co., Ltd.
Housing Committee. Accepted:—
Electric wiring in houses on the Northwood Park estate (£447).—Tomlins, Ltd.

Forthcoming Events.

Optical Society.—Thursday, June 9th. Imperial College of Science, South Kensington, S.W. 7.30 p.m. Paper, "The Use of Photo-Electric Cells for Precision Photometry of Electric Lamps." Mr. T. H. Harrison.

Physical Society.—Friday, June 10th. Imperial College of Science, S. Kensington, S.W. 5 p.m. Ordinary meeting.

Heat Engine Trials Committee.—Friday, June 10th. Institution of Civil Engineers. 6 p.m. Discussion on the Report of the Special Committee on the results of Heat Engine Trials.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the name and address of makers of the following:—

Filaments for NERNST lamps.
230-volt lamps (believed imported) which are no larger than a motor-car headlight bulb.
BELMAPHONE electric buzzer.

We also have an inquiry for the present address of Messrs. William Pemberton & Sons, late of Imperial Buildings, Birmingham.

Notes.

An Important Committee Appointed.

At the moment of going to press we are informed that th Electricity Commissioners, in pursuance of the provisions Sub-section 3 of Section 48 of the Electricity (Supply) Ac 1926, and after consultation with associations representin local authorities who are authorised undertakers, contractor and persons engaged in the business of making and selling ele trical fittings, have appointed the following to be a committe to determine any question which may be raised under Sectio 48 of the Act as to the recognised retail or trade prices any electrical fittings and to advise and assist the person concerned as to the method of giving effect to the provision of the Section:—Mr. D. N. Dunlop, Chairman. Messrs R. W. L. Phillips, A. Nichols Moore, S. E. Fedden, F. W Purse, Councillor J. Moore, and Mr. A. C. Cramb, representin the Incorporated Municipal Electrical Association. Messrs H. H. Berry and J. S. Ramsden, representing the British Elec trical & Allied Manufacturers' Association. Mr. F. Winstanley representing the Electric Light Fixtures Association. Mr F. J. Collis, representing the Electrical Accessories Manufac turers' Association. Mr. C. W. Sully, representing the Elec tric Lamp Manufacturers' Association. Mr. W. F. Bishop representing the Cable Makers' Association. Messrs. A. G Beaver and G. Donovan, representing the Electrical Whole salers' Federation. Messrs. H. J. Miles, T. E. Alger, H Marryat, and L. C. Penwill, representing the Electrical Con tractors' Association. Messrs. J. Allen and W. Finlay, repre senting the Electrical Contractors' Association of Scotland.

Electricity Supply in Ayrshire.

The members of the Ayrshire Electricity Board recentl made an official inspection of their undertaking. In recen years there has been remarkable development in electricit production and distribution throughout the area, the outpu at Kilmarnock being upwards of 40 million kWh per annum there are 204 sub-stations and 121 miles of overhead trans mission lines. At a dinner in connection with the inspection Mr. W. C. Bexon, the engineer, said he did not think th Ayrshire Electricity Board need worry unduly about the opera tions of the Central Electricity Board. The Central Boar estimated that in 1932-34, by linking up, it would save o the whole a yearly sum of £175,603, of which £54,627 woul be a saving to Glasgow Corporation and the Clyde Valley Com pany, £45,756 a saving to Edinburgh Corporation, and £100,00 a saving to the West of Scotland belt, with the remainde to the other undertakings involved. He could not quite agre with the Central Board with respect to this point. To spen five millions in order to effect a saving of £175,000 a year di not appear to him to be altogether right, especially when hal of the capital would be spent on changing the frequency from 25 to 50 cycles. He did not see how the Ayrshire Board woul get any benefit from that. The Ayrshire Board, in 1932-34, was going to save £17,500, which was equivalent to .07d. per unit. On the basis of the present figures he did not see how the Central Board could close the station of the Ayrshire Board at Kilmarnock.

Fatalities.

On May 26th, William Yates, aged nine years, of Bargoed, climbed a mast conveying the cables from Bargoed power station to Taff Merthyr, and came into contact with the cables. He received a fatal shock at 11,000 V.

On May 24th, Mrs. Violet Rainford receiver a fatal shock. At the inquest it was stated that she was holding a reading lamp, the flex of which was defective; there was also a fault in the wireless headphones she was wearing at the time arising from the fraying of flexibles, and Mrs. Rainford was wearing steel-rimmed spectacles. The coroner's verdict was "that Mrs. Rainford died from an electric shock caused by the passing through her of a current, and that it was due to a defective flexible of the lamp standard and defectively wired wireless headphones." We refer to this fatality in our leading columns to day.

B.E.S.A. Publication.

The British Engineering Standards Association has recently issued a B.S.S. (No. 134-1927) for iron or steel tubular poles for telegraph and telephone purposes. It deals in a very complete manner with the full details of the construction of iron and steel telegraph poles, four types of which are recognised as standard, as follows: Type A, tapered tubular pole in two or three parts; type B, riveted (seam) tapered pole in multiple sections; type C, one- or two-piece pole in reduced parallel steps; and type D, multiple-section pole in parallel steps. Perhaps the most useful feature of the specification, apart from the constructional details, is the list of standard lengths and test loads, these being common to all four types of pole. Inasmuch as the overall lengths necessarily vary slightly according to the type of construction employed, a number of nominal overall lengths have been adopted as the basis of comparison between the various types. These range from 18 to 44 ft., and the crippling loads range from 300 to 2,200 lb. applied 6 inches from the top of the pole. The general clauses of the specification explain the assumptions

regarding ground-resistance which have been made for the purposes of calculating the test weights. A schedule of mechanical properties of and calculated stresses in the materials is given, followed by clauses dealing with the means to be employed for protecting the component parts of the poles from corrosion. The sectional clauses give full details of the methods of testing the poles and their bases, if any, together with very complete drawings and tables of dimensions of the component parts of the poles and of the accessories used with the poles. The specification is bound in cloth, and copies may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, London, S.W.1, price 10s. 6d., post free 11s. 0d.

Floodlighting Handbook.

A recent publication of the E.L.M.A. Lighting Service Bureau, London (Electric Illumination Bulletin, Handbook No. 6, "Floodlighting"), is the result of a large number of tests and investigations which have been carried out in order to obtain data on the subject, and includes much useful information of a practical character concerning the planning of floodlight installations. It is shown that the beam from a parabolic reflector in practice is always somewhat divergent, due to the dimensions of the light source. The beam spread from the built-up mirrors with which many floodlight units are equipped nowadays is considerably greater than that obtained from a plain parabolic mirror, and it should be borne in mind that the spread is obtained at the expense of beam intensity, so that the use of mirror units is almost entirely confined to short-range projection. A method of obtaining definite asymmetrical distribution of light is outlined and involves the use of a "spreading glass," consisting of a sheet of clear glass ribbed on one side, the light being spread outward at right angles to the ribs. The various methods by which streakiness on the lighted surface, which usually results from the plain parabolic mirror, is avoided, are given. These include the use of diffusing mirrors, diffusing glass fronts, sectional mirrors, and white lamps. The beam spread from the plain parabolic mirror has been found to be 32 deg., from the diffusing parabolic mirror, 44 deg., and from the plain parabolic type with a diffusing front, 46 deg., in each case the fitting being equipped with a 250-W floodlight lamp. The co-efficient of utilisation is defined, among other characteristics of commercial floodlights, and this varies from 25-30 per cent. for the shallow parabolic plain mirror to 55-60 per cent. for the ribbed-mirror square-pattern flood lantern. Some interesting information on the constructional design of units is given, and the applications of floodlighting are dealt with at considerable length. The latter section of the work is particularly well illustrated.

The Ontario Hydro-Electric Power Commission.

The ninth annual report of the Hydro-Electric Power Commission of Ontario, which was presented to the Provincial Legislature recently, states that the financial results of operation during the year were very satisfactory. The Commission increased its power development from 808,398 h.p. to 928,032 h.p. The revenue from consumers reached a total of $20,555,179, which was sufficient to meet fixed charges, provide $4,295,894 for sinking funds, &c., and leave a surplus of $565,413. The report showed a notable increase in the number of rural transmission lines, 750 miles having been added during the year. The total rural mileage is now 2,300. The number of rural customers reached is 19,000, and the investment in rural lines totals $4,750,000, the revenue from this source being $743,133. The total of the public investment in the system amounted to $203,442,759, of which $155,769,665 is invested in the Niagara Falls System. The increase in power during the year occurred almost entirely in that system, which had 800,000 h.p. of plant in comparison with 683,646 h.p. last year. The total reserves held by the Commission for sinking fund, contingencies, &c., are $24,751,411, this fund having increased rapidly during recent years. Regarding the question of the future power supply for the eastern district, the report stated that plans were under consideration for supplying large blocks of 60-cycle power from the supply to be obtained under the contract entered into with the Gatineau Power Company for 260,000 h.p.

A Rural Electrification Scheme.

An interesting example of a rural electrification scheme is to be found in the installation recently completed at Preesall, near Lancaster. The United Alkali Company has established works on the outskirts of the village, and it is from the power house of those works that a bulk supply is provided by the company at 550 V, 50 cycles, 3-phase, through the medium of a kiosk-type sub-station. This contains two 50-kVA transformers which step up the pressure to 6,600 V, at which the supply is transmitted to the village, where it is received by two 50-kVA kiosk sub-stations for reducing the pressure to 416/240 V for distribution. The l.p. distribution system extends as far as Preesall Park on the south, and interconnects between the kiosk sub-station at Preesall and the one at Knott End, and finally terminates at the extreme limit of Knott End, including the Ferry Slip. The main distributors are sub-controlled by means of feeder pillars, one at Preesall and the other at Knott End, where the local distribution is split up. In addition to over 250 consumers who have already been connected to the mains, some 60 public street lamps are supplied from the system. These are connected directly to the local distributors, and each is controlled by means of a time switch. The system of charging is on a flat rate of 10d. per kWh for lighting and 2d. for power and heating. During the quarter ended September 30th, out of 18,000 kWh which were sold 14,300 kWh were for power and heating. The Preesall Council hires out electrical domestic appliances of all types, and it has at present about 30 electric cookers and 50 wash boilers connected to the mains. Several of the local farmers are using power for milk separating and other small-power requirements about the farm, and poultry farmers are also adopting the use of electricity in their cabins to increase the production of eggs. A special rate is charged for electricity for this purpose, provided it is used during certain restricted hours. The principal power consumer is the local flour mill, which has been converted from windmill operation to the electric drive. Three motors have been installed, totalling 45 h.p., and a special arrangement has been made to ensure that the supply will not be taken during periods of maximum peak loads. The contract for the complete scheme was placed with the Pirelli-General Cable Works, one of the associated undertakings of the General Electric Co., Ltd., by which the switchgear and transformer equipment was supplied.

Novel Electric Vehicles.

Our recent note on the subject of electric battery-driven street-lighting tower wagons (April 1st issue, page 523) has prompted Messrs. Electromobile, Ltd., to draw our attention to the fact that their associated company in America has built

A Street-lighting Tower Wagon.

a number of this type of vehicle, which can be supplied in this country when required. The accompanying illustration depicts such a wagon in the service of the Philadelphia Electric Co., U.S.A.

Appointments Vacant.

Assistant master in the Electrical Engineering and Physics Department of the L.C.C. School of Engineering and Navigation, Poplar, for the L.C.C. Permanent-way foreman for the Dundee Corporation tramways. Inspector of works (£6) for the Tilbury U.D.C. electricity scheme. Clerk of works (84s.) for the Llanfairfechan U.D.C. electricity scheme. Meter repairer for the Stepney Borough Council Electricity Department. Commercial assistant for the Borough of Colchester Electricity Department. Lecturer in electrical machinery for the L.C.C. Hackney Institute. (See our advertisement pages to-day.)

Electrical Development in Germany.

According to the report for 1926 of the Union of Electricity Works. the total capacity of the German works amounted to 5,700,000 kW, as compared with 5,000,000 kW for the previous year. The running of the works was normal, although sales of electricity for power purposes suffered considerably from the depression in industry. Only in the last months of the year did industrial consumption of power begin gradually to increase, and there was a rise in output from 11,700,000,000 kWh in 1925 to 12,100,000,000 kWh in 1926, or about 4 per cent. Contrary to industrial sales the use of electricity in homes increased considerably, and was large enough in many places to make up for the falling off in sales to industries.—*Reuter's Trade Service* (Essen).

Electrodeposition for Rust Protection.

At a meeting of the Electroplaters' and Depositors' Technical Society, which was held at the Northampton Polytechnic Institute on May 18th, Mr. S. Wernick, B.Sc., read a paper on "The Protective Effect of Metal Deposits on Iron." He said that the three important factors which concerned electrodeposition for rust protection were the nature of the protective metal, the thickness and condition of the deposit, and the conditions under which it had been deposited. So far as the first two points went, a useful guide was found in applying Nernst's solution pressure theory and the normal potentials of the metals commonly deposited. The same theory gave a good picture of the mechanism of the rusting of iron. Theoretically, of the metals which had been deposited, only zinc, chromium and possibly cadmium could be expected by acting anodically to the iron to act as rust preventives. The conditions of deposition were, however, extremely important factors: such factors as the preliminary treatment, porosity of the base metal, structure of the deposit, type of solution used, throwing power of the solution, mode of handling, and the final finish, all entered into the production of an efficient deposit. The throwing power of a solution was particularly important in the case of articles with sharp bends or deep recesses. This fact, together with the fine structure obtainable from cyanide solutions, accounted for the marked superiority of these baths over acid sulphate solutions in the case for example of zinc.

Electrolytic zinc was superior to zinc deposited in any other way on account of its great purity. Nickel could act as an efficient protector provided its thickness was at least 0.001 inch. Cobalt had given very good results with a copper underlay and had stood up better than a copper-nickel deposit. Cadmium was certainly comparable with zinc as a rust preventive. Chromium gave varying results mainly of a disappointing character—probably due to its proneness to passivity; a copper-nickel underlay gave improved results. In conclusion, he stressed the need for a standard corrosion test which should be laid down to render the results of different investigators comparable.

Phototelegraphy.

Photographs sent by radio are enlarged to nine times their original size by means of new receiving apparatus tested successfully by the Radio Corporation of America, according to the *T. & T. Age*, which explains that the paper used for receiving the pictures was made especially for the purpose. The actual enlarging is done by a small asbestos device attached to a rubber tube, through which hot air is constantly blown; a tiny opening at the end of the tube lets hot air blow on the paper, making a black mark. The pictures are made, however, by a second tube conveying cold air, the passage of which to the paper is controlled by radio signals; if the cold air passes in front of the current of hot air, it prevents the hot current from making a mark on the paper. Thus there is obtained the succession of black dots and lines and white spaces, which, when seen together, make the picture. The receiving marker moves across three times as far and up and down three times as far as in the original photograph.

Electric Smelting in Sweden.

A preliminary statement was recently made before the Varmland Mining Association concerning the trials which have been made at the Uddeholm works with the so-called Flodinska method of producing steel from ore briquettes. Since promising results were obtained in a small experimental furnace of from 200 to 300 kW, a furnace of from 1,500 to 2,000 kW has been constructed at Hagfors. This was in operation for an uninterrupted period of five weeks, and during this period a total of 395.7 tons of steel was produced from 921 tons of briquettes. The consumption of briquettes was high, but it has to be considered that the briquettes contain ore besides the requisite quantity of coal and limestone. The consumption of energy was about 2,700 kWh per ton, which is regarded as being low, as for electric pig iron the consumption is from 2,400 to 2,600 kWh. The consumption of electrodes averaged 11.6 kg. per ton, as compared with 6-7 kg. in the case of pig iron, but it is reckoned that the former rate is reducible. The analysis of the steel made was quite satisfactory; the material was rolled for various purposes, and rolled and cold-drawn tubes were also made from it. It would have been possible to keep the furnace in activity for a longer period than five weeks, but it had to be stopped on account of a scarcity of briquettes.

The Raxalp Cable Railway.

The electrically-operated suspended cable railway recently constructed to the summit of the Raxalp mountain in Austria opens up one of the most beautiful pleasure resorts in the neighbourhood of Vienna. In 1925 the Vienna Building Credit Bank approved of a scheme submitted by the Adolf Bleichert Co., of Leipzig, Germany, for the use of the system patented by Herr Ing. Zuegg, of Meran. The manufacture of the cables and the bulk of the material for the line was, however, entrusted to Austrian firms. The line is 1.34 miles in length, the difference in altitude between the lower and upper stations being 3,339 ft.; the valley station is 1,731 ft. above sea level and the summit 5,070 ft. Five cable supports have been provided, the first, fourth, and fifth being of the "gate" type, and the second and third ordinary towers, over 98 ft. high. The cable spans between supports, from the valley upwards, are, respectively, 656 ft., 1,968 ft., 2,624 ft., and 1,408 ft.; the final span is a short one, and tended to allow the cable to approach the upper station in an almost horizontal position. The average gradient of the line is 46.6 per cent., or nearly 1 in 2. The two cables are 50 mm. (approximately 2 in.) in diameter, and the total length of 7,216 ft. weighs approximately 25 tons. Each car has accommodation for 27 passengers, the line being operated in pendulum fashion with two ascending and two descending cars. The tension applied by means of heavy ferro-concrete blocks at the lower ends of the cables is one of the features of the system, reducing the number of supporting towers. The travel of the cars is effected by a 25-mm. haulage cable operated by electrically-driven winding gear at the summit station. In addition, there is a counter (ballast) cable and an auxiliary cable by means of which a small car can be run for emergency purposes. The cars are in telephone communication with both stations during their journey, and three independent brakes are provided. The cars are electrically lighted by means of accumulators, provision for charging which is made at the upper station. The normal speed of the cars ranges from 11 to a little over 13 ft. per second, so that the journey is completed in from 9 to 10 minutes. The operating plant at the summit station, which was supplied by the "Elin" Gesellschaft für Elektrische Industrie, of Vienna, comprises two 70-h.p. Diesel engines, only one of which is used at a time, the belt pulley between the two, which drives a 60-kW generator, being provided with a double clutch so that the dynamo can be connected up to either engine. Two motors operate the haulage cable, a main one of a continuous capacity of 64 h.p. and an emergency motor designed for a continuous output of 22 h.p.; a "buffer" plant, which includes a small generator and a 60-cell 370-amp.-hour battery of accumulators, not only takes up any excess of power on the downward journey, but also provides a reserve supply for the motors, and enables the engines to be run at a constant speed. There is also a small d.c. 110-V dynamo for various auxiliary purposes, while for lighting a 5-kW crude-oil engine and d.c. dynamo are also available. Many constructional difficulties had to be overcome, but the actual work of building the cable railway was carried through within twelve months.

Educational.

Loughborough College.—British Empire scholarships in the Faculty of Engineering, Loughborough College, which are tenable at Loughborough for the full period of the diploma course, have been awarded by the governors for 1927 as follows: G. Macleod (Stockport); W. H. Medcalf (Woodbridge), T. Marash (Scots' College, Galilee), J. le P. Webb (Cheltenham), R. G. Martin (Wyggeston), G. L. Ryan and F. Laurence (Loughborough Junior College). These scholarships are open to all British subjects resident in any part of the Empire, and are of the value of £75 per annum.

Manchester.—We have received the prospectus of the Municipal College of Technology for the summer evening classes, 1927. The classes, which will embody short courses of lectures and laboratory work, including electrical and mechanical engineering, will begin on Monday and Tuesday, June 13th and 14th.

Colour Lighting.

On May 24th members of the Junior Institution of Engineers attended a lecture and demonstration on colour lighting and its application to the stage, theatre, kinema, and so on, in the miniature theatre attached to the showrooms of Messrs. Holophane, Ltd. Mr. Gillespie Williams, the lecturer, demonstrated the effects which can be produced by the "Duo-Phantom" apparatus, Electrical Review, May 6th, 1927, p. 735, a recent Holophane production.

Volta Centenary Exhibition.

The King of Italy opened, on May 28th, an electrical exhibition at Como in commemoration of the centenary of the death of Alessandro Volta, the Italian scientist who evolved the Voltaic Pile, one of the most momentous contributions ever made to the technique of generating electricity. The exhibition is being held in the picturesque Villa Olmo at Como, and will continue until October. An international Telegraph and Telephone Congress will take place during the period of the exhibition. One of the most interesting contributions to the display of electrical devices is made by Senatore Marconi, who has loaned a valuable collection of apparatus, some of which was used in his earliest experiments in 1895, together with a number of transmitting and receiving instruments which were used in the early days of commercial wireless before the development of the thermionic valve. The Marconi Company is exhibiting a collection of photographs illustrating the evolution of wireless apparatus and wireless telegraph stations, together with a collection of modern wireless apparatus.

Association of Teachers in Technical Institutions.

The annual conference of this Association is to be held at Plymouth from June 4th to June 7th. It will be opened officially on Monday, June 6th, with a civic welcome by the Mayor of Plymouth. On the same day Mr. H. Hall will deliver his presidential address.

The New Carlisle Station.

The new generating station at Carlisle, which has been constructed at a cost of £230,000, was officially opened on Thursday last week by the mayor, Mr. Archibald Creighton. The Willow Holme station, which was described in our last issue, has been constructed with a view to supplying an area of twenty to thirty miles beyond the city's boundaries. The River Eden, which was Carlisle's protection in the days of the Border raids, is now one of its chief assets in the supply of electricity. Its minimum summer flow is 10 million gallons per hour, and the station's present need is 600,000 gal. per hour. The ceremony was attended by a large number of citizens and local manufacturers, and also representatives from the rural areas. At a celebration luncheon after the ceremony, Sir John Snell, chairman, Electricity Commissioners, the chief guest, said the Government had taken a particular interest in the Carlisle scheme, and if he might have the courage or audacity, he would hazard a suggestion as to Carlisle's possible future under the new Electricity (Supply) Act. The Commissioners had lost no time in surveying the country; they had already surveyed the industrial districts of Lancashire and Yorkshire, and Cumberland and Westmorland; a scheme for Central Scotland had already been published, and one for Central England was nearly ready for publication. The geographical position of Carlisle would hardly warrant the construction of a main arterial line to connect it with other systems. But, supposing that the L.M. & S. Railway Company determined, because of the heavy gradients with which it had to deal, to electrify its system, say from Derby and Preston on the south and Glasgow on the north, then, there would be a reason for an arterial line, which would pass through Carlisle or its immediate vicinity. If the L. & N.E. Railway decided to electrify its line between Newcastle and Carlisle there would be sound reason for electrical interconnection with the North-East Coast companies. Carlisle would have to extend its area of operations in the rural districts around, and the gap between the North-East Coast and Carlisle developments would be lessened. It would be extremely foolish to say that Carlisle would remain isolated.

Speaking of the development of electricity in the country, Sir John said that a conservative estimate of the consumption in the country amounted to six thousand million electrical units, but his own idea was that it would rise to six times that amount. The Government had decided upon a scheme of twenty-one thousand millions by 1940. Sir John paid a high tribute to the technical skill and ability of the city electrical engineer, Mr. C. W. Salt, M.I.E.E.

In reply to a toast, Mr. Salt said that in designing the station he had felt it his duty not to permit the question of abnormal high efficiency to become an obsession. He had found that with moderate-sized power units the saving due to reduced coal consumption was overweighted by the increased capital outlay without consideration of the probability of increased maintenance charge. This view applied to local conditions only. He had worked along the lines of introducing elasticity in the lay-out which would permit, when the occasion arose, of introducing plant which would give an overall higher thermal efficiency. The whole problem of economical electricity supply was not confined to generation and transmission; a third and very important factor was the consumer and his consuming devices. The co-operation of the consumer was essential to economical supply, and the sympathetic consideration of the consumer was helpful during the present stage of development when high capital charges for a temporary period might almost equal the advantages of lower working costs.

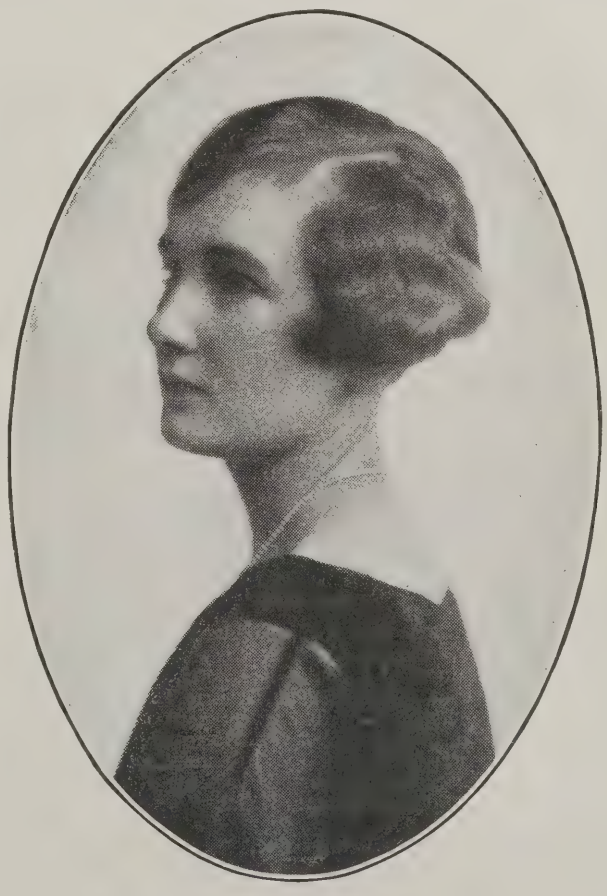
Sign Floodlighting.

An interesting example of electric floodlighting is to be seen at the Rugby works of the British Thomson-Houston Co., Ltd., where the method is applied to three large signs placed over the works. One of these, measuring 80 ft. in length, is floodlighted at night by a battery of six B.T.-H. projectors, arranged in a single row on a roof 50 ft. below the sign. A B.T.-H. monogram sign, measuring 18 ft. across the circle, is illuminated by a similar arrangement. A battery of six projectors in a single row is situated at a distance of 83 ft. from the sign. The third sign, 76 ft. long, is served by a similar battery 86 ft. away. All the projectors are provided with plain mirror reflectors and equipped with Mazda gasfilled projector lamps.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements

Mr. P. N. RAND, who recently relinquished his appointment as general sales manager of the Metropolitan-Vickers Electrical Co., has been appointed to a similar post with the English Electric Co., and will take up his duties as soon as his present commitments permit. We understand that Mr. Rand was originally on the staff of Siemens Bros. Dynamo Works, which is now part of the English Electric organisation. He left them to join the British Westinghouse Electric & Manufacturing Co.



On May 16th, in the Upper Dining Room at the Metropolitan-Vickers works at Trafford Park, Captain Hilton presented to Mr. P. N. RAND a magnificent gold cigarette case and a white skunk motor rug, subscribed for by his many friends in the company. Captain Hilton referred to the valuable services Mr. Rand had rendered to the company and the regret that all who came in contact with him felt when it

Mr. P. N. Rand.

became known that he had decided to sever his long connection with it. Mr. Rand, in reply, remarked that he had recently had a tooth out, but of the two ordeals, would much prefer to have got this ceremony over and still have to face the dentist. Mr. Rand carries with him the heartiest good wishes for success in whatever direction his future activities may lie.

Miss EDNA GARDINER, who, as announced elsewhere in this issue, won the first prize in the E.D.A. ballot, is a typist in Bristol. The Electrical Development Association has sent us a portrait of Miss Gardiner, which is reproduced herewith.

Miss Edna Gardiner.
Winner of the E.D.A. Ballot Competition.

She has expressed a preference for the £2,000 cheque instead of the all-electric house, and says that she intends to invest the money and continue in business. Mrs. Gardiner, who won the fifth prize, is Miss Gardiner's mother; her father was not successful—but neither were many others of us.

On Saturday last a presentation was made to Mr. G. R. SPURR, who completed 21 years' service as electrical and tramway engineer to the Walthamstow Council last month. Councillor H. Frost, chairman of the Council, made the presentation on behalf of the staff and employés of the two departments. It took the form of a coffee service, a suit case, and pipe. Councillor Frost spoke in warmest praise of Mr. Spurr's service, and attributed the present satisfactory position of the undertaking largely to his technical and managerial skill. Mr. V. L. McEntee, chairman of the Electricity and Light Railway Committees, followed. Mrs. Spurr was presented with flowers by the only lady member of the staff. In his reply, Mr. Spurr recalled some lively incidents of the days of gas producer plant, and among other things mentioned that he had recently celebrated his silver wedding.

Mr. J. H. C. BROOKING, M.I.E.E., will shortly be leaving the St. Helens Cable & Rubber Co., Ltd., to join the Greenwich Cable Works, Ltd., of Crooms Hill Works, Greenwich, as managing director. For the present his home address is "The Milestone," Bath Road, Slough.

The Poplar Borough Council has expressed high appreciation of the services of the borough electrical engineer, the staff of his department, and other officers concerned in the excellent arrangements made on the occasion of the opening of the new generating station.

The Department of Overseas Trade announces that Mr. J. W. BRIGDEN has been appointed Trade Commissioner at Cape Town in succession to Major G. Fetherston, D.S.O., M.C. Mr. Brigden will sail for South Africa on June 10th. Mr. Brigden will be Junior Trade Commissioner and will have offices at Johannesburg (P.O. Box 839, Goldfields Buildings, Eloff Street). Mr. N. Elmslie is Senior Trade Commissioner, and has recently moved his headquarters from Johannesburg to Cape Town.

At the annual meeting of the National Joint Board of Employers and Members of Staff (Electricity Supply Industry) held on May 20th, Alderman W. WALKER, M.I.E.E. (Manchester) was appointed chairman for the eighth successive year, and Mr. A. W. CROMPTON, A.M.I.E.E., president of the Electrical Power Engineers' Association, was appointed vice-chairman.

As stated in our "Business Notices," Dr. H. R. WRIGHT, managing director Siemens Bros. & Co., Ltd., has joined the board of the British Columbia Telephone & Telegraph Co.

The Chesterfield Town Council is recommended to increase the salary of the borough electrical engineer from £700 to £800, with a maximum of £900; that of the tramway manager from £650 to £750, maximum £800; that of the station superintendent from £456 to a maximum £500; and that of the deputy tramway manager from £355 to £400, maximum £450.

Mr. W. J. H. WOOD, borough electrical engineer of Bolton, has been appointed engineer-in-chief to the County of London Electric Supply Co., Ltd., in succession to Mr. Archibald Page. In accepting Mr. Wood's resignation on May 27th, the Bolton Electricity Committee recorded its "great appreciation of the excellent and valuable services rendered by him in the department, which have resulted in the undertaking being successfully developed."

The marriage took place at the Parish Church, Ospringe, on May 25th, of Mr. E. F. BESWICK, manager for Messrs. Jabez Smith & Son, electricians, of Faversham, and Miss H. J. MITCHELL.

Obituary.—MR. J. J. S. MACLAREN.—The death occurred on May 24th, of Mr. James Joseph Stainton Maclaren, chairman of Carron Company, in his 85th year.

MR. J. H. WOODWARD.—We learn with great regret of the death of Mr. John Harold Woodward, a partner in the firm of Messrs. Preece, Cardew & Rider, consulting engineers, at the age of 62. Mr. Woodward was born in Macclesfield; his father was connected with the silk manufacturing industry. After spending a short time in his father's silk mill, he went, in 1882, to Owens College, Manchester, and took up engineering studies. He became specially interested in electrical work and in 1885 he joined the technical staff of Elwell-Parker, Ltd., at Wolverhampton, where Thomas Parker was developing various early dynamos, alternators, and secondary batteries. The company was absorbed by the Electric Construction Company in 1889, and the lay-out of the new works at Bushbury, Wolverhampton, was due to a great extent to Mr. Woodward. He designed much of the work for the electrification of the Liverpool Overhead Railway in 1890, and for other early electric railways and tramways. The first alternators used by the Metropolitan Electric Supply Company in Manchester Square and Rathbone Place, erected in 1889, were of his design. Subsequently, when Thomas Parker left the Electric Construction Company, Mr. Woodward went with him, and the works of Thomas Parker, Ltd., were developed also at Wolverhampton. In 1899, he joined Messrs. Preece & Cardew, and in 1909 he was made a partner in the firm which became Preece, Cardew, Snell & Rider, and later, on Sir John Snell's retirement, Preece, Cardew & Rider. Mr. Woodward was largely associated with the firm's lighting, tramway and railway work in this country, the Colonies, and foreign countries. He visited the United States, Australia, New Zealand, and South America. Among the electricity supply and tramway undertakings upon which he was recently engaged, were Wellington, Auckland, Dunedin, Sydney, Brisbane, Shanghai, Hong Kong, Buenos Aires, &c. Mr. Woodward was married in 1905 and he leaves a widow and one daughter.

MRS. HOADLEY.—We wish to express our sympathy with Mr. E. E. Hoadley, borough electrical engineer at Maidstone, whose wife passed away on May 26th in her 48th year. Mr. and Mrs. Hoadley celebrated their silver wedding in April last.

MR. C. LEHMANN.—Mr. Charles Lehmann, late of the Eastern Telegraph Co., Ltd., died at Vigo, Spain, aged 67 years, on May 18th.

MR. L. LILLEY.—The death is announced of Mr. Leonard Lilley, who was for the past 14 years on the staff of the General Electric Co., Ltd., at Witton. He was 41 years of age.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Regent Electrical Co., Ltd.—Private company. Registered May 25th. Capital, £400 in £1 shares. Objects:—To acquire the business of a dealer in electric lamps carried on by A. F. Lowe as "The Regent Electric Lamp Co." at 72, Finsbury Pavement, E.C. The permanent directors are:—A. F. Lowe, 128, Chestnut Avenue, E.17, estate agent; T. W. McEwen, 16, Briar Avenue, S.W.16, merchant. Solicitors: Bein & Lawrence, 72, Finsbury Pavement, E.C. Registered office: 72, Finsbury Pavement, E.C.2.

Auto-Electric Advertising Co., Ltd. — Private company. Registered May 23rd, with a nominal capital of £2,000 in 1s. shares. The objects are to carry on the business of advertising contractors and agents, manufacturers of and dealers in apparatus, appliances, plant and material employed by such contractors, electrical and general engineers, &c. The first directors are:—Sir Frank C. Meyer, Bt., M.P., 18, Lowndes Street, S.W.1. (director of British Industrial Corporation, Ltd.); Sir Alan Burgoyne, Fincher's House, Amersham, director of companies; H. Fitzpatrick, 24, Throgmorton Street, E.C.2; C. W. C. Lynfield, 82, North Gate, N.W., gentleman; I. Rapaport, 26, Belsize Lane, N.W.3; A. F. H. S. Simpson, C.M.G., Windham Club, St. James's Square, S.W.1. Qualification, 100 shares. Remuneration, £250 each per annum (chairman £350). Solicitors: Wild, Collins & Crosse, Kennans House, Crown Court, Cheapside, E.C.2.

Abbey Cables, Ltd.—Private company. Registered May 23rd. Capital, £2,000 in £1 shares (1,000 preferred ordinary and 1,000 ordinary). Objects: To carry on the business of manufacturers of and dealers in telegraphic, telephonic, and all other kinds of electric and other cables, &c. The subscribers (each with one share) are:—S. G. W. Norton, "Reo," Woodcote Valley Road, Purley, electrical engineer; A. Maguire, 36, Eaton Place, Belgravia, S.W., gentleman. Solicitors: Gordon, Gardiner, Carpenter & Co., 7, Serjeants' Inn, Temple, E.C.4.

R. A. Poole (London), Ltd.—Private company. Registered May 23rd. Capital, £1,000 in £1 shares. Objects: To acquire the business of a wholesale electrical supplier and distributor of electric lamps, wireless valves, wireless apparatus and accessories, motors and accessories, and electric cables, carried on by R. A. Poole, at 67, Goldhawk Road, Shepherd's Bush, W., as "Poole's Electric Lamp and Accessories Co." The directors are:—R. A. Poole, 67, Goldhawk Road, Shepherd's Bush, W.12; Mrs. M. K. Poole, 7, The Common, Ealing, W.5. Qualification, £10 shares. Solicitor: A. C. Jaques, 102, Colmore Row, Birmingham. Registered office: 67, Goldhawk Road, Shepherd's Bush, W.

Weenen, Goddard & Co., Ltd.—Private company. Registered May 26th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of electrical engineers and contractors, &c. The permanent directors are:—H. H. Weenen, 22, S. James' Mansions, West Hampstead, N.W.6, electrical engineer; A. G. Goddard, "Westholme," 67, Rancliffe Road, East Ham, E.6, electrical engineer. Solicitors: Bartlett and Gluckstein, 199, Piccadilly, W.1.

Victor X-Ray Corporation, Ltd.—Private company. Registered May 21st. Capital, £1,000 in £1 shares. Objects: To manufacture and deal in Röntgen or X-ray electro-therapeutic, electro-surgical, scientific, chemical, medical or mechanical machinery, tools, instruments, appliances, and devices, &c. The company has the right of the trade mark "Victor," No. 370,638. The directors are:—L. M. Forsyth, Morley House, Regent Street, W.1, electrical engineer; J. F. Stewart, Crown House, Aldwych, W.C.2, secretary; V. J. Radbone, 268, St. James' Court, S.W.1, electrical engineer. Solicitor: A. R. Monks, Crown House, Aldwych, W.C.

W. D. Willson, Ltd.—Private company. Registered May 19th. Capital, £1,500 in £1 shares. To adopt an agreement with W. D. Willson, and to carry on the business of electric, telephonic, and wireless engineers, dealers in electrical and wireless fittings, &c. The first directors are:—W. D. Willson, 1, Fell Road, Croydon, electrical engineer (life director); A. A. Baster, 22, George Street, Croydon, incorporated accountant; Mrs. F. C. Willson, G. W. Adams, and J. McCarthy (addresses not stated). Qualification of life director, 200 ordinary shares; of other directors, £10. Registered office: 1, Fell Road, Croydon.

Triotron Radio Co., Ltd.—Private company. Registered May 27th. Capital, £100 in £1 shares. Objects: To carry on the business of manufacturers, importers and exporters of thermionic valves. The subscribers (each with one share), are:—A. Kinge, 25, Glenburnie Road, Upper Tooting, S.W.17, clerk; A. W. Harwood, Police Station, Staines, Middlesex, clerk. J. Axelrad is first and permanent director. Qualification, 5 shares. Solicitors: Philip Conway Thomas & Co., 80, Rochester Row, S.W.1. Registered office: 80, Rochester Row, Westminster, S.W.1.

Official Returns of Electrical Companies.

Carmichael & Partners, Ltd.—Capital, £500 in £1 shares. Return dated August 31st, 1926 (filed March 21st, 1927). 52 shares taken up. £52 paid. Mortgages and charges, nil.

Hambling, Clapp & Co., Ltd.—Return dated November 18th, 1926. Capital at date of return: £1,000 in £1 shares (increased November 24th, 1926, to £2,500 in £1 shares). 472 shares taken up. £472 paid. Mortgages and charges, nil.

Tungstone Accumulator Co., Ltd.—Capital, £1,000 in £1 shares. Return dated September 29th, 1926 (filed March 21st, 1927). 500 shares taken up. £500 paid. Mortgages and charges, nil.

Spa Radio Co., Ltd.—Capital, £1000 in £1 shares. Return dated May 28th, 1926 (filed April 8th, 1927). 460 shares taken up. £460 paid. Mortgages and charges, nil.

Lancashire Telephone Systems, Ltd.—Return dated January 12th, 1927. Capital at date of return: £3,000 in £1 shares (increased March 15th, 1927, to £4,000 in £1 shares). 1,705 shares taken up. £1,705 paid. Mortgages and charges, £250.

Weald Electricity Supply Co., Ltd.—Capital, £40,000 in £1 shares. Return dated December 6th, 1926. 5,504 shares taken up. £1,504 paid. £4,000 considered as paid. Mortgages and charges at date of return, nil. Issued January 1st, 1927, £50,000 debentures (part of series of £100,000 authorised December 15th, 1926).

Carlisle and District Transport Co., Ltd. (formerly The City of Carlisle Electric Tramways Co., Ltd.).—Capital, £60,000 in £1 shares. Return dated March 1st, 1927. All shares taken up. £60,000 paid. Mortgages and charges, £40,000.

Chislehurst Electric Supply Co., Ltd.—Capital, £15,000 in £5 shares. Return dated April 25th, 1927. All shares taken up. £15,000 paid. Mortgages and charges, nil.

Automatic Coil Winder and Electrical Equipment Co., Ltd.—Capital, £10,000 in 8,000 ordinary and 2,000 deferred shares of £1 each. Return dated February 21st, 1927. All shares taken up. £3,000 paid. £7,000 considered as paid. Mortages and charges, £2,800.

Ventimotors, Ltd.—Capital, £8,000 in £1 shares. Return dated February 11th, 1927. All shares taken up. £8,000 paid. Mortgages and charges, nil.

Electron Co., Ltd.—Capital, £1,000 in £1 shares. Return dated March 14th, 1927. 970 shares taken up. £970 paid. Mortgages and charges, £3,500.

Lacy Patents Holding Co., Ltd.—Capital, £1,000 in 1s. shares. Return dated December 31st, 1926. All shares taken up. £1,000 considered as paid. Mortgages and charges, nil.

F. C. Brown (Electricity), Ltd.—Capital, £1,000 in £1 shares. Return dated December 15th, 1926 (filed March 25th, 1927). All shares taken up. £25 paid. £975 considered as paid. Mortgages and charges, nil.

Gauntletts, Ltd.—Capital, £40,000 in 35,000 cum. preference shares of £1 each and 200,000 ordinary shares of 6d. each. Return dated December 31st, 1926. All shares taken up. £25,000 paid on 25,000 preference shares. £15,000 considered as paid on 10,000 preference and 200,000 ordinary shares. Mortgages and charges, nil.

Neon Lights (1923), Ltd.—Capital, £30,000 in £1 shares. Return dated December 31st, 1926. 27,000 shares taken up. £12,000 paid. £15,000 considered as paid. Mortgages and charges, £1,500.

Automobile Electrical Repairers, Ltd.—N. J. Dodd, of Sardinia House, Sardinia Street, W.C.2, ceased to act as receiver or manager on May 16th, 1927.

Electrical Devices, Ltd.—S. A. S. Forster, C.A., of County Chambers, Middlesbrough, was appointed receiver on May 18th under powers contained in debenture dated January 5th, 1927.

Claremont, Johnson & Co., Ltd.—W. J. Hodge, of 26-27, Union Bank Buildings, Holborn Circus, E.C.1, ceased to act as receiver or manager on May 2nd, 1927.

Bedale and District Electric Supply Co., Ltd.—Particulars filed of £2,000 debentures authorised February 7th, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Satisfaction in fall on May 14th, 1927, of debenture dated January 16th, 1920; debenture dated November 7th, 1921; and mortgage dated November 7th, 1921, securing £1,500, £600, and £2,100 respectively.

Clear Hooters, Ltd.—Particulars filed of £8,000 debentures authorised May 5th, 1927, charged on the company's undertaking and property (subject to first and second mortgage debentures issued or to be issued for sums not exceeding in the aggregate £2,200 and £1,000 respectively) the amount of the present issue being £5,250 7s. 4d.

Century Cables, Ltd.—Mortgage debenture dated May 11th, 1927, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders:—Sir Edward Nicholl, K.B., J.P., D.L., Littleton Park, near Shepperton; and R. G. Ellis, Netherside Hall, Skipton-in-Craven, Yorks.

Rose Bros. Electrical Co., Ltd.—S. G. Morris, of 6, Wardrobe Place, Doctors' Commons, E.C.4, was appointed receiver and manager on May 13th, 1927, under power contained in debenture dated August 23rd, 1921.

Uneeda Supplies Co., Ltd.—Particulars filed of £1,000 debentures authorised April 25th, 1927, charged on the company's property, present and future, the amount of the present issue being £400.

City Notes.

Eastern Telegraph Co., Ltd.

The annual meeting was held on May 24th. Sir John Denison-Pender, G.B.E. (chairman), who presided, referred to the death of Mr. A. R. Hardie, a director, who had been associated with the company for 55 years. Dealing with the report (ELECTRICAL REVIEW, May 20th, p. 810), the chairman said the results could be considered satisfactory in view of the depressing conditions which existed during the greater part of the year. They had received a contribution from one of their subsidiary companies of £206,500, and had thus been able to write off entirely the remaining balance of £493,000 in respect of expenditure on new cables and cable renewals. Nearly four and a half million pounds had been charged against the reserve fund since the Armistice in respect of new cables and cable renewals, and since the company was formed approximately twelve million pounds had been so charged. Their negotiations with the British and French administrations with regard to the direct line between Paris and London had been successfully concluded, and the new direct route was opened for service on March 1st last. Negotiations had practically been completed both with the Palestine and Egyptian administrations for the laying of a new cable between Egypt and Palestine. The negotiations with the Greek Government had been brought to a satisfactory conclusion, and they had been granted a concession for 50 years. Negotiations were recently re-opened with Turkey, and a convention had been agreed

upon and signed, and now only awaited ratification. It had been decided to lay further submarine cables between Alexandria and Port Said and underground lines between Port Said and Suez. The improved means of communication would enable them to install their direct regenerator system between London and India, with substantial benefits to the service. Thirty-one cables of the associated companies were now being operated by the regenerator system; this gave considerable increase in capacity with resultant gain in transmission times. Having carefully watched the development of wireless during the past 30 years, he (the chairman) had no cause to alter the opinion formed and expressed over that period that the cables would remain more reliable than the wireless service. The prospect of the return to normal trade conditions would counterbalance to a very large extent the present day competition with which they were faced, but the obvious solution, in the interests of the public and others, was co-operation in some form or another which would eliminate wasteful and unremunerative expenditure and, at the same time, provide a dual and alternative means of communication. Given a fair field for the unrestricted development of the cable industry, it would continue to prove itself the best and most reliable means of telegraphic communication.

Eastern Extension, Australasia and China Telegraph Co., Ltd.

The annual meeting was held on May 26th, under the presidency of Sir John Denison-Pender (chairman). In presenting the report (Electrical Review, May 20th, p. 811), the chairman said that the increase of £93,106 in the gross revenue was due to two "windfalls," not to be expected to recur. One of these represented refunds of income tax received from the Netherlands Indian Government, and the other was an amount which had been held in suspense pending the result of a lawsuit which was decided in favour of the company. The actual traffic receipts showed a decrease of £35,115, but in view of the disorganised trade conditions, the result could not be considered as unsatisfactory. In conformity with the action taken by the cable system worked by the Pacific Cable Board their tariff had been reduced. That reduction of tariff and the competitive "beam" service must naturally result in a certain loss of revenue. Their thanks were due to the Commonwealth Postal Department for the speedy construction of the new land-line between Adelaide and Perth, which was handed over to the company on March 25th last. Worked in conjunction with the duplicate Perth-Cocos cable, it had already proved itself a valuable adjunct to the system.

With the state of affairs at present ruling in China, it had been found impossible for the Great Northern Telegraph Company and themselves to continue negotiations with the Chinese Telegraph Administration, and these had been postponed until a more opportune time. China failed to pay the instalment of a loan which fell due on June 30th, 1922, and after extending every possible consideration and realising that affairs in China were not tending to become stabilised, but rather the reverse, the companies decided to exercise their lien, whereby amounts falling due to the Chinese Administration as its share of the revenue derived under the joint purse agreement had, since January, 1927, been retained by the companies and placed towards the liquidation of outstanding instalments. Interruptions of their cables had been few in number, and, owing to duplication throughout the system, quite immaterial.

Oriental Telephone and Electric Co., Ltd.

The report for the year ended December 31st last records a net revenue of £68,282, and after adding £14,219 brought forward and deducting interim dividends, there remains a balance of £58,735. After paying the final preference dividend it is proposed to distribute a final dividend of 6 per cent. on the ordinary shares (making 10 per cent., free of tax, for the year), together with a tax-free bonus of 2 per cent., leaving £17,812 to be carried forward. Satisfactory progress was made by the Singapore branch and the Hongkong Telephone Co., Ltd. The Mauritius branch again showed an adverse result, the increased rates not having been authorised yet. The heavy charges which had to be met by the Bombay Telephone Co., Ltd., precluded the payment of a dividend. The Bengal Telephone Corporation, Ltd., paid a dividend of 6 per cent. (free of Indian income tax), as against 2 per cent. The Madras Telephone Co., Ltd., repeated its dividend of 7 per cent., free of Indian tax, but the Rangoon Telephone Co., Ltd., was forced to reduce its dividend from 8 to 5 per cent., free of Indian tax, owing to special charges for depreciation. The Hongkong Company paid dividends amounting to 8 per cent., enabling the China and Japan Telephone Co. to pay 15 per cent., free of tax. The staff pension fund has now been instituted. Sir Thomas S. Catto, Bt., has been appointed to a vacancy on the board caused by the resignation of Mr. G. P. Ness. Meeting: To-day (Friday).

Lancashire Electric Light and Power Co., Ltd.

The annual meeting was held on May 23rd, Mr. A. Shepherd, W.S. (chairman) presiding. In presenting the report and accounts (Elec. Rev., May 20th, p. 810), the chairman said that a considerable amount of cables had been laid during the year; the capital expenditure amounted to over £467,000. The sales of energy had risen from 130,558,000 kWh to 146,580,000. The new Padiham station, which was put into operation in January this year, had proved very efficient; it would eventually be raised to 50,000 kW. Additional plant was necessary for the development of the southern part of the company's area, and the company had therefore purchased a site at Kearsley and had asked the Electricity Commissioners for permission to build a station there. The Commissioners had agreed to this, subject to a condition with which the company was willing to conform. The plans provided for a station housing four 31,250-kW sets, but arrangements had been made to provide for two further sets. It was hoped to have the first two sets ready for the winter of 1929-30. The initial capital cost was estimated at £875,000, and the cost with four sets installed at £1,645,000. Dealing with the progress of the company, the chairman said that since 1906 the revenue had risen from £5,300 to £582,300, the maximum demand from 2,060 kW to 60,340 kW, and the energy sold from 3,043,000 kWh to 146,580,000 kWh. After mentioning the issue of preference shares which was made in November last, the chairman said that for the purpose of providing funds for the construction of the Kearsley station it was intended to make an issue of debenture stock at a favourable opportunity.

Oliver Pell Control, Ltd.

Owing to the industrial conditions last year the turnover of this company declined from £92,292 to £67,856. The net profit was £1,520, and the addition of £7,281 brought forward makes available £8,801 After deducting the interim dividend on the 8 per cent. preference shares and writing off the preliminary expenses of a preference share issue, a balance of £5,846 is carried forward. At the annual meeting on May 18th, Mr. Charles Oliver (chairman) said that the directors were pleased that the results were so good as they were, in view of the conditions. The directors, who held the bulk of the ordinary shares, considered it advisable not to pay an ordinary dividend. In September last they entered the wireless trade and had already established a reputation; that branch had enabled them to show a profit. The turnover of the switch department showed an increase of 42 per cent., but that of the coil-winding department fell by 50 per cent. and mainly accounted for the fall in the revenue. They proposed to institute a bonus system for their workpeople when the state of trade warranted it. The new R.I. & Varley, Ltd., was to market the radio products of themselves and Radio Instruments, Ltd. .

Chili Telephone Co., Ltd.

The *Financial Times* reports that a circular has been issued to shareholders stating that half of the company's shares have been acquired by a purchaser at £8 per share, and that the same purchaser is prepared to buy all or any of the remaining shares at the same price. The directors make no recommendations. The company has an authorised capital of £1,000,000 in £5 shares. Our contemporary says that it is in a position to state that the buyer is Colonel Behn, acting on behalf of the International Telephone and Telegraph Corporation.

Sir W. G. Armstrong, Whitworth & Co., Ltd.

The report for 1926 shows a balance to the credit of the profit and loss account of £140,582, and after providing for debenture interest there was a net loss of £531,210, which reduces the balance brought forward to £114,181. The report states that a revaluation of properties will have to be made, and in due course proposals for a reconstruction and the reduction of the company's capital will have to be made. Certain alterations in the articles are to be put forward at an extraordinary meeting to be held after the annual meeting on June 9th.

Mexican Light and Power Co., Ltd.

A meeting of the holders of the company's 5 per cent. second mortgage 50-year bonds was held last week, when Mr. E. R. Peacock, chairman of the Bondholders' Committee, explained a scheme for dealing with arrears of interest. He said that it was proposed to fund the arrears up to December 1st last by the allocation in respect of each £100 bond, £7 10s. in cash, and £50 par value of bonds of the same issue. The proposals were approved.

Electric Construction Co., Ltd.

The directors recommend a final ordinary dividend at the rate of 9 per cent. per annum, making 7½ per cent. for the year. This rate has been paid for several years, but since 1917-1918 a bonus of 2½ per cent. had also been distributed, but this is not repeated.

Penarth Electric Lighting Co., Ltd.

The net revenue for the past year was £11,075 (against £11,493). After adding £2,924 brought forward and providing for renewals, &c., it is proposed to place £2,000 to reserve and to pay an ordinary dividend of 7½ per cent., leaving £2,482 to be carried forward.

Reduction of Capital.

Premier Electric Welding Co., Ltd.—An extraordinary meeting is to be held on June 17th to consider resolutions for the reduction of the capital from £100,000 to £26,250. This is proposed to be effected by the cancellation of 12,800 unissued shares and of 14s. per share of the 87,500 issued £1 shares.

Stock Exchange Notices.

Application has been made to the Committee to allow the following to be officially quoted :—

Constantinople Telephone Co.—£200,000 6 per cent. Obligation Bonds of £100 each, Nos. X10,001 to X12,000; and £95,436 6 per cent. certificates, Nos. 1 to 3,993 and 4,002 to 4,346 of £22 each (Bearer).

White (J. G.) & Co., Ltd.—360,000 ordinary shares of 4s. each fully paid Nos. 1 to 360,000.

The undermentioned securities have been ordered to be officially quoted :—

City of London Electric Lighting.—400,000 ordinary shares of £1 each, fully paid, Nos. 1,500,001 to 1,900,000.

Dealings in the following have been specially allowed by the Committee under Rule 159 :—

Baird Television Development.—400,000 deferred ordinary shares of 1s. each, fully paid, Nos. 100,001 to 500,000.

Electrical Finance and Securities.—Option certificates (to bearer) in respect of 20,000 ordinary shares at par, until January 1st, 1931.

Low Temperature Carbonisation.—1,516,569 shares of 2s. each, fully paid, Nos. 2,878,389 to 4,067,411 and 5,120,586 to 5,448,131.

White (J. G.) and Co.—360,000 ordinary shares of 4s. each, fully paid, Nos. 1 to 360,000.

Colombo Electric Tramways and Lighting Co., Ltd.

The report for the past year shows a net revenue of £123,413, and a balance, after providing for debenture interest, and adding the amount brought forward, of £175,696. From this £9,900 is transferred to general reserve and renewal fund, which has to be dealt with by writing off £9,900 to special renewal account. £60,000 is transferred to debenture stock redemption and account, and a dividend of 20 per cent., free of tax (as against 15 per cent.), is recommended, leaving £79,628 to be carried forward.

Pinchin, Johnson & Co., Ltd.

The usual dividend at the rate of 6½ per cent. per annum has been declared on the preference shares in respect of the half-year ending June 30th.

Glenfield & Kennedy, Ltd.

The profit for the past year fell from £77,657 to £59,762. The final ordinary dividend is 6 per cent., making 10 per cent. for the year, as for 1925-26.

British Columbia Electric Railway Co., Ltd.

The directors have declared a dividend of 4⅜ per cent., free of tax, on both the preferred and deferred ordinary stocks, as in 1926.

General Electric Co.

This American company has declared a quarterly dividend of $1, as against 75 cents, together with an extra dividend of $1.

British Thomson-Houston Co., Ltd.

The dividend on the 7 per cent. cumulative preference shares in respect of the half-year ended June 30th has been declared.

Western Telegraph Co., Ltd.

A third quarterly dividend of 5s. per share, free of tax, has been declared.

American Telephone and Telegraph Co.

The regular quarterly dividend of $2.25 has been declared.

German Companies.

The *High Frequency Machine Company for Wireless Telegraphy*, Berlin, reports net profits of 89,000 marks for 1926, as compared with 86,000 marks in the previous year, the dividend again being 8 per cent. A further sum was received during the year on the former holdings of Marconi shares. On the other hand, the satisfaction of the American claims was still uncertain, as compensation for radio stations has been struck out of the Bill now under consideration.

The *Lloyd Dynamo Works Company*, Bremen, states that it was impossible fully to occupy the plant in 1926 owing to the lack of orders for large machines, the low prices for small motors and the depression in the shipbuilding industry. A total loss of 929,000 marks is recorded as against one of 158,000 marks in 1925. It is proposed to extinguish the loss by a reduction of capital.

The *C. Lorenz Company*, Berlin, states that the turnover in 1926 showed an increase over the previous year, although at falling prices. The net profits amounted to 418,000 marks, as against 552,000 marks; the dividend is reduced from 8 per cent. to 6 per cent.

French Companies.

The *Société d'Electro-Métallurgie, Electro-Chimie et Aciéries Electriques d'Ugine* reports a net surplus of 10,660,000 fr. for 1926, including the balance forward, comparing with 9,000,000 fr. in the preceding year. It is intended to increase the dividend from 45 fr. per share to 50 fr.

The *Société Thomson-Houston* reports net profits of 27,245,000 fr. for 1926, the amount available with the balance brought forward being 30,326,000 fr. It is proposed to apply 15,000,000 fr. to the reserve redemption fund for buildings, plant and equipment, and 3,000,000 fr. to meeting fluctuations in the prices of raw materials, the balance of over 12,000,000 fr. being carried forward.

The *Compagnie D'Appareils Electriques et Compteurs Garnier*, Lyons, records net profits of 432,000 fr. for 1926, as compared with 402,000 fr. in the previous year; the dividend is increased from 75 fr. to 80 fr. per share.

Belgian Company.

The *Société d'Electricité et de Mécanique* (*Procédés Thomson-Houston et Carels*), Brussels, reports a net balance of 378,000 fr. for 1926, which has been carried forward. The directors state that the concentration of work on certain types of machines has permitted of a reduction in the prime costs and an improvement in the quality, the transformer department in particular having developed. The industrial installation branch continued to progress, but competition remained very keen.

Stocks and Shares.

Monday Evening.

Stock Exchange markets have recovered to a great extent from the disappointment experienced at the failure of the Bank rate to fall to 4 per cent. The depression in prices which was caused by the retention of the rate at 4½ per cent. became accentuated by the turn of Russian events. Moreover, the flood of new issues which hastened to get ahead of the Whitsun holidays left the markets with an *embarras de richesse*. So plentiful, however, is the supply of fresh money that the newcomers have found no difficulty in securing homes more permanent than those of stags and underwriters. It may give some idea of the volume of business which is being transacted to state that, on the last Stock Exchange account-day, the business in County of London Electric 5 per cent. debenture stock was alone sufficient to tax energies severely, and it was estimated that nearly half of the total issue of four million pounds must have changed hands on pay-day, May 26th. Investment demand is further illustrated by the rises that have occurred in the prices of cable stocks.

The group of South American telephone companies attracted a good deal of attention on a report, evidently well founded, to the effect that the International Telephone and Telegraph Co. of America can be regarded as the recent buyer whose support has caused such a rise in the prices of United River Plate Telephones and a few others. The International Telephone and Telegraph is also presumed to be the prospective purchaser who is offering to buy Chili Telephone shares from shareholders at £8 a share. The company states in a circular that half the shares have been acquired by a purchaser, and that he is prepared to buy all, or any, of the remaining issued shares at the same price. The offer had to be answered on the Wednesday in this week, and those who accept will receive cash against delivery of certificates on June 16th. The International Telephone and Telegraph Corporation is acting through Colonel Behn. It was only a couple of months ago that Montevideo Telephone shareholders received an offer of £2 a share from the same hand. International Telephone and Telegraph shares, of $100 each, have risen several points this week, to 144½.

On the strength of these developments, Venezuela Telephones, ordinary and preference alike, have risen several shillings during the past few days to 28s., and Bogota Telephones strengthened to 37s. 6d. Bogota is, of course, in Columbia, and the company is one whose shares have been introduced fairly lately into the Stock Exchange market. Anglo-Portuguese Telephones have risen to 21s. 6d. Lord St. Davids has retired from the board and chairmanship of the company, Sir Alexander Roger having taken his place. Sir Alexander is chairman of the Automatic Telephone Manufacturing Company, and the International Automatic Telephone, and director of several other concerns. It is understood that he has bought out some of the largest proprietors and has secured control of the Anglo-Portuguese Telephone Company on behalf of other interests. It is claimed that this deal will leave the control of the company in British hands, an obvious advantage at a time when Americans are actively engaged in endeavours to obtain a hold upon telephone companies in various parts of the world.

At the meeting of Siemens Bros. & Co., the chairman pointed out that the telephone industry is particularly suited to relieve the present industrial difficulties. For every million pounds spent by the Government on telephony, he said, employment was provided for approximately six thousand workpeople, while the national expenditure on telephones augmented the national revenue. Siemens are, it is scarcely necessary to say, very intimately connected with various branches connected with telephony. The shares at 27s. 6d. ex dividend show no actual change beyond the amount deducted for the dividend. Brush ordinary are also ex at 26s. 3d. Mr. Garcke said at the meeting that all the main departments of the company's business were kept well occupied throughout the past year. A disappointment is afforded by the dividend announcement of the Electric Construction

Company: no bonus is to be added to the 7½ per cent. rate paid for many years. From 1919 to 1925, an annual bonus of 2½ per cent. accompanied the dividend. No nominal change occurred in the price, but actually the market has weakened, and shares have been changing hands around 27s. 3d. Doubtless the report will debit the coal stoppage with causing the disappearance—it is expected to be only temporary—of the bonus. Henleys have come down 1s. to 88s. 9d., the cable equipment list being disposed to droop. British Aluminiums have shed a trifle, at 43s.

United River Plates touched 9 11/16ths, before the rise tempted shares to market, and the price reverted to 9⅜. Oriental Telephones spurted sharply to 56s. 3d., this showing a gain of 2s. 9d. The company is again paying 10 per cent., tax free, for the year, and the 1926 profit, £68,300, is about £1,200 more than that secured in 1925. Automatic Telephones are unaltered at 45s., but Internationals tread closely upon the heels of £2, which is higher on the week. There has been fairly persistent buying of Marconis up to 20s., and Canadian Marconis rose a little to 4s. 3d. bid.

Once more, a spectacular rise in Brazilian Tractions stands out as the chief feature in our price-lists. An advance of 7½ points has lifted the shares to 154, and the preferred sympathetically strengthened to 129. Explanation of the long-continued strength is crystallising into categorical rumour that each share is to be split into three, and that upon the latter the dividend will be 2½ per cent. This rate would be equal, of course, to 7½ per cent. upon the existing shares, now in receipt of 6 per cent. There seems to be sound reason for the assumption that, as regards the splitting scheme, rumour is likely to be correct. The company's earnings, also, are good enough to warrant hopes of increased distributions in the near future. Barcelona Trams have been less animated than of late, and now stand at 50. Sidros, in which interest has also subsided to some extent, are 15½. Mexican Light and Power preferred strengthened to a slight extent. The company is said to have announced its intention of spending 14 million dollars upon developments. Buenos Aires Lacroze 6½ per cent. debenture stock can be bought, free of stamp and fee, at its issue price of 96½, or a trifle less.

Of other new stocks, Electrical Finance and Securities 5½ per cent. debenture stock, which came out at 92½, is quoted at 1½ premium, and the 7 per cent. preference shares at a premium of 6d. each. Both can be bought in scrip form, thus saving the purchaser the cost of Government stamp. The same advantage applies to the new County of London Electric 5 per cent. debenture, the price of which is 97½—a premium of 1½ points.

British Columbia Electric preferred is 2½ higher at 121. Deduction of the interest from the price of Anglo-Argentine Tramways 5 per cent. debenture has left the stock at 70½, bringing the yield to £7 1s. 10d. per cent. on the money. The Shanghai Electric Construction Company did well last year, the dividend being maintained at 10 per cent., and the profits of £122,400, the highest since 1920, being £50,000 more than those of the previous year. The shares have risen 2s. 6d. to 37s. 6d. Colombo Electric Tramways and Lighting ordinary shares are to receive 20 per cent., tax free, against 15 per cent. in each of the two preceding years. The company's earnings have expanded in remarkable fashion.

Bournemouth and Poole ordinary show a tendency to rally, and have braced up to 56s. 9d. Lancashire Light and Power ordinary at 26s. are ex dividend. The chairman quoted eloquent figures, at the meeting last week, to indicate the strides taken by the company's gross revenue, and the sale of current, over the past 21 years. He mentioned that the new station near Burnley, which came into commercial operation last January, has already shown itself to be highly efficient. A net decline of 9d. has left Urban ordinary at 25s. ex dividend. In the list of London electricity supply shares no alterations have to be noted. The Penarth Electric Lighting Company has declared a dividend of 7½ per cent. on its ordinary shares.

The report of the Electricity Commissioners on the generation of electricity in this country for the year ended March 31st, 1926, is regarded in the market as being too belated for it to possess more than an academic interest.

Home Railway stocks are unbefriended. A dull depression has settled over the market. Electric issues have gone the same way as steam stocks. Districts and Metropolitans have declined. London Electric ordinary keeps about 59. Underground Electric Railways are steady. The various London tramways descriptions remain without alteration. Of the foreign tramways shares, La Plata ordinary dwindled to 4s. 6d., after being up to 5s.

The iron and steel market is somewhat subdued by the Armstrong, Whitworth report for 1926, disclosing a loss of £531,000. That the results would be bad had been assumed in advance, but the official figures did nothing to temper previous apprehensions. On the other hand, there are tangible proofs, in the shipping industry, of returning trade, and these serve to encourage hopefulness in respect of the present year. The rubber share market looks for a better price of raw rubber to develop during the new month of June, as the effects of the latest restriction come into practical play. Business in the Stock Exchange is nothing to write home about, as the schoolboys say, and the main interest in the city has centred less upon stock and share prices than upon those quoted from a little place called Epsom.

The Incorporated Municipal Electrical Association.—II.

Annual Convention at Buxton.

ON Monday last the Palace Hotel, Buxton, became the official headquarters of the I.M.E.A., *pro tem.*, and the President, with members of the Council, there welcomed informally members and visitors attending the Convention. Next morning, at the Opera House in the Pavilion Gardens, His Worship the Mayor of Buxton (Councillor W. Goodwin, J.P.) extended to the members a cordial welcome, expressing the pleasure of his Corporation at receiving so important an Association, and referring briefly to the exhilarating air and medicinal waters which were at the disposal of the visitors. Moving a vote of thanks, the President, Mr. R. W. L. Phillips, M.I.E.E., on behalf of the Association, thanked the Mayor and Corporation for their efforts to ensure the comfortable accommodation of those attending the Convention (the total number. we understand, was no less than 890); Alderman W. E. Souter, chairman of the Bedford Electricity Committee, warmly seconded the motion, which was carried by acclamation. The president then proceeded to deliver his address, of which an abstract is given below.

Mr. Phillips commented on the incessant labour imposed upon himself and the Council during the past year by conferences and meetings in connection with the Electricity (Supply) Bill. After a pardonable expression of gratification at the success of municipal electricity supply undertakings in generating and selling electricity more cheaply than the companies did, and in establishing themselves in a very sound financial position, he rescued the Report of the Advisory Committee on Domestic Supplies of Electricity and Methods of Charge from the obscurity into which it had been thrown by the Electricity Bill, and drew attention to several of its recommendations which needed immediate settlement, especially the question of a domestic tariff suitable for universal adoption.

A vote of thanks was moved by Mr. A. J. Howard, of Taunton, a fellow pupil at Taunton with Mr. Phillips, and was seconded by Ald. H. Leese, of Stoke-on-Trent.

Afterwards the ladies joined Mrs. Phillips and partook of light refreshments, whilst the sterner sex heard and discussed a paper by Mr. W. C. Bexon, chief engineer, Ayrshire Electricity Board, on "Methods and Capital Costs of Distribution over an Extensive Area." The author dealt with the cost of constructing and tapping extra-high-pressure transmission lines (22,000 volts) to serve an area of 1,100 square miles, the construction and costs of open-air sub-stations, underground distribution, and overhead low-pressure distribution, and the regulation of long-distance transmission lines. He expressed a preference for duplicate feeders on the same poles, the latter being of wood, and regretted that the 1926 Act did nothing to remove the difficulty of obtaining wayleaves. Where necessary, however, he used steel towers. His experience of open-air sub-stations since 1918 had been very favourable. For distribution he found 3,300-V feeders most suitable, with transformer kiosks except where much switchgear was required, necessitating the use of a brick building. In villages the cost of distribution had to be a minimum; overhead mains were the only solution, but the present regulations almost put them out of court, and urgently needed revision. He doubted whether electricity would ever be available to the whole population at 1d. a unit, unless the many regulations were relaxed, and concluded with some suggestions to that end.

After the official photograph had been taken in the Pavilion Gardens, the members dispersed for luncheon. The afternoon was set apart for a special visit to the electrical exhibition, which was housed in the Pavilion Corridors. At the invitation of the Mayor, the visitors afterwards took tea in the Pavilion Gardens.

In the evening the President, supported by the Mayor of Bedford (Ald. Gilbert H. Barford, J.P.), and the chairman and members of the Bedford Electricity Committee, held a reception at the Palace Hotel.

The programme for Wednesday opened with a paper on "Recent Developments in Power Plant Design, and their Effects on the Economy of Generation," by Mr. T. Roles, M.I.E.E., City Electrical Engineer, Bradford, and a discussion thereon; afterwards Rotarians were invited to attend a special Rotary Luncheon at the Buxton Hydro. For the afternoon a visit to the Derwent Valley Waterworks by motor coach was planned, the route lying through Millers Dale, Tideswell, and Hathersage, and returning *via* Castleton, Peak Forest, and Dove Holes.

On Thursday, Mr. H. H. Berry was to read a paper on "Electrified Homes of Great Britain and Ireland, with special reference to the Heating Question"; the afternoon was set apart for the annual meetings of committee representatives and members of the A.M.E.E. respectively, whilst members of the E.A.W. and other ladies attending the Convention were invited by Dr. and Mrs. Ferranti to visit Baslow Hall, which is electrically equipped throughout. In the evening the annual dinner of the Association was to take place at the Pavilion.

Presidential Address.

By R. W. L. Phillips.

(Engineer and Manager, Bedford Corporation Electricity Department.)—(*Abstract.*)

I HAVE recently had before me a careful analysis of a large amount of data which show that municipal supply undertakings so manage their business as to be able to generate and sell at a lower cost than other supply undertakings, and, partly owing to the system of dealing with capital, they are to-day for the most part in a very sound financial position. All will agree that this is in some measure due to the versatile set of men who for the last thirty or forty years have given of their best to the industry: men who, as the necessity arose, emerged from the engineer to the business manager.

The complete accomplishment of the co-operation between the supply and electrical contracting branches of the industry is a problem which, I think, is approaching solution. This co-operation started with the agreement which led to the inclusion of Clause 48 in the Electricity (Supply) Bill, an agreement made possible by the excellent spirit evinced by all parties to the negotiations, which it is hoped will be maintained and strengthened in operating under the clause.

Another important publication that made its appearance during the year, which, had it not been overshadowed by the Government Bill, would have received much more attention, was the Report of the Advisory Committee appointed by the Electricity Commissioners on Domestic Supplies of Electricity and Methods of Charge.

All engaged in the industry are convinced that the development of domestic supply is of great importance. Consumers who are being connected to the mains at the present time in very large numbers, at a greater rate than has been known

before, are mostly residents in the smaller types of houses, which cost practically the same amount to connect as the larger ones already connected to the mains, but produce very much less revenue. The effect on the cost of supply of the revenue per service has often been demonstrated, and it must be the endeavour of all to encourage the individual consumer to use more electricity, and to do so as rapidly as possible.

A great obstacle to progress in the path of domestic electrification is the high resistance to change that is met with in the British household. We know that we can introduce into these households methods which will enormously increase efficiency and comfort as compared with present methods, but find the utmost difficulty in persuading the people to give our methods a full and sufficient trial. The Advisory Committee's Report has carefully analysed the question of domestic supply, and a detailed study will, I think, assist in approaching the difficulties which have arisen and may arise in the future.

The daily Press gave some the impression that the passing of the 1926 Act would render possible a cheap supply of electricity in all areas. In some areas it is difficult to find revenue sufficient to warrant the capital expenditure on the mains required, so that even at the moderate tariffs existing, and even if electricity cost nothing to generate, the business is often impracticable. It is evident that this fact was well to the fore during the deliberations of the Advisory Committee, as a number of the recommendations are directed towards reducing the cost of transmitting and distributing mains.

The question of wayleaves for overhead lines, in many cases, is the principal difficulty to be overcome. In rural England one has no sooner planned a nice straight line across country than it is found that, in only a few miles, there are scores of different owners to deal with, and consequently scores of wayleaves to negotiate. Each owner generally requires a different consideration for granting the privilege, and sometimes it is necessary to divert the line and so increase the cost. Provided the line does not interfere with the amenities of his land to any extent, the owner should not be in a position to demand exorbitant consideration. Within my experience, in many cases it has been cheaper or but little more expensive to put the cable underground.

Some of the points raised in the Advisory Committee's Report are taken care of by Section 48 of the 1926 Act, by which all municipalities are given powers to sell. I am able to state, on the authority of the Minister of Transport, that this Section authorises, by implication, the provision of showrooms and a reasonable expenditure on advertising and other forms of publicity work.

Perhaps the most important matter that the Advisory Committee considered was the question of a suitable domestic tariff for general adoption. The Committee examined in detail some 13 different methods, and yet was unable to select one as being sufficiently perfect for universal use. Having regard to the fact that the Commissioners have power to fix a tariff for the country, it is time that the industry made up its mind as to what it wants.

As so many methods of determining the fixed-charge portion of the tariff seem to have proved more or less successful, one could almost argue that the actual method to be adopted in any particular case is not of very great importance. If anything, the evidence in the Report leans towards the adoption of floor area as possibly the favourite method, and it is significant that floor area also plays some part in the determination of the ordinary assessable value of domestic hereditaments, but this method has some staunch opponents.

Attention is called to the fact that any alternative flat rate must be high, but I do not think it is always realised that this should refer to the heating as well as to the lighting rate. For instance, it is no use offering a two-part tariff to replace, say, a lighting rate of 6d. and a heating rate of 1d., unless the unit charge of the two-part tariff is less than 1d., otherwise there will be no inducement for increasing the use of apparatus already in use on the 1d. rate. There is a distinct difficulty in this connection when introducing for the first time a two-part tariff, especially in areas where the lighting and heating rates are low. The raising of both these charges merely to introduce an alternative tariff creates a suspicion in the minds of consumers, difficult to allay, which militates against the new tariff, and I think this difficulty has been one of the chief obstacles to its introduction.

It would be of immense benefit to the whole industry if one system of charging could be adopted throughout the country, and this benefit would be increased enormously if the unit charge could be standardised, leaving each undertaking to determine the fixed-charge factor according to the cost obtaining in the district. When national generation is established there should be no great difficulty in this. All catalogues, advertisements, and other propaganda literature would then be able definitely to state the actual cost per hour, day, week or year, of the apparatus described, irrespective of the district in which it is to be used, which would undoubtedly foster the use of all types of domestic apparatus.

Most of the matters touching upon overhead lines could possibly be settled by a conference between the Electricity Commissioners, the Postmaster-General, and the supply authorities, and I have reason to believe that this can easily be arranged by application to the Electricity Commissioners, but it should be taken in hand forthwith. A number of the improvements suggested could be settled first by agreement between certain parties, and if necessary a short Bill could be introduced to ratify them. I therefore suggest that this Association introduce into its work for the coming year the consideration of the best way of setting this machinery in motion.

Of equal importance is the question of the terms and conditions upon which a bulk supply will be available to those undertakings which are to cease generating. The terms examined so far vary in different undertakings to such an extent as to render analysis an absurdity. Most of them adopt the usual method of charging a fixed price per kilowatt of maximum demand with an added unit charge, but the prices charged vary from 15s. to six guineas per kilowatt per annum and from 0.35d. to 0.75d. per unit. Moreover, the methods of determining the maximum demand seem to be only limited by the number of undertakings. There is no doubt that this point must receive the very careful consideration of all concerned, as it is obvious that a false step may lead to a state of affairs which may seriously cripple the development of electricity supply, particularly when it is necessary to offer special rates to consumers to suit special conditions.

Many of these vital points nowadays seem to be prejudged and settled without reference to the industry concerned, and I think it is the duty of the Bulk Supply Committee to get to work as quickly as possible and take the necessary steps to formulate standard procedure.

Our hon. secretary, Mr. Alex. C. Cramb, must on this occasion be especially congratulated and thanked for bringing to a successful conclusion what has been his object for so many years, *viz.*, the securing to all municipalities of the powers to sell. It is almost entirely due to his determination and good work that this clause was secured in the 1926 Act.

Distribution over an Extensive Area.

Methods and Capital Costs.

By WILLIAM C. BEXON.

(*Abstract.*)

THE author pictures an electricity works supplying in its own particular township; between 20 and 25 miles away are other towns having populations of between 11,000 and 30,000, which have no electricity supply. The country intervening is sparsely populated, but there are a number of villages, an occasional large works, and a number of collieries. The paper gives details and approximate costs of supplying this large area.

Extra-High-Pressure Transmission Lines.

Underground cables at pressures of 33,000 volts and above have yet to be proved reliable, and in transmitting energy over large areas, it is almost impossible to have overhead construction throughout; telephone and telegraph wires are

Fig. 1.—P.O. Line-Guarding System.

met with, and at these points underground cables have to be laid. The Post Office authorities may, however, agree to an overhead transmission line, provided a very expensive and unsightly system of guarding is erected. The guarding shown in fig. 1 had to be erected for the purpose of protecting only nine overhead telegraph wires.

From data available voltages of 22,000 to 25,000 are shown to be the most economical for a radius of 25 miles, and a voltage of 11,000 for a radius of 10 miles, which bears out the old rule of 1,000 volts per mile. Cables manufactured for 22,000 and 25,000 volts have proved reliable.

An engineer, in designing an e.h.p. distribution scheme over a large area—and in this paper the author is dealing with an area of 1,100 square miles—has to make an estimate of the maximum load. The transmission lines must be designed to deal with an anticipated load, and at a reasonable capital expenditure. Continuity of the supply is a very important factor. The objection to separate feeders is the high capital cost, and, in the author's opinion and experience, a duplicate feeder on the same poles is the most economical.

Six-wire line construction on "A" poles is easily effected, and at a minimum cost. The capital cost per mile of such a line, for a working pressure of 22,000 volts, erected under the latest electricity regulations, and allowing for one heavy angle, two light angles, and four duplicating straight-line poles, is as follows:—

Norwegian fir poles, 40 ft. long, insulators, &c.	£492	0	0
Copper wire No. 1/0s.	491	0	0
Erection of poles	58	0	0
Running out and hanging copper	25	0	0
Straining and binding in	31	0	0
	£1,097	0	0

Total cost per mile—say £1,100 0 0.

For a 3-wire line construction, the capital cost would be £720 per mile. Therefore for the same capacity of line the ratio is £1,100 as against £1,440 per mile. If the lines were designed for a working pressure of 11,000 volts there would be a deduction of approximately £20 per mile.

The cost of lattice masts is very much in excess of that of wooden poles. Farmers object to the concrete foundation and demand a very much higher wayleave rental. In addition, these masts require to be painted annually, and they show serious signs of deterioration in acid and salt atmosphere.

The Kay pole, fig. 2, which is made up of steel tubes, is free from rivets, bolts and nuts, but owing to the amount of land taken up by the four legs, *viz.*, 18 sq. ft., delay often occurs in obtaining wayleaves, and a considerable sum in excess of the wayleaves for an "A" pole is asked.

The most difficult factor is obtaining the necessary wayleaves. The Electricity (Supply) Act, 1926, does not give any better facilities for obtaining wayleaves than previous Acts, which are practically of no use. The farmer puts forward every possible objection. The author has found the following arrangement to work satisfactorily: the Authority pays for all damage done due to the erection of the poles, &c.; if the farmer requires a supply the Authority runs a service line into his premises free of expense to him, but he in return frees the Authority from all annual wayleaves and other expenses.

Another difficulty in connection with wayleaves is that the farmer invariably wishes as many poles as possible to be placed on the hedge line, and this is often impossible. The Road Authorities stipulate that any structure shall not be less than 25 ft. from the centre of the road. It is necessary, therefore, to place the poles in the cropping fields. Again, should the Post Office have lines running along a roadway the Lighting Authority cannot erect lines on the opposite side of the road, as the Post Office stipulates that the distance between its lines and those of the Lighting Authority must not be less than a distance equal to one and a half times the height of the highest wire, and as roads are not often of such a width the power lines have to be erected in the fields.

Unfortunately, from the revenue point of view, a farm supply is small considering the amount of capital involved in giving the supply. The author has taken at random the consumption of 73 farms, and the total consumption for 12 months amounted to 63,558 units, which gave an average annual revenue from each farm of £11 16s. 3d.

Tapping E.H.P. Transmission Lines.

A reasonably cheap method of giving a supply to a farm is by using a pole transformer; the capital cost of a 20-kVA supply under this scheme would be £150.

Fig. 3 shows a 50-kVA transformer mounted on a 4-member structure, and supplying eight farms, all situated within a radius of 1½ miles. The type of fuse employed in this gear is merely a small fuse wire passed through a glass tube, filled up with sand and sealed at both ends. It is inserted between two horns. When a fault occurs the fuse is blown to atoms, but the cost of replacing is almost infinitesimal.

The same arrangement of tapping transmission lines to supply villages can be adopted. The author has had experience of this type of tapping for a number of years, and it has proved quite reliable.

In long-distance transmission lines for supplying townships it is advisable to have disconnecting points at intervals, so that should a fault occur it can be localised more readily; the isolating station and transformer station for the supply to a village can be on the same structure, fig. 4, costing, with a 200-kVA transformer, £662. The isolating switches are operated from the ground level.

Open-Air Sub-Stations.

It is advisable to make the system of supply standard in all townships and villages in the one area with a view of minimising spares, and to have the smallest amount of stock. For a town of 20,000 inhabitants 3-phase, 4-wire is the most economical system, with 415 volts between phases, and 240 volts between phase and neutral. To give a supply to consumers in townships situated 20 miles from the power station, at the same rate as rules near the power station, every possible method of minimisng the capital costs must be taken.

If there is but little switchgear required, an open-air substation will suffice, but where there is to be large distribution

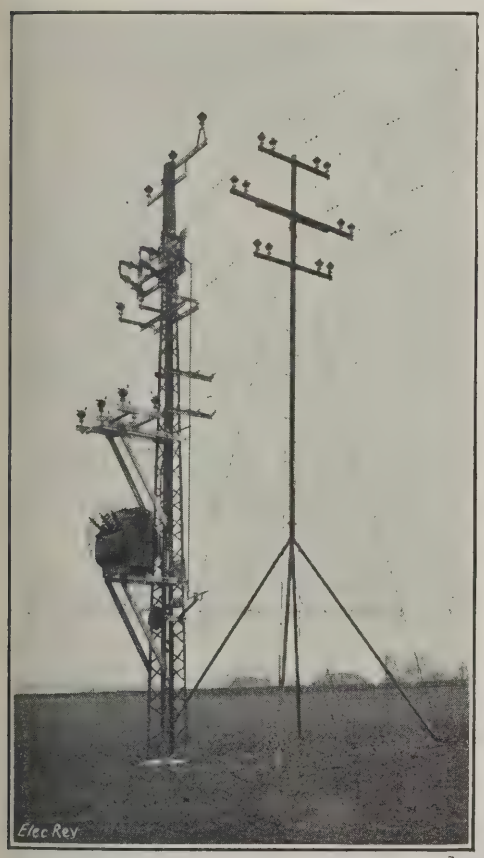

Fig. 2.—Kay Pole and Transformer.

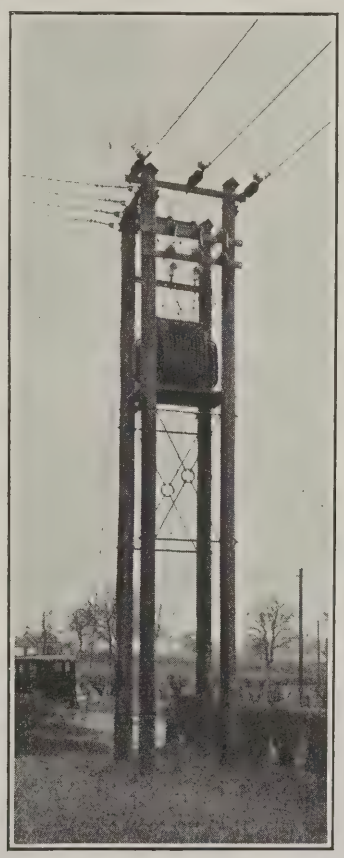

Fig. 3.—Four-Member Pole and Transformer.

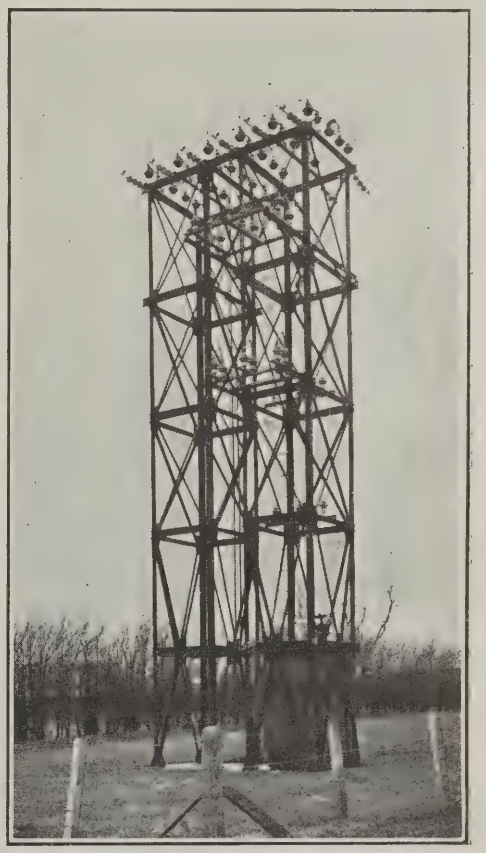

Fig. 4.—Isolating Tower Station.

control from the sub station, one of the brick type would be as economical. Fig. 5 shows an open-air sub-station, 22,000/11,000 volts, 3-phase, consisting of two feeders in, two feeders out, two 1,500-kVA transformers (one of which is a spare). It is built up of "H" beams.

The total cost of this sub-station, excluding transformers, is £1,351.

The total amount of land occupied is 76½ square yards, and a minimum rental of £1 per annum is asked for. To build a brick sub-station to house the above apparatus would increase the capital cost considerably.

The chief disadvantage of the open-air sub-station is that inspection of the transformers can only be undertaken in dry weather. Nevertheless, the advantages of an open-air sub-station far outweigh the disadvantages. The author has had this type of sub-station under his supervision since 1918, and very little trouble has been experienced.

Underground Distribution.

In the author's opinion it is uneconomical to have a low-pressure feeder and distribution system in a town, owing to the amount of copper required to overcome voltage drop. A 3,300-volt, 3-phase feeder system meets practically all cases.

An approximate price per mile for supplying and laying cables (allowing a maximum voltage drop of 100 volts) for 3,300-volt cable, suitable for a route length of three miles; 6,600-volt cable, for six miles; and 11,000-volt cable for 10 miles, at a power factor of 85 per cent., is as follows (these prices do not include excavating and reinstating):—

3-core Lead Covered and Armoured Cable.

Carrying capacity in kW.	Size of cable.	Price per mile.
3,300-volt—		
500	.075	£1,056 0 0
1,000	.15	1,435 0 0
1,500	.25	1,906 13 4
6,600-volt—		
500	.04	1,122 0 0
1,000	.075	1,371 6 8
1,500	.10	1,532 13 4
11,000-volt—		
500	.04	1,349 6 8
1,000	.04	1,349 6 8
1,500	.06	1,481 6 8

The tapping of a 3,300-volt system can be done at a minimum capital cost. A 3,300-volt, 3-phase, 3-way, disconnecting pillar, and cast-iron transformer kiosk, erected on the footpath in a main thoroughfare, and housing a 100-kVA, 3-phase transformer, costs £331 inclusive.

In view of the fact that consumers are now making much more use of heating and cooking apparatus, it is advisable to have the neutral the same size as the other cores, and this adds very little to the cost.

Another advantage of the 3,300-volt, 3-phase system is that reliable motors of large size can be built for the voltage, and the switchgear (which takes up very little space) is also inexpensive. The pressure of 3,300 volts is also useful for collieries, more particularly for pumping.

The domestic supply is increasing considerably year by year, and with a system of high-pressure feeder distribution, which can be tapped at little expense, the engineer need not fear pressure drop.

A typical lay-out of a distribution system, fig. 7, is, roughly, as follows: From the main e.h.p. sub-station a ring-main is run direct through all the kiosks and back into the main sub-station. The low-pressure 4-core mains are also run, and interconnected with the various kiosks. Under this system of distribution the pressure is equalised in all the districts, and the tappings—both on the high- and low-pressure feeders—can be made when extra transformers are required.

In a small town having a population of 8,000, whose chief industry is shipbuilding, the demand from the shipyards is approximately 1,750 kW. The only other load in the area is small power, and the usual domestic load. It was found that the cheapest method would be to run an 11,000-volt feeder to the shipyard, and also to have a 3,300-volt ring-main distribution system. The 11,000-volt feeder was interconnected with a 3,300-volt ring-main by a transformer. The consumers, at their own expense, built the sub-station, and allowed the use of it for supplying other consumers in the district. This is a standard arrangement with consumers who require a special e.h.p. supply.

By having two or three pressures of supply the cost of sub-stations is increased. A sub-station capable of housing two 11,000-volt incoming feeder panels, one 11,000-volt outgoing feeder panel, one 11,000-volt transformer panel; two 3,300-volt outgoing feeder panels, and two 3,300-volt transformer panels, is a two-floor building, 16 ft. by 14 ft. by 20 ft. The 11,000-volt switchgear is of the ordinary draw-out cubicle type, and the 3,300-volt switchgear is of the ironclad draw-out type. The sub-station also contains a low-pressure distribution board and two 300 kVA transformers. The cost of the two-floor sub-station, excluding the transformers, is £1,064. Where land is difficult to obtain the two-floor sub-station minimises the difficulty.

In the case of a single-floor 11,000/3,300-volt brick sub-station, the building is 14 ft. by 14 ft. by 14 ft., with a concrete roof, and houses the following plant:—

Two 11,000-volt truck feeder switches.
One 11,000-volt transformer feeder switch.
Three 3,300-volt ironclad 3-phase feeder switches.
One 500-kVA transformer, 11,000/3,300 volts.

The cost of the sub-station complete would be £1,206.

Fig. 6 shows a simple brick sub-station which houses two 250-kVA transformers, 11,000 V.

To reduce sub-station capital costs, sheet-steel sub-stations have been developed. The capital cost of this type, of 200-kVA capacity, including h.p. and l.p. switchgear, is approximately £600. The approximate dimensions are 8 ft. 6 in. by 7 ft. 6 in. by 7 ft. The local authority may object to a construction such as this being erected in a residential or shopping area, but this type of sub-station will be useful in some areas.

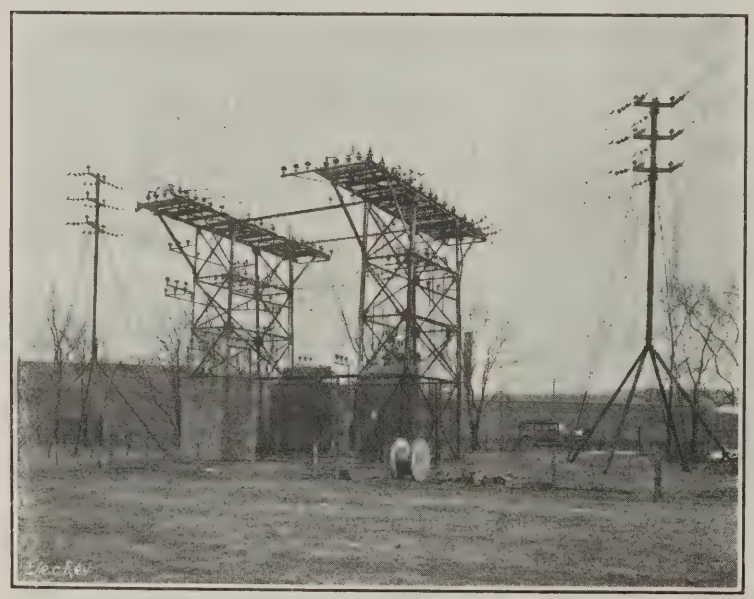

Fig. 5.—Out-door Sub-station, 22,000-11,000 V.

Fig. 6.—Simple Brick Sub-station.

In the author's opinion it is somewhat absurd for the Authority to have a set of fuses, and the consumer a similar set within three feet of them. Why one set would not suffice it is difficult to understand.

Overhead Low-Pressure Distribution.

Distribution in small villages is an entirely different matter from distribution in towns. There are no large shops and practically no power. The shops are closed early, and the consumption is exceptionally small. The cost of distribution must, therefore, be at the minimum. Overhead distribution is the only solution, but the present regulations almost put out of court overhead distribution in some small villages, and the sooner these are altered the better for the supply industry and the consumer.

For many years overhead tramway systems have been in existence working at 500 V. There are no rules stipulating that an earth wire must be used in case the wire should fall, and the number of serious accidents is practically negligible.

Some of the conditions stipulated in the Electricity Com-

missioners' Regulations, 1923, particularly Clause 13, are unnecessary, and the Post Office will not allow bare wires over its own lines unless the Lighting Authority agrees to pay for alterations and protection.

The cost of overhead distribution, 3-phase, 4-wire, using No. 2/0 copper, is approximately £600 per mile. The cost of an overhead service, using No. 6 copper, is £2 12s. (twin), and £5 3s. (4-wire).

To minimise the cost the author stipulates that the work by the Authority shall terminate on the chimney of the building; from this point the consumer, at his own expense, must, through his electrical contractor, provide and erect the necessary wiring from the overhead line.

The following particulars are of a village having a population

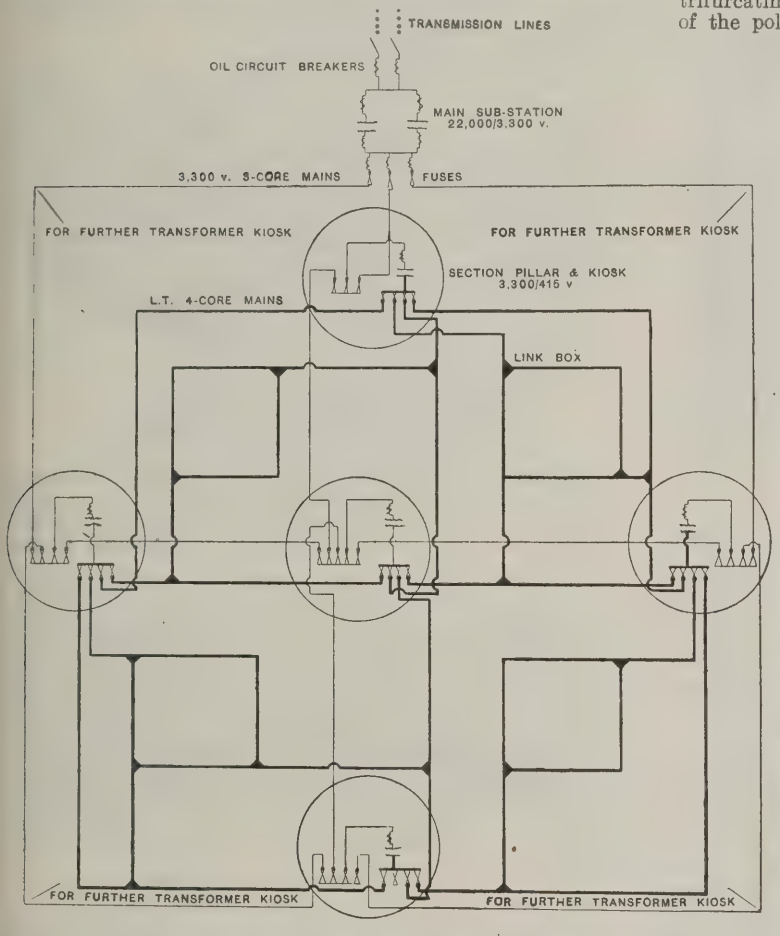

Fig. 7.—Typical Layout for h.p. and l.p. Systems.

of approximately 4,000. The total length of distribution through the streets was 2 miles 1,600 yards, and the capital cost in giving the supply was £2,924, excluding meters, made up as follows:—

One open-air sub-station, complete ...	£122	0	0
One 100-kVA transformer	242	0	0
Overhead distribution	1,810	0	0
Services	750	0	0

At the end of the first year the number of consumers was 254, and the revenue £732, an average per consumer of £2 17s. 8d. Had underground cable been adopted in place of overhead lines the capital expenditure would have been £4,750, and with reinstatement costs, a further sum of £1,000.

Quite a different type of village consists of practically one street. There are 50 consumers, and the total consumption for 12 months was as follows: Lighting, 10,723 units; heating, 20,457 units; power, 5,666 units.

The revenue was £497, an average of almost £10 per consumer.

Regulation on Long Transmission Lines.

Pressure drop on an e.h.p. line is not so serious a question if the whole of the lines are on the ring system, but to supply an area as is suggested in this paper the undertakers cannot afford to interconnect all their lines almost at the commencement of the scheme, but must wait until the lines are earning a reasonable revenue, and also, if possible, until the interconnecting lines can be used, not only as part of the ring system, but as feeders; *i.e.*, it is not advisable to run the interconnecting lines until there are a sufficient number of consumers *en route*.

An induction regulator, situated in the power station, having a 10 per cent. buck and boost, will give ample voltage regulation to allow for the voltage drop on the transmission line. A double-wound regulator does not seriously affect the power factor; its efficiency is approximately 95 per cent.

Increasing the pressure at the power station to give a correct voltage at the farthest point means that the pressure at less distance from the station is high, but this condition can be obviated by installing tapping transformers in the sub-stations *en route*. With the latest type of tapping switch, operated from the outside of the tank of the transformer, it is a simple matter to alter the tapping. The transformers should have tappings giving a range of variation of not less than plus or minus 5 per cent.

Manufacturers have now put on the market an automatic regulating-type transformer which will be of great service in keeping the correct pressure in the outer districts.

Overhead Line Troubles.

One of the greatest weaknesses in overhead lines is the trifurcating boxes. These were usually erected at the top of the pole, and it was impossible to inspect them until the

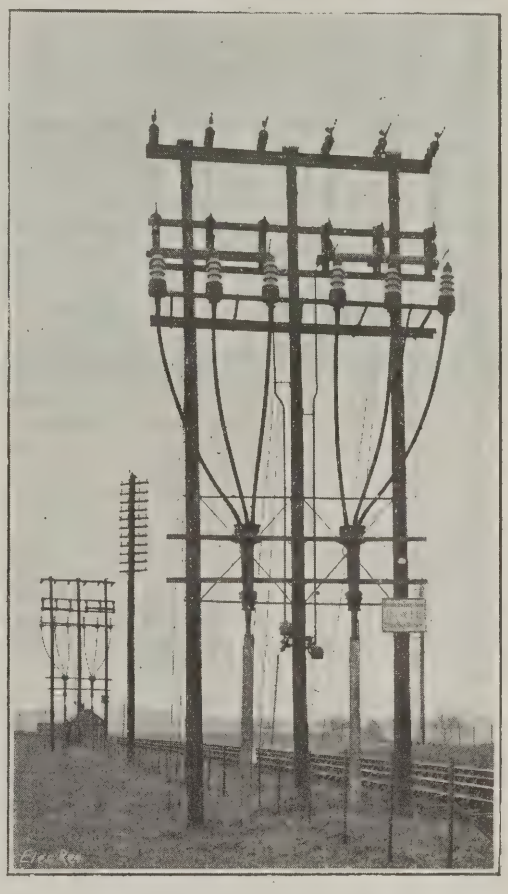

Fig. 8.—22,000-V Pole with special Dividing Boxes.

lines had been made dead. If a fault occurs on one of the boxes on a 6-wire line then both lines have to be shut down until the box is repaired. The author, in conjunction with one of his assistants, designed and patented a box which has minimised these troubles. Instead of the dividing box being erected at the top of the pole, a small sealing end box, terminating the underground cable, is erected 10 to 12 feet up the pole. Special lead-covered cambric tails are run from this sealing box to the top of the pole, and the cables terminate in porcelain sealing ends, fig. 8. This type of box has been in use for the last four years, and no breakdown has yet occurred. The boxes can be inspected easily, and should one break down it can be repaired without curtailing the whole of the supply on the 6-wire line.

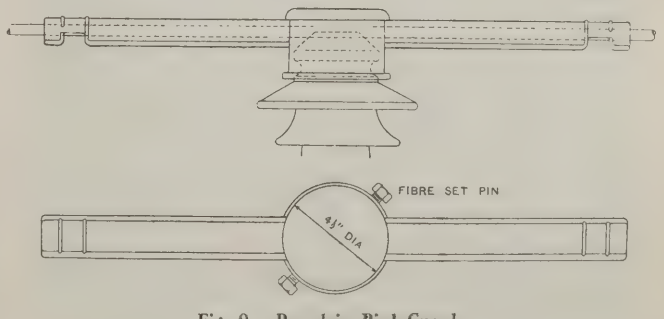

Fig. 9.—Porcelain Bird Guard.

Lightning surges give rise to flash-overs on the line, and when once established will be maintained by the power from the alternator. The flash-over takes place usually where the clearances to earth are the least. This is minimised by the use of aluminium lightning arrestors, which, preferably, should be at both ends of the lines.

The failures of insulators would be comparatively few provided the insulators were those manufactured in this country and recommended by the manufacturers for the specific duties, and not as recommended by any association.

Probably the greatest number of failures of overhead transmission lines are caused by crows. Fig. 9 shows a bird guard which should overcome this difficulty. It is made of porcelain and is in three pieces. It can be erected quickly.

Another disturbance caused by crows is when a large flock rests on the entire length of a span; immediately one starts the whole flock flies off, and invariably a short circuit takes place. Sometimes the birds themselves cause a short circuit, and sometimes the lower wire swings and touches the higher one immediately the weight has gone off the wire. To overcome this difficulty the wires should not be in a direct vertical plane. If the middle cross-arm is 4½ ft. longer than the top arm and 3½ ft. longer than the lower arm, the middle wire is not in a vertical plane with either the top or the lower one.

Sleet causes unequal loading, and, therefore, unequal sag in the different spans. If the lines are in the same vertical plane they are liable to touch; by extending the arm this trouble is obviated.

The politicians and the Press, during the period when the Electricity Bill was going through its various stages, stated that an electricity supply would be available at 1d. per unit to every person irrespective of whether his or her residence was situated in a town or in the wilds of the country, but, with the many regulations which electricity authorities have to contend with—the first cost in obtaining wayleaves, coupled with the initial capital cost in giving a supply of energy—the author is not so optimistic as to believe that the day will come when supply will be given at this price.

There is no doubt, however, that the cost would be decidedly less if electricity authorities had the same privileges as the Post Office, and I fail to see why that should not be so, considering that from the points of view of health and cleanliness and cheapness of production, which is necessary to compete in foreign markets, electricity is as important as, if not more important than, telegraphs or telephones.

So long as electricity authorities are governed by so many regulations, and meet innumerable difficulties in obtaining wayleaves, electricity in the outlying districts and small townships will not replace the coal fire. If, however, the regulations were minimised, and more facilities given to the electricity authorities, they would be in a better position to provide a cheap supply; and as the figures given in this paper indicate, if more use were made of electricity for heating and cooking in the villages, the financial results would be decidedly better.

The question of interlinking power stations is now being considered by the Government with a view of reducing generating costs. Many collieries have their own stations, and are able to generate at very low cost owing to the fact that they burn a fuel of a very inferior quality. If these stations, which often have ample spare plant, were connected to the public transmission lines, it would tend to reduce the capital and the working costs, and make full use of a fuel which cannot be sold. Furthermore, by taking a supply from a colliery, or any other private source, an area can be developed until the revenue is sufficient to warrant the extension of the transmission lines to it.

The revenue figures given in this paper are based on the following charges: Lighting, 6d. and 5½d. per unit; heating and cooking, 1½d. per unit. Alternatively, 10 per cent. of the assessed value of the house per annum, plus 1d. per unit for all units consumed.

In this paper the author has mentioned hindrances and difficulties in giving a supply over large areas; the following suggestions to overcome these are made, all of which should result in cheapening the electricity supply:—

(*a*) Statutory rights should be given to electricity authorities to erect transmission lines through agricultural country, after submitting plans to the Electricity Commissioners. The present method of giving notice, and later having an inquiry, causes considerable delay and should be abolished.

(*b*) A statutory wayleave rental of 1s. per pole per annum to the landlord should be made compulsory throughout the country.

(*c*) A statutory wayleave rental of 1s. per pole per annum in grass, 1s. 6d. in corn, and 2s. 6d. in green crops should be given to the tenant.

(*d*) Statutory powers should be given to electricity authorities to erect section boxes and kiosks in public thoroughfares.

(*e*) Any expenses incurred by an electricity authority in removing works, *viz.*, underground cables, transmission lines, section boxes, &c., on account of alterations to a street, &c., by the local authority should be repaid to the electricity authority by the local authority.

(*f*) Electricity authorities should be relieved of all rates and taxes on transmission lines in areas from which no revenue is derived.

(*g*) The rule of paying to the Post Office Authorities a proportion of the cost of laying its works underground when it is second-comer should be cancelled.

(*h*) The Post Office condition that power lines must be not less than a pole-and-a-half distance from telegraph lines should be cancelled.

(*i*) Facilities should be given to electricity authorities to erect poles along the roadside.

The I.M.E.A. Exhibition.

AS in previous years, an exhibition of electrical apparatus is being held this year in connection with the Convention at Buxton. It is arranged in the Pavilion, where about 30 stands are to be seen. Domestic apparatus forms the predominant feature of the display, almost every firm showing some sort of heating or cooking appliances.

The show of METRO-VICK SUPPLIES, LTD., is particularly interesting. A new type of "Cosmos" boiling plate and a new "Cosmos" cooker are to be seen, in addition to a complete range of domestic electrical appliances, including new 1- and 3-kW flat-bar radiant fires which have been produced to meet the demand following the introduction of the 2-kW type last year. "Cosmos" fans, the "Emvee" lampholder, and a range of Harcourt electric light fittings are also included in this exhibit.

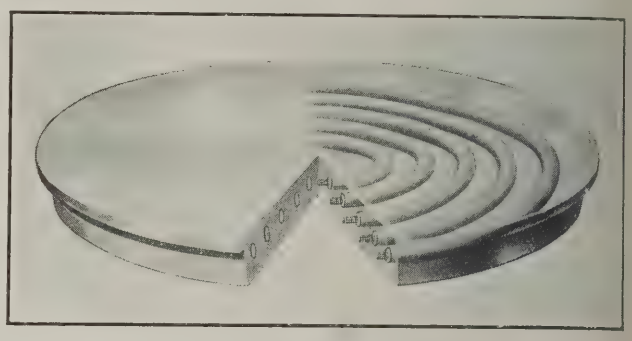

Fig. 1.—New Boiling Plate; Cast-in Elements.

Continued investigation by the M.-V. research department into the possibilities revealed by the discovery of crystalline magnesium oxide has resulted in a further improvement in the construction of the elements for the "Cosmos" plates.

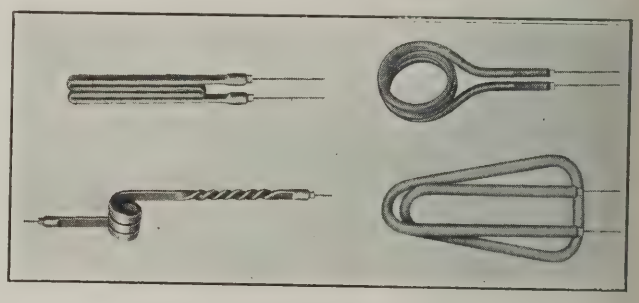

Fig. 2.—Twisted Tubular Elements.

The new plate is manufactured by a process which ensures the building of a complete wall of crystalline magnesium oxide around and in close contact with the heating element, but it has the distinct and important advantage that there is an appreciable reduction in weight as a result of the adoption

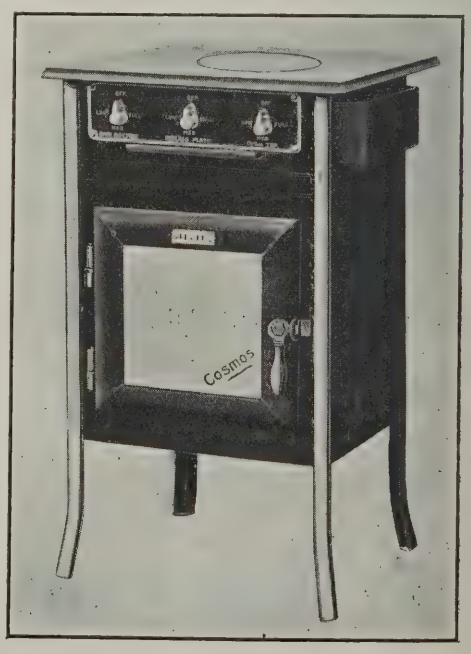

Fig. 3.—New "Cosmos" Cooker.

of cast-in tubular elements, fig. 1; consequently the stored heat is less than in the case of the previous type of plate,

ELECTRICAL REVIEW, June 18th, 1926, p. 935. In order to minimise the space and weight it was found advantageous to insert the magnesium tube containing the heating element into an outer metal tube or covering before converting the magnesium into crystalline magnesium oxide. Perfect thermal conduction is claimed to be ensured between the heating coil and the inner surface of the outer metal tube through a layer of even thickness of electrical insulation around the element coil. It is claimed that a tubular element constructed in this fashion can be formed, coiled, twisted or flattened into any shape, fig. 2, without damage to the insulation.

A new self-contained table stand boiling plate is mounted

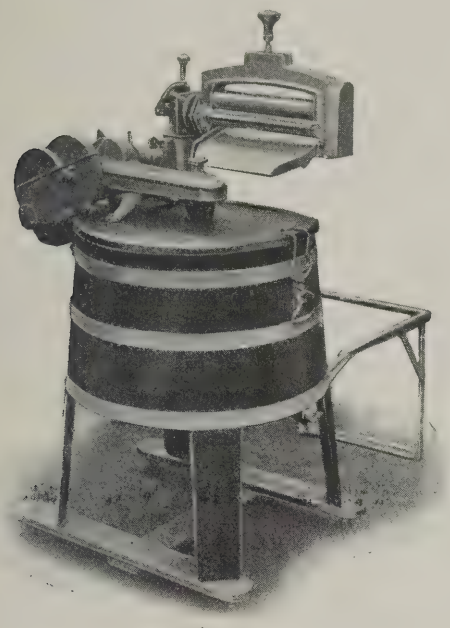

Fig. 4.—Electric Washing Machine.

on a black enamelled stand, with a nickel-plated top plate, fitted with a three-heat rotary pointer switch and fuses. It can be supplied either with a 6¼-in. boiling plate, 1,200 W, or an 8½-in. plate, 2,000 W.

The latest addition to the range of "Cosmos" cookers is the new small model, fig. 3, which is specially designed to meet the increasing demand for an efficient cooker for small houses, bungalows, flats, and so on. The overall dimensions are 22 in. by 17 in. by 33 in. high.

The oven is fitted with a removable single-unit lining. The elements are placed at the top and bottom of the oven. The grill is situated in the centre of the top element of the oven. This cooker is supplied in two models, one with one 8½-in. boiling plate, the other with a 6¼-in. and a 4¼-in. plates.

MESSRS. BURNLEY COMPONENTS, LTD., are showing a new electric washing machine, fig. 4, which they have designed specially for hire-purchase and hire schemes. It is constructed of a cypress wood tub in which a dolly is rotated to and fro by means of a motor, the dolly making 110 half-strokes per minute. A rubber roller type wringer is fitted to the machine, and the usual reverse movements are provided for. The washer is mounted on castors, and is easy to move about. A folding tub rack is fitted on the side to permit a basket or another tub to be placed within easy reach. The

Fig. 5.—An Electric Wagon.

makers are also showing the "Burco De Luxe" wash boiler, together with their housing scheme type of boiler.

The electric vehicle shown in fig. 5, which is being demonstrated at Buxton, is being exhibited by MESSRS. ELECTRICARS, LTD., by whom it was designed and built chiefly for house-refuse collection, but it may be used, with suitable bodies, for general purposes.

An unusually light chassis construction has been adopted, and also a light battery housing, driver's cab and shield. The makers guarantee the vehicle to carry an overload of 25 per cent. The normal capacity of the vehicle is 30 cwt., and its gross weight, when fitted with an all-steel tipping body and the electrical gear, is such that the road tax is only £13 per annum.

(To be continued.)

Electrical Imports of Spain.

THE following figures, showing the imports of electrical goods into Spain in 1926, are taken from the recently issued trade statistics. The totals for 1925 are given for purposes of comparison, and notes of increases or decreases added.

	1925. Quantities. 100 kg.	1926. Quantities. 100 kg.	Inc. or dec. 100 kg.
Dynamos, motors, transformers, switchgear, &c.—			
Total	52,902	41,985	−10,917
From Germany	14,817	11,348	− 3,469

Conditions in Switzerland.

Electrical Manufacturers Cut Prices.

A REPORT on the economic and financial conditions in Switzerland, dated February, 1927, has been published by the Department of Overseas Trade through the Stationery Office (1s. 6d. net). It was prepared by Mr. R. A. C. Sperling, C.B., the British Minister at Berne, who says that the hopes of improvement during the past year were not fulfilled. The home market was flooded with cheap foreign goods, while Swiss producers were forced to accept unremunerative prices to keep their hold on foreign markets. Among the adverse factors were the British coal dispute, which curtailed this country's purchasing power; the fall in the Latin exchanges; and the incidence of the new British and German tariffs instituted in 1925. Half of the introduction is devoted to advice to British traders with regard to the Swiss market. It is again pointed out that openings certainly exist for British goods, but certain "trade points" must be attended to. Briefly, these are as follows:—Adaptation of goods to local requirements; through quotations, either f.o.r. duty paid or c.i.f., and in Swiss francs, should always be given if possible; correspondence should be in French, or, if possible, in German, in cases where German is employed; catalogues and lists should be in French or German, and the metric system should be used; resident agents should be employed, and separate agents for the German and French-speaking parts are desirable; travellers with a good knowledge of the two languages should be sent out frequently; and the desirability of advertising should not be overlooked.

Electrical Industry and Foreign Trade.

As in the machinery industry, there was a falling off in the electrical industry during the latter part of last year. The orders placed by the Federal Railways on account of electrification were an important factor in increasing the year's turnover. The present electrification programme, however, will be completed in 1928, and many manufacturers are now looking about for a substitute for this source of orders. There was a smaller demand for standard apparatus such as small dynamos and motors, transformers, switchgear, &c., and this trend was sufficiently pronounced to create misgivings as to the near future. The policy of Swiss manufacturers was towards further price reduction, notwithstanding unfavourable local manufacturing conditions, in order to meet keen foreign competition. The high quality of Swiss electrical products is a great asset, states Mr. Sperling, which opened the road in 1926 to not a few technical successes, the financial side of which was jeopardised in many cases by price-cutting.

The imports of electrical equipment during 1926 totalled 2,043 tons, valued at 16 million fr., an increase of 365 tons as compared with 1925. They consisted principally of accumulators (380 tons), telegraph and telephone apparatus (433 tons), insulators (296 tons), dynamo-electric machines (410 tons), and unspecified apparatus (491 tons). The main sources of supply were Germany, France, Italy, Great Britain, and Belgium. The exports consisted of 7,649 tons of dynamo-electric machinery, valued at 27 million francs, which went to Spain, France, Germany, Brazil and other South American countries, the Dutch Indies, &c.; and of 2,134 tons of apparatus (chiefly meters and unspecified goods), valued at 24 million francs, sent to France, Belgium, Great Britain, Germany, Holland, Czecho-Slovakia, Argentina, &c.

Water Power Development.

At the end of 1925 the rating of hydro-electric plant actually installed was 1,859,000 h.p., and during last year a further 41,000 h.p. was put into service, while 320,000 h.p. was under construction. It is stated that the present development represents about one-fourth of the total water-power resources of the country. The largest works under construction are a railway power station of 115,800 h.p., and one of 100,000 h.p., being built by the Oberhasli (Bernese Oberland) Power Supply Co.; the former was to be completed this spring, and the other is expected to be finished in 1929-30. The output of Swiss electricity works during 1926 is put at about 4,000 million kWh, or about 80 per cent. of the maximum available output. Of this about 775 million kWh was exported, and a similar amount used in the electrochemical and metallurgical industry, while about 200 million kWh was consumed for traction purposes. Exports of electrical power are being looked upon as an increasingly valuable source of national revenue, and the steps taken by the Federal authorities to bring about a more healthy state in export conditions are now bearing fruit. Contracts on an exchange basis were concluded in 1926 by some power companies for the export of surplus summer output, and the import in winter of power produced by "thermic" stations abroad. The annual power consumption is stated to be about 1,000 kWh per head of the population.

Railway Electrification.

The bulk of the work carried out on the Swiss Federal Railways during the past year consisted of electrification and the reconstruction and improvement of stations and track equipment. With the growth of motor transport competition and heavy wages and salaries, the financial situation is giving cause for anxiety and expenses are being cut down all round. The 1927 Budget allowance for electrification, &c., has been reduced by about 17 per cent. as compared with 1926; the actual sum allotted to electrification is 29.9 million francs; 22.5 millions is allotted for the purchase of electric locomotives and 5.3 millions for motor coaches. In January last the Federal Railways operated 1,053 km. of electrified normal gauge lines, 138 km. having been opened to single-phase electric traction in 1926-27. A further 229 km. was to be completed by last month (May), and by the end of the year another 205 km. was to be put into operation. The railways have at present about 280 electric locomotives and 25 motor coaches.

Communications and Broadcasting.

The Swiss administration concentrated most of its activities on the development of the telephone system, which at the end of 1926 served 161,689 subscribers with 210,484—an increase of 7,946 subscribers and 10,278 lines since 1925. Numerous inland trunk services, mostly underground, were put into operation in 1926, and several new international connections were established. Direct communication, by means of three circuits, was to be opened between London and Switzerland this spring. Automatic exchanges with an ultimate capacity of 10,000 lines were completed at Berne and Basle, while two similar exchanges are being installed at Zurich. Automatic sub-exchanges and satellite exchanges are also being erected at various points. Telegraphic traffic continues to decrease and several inland lines were put out of circuit in 1926; two new international lines were opened, however.

New broadcasting stations were opened at Berne in November, 1925, and Basle in June, 1926, thus bringing the total for Switzerland to five stations. The Lausanne station was re-equipped and improved in 1926. At the end of the year there were 51,194 licensed receiving sets; the increase since January was nearly 18,000. The stations at Berne, Basle, Geneva and Lausanne are now working together, the programme of each of these stations in turn being relayed by the others. The Swiss Marconi Company's station at Berne-Muenchenbuchsee dealt with more than 500,000 telegrams in 1926, *i.e.*, an increase of over 100,000 since 1925. A short-wave transmitter will be added shortly to the two high-speed and one broadcasting transmitters already installed.

Swiss Hydro-Electric Development.

According to the Swiss Press, at the end of 1926 the hydro-electric development of the country amounted to 1,867,000 h.p. Of this total 46 per cent. was developed by private undertakings, 17 per cent. by local authorities, 26 per cent. by Cantonal and other authorities, and 11 per cent. by the Swiss Federal railway authorities. The important new plants completed during last year included the Ober-Ems station of the Illsee-Turtmann Gesellschaft and the Reichenbach station of the Reichenbach Elektrowerke Gesellschaft of Meiringen. New stations in course of construction and extensions to existing stations will, when completed, bring the total capacity of hydro-electric plants up to 2,241,000 h.p.

New Electrical Devices, Fittings and Plant.

Readers are invited to submit particulars of new or improved devices and apparatus for publication in this Section.

An Electric Welding Plant.

An electric welding plant which has recently been shipped to Ceylon, and which will be used for track-repair work on the Columbo tramways, has some unusual features. The set, fig. 1, was built by the Parsons Oil Engine Co., Ltd., Town Quay Works, Southampton, in conjunction with the Equipment & Engineering Co., Ltd., Norfolk Street, Strand, London, W.C.1. It comprises a standard 14- to 16-h.p. Parsons

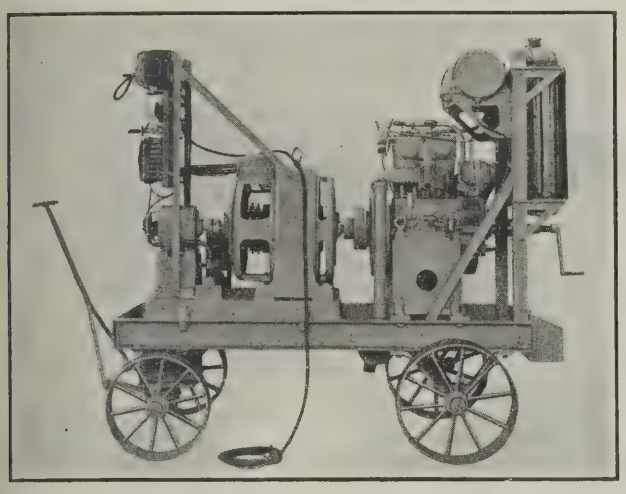

Fig. 1.—Electric Welding Set.

petrol engine, 1,000 r.p.m., fitted with a fuel tank and radiator, directly coupled to a welding generator and exciter, the whole outfit being mounted upon a welded-steel frame. The generator has a differential compound winding of an unusual design. An adjustable divertor path for the series winding is provided, and consists of an externally placed high-inductance electro magnet. Upon striking the welding arc the bulk of the heavy current is forced round the reverse series turns upon the generator and the open-circuit voltage descends much quicker than with the usual control of tapped series turns. The advantages claimed for this control are greatly reduced strain upon the plant generally, a much more flexible welding arc, and less liability of the metallic electrode to adhere to the work. The complete switchgear is mounted upon the iron uprights above the exciter and contains all the requisite instruments to control the plant, including an adjustable air-cooled reactance with a laminated core.

A Tropical-Climate Fan.

A recent production of the General Electric Co., Ltd., Magnet House, Kingsway, London, W.C.2, is the pulsating ceiling fan, fig. 2, for use in tropical climates, which is claimed to not only keep the air circulating freely, but, in

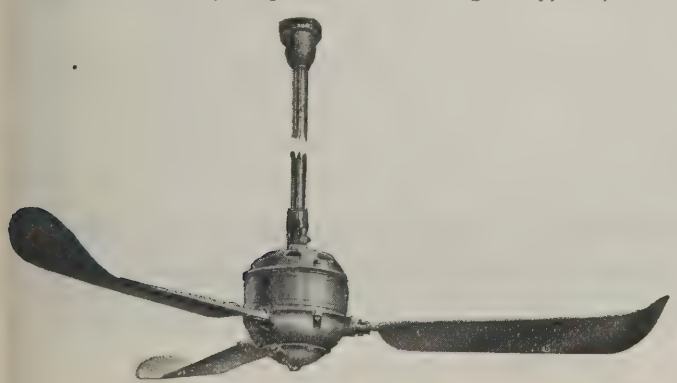

Fig. 2.—Pulsating Ceiling Fan.

addition, to deliver an intermittent volume of cooling air every five seconds, in a similar manner to the old-fashioned curtain punkah. This effect is brought about by a system of gears which varies the pitch of the blades as the fan rotates. The intermittent draught allows the body to perspire between the cooling periods, thereby inducing a healthy physiological effect.

The motor is of the semi-enclosed induction type, fitted with a ball thrust bearing running in oil, and the windings are specially insulated. The fan is claimed to be practically noiseless. The loading is from 120 to 125 W on voltages between 100 and 250, single-phase, 50 cycles. The three specially designed blades are made of aluminium-sheet formed into a definite contour which, it is claimed, ensures the minimum of slip and gives the highest possible volumetric efficiency. The sweep of the blades is 60 in. and the speed 190 r.p.m. The total weight is 57 lb., and the length of the down rod is 60 in. A standard finish of white enamel and nickel plate gives a very pleasing appearance. The blades are frosted to prevent flickering while rotating.

Electrically-operated Switchgear.

Messrs. Johnson & Phillips, Ltd., Charlton, London, S.E.7, have recently completed a number of electrically-operated oil circuit breakers, for use in a large London traction sub-station, which present a number of interesting features. They are designed to carry 300 A at a working pressure of 11,000 V, with a guaranteed rupturing capacity of 300,000 kVA. Each breaker consists of three single-pole units, mechanically coupled. Fig. 3 shows a breaker with the tanks removed; it will be seen that there is no operating mechanism near the terminals, which enables large clearances to be obtained without unduly increasing the overall dimensions. The fixed contacts are insulated with porcelain, and the moving blades by means of moulded micanite. The con-

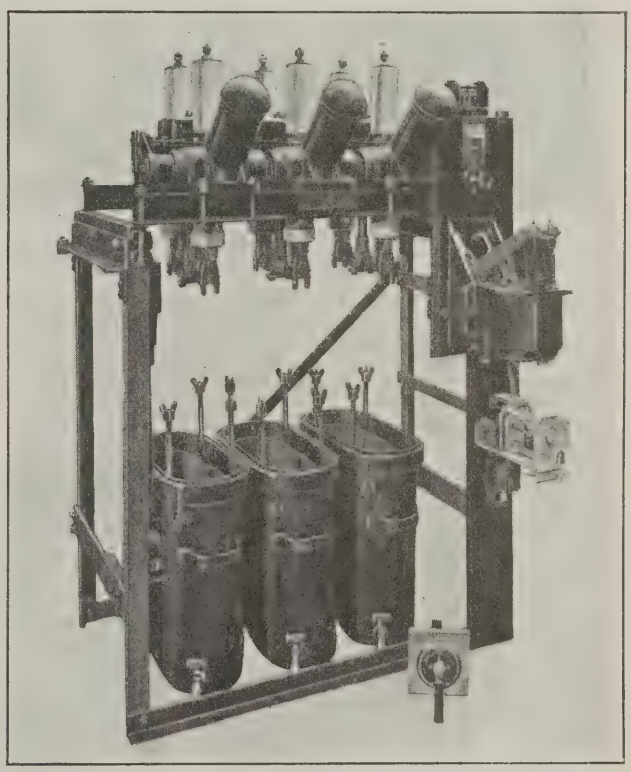

Fig. 3.—Electrically-Operated Circuit Breaker.

tacts are of the timed multiple-break type, made under license from the Electrical Research Association. The arcing fingers are of large thermal capacity and in pairs, one finger of each pair being on either side of the moving blade; they are so arranged that the contact pressure is increased by electro-magnetic effect under fault conditions. The fingers part at different points of the current wave, thereby increasing the possibility of one pair opening near the zero point of the wave when conditions for breaking the arc are more favourable than at other points of the cycle. The operating mechanism is of the solenoid type, governed by a contactor operated from the control switch. The contactor takes the control of the breaker out of the hands of the operator as soon as the control switch is closed, and ensures that the time interval before the breaker closes is constant. This time interval is small, due to the speed of operation of the solenoid mechanism, and synchronising is thereby simplified. The contactor switch for the solenoid has four breaks in series and avoids the usual dash-pot time lag, which is very indefinite in operation and requires constant attention. The mechanism is free to trip under fault conditions at any point of the travel after the arc tips touch, but "pumping" is impossible. Baffled vent pipes prevent oil throwing, and there is a large air cushion above the oil surface. Accelerating springs give a quick break, shock and rebound being absorbed by an oil dash-pot buffer.

A Window-Dressing Competition.

Effective "Hoover" Displays.

WE have received from MESSRS. HOOVER, LTD., a report upon the results of their 1927 window-dressing competition, together with photographs of the prize-winning windows. The competition entries were thoroughly representative of all branches of the "Hoover" dealer connection—large departmental stores, electricians, furnishing houses, hardwaremen, &c.

A very beautiful display arranged by Messrs. Bacon and Curtis, Ltd., of Bournemouth, took the first prize. In this, the connection between spring and the "Hoover" was the theme. The floor of the window was covered with turf, from which sprang "a host of golden daffodils," while overhead was a bower of blossoms creating the real vernal atmosphere. On one side of the window stood an unobtrusive "Hoover," and the display was completed by a series of neat cards and window posters. We regret that the photograph does not do justice to the window, and therefore cannot be reproduced.

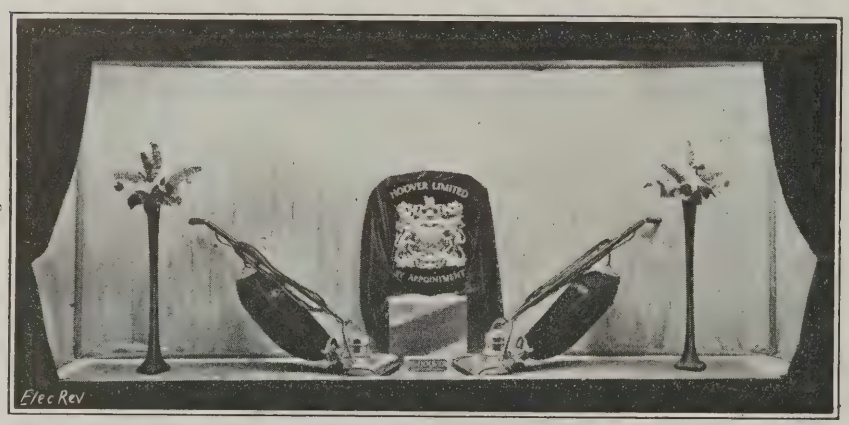

Fig. 1.—The Bradford Electricity Department's Display.

The Bradford Corporation Electricity Department was awarded the second prize for a window of which simplicity was the keynote. As will be seen from fig. 1, the display consisted of draped Royal Arms supported by two "Hoovers," and flanked by two tall vases containing lilac sprays, which were just sufficient to suggest the season of the year. A white background and concealed lighting did the rest.

The third prize was taken by Messrs. Arnolds, Ltd., Great Yarmouth, for a very ingenious arrangement. A latticed window contained a central sheet announcing "A Wonderful New Invention of War—Captures a Million Prisoners a Minute." For intervals of a few minutes throughout the day this sheet was raised to show a "Hoover" and its accessories, cards explaining that the reference to "prisoners" applied to germs. Inside the shop seats were provided for demonstrations of the machine.

A more elaborate entry was that of Messrs. Walker Bros., Birmingham, who took the fourth prize for the window depicted in fig. 2. The *pièce de résistance* was a "Hoover" in a blaze of glory and an announcement that "The 'Hoover' brings Sunshine to the Home." In the rear six cards dealt with six points regarding the cost and virtues of the cleaner. In the two side panels and the outer windows further examples of the machines appeared, and the whole assembly was well lighted, giving the utmost value to it.

Consolation prizes were awarded to Messrs. Ray & Miles, Ltd. (Liverpool), the Northampton Electric Light and Power Co., Ltd., the Negus Electrical Co. (Cambridge), Messrs. John Barnes and Co., Ltd. (Finchley Road, N.W.), and Messrs. Flashman's (Folkestone).

More attention is now being given to the necessity of making an effective display in the shop window. It is remarkable how excellent a show can be made in a small space when proper attention and ingenuity are brought to bear upon the problem. Some windows contain a mass of material which has been allowed to fall together in more or less chaotic state. Instead of arresting the attention of possible purchasers, it is apt to weary—even to annoy! A few things well shown are sometimes better than a thousand. They make the people think—they make them talk, both preliminaries to buying! Such examples as those dealt with above show how it can be done. While large stores and contractors with big windows and spacious premises can afford to employ skilled experts to display their wares to best advantage, smaller businesses have to make the best they can out of the limited resources that are at their command, but it is wonderful what the "small" man or woman and one assistant can do by careful and artistic planning after a critical or interested inspection of the windows of other traders who are great on the point of display.

Fig. 2.—Messrs. Walker Brothers' Window.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The London and Home Counties Electricity (No. 2) Bill.

When the proceedings before the Committee dealing with this Bill were resumed on May 24th, Mr. WROTTESLEY, K.C. (for the Barnes U.D.C.) questioned Mr. Rider, suggesting that in view of the proposal of the London Power Co. to erect a station adjacent to the area, there was no necessity for the Joint Electricity Authority's projected station; and that if the latter station were erected there was a possibility of its being unremunerative. Mr. Rider replied that the station would not be erected until there was practically an assured load; he believed the North Metropolitan Co. would take a good supply. The Chairman intervened to remind Mr. Wrottesley that the Committee was guided to a great extent by the fact that the Electricity Commissioners were satisfied that at least one riverside station in the West of London was necessary. Counsel replied that he aimed at showing that only one station was necessary. Mr. Rider agreed that the Authority would not be able to supply the London Power Co.'s customers, except by agreement with the company, but there would be a linking up with the company and reciprocal supplies. The western part of the Authority's area could be supplied more economically from Chiswick than from Battersea. It was important to look very far ahead; he did not anticipate any deficiencies in the meantime, however. Mr. Rider admitted that in his report last year he did not have the erection of a large station at Battersea in mind. The effect of that station would be that the development at Chiswick would not be so rapid as would otherwise be the case. He pointed out, however, that the development of the demand was more rapid than had been anticipated. Mr. WROTTESLEY suggested that it would be better if the Chiswick station were erected some years hence, but Mr. RIDER said that if the opportunity of acquiring the site was not taken it might be lost altogether; he could not agree that an alternative site at Hurlingham would be as suitable.

The Hon. EVAN CHARTERIS, K.C., for the London Power Co., said that in view of Mr. Rider's evidence as to the desirability of constructing the stations at Battersea and Chiswick concurrently he did not propose to cross-examine him.

The Committee adjourned until the following day, when Mr. RIDER, in reply to questions, said that he did not think that it would be cheaper to deliver coal by water than by rail. He also said that the coal storage arrangements would not pollute the river, nor would the station be detrimental to any building in the vicinity. Mr. ROWAND HARKER, for Concrete Agregates, Ltd., said that his clients had received certain rights in connection with the site. The CHAIRMAN said that the erection of the station was of greater public importance, and compensation would be paid if necessary. Mr. HARKER protested, and left the committee room. In re-examination, Mr. RIDER said that the use of electricity instead of coal for domestic purposes would lead to less pollution of the atmosphere. He said that the plant of the local authorities could not be increased without the Electricity Commissioners' permission, and the Central Board could compel them to take a supply from Chiswick if it was cheaper. If the two proposed stations were constructed together, transmission systems with a minimum of mains could be arranged.

Mr. W. CASH, C.A., gave evidence regarding the finances of the Authority, and said that it was at present empowered to borrow up to £7,000,000. The London County Council was prepared to guarantee interest on a loan of £1,000,000 at least, provided the Commissioners were satisfied that the scheme was the best from a technical point of view. The Authority would have no difficulty in borrowing money; the net rate would be 5¼ per cent. Sir HOWARD FRANK, surveyor, supported the promoters' contention that the amenities of the district would not be adversely affected, and he pointed out that the station would make a great difference to the ratable value of Chiswick.

On May 26th, the Committee visited the site, and when the proceedings were resumed in the afternoon Mr. JAMES SWINBURNE, F.R.S., gave evidence that if the furnaces were properly designed there would be no emission of smoke, and the gases would not be harmful. He would not agree that the depth of water in the river would at times be insufficient for the station, and said that the discharge of condensing water into the river would not raise its temperature appreciably.

On May 27th, Mr. E. WILLIS, architect, surveyor, and engineer to the Chiswick U.D.C., gave evidence in support of the Bill, and said that his Council had passed a resolution favouring the erection of the station on the Duke's Meadows site. Steps had been taken to preserve the amenities of the district and he was confident that no nuisance would arise. The Council was convinced of the necessity for the station, and also considered the effect upon the ratable value of the district.

Sir DUNCAN WATSON, J.P., chairman of the Joint Electricity Authority and member of the Central Electricity Board, explained the powers and duties of the Authority, and gave evidence showing the necessity for the station, without which, he said, the Authority would be unable to carry on. If the station were erected the Electricity Commissioners would be able to withhold permission for the extension of small stations which at present they had to give. He quoted the number of applications for extensions which had been made by supply authorities in the area between November, 1925, and March, 1927. The aggregate amount of plant involved was 508,876 kW and sanctions representing 300,000 kW had been granted to date.

Mr. WROTTESLEY said that the witness had not included the London Power Co.'s application to erect a station at Battersea in his list; Sir Duncan replied that if the station was sanctioned the company would probably install plant at Battersea instead of Deptford. Witness further stated that not one municipality had told the Authority that it would not shut down its station to take a bulk supply. The question of shutting down plant was one for the Central Board to deal with. Asked if one municipality had agreed to take a bulk supply, Sir Duncan repeated his statement that he did not know of one authority who would refuse to do so. Replying to further questions, witness said that while the London Power Co. could demand a supply from the Joint Authority, the latter could not demand a supply from the company.

The Committee adjourned until May 30th.

On that day Mr. H. P. MCMILLAN (for the London Power Co.) said that the company's application for permission to erect a power station at Battersea was before the Electricity Commissioners, who would hold an inquiry. The company was in no way hostile to the Authority's proposals, but the Committee had to consider the electrical interests of the whole of the area. It was the concern of the company to see that nothing was done which would prejudice its application. Two different tribunals were dealing with the applications, which was a disadvantage. It was hoped that steps would be taken by which any decision of the Committee would not prejudice the company's position. He suggested that Sir John Snell might be asked to give his views.

Sir DUNCAN WATSON, in the resumption of his cross-examination by Mr. Wrottesley, said that he was satisfied that the whole of the output of the Battersea station would be taken by the ten constituent companies of the London Power Co., and that there was a need for both stations. It was not desirable to extend existing stations. He admitted that in supplying some of the central districts the extra cost of transmission from Chiswick might be sufficient to turn the scale in favour of the Battersea station.

Mr. S. L. PEARCE (engineer-in-chief to the London Power Co.) gave evidence as to the need for the two stations, pointing out that the increase of the demand for electricity in the area was more rapid than the growth of population.

The Committee adjourned until May 31st.

Washington Radio Conference.

On May 23rd, Viscount WOLMER informed Mr. Hore-Belisha that the Radio-telegraph Conference to be held at Washington would deal with certain aspects of broadcasting, and various proposals would be considered having for their object the reduction of interference between the broadcasting services and other wireless services.

Yorkshire Electric Power Bill.

This Bill has been read a second time in the House of Commons.

Special Orders Approved.

Special Orders have been approved relating to part of the rural district of Darlington, Durham, and part of the rural district of Croft, North Riding; part of the urban district of Tilbury, Essex, and the amendment of the Romford and District Electric Lighting Order, 1913; the borough of Ludlow, Salop; the burgh of Peterhead, Aberdeen; the urban district of Burnham-on-Crouch and part of the rural district of Maldon, Essex; the urban district of Axminster, the parishes of Axminster Hamlets and Chardstock, Devon, and the borough of Chard and the parish of Chard, Somerset; the parish of Dockenfield and part of the parish of Frensham, Surrey, and the parishes of Bentley, Coldrey, and Froyle, and part of the parish of Binstead, Southampton; and a Special Order authorising the Crowborough District Gas and Electricity Company to raise additional capital for electricity purposes.

Electric Railways.

On May 25th, Colonel ASHLEY informed Sir John Power that at December 31st, 1919, 821 track miles were worked, either wholly or partly by electric traction in this country, compared with 1,241 track miles at December 31st, 1926. The corresponding figure at December 31st, 1913, was 502 track miles.

General Interconnection.

On May 25th, Sir JOHN POWER asked the Minister of Transport when the Central Electricity Board expected to commence the construction of the general interconnection system.

Colonel ASHLEY said that under the provisions of the Electricity (Supply) Act, 1926, the Central Board was not in a position to commence works in any area until a scheme had been adopted for that area, and schemes could only be adopted after they had been received by the Board from the Electricity Commissioners and the statutory procedure as to publication and consideration of objections had been carried out. In those circumstances it was not yet possible to say at what date actual construction would begin.

"Beam" Wireless.

On May 26th, Viscount WOLMER informed Capt. Fraser that the beam stations for communication with South Africa were expected to be ready for the official tests in the course of the next few weeks. If the tests were successful, the stations would be taken over by the Post Office and a wireless telegraph service with South Africa would be opened. It was impossible at that stage to say whether the stations would be fully occupied with telegraph traffic, but it seemed doubtful whether a directional station was likely to be as suitable for purposes of Imperial broadcasting as a station capable of transmitting in all directions.

Imperial Broadcasting.

On May 26th, Capt. FRASER asked if the Government would make a grant to the British Broadcasting Corporation to enable it to establish and maintain a short-wave wireless transmitter to relay existing programmes to the Empire or parts of the Empire in order that such a project might be proceeded with immediately without hindering the development of the Corporation's new British scheme.

Viscount WOLMER said that the British Broadcasting Corporation had been given authority to conduct experiments in short-wave transmission, and he understood that it was its intention to carry out those experiments before putting forward any proposals for a service to distant countries. The incidence of the cost of such a service, if it should be found to be practicable, would be a matter for settlement between the Corporation and the Dominions and Colonies concerned.

Adjournment.—The House of Commons was to adjourn yesterday (Thursday) for the Whitsun recess, until June 13th.

Train Collision Report.

The report on the official inquiry into the causes of the collision between two passenger trains which occurred in February last on the L. & N.E. Railway, near Hull, has now been issued. A passenger train from Withernsea to Hull was approaching Paragon station on the incoming line when it came into head-on collision with a train from Hull to Scarborough. It is concluded that the Scarborough train was diverted to the wrong line as the result of the signalman inadvertently moving the wrong points, which were electro-pneumatically operated.

Correspondence.

Correspondents should forward their communications **as early as possible.** *No letter can be published unless we have the writer's name and address in our possession.*

Cheap Electricity.

Mr. Mountain's plea for simpler tariffs will awaken interested support in many technical and lay breasts, but has he not considered that present-day tariffs were *evolved* from the old and apparently innocuous flat-rate? The peculiar difficulties and limitations of the electricity supply industry have always made the apportionment of charges and the assurance of an adequate and fairly-spread return a difficult problem. To fix a flat rate in the case of a particular consumer at a particular period is more or less straightforward; but to expect that rate to remain a fair one to both supply undertaking and consumer is out of the question in view of the changing conditions of industry in general, changes in the consumer's own conditions, and in the electricity supply industry itself.

The double tariff gave the consumer the opportunity of buying energy at a cheaper rate during "off-peak" periods: a choice of two flat rates. Many consumers, however, require supply only during an eight-hour day, so that they cannot avail themselves of the cheaper rate. They may be required to pay an annual "stand-by" or "minimum" charge, but why should this be regarded as an impost? Connection to a source of supply is at hand, and a supply undertaking cannot be expected to provide this gratis (and perhaps have but a dubious chance of selling energy). If (as happens) the consumer has his own generating plant, he can often quite readily and economically take kWh up to the amount of the annual or other charge; certainly he is "slow" if he does not. Where such charge can operate hardly is in the case of, say, a small colliery that is nearly worked out, and cannot bring the value of energy consumption up to the figure, much, obviously, depending on the proportion.

There are, of course, qualifying factors in tariff agreements such as a coal clause—which is not in the least mysterious, and (or so one imagines) ought to be regarded as evidence that there can be truth in economic relations as well as in advertising. We come to the two-part tariff, which has received legislative blessing—a fact which, to many minds, is by no means a guarantee of ultimate probity! The payment of a small rate per kWh on the energy consumption is, of course, quite straightforward, and its actual value may be welcomed. But the kW fixed charge is suspect. Why should it be? The consumer is, in fact, reserving for his own use plant capacity up to the value shown by the max.-demand indicator; to that extent he is a shareholder liable to the various capital and other expenses met with in generation and distribution. If this is understood, the method should appear just and straightforward. Naturally, the consumer can query the actual amount of the kW charge, but he must accept this just as he accepts the many hidden charges in a ton of pig iron or a penny tram-ride.

All the foregoing tariff schemes are not difficult of comprehension by anybody; they are quite obvious, and, moreover, an alert and inquiring consumer can check his accounts and his day-to-day electricity expenses by watching the meters.

It is when power-factor is taken into account that difficulties arise—mainly owing to its nature and implications being (as is inevitable) so non-apparent to lay, and to many engineering, minds. Should there be a sine meter, it can be made evident simply that the slower this meter advances relatively to the energy meter, the better is the p.f.; if need be, a table can enable the alert (though possibly non-technical) consumer to follow his power expenses. The two-part tariff with a kVA charge can obviously be rather more suspect than one with a kW charge—but only if the latter is vaguely understood, or if a perilous dissertation upon technical terms is undertaken. On the whole, it appears that the two-part tariff, as a tariff, is the best scheme introduced up to the present—especially when a monthly, rather than a quarterly or yearly, maximum demand is stipulated.

A great deal depends upon the attitude of the consumer to the supply authority. Belonging to one of several classes, he may be entirely trustful, or at any rate quietly acquiescent, in whatever tariff scheme is put into operation—and may take no interest in his periodic power requirements; he may be slightly dubious, but feel reassured if occasionally called on; he may be non-technical and temperamentally distrustful—a "holy terror"; he may understand electro-technical matters to a dangerously small extent—and be a plaguey nuisance; and he may really comprehend arrangements and (though naturally requiring occasional treatment) be generally satisfied, and intelligently aim at bettering his load and economic conditions.

The technical and diplomatic work in relation to the income of a supply undertaking is hardly that of a sinecure. In tariff agreements and in their actual operation the cards are put on the table, and the consumer is not always so entirely helpless as he (or others) would have one believe. This open attitude is merely in keeping with our times.

G. E. Moore.

Newcastle-on-Tyne, *March 21st*, 1927.

The Ideal Wiring System.

In view of the recent article on "The Ideal Wiring System," perhaps the enclosed samples will be of interest to you and your readers. This wiring has only been installed a matter of three years or so, in a perfectly dry house, and was only in contact with the plaster beneath the floor, *i.e.*, in the interstices between the laths. This is only one of the samples of the many breakdowns of the so-called metal-sheathed systems that have been replaced by St. Helen's C.T.S. cable. The former were perfectly bonded.

J. Dean.

Aberystwyth, *May 27th*, 1927.

[The samples sent us show the lead sheathing corroded completely through and exposing the insulating covering of the conductors at one place; in other cases, the action was in progress, but the sheathing had not been fully penetrated. It is well known that lead sheathing should not be laid in contact with plaster.—EDS. ELEC. REV.]

A Mysterious Occurrence.

The mysterious occurrence mentioned by "W.H.M." in your issue of May 27th may be due to the oil siphoning or creeping through the cables which enter the transformer.

Probably the oil had crept as far as the switch, and the act of switching-off on the Saturday started the action by dislodging some tape round the cable end. If "W.H.M." examines the backs of his switchboards he may find evidence of the outflow.

Taking the week-end as 40 hours, and the loss as 100 gallons, this is equivalent to 2½ gallons per hour, or one pint every three minutes. I find it is quite easy to obtain a flow of this amount, especially through a large l.p. cable. If the cables to the transformer are as old as the oil (10 years), there has been plenty of time for the oil to find its way down the inner layer of insulation and the small spaces between the strands.

It is impossible to diagnose the trouble exactly without seeing the transformer and the type of cable exit, but if the tank is perfectly sound, and the top of the windings is anywhere near the cable lugs so that a film of oil could pass, I should certainly suspect the cables. It will be interesting to know whether "W.H.M." finds traces of oil at the switchboard ends of the cable.

J. F. Hinsley.

Birmingham, *May 28th*, 1927.

[It is difficult to imagine that this is the correct explanation of the occurrence, but perhaps the suggestion may afford a clue to the true one.—EDS. ELEC. REV.]

Electromobiles.

As the secretary of this Association, which caters for users, manufacturers, garages and charging stations, and all other interested parties, I am frequently asked: "Why is it that electromobiles are not used to a greater extent in this country, if they possess the many undeniable advantages over other methods of town, &c., transport?"

You have frequently espoused the cause of electromobiles through the medium of your valuable periodical, which has a wide circulation among all classes, and it would be interesting to have the views of your readers through your "Correspondence" columns as to the difficulties prospective users anticipate, and those encountered by existing users.

The main obstacle appears to be the lack of a cheap and abundant supply of d.c. electrical energy for charging batteries.

I do not consider that any charging station is worthy of being registered as such unless the maximum figure of one penny per unit delivered into the battery is adhered to. There are already supplies available under this price. The first cost of the batteries and the electromobiles is another feature which presents itself to prospective users. How is this to be reduced? Can one obtain an electromobile under £200?

The Electromobile Association.

London, *May 30th*, 1927. (J. C. ELVY, *Secretary.*)

Magneto Repairs.

I shall be greatly obliged if any reader will kindly give me the following information:—

1. Names and addresses of firms which manufacture machines and the necessary equipment for winding magneto armatures.

2. If and where it is possible to obtain the necessary data for winding armatures of various makes of magnetos, and the correct method of carrying out the work.

May 28th, 1927. **Magneto.**

The "Old Cromptonians."

We have received from Mr. M. Whitgift, hon. treasurer and assistant secretary, the latest issue of the journal of the Association of "Old Cromptonians." This contains reminiscences by Messrs. G. M. Clarke and E. J. Fox, "Chelmsford Notes," and a complete list of members (186). A recent portrait of Col. Crompton is also included.

Legal.

Triumph Trust, Ltd., v. Frahm.

IN the Mayor's and City of London Court, before Judge Shewell Cooper, on May 26th, a claim was made by the Triumph Trust, Ltd., Old Broad Street, against Mr. P. H. Frahm, Littlehampton, for £5, representing five monthly instalments of £1 due under a hire-purchase agreement made in February, 1926. It was stated that the defendant purchased a wireless set from the General Radio Co., Ltd., and entered into a form of agreement with the plaintiffs, who were a financial company, to pay by instalments. In reply to the plaintiffs' requests for payment, defendant had set up a contention that £50 was due to him from the General Radio Co., Ltd., on account of commission on sales of radio sets in and around Littlehampton. Plaintiffs were not concerned with that matter as they had merely taken the part of discounters in the transaction. The defendant set up a counter-claim for £50, and said that after replying to an advertisement by the General Radio Co., an arrangement was come to whereby he was appointed district agent for an area in the neighbourhood of Littlehampton, and was to receive a commission of 25s. on every wireless receiving set installed by the General Radio Co. in that district, whether as a result of his introduction or not. It was necessary that he should have a set for demonstration purposes, and he paid £5 on account, and signed the agreement now produced by the plaintiffs. He believed that about 50 receiving sets had been sold in his district. Judge Shewell Cooper said that his remedy was to proceed against the General Radio Co., Ltd., and not the plaintiffs, and gave judgment for the plaintiffs on the claim and counter-claim, with costs.

The Dublin and Lucan Electric Railway Co.

IN the High Court, Dublin, on May 23rd, application was made for the confirmation of the sale of the undertaking of the Dublin and Lucan Electric Railway Co. (in liquidation) to the Dublin United Tramways Co., Ltd., for the sum of £12,500 in pursuance of an agreement between the two companies. The official liquidator (Mr. D. McDowall Grosart) also asked for an inquiry to ascertain the amount of prior charges. Counsel for the Dublin Tramways Co. said that there would be a claim against the company for electricity supplied. The Judge ordered the Dublin Tramways Co. to lodge the sum of £12,000 with the liquidator and directed the inquiry to be made.

British Thomson-Houston Co., Ltd., v. Star Electric Lamp Co.

MR. JUSTICE CLAUSON, in the Chancery Division on May 27th, in default of defence, entered judgment for the British Thomson-Houston Co., Ltd., in an action against the Star Electric Lamp Co., of Newcastle, to restrain defendants from selling or dealing in articles made in infringement of the plaintiffs' letters patent 10918 of 1913, relating to gasfilled electric lamps.

Published Specifications.

Compiled expressly for this journal by a firm of Chartered Patent Agents. The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Trade Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from May 25th :—

Gestetner. No. 470,048. Class 6. Electrically-driven duplicating machines and parts thereof.—D. Gestetner, Ltd., Fawley Road, Tottenham Hale, N.17.

V.D.E. (lettering and design). No. 460,704. Class 7. Machinery of all kinds No. 460,705. Class 8. Philosophical and scientific instruments and apparatus for useful purposes. No. 460,707. Class 11. Instruments, apparatus and contrivances for surgical or curative purposes. No. 460,708. Class 6. Metal goods.—Verband Deutscher Elektrotechniker, Berlin. (British representatives: Edward Evans & Co., 27, Chancery Lane, W.C.2.)

Gecovalve. No. 476,214. Class 8. Valves for use in radio-telephony and telegraphy.—General Electric Co., Ltd.

Elima. No. 480,025. All goods in Class 8.—A. Hartley, 37, Standish Street, Burnley.

Zendix. No. 479,101. Class 11. Electric appliances for surgical or curative use, &c.—R. A. Shortland, trading as Shortland Bros., 10, New Brown Street, Manchester.

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

ABERYSTWYTH.—Casino Hotel, Marine Terrace (£80,000); T. Huntingdon & Co., builders, London.

ARMTHORPE.—Business stores, for the Doncaster Co-operative Society; T. H. Johnson, architect, 20, Priory Place, Doncaster.

AUSTRALIA (ADELAIDE).—Improvements, Memorial Hospital; Board of Trustees. Theatre and shops, Rundle Street; Hoyt's Theatres, Ltd. Additions, Film Exchange; Famous Lasky Film Service, Ltd.

AYLESBURY.—County offices, for Bucks. C.C.; county architect.

AYR.—Picture theatre, tea room, and offices, for Scottish Cinema and Variety Theatres, Ltd. (£10,000); the secretary.

AYRSHIRE.—R.C. School (£8,000), at Irvine; clerk, Education Authority, Ayr.

BASINGSTOKE.—Nurses' home, Park Prewett Mental Hospital, for Hants. C.C.; Gutteridge & Gutteridge, architects, 9, Portland Street, Southampton.

BELPER.—Sewage disposal works; surveyor to R.D.C.

BIRMINGHAM.—Picture house, Soho Road and Booth Street, Handsworth, for H. A. Barber, estate agent, 5 and 6, Grosvenor Chambers, Broad Street Corner.

BLACKPOOL.—Houses (50), for the T.C.; H. Hibbert & Sons, builders, Barnsley.

BOLTON.—School, Castle Hill, Tonge Moor; Director of Education.

BOURNEMOUTH.—Church, Wootton Gardens, with electric lighting and heating work, for the Strict Baptist trustees; the secretary.

BOURNEMOUTH.—Wesleyan Church, Winton (£15,000); George Shears & Son, builders.

BUCKINGHAM.—Milk factory, for the London Co-operative Society; T. J. Walker, builder, Winslow.

BURSLEM.—Drill hall, for Staffs. Territorial Army Association; the secretary, Stafford.

CHESHIRE.—Mental hospital accommodation, Upton and Parkside; Committees of County Council.

CHORLEY.—Roman Catholic Central School; Catholic trustees.

CHRISTCHURCH.—Extension of the casual wards, for the Bournemouth and Christchurch Board of Guardians; P. C. Ford, clerk to the Board.

CLATTERBRIDGE.—Extensions, Isolation Hospital; Wirral Joint Hospital Board.

COATBRIDGE.—Sewage works; Corporation engineer.

COVENTRY.—Housing scheme (74), Gulson Road and Harnall Lane; E. H. Ford, city engineer, Council House.

CREWE.—Secondary school extensions, for Cheshire E.C.; F. A. Browne, county architect, Newgate Street, Chester.

CROYDON.—Cinema, Woodside Grange, Addiscombe, with electrical work (£28,500); W. L. Griffiths, architect, London.

DEAL.—Band pavilion (£9,000), for the T.C.; borough surveyor.

DENBIGHSHIRE.—Mental deficiency home (£120,000), for the C.C.; the clerk, Wrexham.

DOUGLAS (ISLE OF MAN).—Housing scheme (66), Olympia Estate, for the T.C.; J. E. Teare, architect, 46, Athol Street.

EDINBURGH.—352 houses at Gorgie Road, for Corporation; city architect.

EXHALL ASH.—Elementary school (£17,500); Warwickshire Education Committee.

HAMPSHIRE.—Equipment of small holdings (£45,000); County Agricultural Committee.

HARLINGTON (HOUNSLOW).—School (£16,500), for Middlesex E.C.; Sir B. S. Gott, secretary, Westminster Guildhall.

HARROW WEALD.—Secondary school, for Middlesex E.C.; Sir B. S. Gott, secretary, Westminster Guildhall.

HECKMONDWIKE.—Co-operative stores, Six Lane Ends; Stead & Walshaw, architects.

HERNE BAY.—Joint Hospital; Herne Bay and Whitstable U.D.C.'s. Municipal offices, for U.D.C.; Prof. A. E. Richardson, assessor.

HIGH WYCOMBE.—Factory, Desborough Park Road, for Lidgley Bros. Factory, Bellfield Approach, for C. H. and S. Keen. Factory extensions, Oxford Road, for Marechal Ruchon & Co., and Totteridge Avenue, for E. Turner.

INDIA (BOMBAY).—Hospital at Mahim; Sir Leslie Wilson's Hospital Fund and Corporation.

IRISH FREE STATE (LIMERICK).—New dock for the Harbour Commissioners; T. F. O'Sullivan, Harbour engineer.

KETTERING.—Hospital extensions (£13,000), for the Joint Hospital Board; the clerk.

LONDON (HACKNEY, E.).—Additions, chocolate factory, Farleigh Road; W. Hennessey & Sons.

(E.C.).—Buildings, 50-51, Little Surrey Street; Premier Press, Ltd.

(HIGHGATE, N.).—Extensions, Highgate School, Southwood Lane; A. E. Munby, 9, Old Square, Lincoln's Inn.

(HOLBORN, W.C.).—Telephone Exchange, Grays Inn Road; Office of Works.

(BATTERSEA, S.W.).—Conversion of Southlands College into elementary school; L.C.C. Education Committee.

(PUTNEY, S.W.).—Additions, Royston Works, Upper Richmond Road; Simmons Bros.

(REGENTS PARK, S.W.).—New wing, Bedford College for Women; Principal.

(STREATHAM, S.W.).—Shops, restaurant and flats, 68-70, Streatham Hill; Rice & Son.

(ACTON, W.).—Technical institute and school (£50,263), for Middlesex E.C.; Sir B. S. Gott, secretary, Westminster Guildhall.

MARCH.—County hall extension, Isle of Ely; county surveyor.

MILFORD HAVEN.—Central school; Pembroke Education Committee. Sanitary block, County School; Pembrokeshire Education Committee.

NEWCASTLE.—100 houses, High Heaton, for Corporation; J. Jacob Paget. Baths, Armstrong Road (£42,500); city engineer.

NORTHAMPTON.—Extensions, town and county school; Education Committee. Additional 84 houses, Weedon Road Estate, for the T.C.; A. Fidler, borough engineer.

ONGAR (ESSEX).—Housing scheme (32), for the R.D.C.; P. R. B. Pearce, surveyor.

PENKULL (STAFFS.).—Development of Garden Village for Stoke-on-Trent Tenants, Ltd.; W. Campbell & Sons, architects.

PENRITH.—Bottling stores, Roper Street; Glassons Brews, Ltd.

PENZANCE.—Scheme for 190 houses, York House Estate; borough engineer.

PERTH.—Stores and workshops for T. Love & Sons, cabinetmakers, St. John's Place; the manager. Repairing factory for Messrs. Norwells' Perth Footwear, Ltd., 47, High Street; the manager.

PLYMOUTH.—United Methodist Church; trustees. Maternity wards, Alexandra Homes, St. Michael's Terrace; Committee.

PORTSLADE.—Electricity for lighting and power; Petersfield Laundry.

ROCHDALE.—Super cinema and café, Wet Rake, Drake Street (£30,000); for Roach Dale Amusements, Ltd.

SCOTLAND.—1,000 steel houses, for various authorities in middle and west Scotland; Second Scottish National Housing Company (Housing Trust), Ltd.

SEAHAM HARBOUR.—72 houses, Carr House Estate; U.D.C. surveyor.

SHIPSTON.—Electric lighting, Police Station and Court; Worcestershire Standing Joint Committee.

SKEGBY.—Elementary school (£16,500); Notts. Education Committee.

SOUTHGATE.—56 houses, Barrow Close; Church Army Housing, Ltd.

STIRLING.—Picture house at 48, Queen Street; Messrs. Menzies Bros., 15, Orchard Place.

STOKE-ON-TRENT.—150 houses for Michelin Tyre Co., Ltd.; city architect.

STOURBRIDGE.—Girls' secondary school (£26,424), for Worcestershire E.C.; A. H. Guest, Ltd., builders, Coalbournbrook Wharf. Extensions to Grammar School (£7,500), for the Governors; the clerk.

STRATFORD-ON-AVON.—Extensions, Grammar School (£20,000); Governors.

THRAPSTON.—Secondary school for girls; Northants Education Committee.

TORQUAY.—Wesleyan Church, Union Street (£23,160); R. F. Yeo & Son, builders. Telephone exchange, Westhill; Office of Works.

TYNEMOUTH.—Electricity supply, new premises in Mariners Lane; British Petroleum Co., Ltd. 56 tenements, Percy Street; Corporation housing architect.

WALLASEY.—Joint mental hospital; Corporations at Wallasey, Birkenhead, and Chester.

WARWICK.—Extensions, county offices, Warwickshire; county architect.

WELSHPOOL.—County offices (£10,000), for Montgomeryshire C.C.; C. S. Thornley, architect, Liverpool.

The
Electrical Review

VOL. C. JUNE 10, 1927. No. 2,585.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The Trading Clause.

THE announcement of the names of the gentlemen who have been approved by the Electricity Commissioners as members of the Committee which is to deal with the celebrated Section 48 of the Electricity (Supply) Act, reached us too late for us to make any comment upon the matter in our last issue. We were obliged to be content with the mere statement of the *personnel* and its objective, which is "to determine any question which may be raised under Section 48 of the Act as to the recognised retail or trade prices of any electrical fittings and to advise and assist the persons concerned as to the method of giving effect to the provisions of the Section."

Twenty representatives of the various sections of the industry and trade who have an interest in the aforesaid matter will be presided over by Mr. D. N. Dunlop, Director of the B.E.A.M.A. The municipalities, the electrical manufacturers, electric light fixtures and accessories manufacturers, the electric lamp-makers, the cable-makers, the wholesalers, and the electrical contractors, will all be there, while the Scottish electrical contractors have two representatives of their very own.

Those who are familiar with the long struggle that has taken place in the industry know only too well how difficult and at times almost despairing has been the problem of bringing a spirit of compromise into existence. They will be quite ready to allot praise wherever it may be due for heroic efforts made to remove stumbling blocks that have persistently appeared in the pathway of negotiation, and a number of names given in the list of members of the new committee might be selected by us here for the purpose of giving credit to several gentlemen whose services proved particularly useful in bringing matters to the present promising position. Mr. Phillips, in his presidential address to the I.M.E.A., singled out Mr. A. C. Cramb as the one to be especially congratulated

for services rendered to the municipal electricity supply interests by bringing the question of selling powers to a successful conclusion. If there had been spokesmen on behalf of the manufacturers and the contractors, other names would have been mentioned as having exercised no less important or less assiduous influence in their own particular sphere both inside electrical circles as tactful negotiators and outside as diplomatic representatives. But while expressing gratification at the setting-up of the Committee and satisfaction with its *personnel*, let us not imagine that our work is finished. In actual fact it is only about to begin. Mr. Phillips, whom we quoted last week, remarked that "he thought" that the problem of the complete accomplishment of co-operation between the supply and electrical contracting branches of the industry was "approaching solution." Memory, if nothing more, must make us all equally guarded, however optimistic we may be. But we can at any rate take heart from the fact that the spirit of co-operation has led us thus far and "the excellent spirit evinced by all parties to the negotiations" fructuated in Section 48. Without that spirit there could have been no such clause—perhaps we do not all know how near we came to actually losing it; and if one thing is more certain than another now that we have it, it is that that spirit of co-operation which has stood us in such good stead must, as Mr. Phillips remarked, be maintained and strengthened in operating the Section.

There have been few more important electrical committees appointed in recent years, and none can do more than this one to smooth out the way for fuller domestic electrical development. That there will be many difficulties to meet is certain, but if this Committee cannot find a way to overcome them no other body of men can do so. Specialised experts as they are, however, not one of them will be able to contribute to the practical solution of the problem if he fail in respect of the spirit of co-operation.

The I.M.E.A. Convention.

THE fact that the annual Convention of the Incorporated Municipal Electrical Association which was held last week was the thirty-second of its order did not deter a speaker at the dinner from referring to the infancy of electricity; but the record attendance bore witness to the constantly growing vigour and importance of the industry, suggesting that it was at least approaching maturity. Mr. R. W. L. Phillips, retiring after an exceptionally strenuous year of office, is to be congratulated upon the very successful Convention over which he has presided, and his successor, Mr. F. W. Purse, is likewise to be congratulated upon attaining a position which will afford him the fullest opportunity to employ his undoubted talents in the interests of the Association and of the electricity supply industry.

The papers and discussions at the Buxton Conference were of a high order, on the whole, and will provide much food for thought. Mr. W. C. Bexon's able and comprehensive review of the problem of electricity supply over a large area was particularly useful in view of the developments foreshadowed under the Government scheme, especially in respect of the difficulties that the supply engineer has to contend with, and the convenient list of much-needed amendments which he appended to his paper was cordially approved in the discussion. It is singular that whilst the Government scheme was specifically designed to hasten the provision of a cheap and universal supply of electricity, no attempt was made in the Electricity (Supply) Bill to clear the obstacles out of the way, although attention had been repeatedly drawn to the importance of this matter. Whilst further legislation is not likely to be introduced for some considerable time, much could be done by the Electricity Commissioners, not only relaxing the stringency of their regulations, but also, as Captain J. M. Donaldson suggested, by providing explanatory memoranda and official documents; where a local engineer or manager can make little headway against misguided opposition, a Government department can bring powerful influence to bear without either exceeding its powers or incurring expense.

Mr. T. Roles passed in review the many new developments in the design of generating plant which have taken shape during the past ten years, and which, though slowly carried into effect, bid fair to produce fundamental changes in central-station practice. We have already referred to the experimental character of some of the new departures, which has caused the designers of new power stations supplying large communities to adhere to standard practice for the sake of unquestionable reliability and continuity of service, a consideration of the utmost importance; but history teaches that progress must inevitably continue, and Mr. Roles himself has the proud distinction of leading the way in this country with the 1,100-lb. per sq. in. steam plant that he is installing at Bradford. All the more credit attaches to this bold step in view of the difficulty experienced by engineers in municipal service in securing authority to depart from the beaten track, and the Bradford Electricity Committee deserves the thanks of the electrical engineering industry for adopting so progressive and enterprising a policy. Mr. Roles quoted from the admirable paper read by Mr. H. L. Guy before the Institution of Mechanical Engineers, on "The Economic Value of Increased Steam Pressure," which we judged to be of so much importance that we recently reproduced almost the whole of it in our pages.

Mr. H. H. Berry read his paper on the "Electrified Homes of Great Britain" with, we believe, the spirit of a martyr, for it was common knowledge that the policy which he advocated was highly distasteful to many of the members—being, in fact, described as anti-propaganda; however, he was not roughly handled, and the discussion was notable for the enthusiasm and ability displayed by the women who took part in it. We think the I.M.E.A. is doing good service by inviting the Electrical Association for Women to participate in the Convention; the E.A.W. is still a newcomer in the electrical field, and its members keenly appreciate the opportunity of conferring with the senior Association and expressing their views on domestic electricity supply in public debate.

The Birthday Honours.

THOUGH electricity and electrical developments have occupied a foremost place amongst public questions and affairs during the past year, nobody will accuse the powers that be of distributing the King's Birthday honours with a prodigal hand to those connected with either the science or the industry. In conferring the distinction of Order of Merit upon Sir C. A. Parsons, F.R.S., His Majesty has given further national recognition to the genius and achievement of an engineer whose work has been of immense value not only to British power station engineering, but has contributed magnificently to the glory and prestige of British engineers wherever the turbine has found its way on or by land and sea. In every engineering circle there will be full approval and satisfaction at the inclusion of Sir Charles Parsons in the number of those who wear the rare and much-coveted Order of Merit. To some it may seem that it has come later than it should, but the timeliness of it in view of the national trust in new power-station activity is beyond question. The second outstanding electrical name in the Birthday List is connected with the commercial rather than the engineering side of electricity development—we refer to Sir Harry Benedetto Renwick, K.B.E., who is made a Baronet "for political and public services in connection with electricity schemes" (to quote *The Times*). Sir Harry is the chairman of the County of London Electric Supply Co., Ltd., which owns the Barking power station, which was opened by His Majesty. We give the names of other gentlemen who have received recognition of their public and other services in this year's List, in our "Personal" column.

Stourport Electric Power Station.

A new 25-cycle capital generating station capable of extension to an ultimate capacity of 250,000 kW, designed to serve, in conjunction with other plant, the Central England district, a scheme for which is being prepared by the Electricity Commission.

INCORPORATED in 1903, the Shropshire, Worcestershire and Staffordshire Electric Power Co. has grown to be amongst the largest undertakings of its kind in this country. Its distribution area includes both rural and industrial districts, covering practically the whole of Worcestershire, the southern portion of Shropshire, and portions of South Staffordshire; it has further been entrusted with the task of supplying electricity in the "Avon Valley" area, which includes parts of north Gloucestershire and south-west Warwickshire, a total of about 1,412 sq. miles. To meet the increasing needs of the area a new capital station at Stourport was formally inaugurated on June 2nd by Mr. Stanley Baldwin, Prime Minister, in the presence of a distinguished gathering numbering some 1,500 persons, who were received by Mr. E. Garcke, chairman of directors, Mr. W. G. Bond, managing director, and Mr. J. T. H. Legge, chief engineer, of the Company.

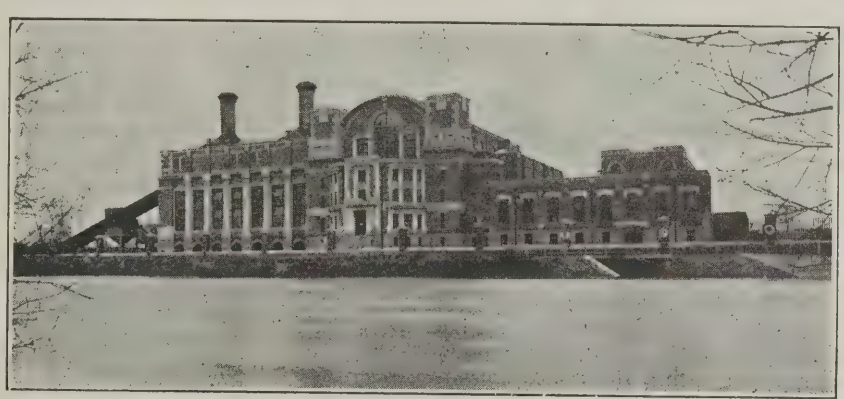

Fig. 1.—The New Stourport Generating Station.

river, whilst the amount of water available will permit of the plant being developed to a capacity of 250,000 kW without the use of cooling towers; a minimum of 240 million gallons per day is obtainable. Resting on sandstone rock 14 ft. below the surface of the ground, the foundations consist of Raymond piles (composed of concrete poured into reinforced steel shells previously driven on mandrels) in groups, the tops of which are bound together by reinforced-concrete beams, on which a reinforced-concrete raft is superimposed in sections to allow for expansion which is expected to result from the periodical saturation of the ground when the river flow is at its maximum. The steel-framed brick superstructure has ferro-concrete floors and the roofs are supported on "Siegwart" pre-cast hollow concrete beams.

The building work was carried out by the Mitchell Conveyor and Transporter Co., Ltd., which also supplied the coal- and ash-handling installations, each unit

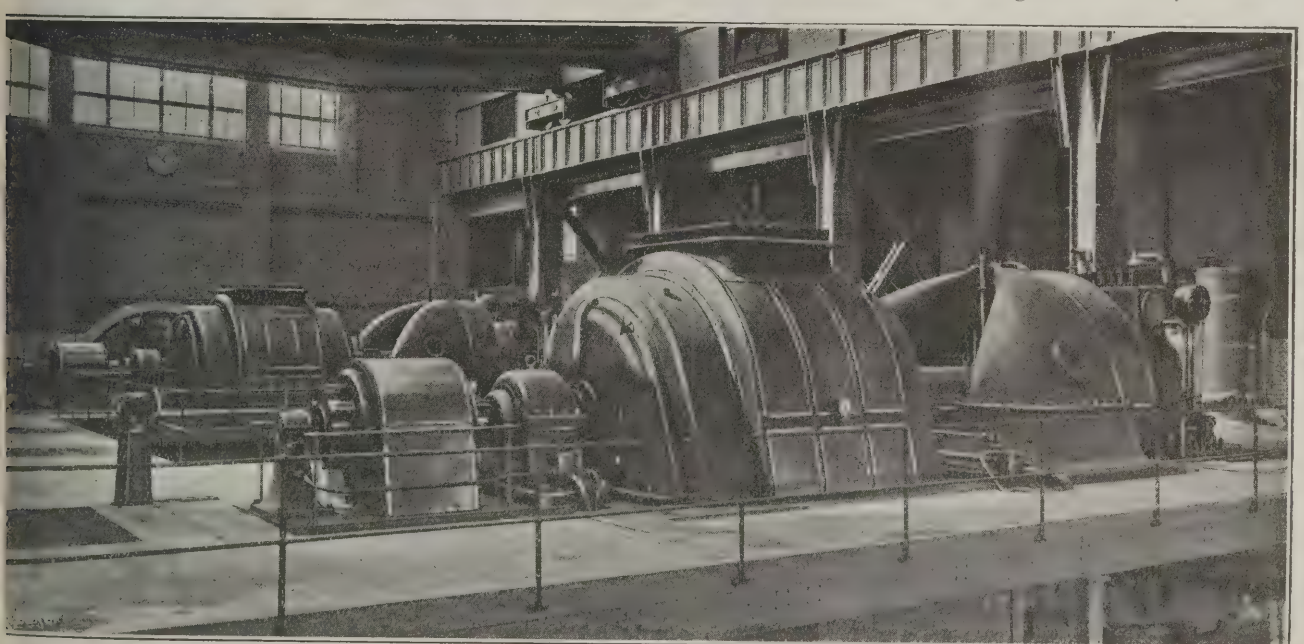

Fig. 2.—The First Two 25-cycle, 3-phase, 1,500-r.p.m., 5,500-V, 18,000-kW Steam Turbo-generators Installed.

The 32-acre site of the station, with 20 adjoining acres affording access to the docks of the Staffordshire and Worcestershire Canal Co. and the Great Western Railway, at the confluence of the Rivers Stour and Severn, is favourably situated for the delivery of fuel from the Midland coal fields *via* canal, railway, and

of which can handle 50 tons per hour, but slight modification will increase its capacity to 100 tons per hour. The coal is unloaded from barges in the canal basin by grabs operated from two travelling jib cranes, discharging on to two collecting conveyors running parallel to the quay, through receiving hoppers on to a second

series of ball-bearing 24-in. belts that carry the coal over the public road to a transit storage bunker; the cranes are electrically driven, the hoisting, slueing, and travelling motions being each operated by a separate motor. The 250-ton ferro-concrete transit bunker, which is divided longitudinally to hold two classes of coal, feeds the coal through chutes to wagons drawn by

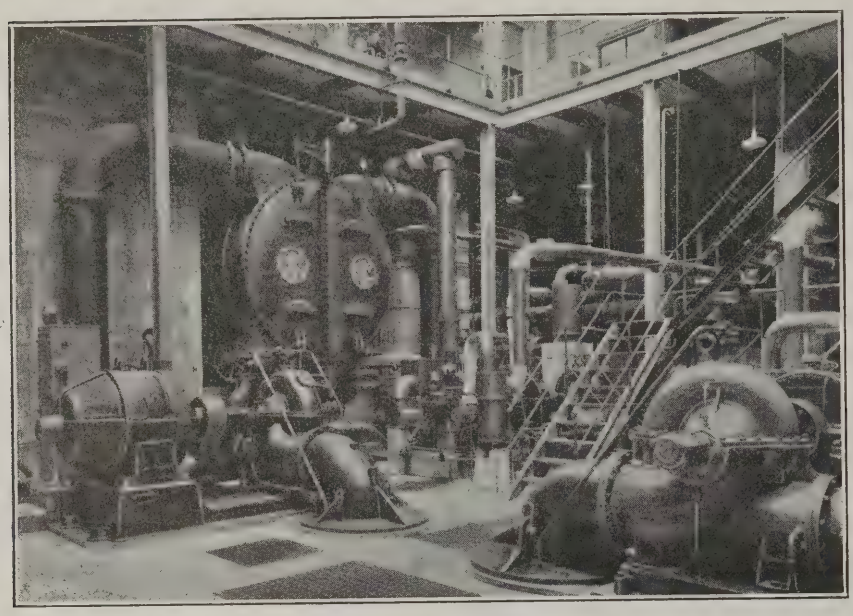

Fig. 3.—A 25,000-sq. ft. Condenser and Auxiliary Plant.

"English Electric" storage battery locomotives having a speed of over six miles per hour and capable of hauling a loaded train of 18 tons weight on a 30-in. gauge track to the storage ground adjoining the boiler house. At this point the wagons discharge through hoppers at ground level on to the storage conveyor by means of which the coal is stored by a butterfly stacker fed from the main conveyor that feeds the raised hopper, by means of which reclaimed coal is returned to wagons. A re-claiming travelling jib grab crane runs parallel to the stacking conveyors and is used for trimming the coal and also for re-discharging either to wagons or direct to the boiler house covered inclined conveyors. Automatic weighers are fitted at each point where it is required to know the amount of coal passing, whether into stock, from stock, into the bunkers, or from the barges. All ash leaves the dumping bars through hoppers into a water trough, from which it is carried by a drag link conveyor to a special hopper for transferring to ash wagons.

The steam-raising equipment, supplied by the Stirling Boiler Co., Ltd., comprises four "tri-drum" water-tube boilers with Stirling superheaters and Babcock & Wilcox economisers. The feed-water system is closed, Weir pumps being used and the make-up evaporated, with preliminary heaters supplied with steam bled from the turbines; provision is also made for utilising live steam from the boilers for this purpose. At a temperature of 150 deg. F. the water enters the economisers and is raised to 250 deg. F. before entering the boilers, a steady feed being maintained by Cope automatic regulators. Each boiler has 10,000 sq. ft. of heating surface, and is normally capable of evaporating 60,000 lb. of water per hour to steam at 350 lb. per sq. in. pressure, superheated to 686 deg. F.; under overload conditions, the four boilers are capable of supplying 320,000 lb. of steam per hour at the aforementioned pressure and temperature, and under each are two Babcock & Wilcox component-type chain-grate stokers, with a combined grate area of 324 sq. ft. One "Sirocco" forced-draught and one induced-draught fan are fitted per boiler and the flue gases pass through Davidson dust collectors situated at the bases of the two chimneys.

In addition, each boiler is equipped with six pressure jet oil burners, designed to obtain 30 per cent. of the normal evaporation of the boiler. One of these burners is fitted in the front of each mechanical stoker, and so arranged that sufficient temperature can at any time be obtained for the ignition of low-grade fuel. The oil installation is primarily incorporated to meet sudden demands for steam, thereby dispensing with the necessity of keeping stand-by boilers. Avery automatic weighing machines are provided on each stoker hopper, specially designed for weighing wet slack; besides Diamond soot blowers, soot pockets are also being provided from which the flue dust will be extracted by Smith & Yates suction plant. Special attention has been paid to the incorporation of instruments on a panel at the front of each boiler with the starters and shunt regulators for the motor fans situated immediately beneath.

The turbo-generators in the first section of the station were supplied by the British Thomson-Houston Co., Ltd., and consist of two main sets each of 18,000 kW and a house-service set of 750 kW capacity. Each of the main single-cylinder turbines of the impulse 17-stage type runs at 1,500 r.p.m. and drives an alternator having a maximum continuous rating of 22,500 kVA, 80 per cent. power factor, generating three-phase current at 25 cycles, 5,500 volts. Mounted on each alternator shaft is an auxilliary shunt-wound d.c. generator rated at 250 kW, 460 volts, connected through a control pillar to the auxiliary circuits for the condenser pumps, thus each turbo set is self-contained and is provided with an auxiliary turbine-driven oil pump, a main governor arranged for motor operation at 230 volts d.c. and an emergency governor with an electrical tripping device on the switchboard. Each alternator is provided with a direct-coupled exciter, and the stator frame is hollow in section, the space between the outer

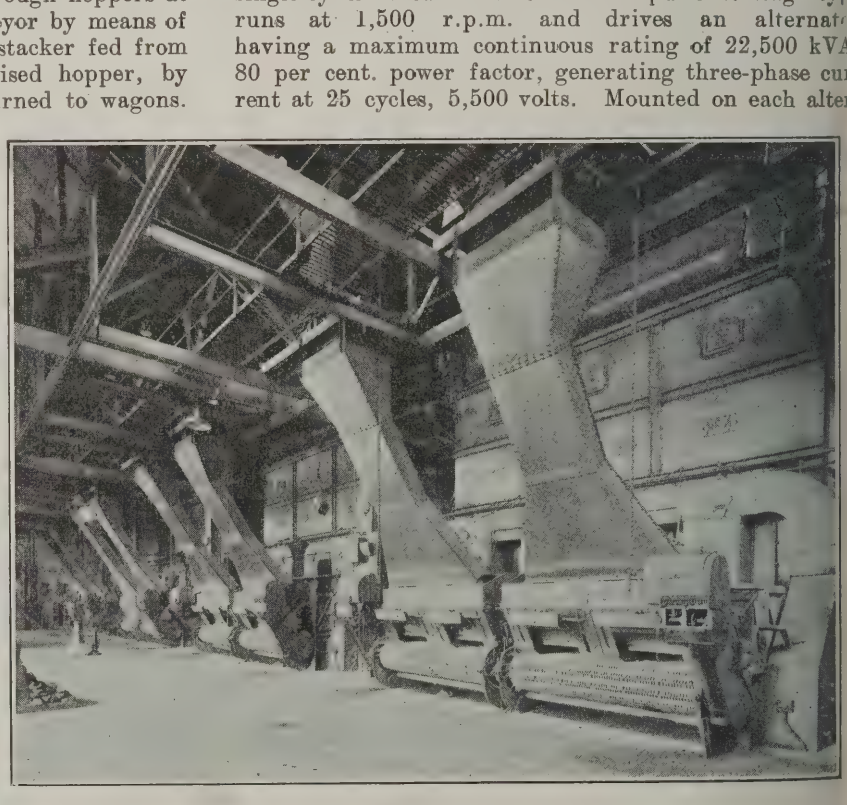

Fig. 4.—The four 60,000-lb. "Tri-drum" Boilers.

hell and the core laminations forming a chamber from which the heated air passes to the coolers in the foundation. A complete system of distance-temperature thermometers was supplied by the Cambridge Instrument Company, Limited.

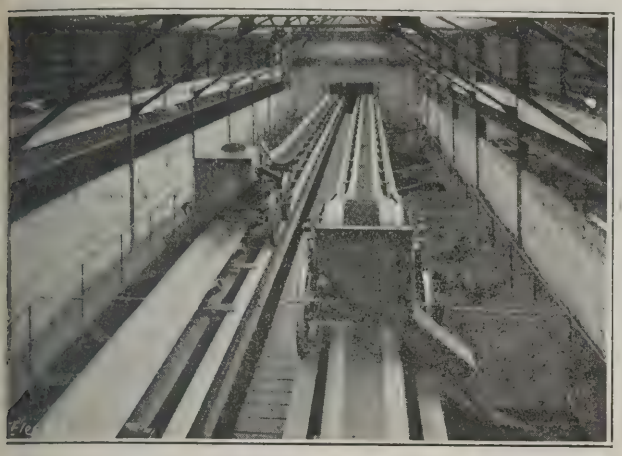

Fig. 5.—Boiler-house Coal Conveyors over Bunkers.

All the condensing plant was manufactured by Cole, Marhant & Morley, td., to maintain a 9-in. vacuum when ealing with 150,000 b. of steam per hour ith circulating ater at the rate of ,050,000 gallons er hour at a temerature of 55 deg. '. Each condenser as a cooling surface f 25,000 sq. ft. and s of the two-flow ype, with divided ater heads, so that ne half of the tubes an be cleaned without shutting down he plant. Each is

460 volts, and the other by a small vertical turbine. There are two Mather & Platt circulating-water pumps, each capable of dealing with 63,000 gallons of water per hour; one is driven by a d.c. motor rated at 138 b.h.p., 460 volts, and arranged for speed variation from 615-685 r.p.m.; the other is driven by a B.T.-H. turbine rated at 138 b.h.p., 6,000 r.p.m., geared down to the pump speed of 650 r.p.m., and exhausting against 20 lb. absolute back pressure into the low-pressure heater in conjunction with the steam tapped from the main turbine. The two Weir condensate extraction pumps for each set are driven by a d.c. motor and a steam turbine, which also exhausts into the heater steam range: they discharge into the closed feed system; when the condensate temperature is 73 deg. F., the temperature rise due to passing through the air extractor heater is 7 deg., the temperature rise due to passing through the drain cooler heater is 2 deg., and the temperature rise due to passing through the main feed heater is 68 deg., the temperature of the condensate entering the boiler feed pumps being 150 deg. F.; feed heat can also be provided from the bleeder belt of the main turbine at 11 lb. per sq. in. absolute. Each plant is provided with a Weir evaporator for supplying make-up water to

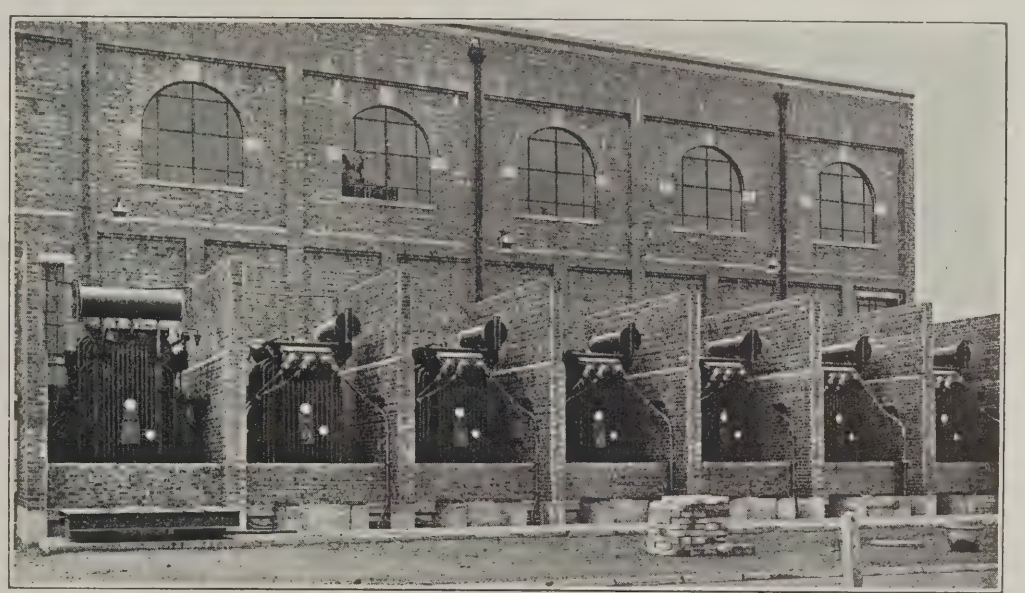

Fig. 6.—Three-phase 33,000/11,000-volt Outdoor-type Transformers.

Fig. 7.—Main 33- and 11-kV Oil Switchgear Control Room.

rovided with a duplicate set of steam-jet Delas air exactors. The extraction and lift pumps are also in uplicate, one being driven by a 32-h.p. d.c. motor at

the system, the duty being 7,500 lb. of water per hour; steam is tapped off the high-pressure ends of the main turbines at a gauge pressure of 70 lb., but in the event of this supply not being available an auxiliary connection to each evaporator can be used for operating on live steam at 325 lb. pressure. A "cushion" tank is provided between the condenser and boilers; all drain recovery is led to this tank, which is connected to the top of the main condenser by a 3-in. pipe delivering make-up to the main condenser for de-aeration, after which such water is passed to the closed-feed system proper.

(To be concluded.)

Our Overseas Electrical Markets.

Trend of import trade of Australia, New Zealand, India, and Africa. Factors affecting purchasing power.

IN continuation of the survey of our principal overseas electrical markets which appeared in the ELECTRICAL REVIEW of January 21st, 1927, it is now possible to show the position during a further period of three or four months. The countries covered are Australia, New Zealand, India, and the Union of South Africa. With regard to Australia, greater detail can now be given than was available when the former survey was made; in addition to charting the trend of the import trade in cable and wire, that in dynamo-electric machines, filament lamps, and telegraph and telephone material is also recorded in fig. 1 since July of last year. Taken as a whole, it will be seen that the Commonwealth's import trade in electrical material is well maintained. The feature of New Zealand's record (fig. 2) is the high total of electrical machinery and

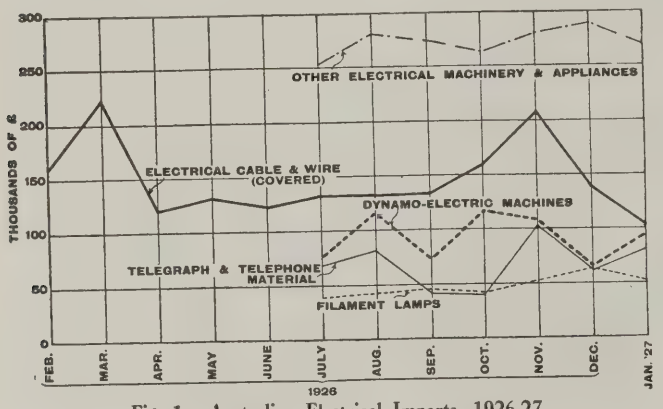

Fig. 1.—Australian Electrical Imports, 1926-27.

equipment in December last, a smaller vertical scale is used for the total; only in one month (*i.e.*, March, 1925) during at least the past eighteen months has this level been surpassed. New Zealand's imports of telephones and accessories also reveal a healthy and regular upward tendency.

In India's electrical trade it is noticeable that while great Britain maintains her predominant position in

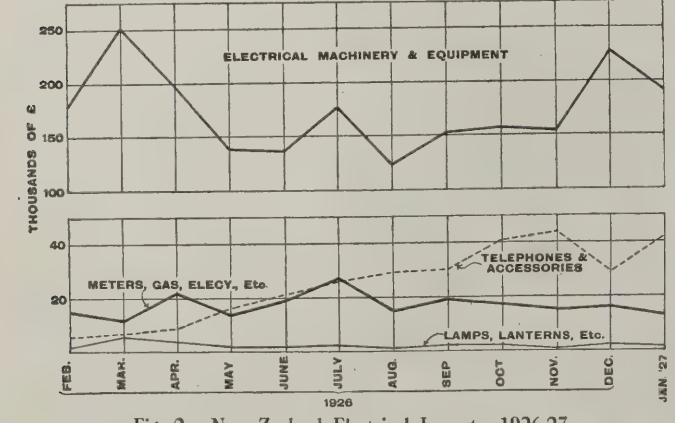

Fig. 2.—New Zealand Electrical Imports, 1926-27.

the imports of telegraph, telephone, and other apparatus (fig. 3), without either Germany or the United States gaining any considerable permanent success; there are signs that the United States is still obtaining some good contracts for machinery (fig. 4). For convenience, in figs. 3 and 4, the sections showing the shares of Germany and the United States are on a larger vertical scale than those showing the total values and Great Britain's share.

With regard to the imports of the Union of South Africa (fig. 5), the noteworthy feature is the steady upward trend since the autumn.

It is hoped that a study of these charts will furnish manufacturers and exporters with some useful indications as to whether they have been obtaining their fair share of the business that is offering in these markets.

It will also be of utility to review factors affecting the general purchasing power of these countries.

Australia.

The natural increase in population in Australia according to the latest statistics, is now the greatest in

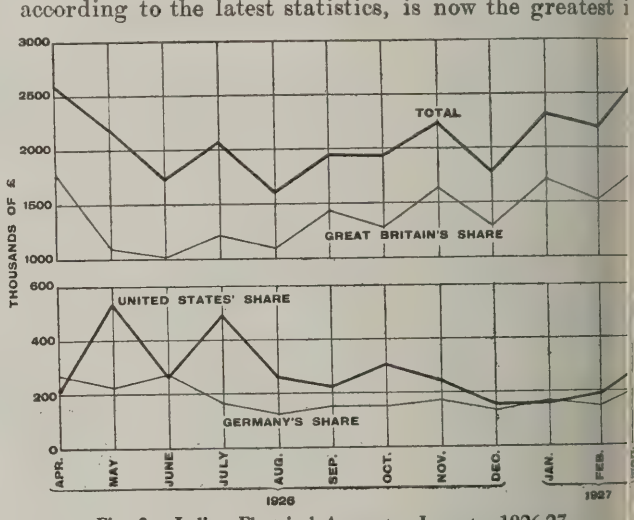

Fig. 3.—Indian Electrical Apparatus Imports, 1926-27.

the world relatively to the population. Wool growing continues to prosper, the number of sheep shorn in the 1926-27 season being 51,880,000, as compared with 45,550,000 in the previous year and 41,320,000 in 1924-25, and the average clip 8.8 lb. per sheep shorn as compared with 8.1 lb. and 8.25 lb. respectively. Producers have been fairly well satisfied so far with

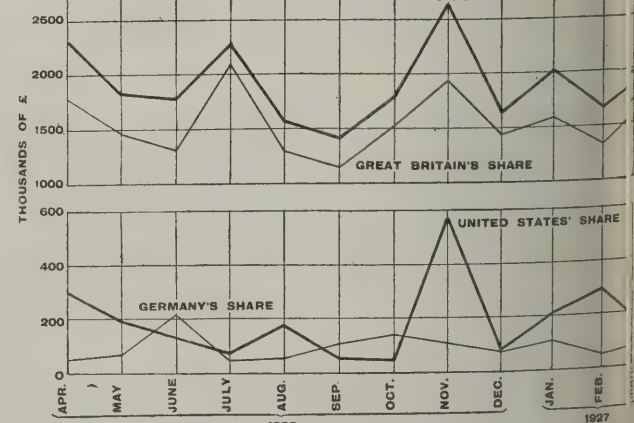

Fig. 4.—Indian Electrical Machinery Imports, 1926-27.

the prices realised. Although there has been a more than usually large adverse balance in the foreign trade of the Commonwealth, it is expected that, during the next few months, this will be much reduced owing to the large quantities of raw materials available for export. The 44-hour working week which is being introduced is a factor which will influence the prospects of import trade, as it will increase production costs. It

elieved also that it will reduce output. While the pre-ent wide gap between exports and imports exists, the ankers are inclined to curtail credits in order to check nports as far as possible.

The prospects for the wheat harvest are, on the whole, ood, the forecast for South Australia showing a larger ield in bushels per acre than in the previous season, ith a small increase in acreage. The estimate for Vestern Australia is also favourable, while that for

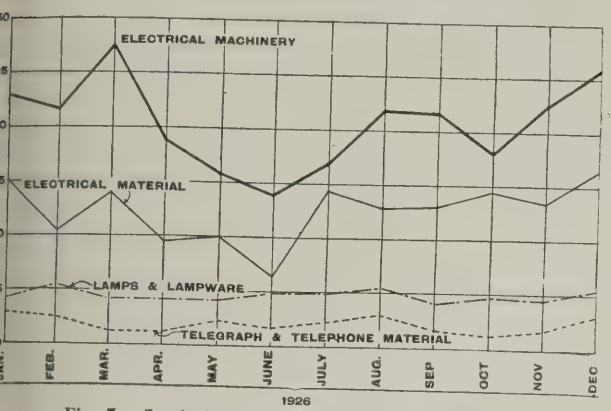

Fig. 5.—South African Electrical Imports, 1926.

ew South Wales is 9 million bushels more than in 25-26. Railway receipts have been advancing, while th the Commonwealth and State revenues are re-rted to be well ahead of estimates.

New Zealand.

Although the import market of New Zealand is quiet ing to large stocks, the position on the whole appears be quite sound. A very satisfactory return is being eived from the wool crop, but the prices of meat and ry produce are a little disappointing. New Zea-d's exports during the first two months of the year alled £10,221,000 in value, and her imports ,304,000. The corresponding figures for the same nths of 1926 were £9,369,000 and £8,951,000.

Unemployment generally in March showed a small in-ase compared with February, and a considerable ance compared with about twelve months previously; the engineering and mechanical trades, however, re was a decrease in March compared with February. avourable feature is the decline in mid-February of points in the index number of the cost of food, which, ever, is still 46 per cent. over that for July, 1914, while including clothing and rent, the expenditure of 20s. before the war went as far as 32s. 6d. in February this year.

South Africa.

In South Africa the recent mining developments are now favourably affecting trade both wholesale and retail. The gold output for April, although showing a decrease on the previous month, was better than in April last year. The agricultural outlook is satisfactory in both the Transvaal and the Free State, and in the drought area in the West and South there has recently been a moderate rainfall. Business in iron and steel during April was brisk, and employment was good in the building trades and in industry generally. In the motor trade, which is an excellent barometer of the purchasing power of the country, improved sales are reported from Cape Town; while Johannesburg, Durban, and East London are buying much as usual; in Port Elizabeth, according to the report of the National Bank of South Africa, Ltd., sales of cheap cars are excellent.

The South African Railway Administration is making provision for handling more traffic in 1927-29 than in 1926-27. Mr. Malan, the Minister, recently stated that the railway workshops and machinery must be remodelled and extended and brought up to date; £15,000,000 has been mentioned as the sum to be spent.

India.

In India, the purchasing power of the ryot is improving, and he is more ready to spend than at any time during the past two or three years. Further improvement is expected to result from the Government schemes for encouraging cultivation. Meanwhile, this season's cotton crop is short in quantity and lower in value than the last. Jute also is yielding less favourable results, but, while the grain crops are doubtful, the exports of tea are satisfactory, and the oilseed crops promise well.

During the current financial year it is hoped to complete 900 miles of new railways at an expenditure of about £10,000,000. Details are believed to have been worked out and are expected to be issued shortly of a scheme for the electrification of the suburban services of the Eastern Bengal railway. The conversion of the North Western railway is proceeding, the next parts to be undertaken being Lyallpur, Sukkur, and Rohri.

A cable from the United States Trade Commissioner in Calcutta reports that the engineering trade is improving.

E.H.P. Transmission.

Some considerations on the possible causes of faults on e.h.p. cables and systems, referring particularly to 33,000-V belted-type cable.

By G. W. PRESTON.

PER-pressure transmission is of ever-increasing importance; not only are high voltages essential for the transmission of moderate nts of power over long distances, they would seem desirable for the transmission of very large nts over comparatively short distances. If the proves to be the case and a great multiplicity of is to be avoided, it will lead to the development ger sizes of cable than are generally employed at t.

le three-core super-pressure cables of .35-sq. in. have been laid, .25 sq. in. is more generally looked upon as being a desirable size. On account of the greater overall diameter of the larger sizes of cable, and of their greater rigidity, the employment of some sort of metallic binder on the cores would seem to be essential, both from the point of view of the mechanical support which it would give to the paper to prevent puckering, and of the increased potential gradient, with a reduction of dielectric thickness, made possible by the presence of such a metallic wrapping, potential gradients of as much as 5,000 volts per mm. being possible.

Unfortunately the performance of the ordinary type

of belted three-core, 33,000-V cable (I do not refer to cables of the "H" or "S.L." types) has not been entirely satisfactory during the past few years. While a considerable amount of research work has been carried out in the laboratory in an endeavour to produce a satisfactory 33,000-V cable, it has become increasingly evident that certain factors in the breakdown of such a cable in service have not as yet been reproducible in the laboratory.

Although the greatest care is exercised both in manufacture and in the subsequent handling of the cable, which is subjected to thorough d.c. and a.c. pressure tests, due precaution being taken that such tests are not injurious to the cable, after thus having been proved capable of withstanding at least twice its ordinary working pressure it breaks down after only a few months of service.

It is evident from the fact that a period of time elapses before breakdown occurs, that some time-voltage relationship exists with which the cumulative effects of frequent surges and pressure rises, due to switching operations or faults on other branches of the system, combine to produce a gradual deterioration of the dielectric. The fact that a cable is frequently not loaded to its fullest extent until some time after it is put into service may in some measure also account for this lapse of time. The damaging effects of a fault on other cables connected to the same system are especially evident in the case of a cable running in parallel with the faulty one, a fault on the one cable being frequently followed by a fault on the other. It is possible that the shock thus sustained by the second cable might have no permanent effect if the cable were allowed to rest for a short period. The reverse to this usually occurs, the cable being called upon to carry the combined loads of the two cables while the fault is being repaired.

Not only may damage be caused by pressure surges when a fault occurs, but so large are the forces brought into play by the sudden dissipation of the enormous amounts of energy that, even with the most sensitive protective devices, permanent damage is probably caused to the sound portions of the faulty cable.

It has been found that 33,000-V cables have proved particularly liable to failure where they have been laid in cast-iron pipes. These failures have occurred not only in the pipes, but in their vicinity, and could be due to a number of causes. The cable may be mechanically damaged during pulling operations, this being particularly liable to occur when the pipe run is not straight, especially if the deviation is in two planes simultaneously. In such cases there is a danger of the cores being separated and voids formed at the weakest point of the dielectric.

The dissipation of heat from the cable in the pipe is less than when the cable is laid direct in the ground, and although it is common practice to lay cable of larger section in pipes, the lower thermal conductivity of the air in the pipe combined with the fact that the cables are usually laid at a greater depth, often in concrete, at points where pipes are used, may account for a rise of temperature at these points. Such an increase of temperature would have an adverse effect upon the dielectric, and would cause an increased expansion of the coppers, which, if no provision were made to counteract it, might produce a distortion of the cores.

It is just possible, however, that the explanation is purely electrical. On the occurrence of a fault, a heavy out-of-balance current would flow, setting up a magnetic field external to the cable. Under these conditions the sudden rush of current encountering an increased reactance due to the inductance of the iron pipe surrounding the cable might cause a sudden rise of pressure in the cable at these points, resulting in damage to the dielectric. Although this might not produce immediate failure, it would lead to a breakdown soon after the cable was again put into service.

A considerable number of failures have been found to occur at times of light load, such as at week-ends and in the early morning. The cause of this is not very clear, though it is evidently due to the cooling of th cable at these times. The contraction of the impregna ing compound may cause it to drain away from portion of the dielectric where deterioration has alread commenced, thus encouraging the extension of charrin and the eventual linking-up of two such spots, causin final breakdown. Secondly, as the cable cools, it possible that the contraction causes a reduction of th internal pressure of the compound, and any air in th dielectric becomes more easily ionised, resulting i breakdown at a previously weakened spot.

Some investigators have noted that the internal di charge in a high-voltage cable under test has bee clearly audible, it having been possible to note th period of the test at which this has occurred. It woul be interesting to conduct a series of tests to determir the effect on this audible period of discharge of mai taining the compound in the cable at various pressure

The question of the exact composition of the impre nating compound is a matter on which great differenc of opinion exist. A compound should be sufficientl viscous to prevent any undue flow on gradients, whic sets up a danger of the high points of the cable drai ing dry, the head of compound at the same time exer ing considerable pressure on the lower portions of th lead sheathing. While impregnation is somewhat mo difficult with a viscous compound, more compound ca be retained finally in the paper, and it is less liable to expelled under the influence of the electric field. Th compound, if expelled, however, must be sufficient mobile to flow back again as soon as the stresses a relaxed.

The mobility of a fluid type of compound, if proper taken into account, could be turned to effective use, ar would seem to possess decided advantages. If adequa provision is made by installing reservoir and diaphrag joints on all gradients, and the lead sheath is effective strengthened, the compound in the cable can be mai tained under a definite pressure.

Fluid compound under pressure would have benefici effects on the insulation. It would be less liable to e pulsion from the paper, and would require a minimu period of relaxed electrical pressure to refill the insul tion. At all places the cable would be well filled wi compound, and any voids caused by the distortion the cores during laying or by heating and cooling wou tend to fill up. The compact between the cores a packings would be greatly improved, a point of gre importance in view of the stresses to which these pc tions of the cable are subjected. Any air included the insulation would be maintained under pressure a the ionisation potential increased.

The fluid-compound idea can be further develope the cable being provided with definite oil ducts a actually filled with a fluid compound under pressure *situ*, after the cable has been laid. The cable may, course, be so strengthened by the addition of metal binders as to reduce the risk of distorting the cores the puckering of the paper to a minimum, though su cables as of the "H" or "S.L." types and the o mentioned above tend rather to counteract the effect core distortion than to prevent it.

The fact that in many cases faults have occurred groups, being confined to comparatively short lengt of the total run, might be accounted for in several wa Adverse local conditions at these places, both from t point of view of laying and of subsequent performan are probably the chief factors in these failures. T possibility of the lengths of cable affected bei of faulty manufacture would account for a number faults occurring on the same factory lengths, thou the local effects of one fault on another are in all p bability more largely responsible. A theory th peculiarities of the system as a whole might ren certain points particularly susceptible to transient d turbances is at present without confirmation.

Fortunately the jointing of 33,000-V cables to-d presents little difficulty, the failure of well designed a carefully made joints being very rare.

The Power Supply of Wireless Sets.

An account of the experiences of an engineer when choosing a high-voltage battery eliminator for his wireless set: almost any of the better-class instruments will operate the average receiver with satisfaction.

By G. F. J.

INSPIRED by some notes in the REVIEW on the subject of the power supply for broadcast radio-telephone receivers, we tentatively decided to try an "eliminator" in place of batteries for energising the valve-plate circuit of a receiving set.

Inquiry from radio manufacturers and dealers in the City revealed a wide choice available, ranging in price from about £3 15s. to £12. (A.c. mains only being available where the set is operated, these notes will, of course, apply directly to that type.)

Eliminator No. 1.—We were first much impressed by the product of a Leicester firm, priced at about £8. We called on a dealer in the centre of the City, and asked to have one demonstrated: the dealer did not seem over-keen, but finally connected the instrument to a 4-valve receiver working on the local station. Results seemed good, but when reception from other stations was attempted, a certain amount of hum was heard. When it was pointed out to the dealer, he admitted it, and gave the vague explanation of "the trams" and "lift motors a door or so away" as the cause.

On requesting permission to try one on our own set, it was declined, with the remark that the manufacturers would not allow retailers to have goods on approval and, in all fairness, they could not allow their customers to do so. The assistant did not know the a.c. consumption of the instrument, or the life of the valve used for rectification, or the maximum d.c. output.

However, another dealer was found in a neighbouring town who was also a keen experimenter, and he gave us the chance of testing one at home. The a.c. consumption was found to be about 20 watts, the maximum output at 100 volts was 15 milliamperes, and there was a single fixed "detector tap" at between 50 and 55 volts; it was a half-wave rectifier, the valve in use being of the U.4 Marconi type. The results with our set were very good, but full volume was not obtained owing to the fact that it takes about 22 milliamperes at 120 volts. No hum was perceptible, except when the set was on the verge of oscillation. The range of the set was only very slightly inferior to that usual when "super" dry batteries were employed. The absence of means of regulation of the detector voltage was rather a disadvantage. (This has been rectified in later model.)

Eliminator No. 2.—The second instrument tested was manufactured by a Sheffield firm, and priced at about £7. It appeared to be a two-valve full-wave (or bi-phase, as the term seems to be) rectifier. It had five positive terminals, and the voltage of each increased as the rheostat was turned towards the "on" position. The maximum output could not be accurately measured when the particular instrument was on test, but there was not enough to give full volume to the cone-type speaker usually used. The demand on the a.c. side was 25 watts, and there was no hum, but when also tested on a resistance-capacity coupled set the hum was very bad. (It has since been found that this feature is common to most eliminators, but the trouble can usually be obviated by replacing the grid leaks of the coupling condensers in the set by audio-frequency chokes). In passing, radio valve makers deprecate voltage regulation by decreasing the voltage of the rectifier-valve filament. It is claimed that this increases the impedance, causing heating of the anode, and consequent decrease of valve life owing to release of occluded gases.

Eliminator No. 3.—A large advertisement in the pages of the REVIEW directed our attention to a different type of instrument, which does not employ thermionic valves, but a special gas-discharge tube. Arrangements were made to try one of this type: it is housed in a metal case (which may be earthed if desired) and has a fully variable detector tap of about 7 to 60 volts, or slightly more. The amplifier voltage is given as 135 V, and the maximum output *at this voltage* is given as 25 mA. A neon tube functions as a voltage regulator, and if more than 25 milliamperes be taken, it will cease to glow, and the voltage will drop to about 100 at 30 mA. On the a.c. side the consumption is 8 watts, as near as could be measured; there was no hum whatever, and the range of the set seemed to be as good as usual.

The disadvantage of this instrument is its high price (£10 15s.), but this is probably set off by cheaper running costs and absence of valve replacements. The tube, of course, will last as long as the vacuum in it, and, provided that care in the selection of the glass is taken, this could be several years. Unfortunately, the price would not permit of our purchasing this one, otherwise we would certainly have bought it at once; in fact, in a year or so's time, we may still do so. By the way, "bi-phase" rectification is used in this case.

Eliminator No. 4 was made by a Manchester firm, and had two thermionic valves of the DU.5 type arranged for two-wave rectification. The price was about £8, and taps were provided at 60 volts, 150 volts, and a variable one in 20-volt steps, from 20 to 150 volts. A number of grid-bias taps were also provided, but were not used. The output (maximum) at 150 volts was of the order of 25 mA, and the input current about 20 watts. The instrument gave very good results on the whole, though a faint ripple could be heard superposed on the higher notes of a soprano, or those of a wind instrument; it was not objectionable and could only be detected with difficulty. This firm has since introduced a new model, with voltages as above, but a claimed output of 70 mA. The price also has been reduced to £6 15s. (See footnote.)

Postponement.—After a trial over a day or two, we decided not to do anything definite about this model. There were rumours of something better still (the later model mentioned) and, meanwhile, a set of high-voltage accumulators was returned to the dealer by the purchaser of such an instrument. The opportunity seemed too good to be missed; the price was right, and the condition good, so a bargain was made on the spot. The problem of charging was overcome by installing two DU.5 valves in parallel, filaments heated by means of an ordinary bell transformer, and a two-throw switch with four poles to connect the battery to the charger and close the mains circuit, or to the set, as

desired. This charges at 30 milliamperes, and when the set is disconnected for the night, the charger comes into operation until the set is required again. (The set is used about 36 hours per week on the average, and dry batteries were found somewhat costly.)

Conclusions.—However, these notes are primarily on the "eliminator," and we may sum up by saying that almost any of the better-class instruments will give satisfaction on the average set, taking between 10 and 20 milliamperes; for a smaller output, "super" dry batteries are satisfactory; if larger, high-voltage accumulators are desirable.

The note on resistance-capacity coupled sets (above) has been borne out since by experience; if the set is of a "supersonic" type, only a test can tell whether a battery eliminator will be satisfactory. We are fully aware that many other types are available, apart from those described above, but we have only mentioned those personally tested; the number was restricted by the attitude of the average radio dealer, who expects one to purchase an instrument costing upwards of £5, without reference to whether it will, or will not, work under certain conditions—or even at all, in a very few cases.

Kits of parts for home construction are available in some cases, usually priced somewhere about £2 less than the complete instrument. It is questionable whether home construction is worth the saving; it is much easier to persuade the manufacturer to "service" the complete thing in case of any trouble, than the parts, however carefully assembled. We have by no means exhausted our trials, but have had to postpone them for a few months; meanwhile, perhaps the results of our inquiries will interest readers who also saw the notes on the power supply for radio receivers. So far, our ideal is No. 3, though the price may take some little scraping together; we are also going to test the improved model of No. 4, as soon as the dealer can obtain one. The promised output of 70 mA seems very desirable, for it will mean that a valve of the "super power" type can be operated with a minimum of expenditure.

The new indirectly-heated cathode valves also show a large degree of attractiveness. We seem to be approaching the day when a radio set having a choice of, say, two programmes will be built to run entirely from the mains; a single three-position switch, giving A, B and "off," the only control necessary. The only thing we lack at present is the alternative programmes!

Note.—Since writing the above notes, we have had an opportunity of testing one of the improved type mentioned above, by the Manchester firm. It is now priced at £6 15s (valves extra), the same voltage arrangements are made as on the older model. The maximum output is 70 milliamperes and full-wave rectification is used; the input on the a.c. side is approximately 18 watts. This instrument is much better than the older model; there is no trace of hum when a pair of headphones is connected to the 4-valve receiver used, even when the set is oscillating.

The moderate price and large output have persuaded us to place an order for one of this type. The valves are priced at 15s. each, and should last 1,500 hours. Since we pay about 0.8d. per kWh for our energy (on the inclusive domestic rate) the running cost for the 36 hours per week on the average during which the set is in use will not be heavy, perhaps 2s. 6d. per year. The valves should last a year, giving a total maintenance cost of 32s. 6d. per annum in this case. Add to this the interest on £6 15s., and the grand total (at 5 per cent.) comes to 39s. 3d., which will certainly be cheaper than "super" dry batteries, three per year of 120 volts, at £2 2s. 6d. each, total £6 7s. 6d.

In certain cases a royalty of 12s. 6d. is payable on eliminators.

The Shops Hours Bill.

Important Alterations Proposed.

By W. ERIC JACKSON, LL.B., Barrister-at-Law.

IT has long been felt that some revision of the Shops Hours Acts is desirable. At present the majority of shops are regulated by three Acts, and in every case two of these at least apply. Now a further Act is foreshadowed by the introduction of the Shops Hours Bill in the House of Commons.

It may be felt in some quarters that it is rather a pity that the Legislature has not seen fit to cancel all the existing statutes dealing with shops and co-ordinate the law in one comprehensive Act. The Bill does not propose such drastic revision. All that is suggested by it is a limitation of hours of work, regulation of the payment of overtime, and amendment of certain important definitions.

The main purpose of the Shops Acts is not so much to enforce early closing as to ensure reasonable working hours for employés. The present Acts do this by providing that every employé shall have his weekly half-holiday, and by providing that shops shall shut at regulated hours; but, except in the case of young persons under 18, no provision is made as to the hours of daily work. Hence at present a shop assistant may work 14 hours on five days a week and be within the law so long as on the sixth day he ceases work at 1.30 p.m. The provision that shops shall shut at 7 p.m. may be some safeguard to assistants so long as the shop opens at a reasonable hour, but the law has not dealt with early opening. Hence a tobacconist has been held to be quite within his rights in closing at 8 p.m. and opening again at five minutes past midnight. The same applies to shops selling electrical goods.

The new Bill, in Section 1, goes to the root of the whole matter. Henceforth no assistant is to work more than 48 hours a week, exclusive of meals. This provision will probably be much criticised in many quarters. It means that assistants may work from 9 a.m. until 7 p.m. on five days a week and from 9 till 12 on Saturday (or Wednesday). The extension hour on Friday will be impossible unless assistants are given time for tea on each day of the week. The present law contains no such regulation as to hours, except in the case of "young persons," who at present must not work more than 74 hours a week, including meal times. If the Bill passes, young persons and adults will all be on the same 48-hour footing. The shop-keeper must produce a list showing the hours per day for each assistant, and keep the list in a conspicuous place in the shop. A further provision is that if any assistant works partly in the shop and partly in a factory or workshop, the total number of hours worked altogether must not exceed the limit of hours laid down in the Factory and Workshop Act.

As regards overtime, the Bill states that for the first half-hour payment is to be made at ordinary rates, for a further period beyond this, time and a half is

to be paid; and on Sundays and public holidays double time. Overtime is to be reckoned in half hours, any period less than half an hour being reckoned as half an hour. The Bill therefore recognises the need for overtime, but criticism will doubtless be levelled at the suggestion for reckoning 10 or 15 minutes' overtime as half an hour.

The interesting part of the Bill, from the legal standpoint, is the amendment of the definitions of "shop" and "shop assistant." A shop means any premises, or any part of any premises, where any *wholesale* or retail trade is carried on, or which is used in connection with the carrying on of wholesale or retail trade, but not a factory or workshop. It appears, then, that any premises where things are bought and sold is a shop for the purposes of the Bill. The inclusion of wholesale premises is an innovation which will probably make little difference in most cases to the hours, but it will impose on wholesalers the duty of rearranging their staff to fit in with the Bill where necessary, and in every case the list of hours mentioned above will have to be made out and displayed. The definition is very wide and will, of course, include a dispatch and packing department, and very possibly the office. This is borne out by the definition of "shop assistant" who, in the Bill, is described as any person wholly or mainly employed in connection with any shop for the serving of customers or receipt of orders or collection, dispatch, and delivery of goods, or in any clerical capacity. Accordingly, clerks, accountants, carmen, messengers, and very probably commercial travellers are shop assistants, as well as counter hands, for they are all employed in connection with a "shop" in one or other of the capacities above mentioned.

Substantially these are the effects of the proposed amendments. The Bill still leaves untouched the somewhat complicated position of a shop in which two trades are carried on. Closing orders will continue to be made by the local authorities, regulating the hours of closing for different classes of shops. Difficulty has often been felt in the case of a shop which sells articles applicable to more than one trade. Electrical dealers sell lighting equipment, radio apparatus, and motoring accessories. Are they to close on the day appointed for hardware, for musical supplies, or for ironmongery? In cases where a shop has two departments, an electrical side and, for example, a furnishing side, the shop must shut on the electrical side on the day for such shops, but need not shut on the furnishing side if such shops are given a different day. Where an article is common to two trades, it may be sold by exempted trades at all hours, but non-exempted trades may not sell it after hours. Take, for instance, acid for accumulators. Sold by an ironmonger after hours, it would be a breach of the law; sold by a chemist when ironmongers were shut, but during the extended hours for chemists, it would be quite legal; sold by a motor dealer at any hour it would be legal. The question is not so much whether an article is hardware, musical supplies, or motor accessories. A trader must not trade at all beyond the hours laid down for that particular class of shop. There may seem some inequality in this, and the inequality may become even more apparent when wholesale houses are brought within the Shops Acts; but such is the law, and the only remedies are either to prevent the proposed amendments and to seek an alteration of the existing Acts, or to have each business put into several classes by carrying on in each shop several distinct trades so that articles common to all those trades may be sold at all hours.

Cheaper Wiring.

The Petty Objections of Urban and Rural District Council Authorities.

By H. W. C.

IN spite of the I.E.E. Rules, &c., no definitely recognised standard exists which can be used to settle any disagreement which may arise between the supply authority and the contractor. The former is all-powerful, and can in many cases make things decidedly unpleasant for a contractor who offends it. If it is not convenient to supply, say, a heating load in a particular spot, the slightest excuse will be used as an objection. The policy of cheap wiring is subject to different views in many quarters, and woe betide a strange contractor who does not comply with the letter of the I.E.E. Rules or the pet theories of the supply company's district engineer! I came across one who required wiring to be rated on the 1,000-amp. per sq. in. rule for a load of 10 amperes! Tactful nursing of the supply engineer's complaint brought about the waiving of this point, and wiring at the I.E.E. ratings for small cable was then accepted as satisfactory.

It is considered in many quarters that the I.E.E. Rules are far too stringent, and form a hindrance to popular electrical development. One such instance is the separate fusing of each heating point installed for the use of radiators. In many suburban dwelling-houses one 2-kW portable radiator with plugs in five of the rooms serves a very useful purpose. Where this equipment answers all the requirements, the cost of a 50-amp. main switch, 50-amp. mains from switch to fuseboard, and five separate circuits of, say, 7/22 s.w.g. cable, would be out of proportion to that of the apparatus installed.

Some contractors have overcome the difficulty by the use of a central plug and very long lengths of flex. But flexible cable at best is not very desirable, and I consider that a looped-in system can in many cases serve the purpose well, without involving undue risk. I once came across a small urban district council which required such an installation to be carried out in accordance with the strict letter of the law, and refused to connect up to any looped-in system, but yet fitted a 10-ampere meter to the circuit, which, it demanded, should consist of cable not smaller than 7/16 s.w.g. I have often wondered how much business is lost through such stringent rulings.

In spite of the campaign for the development of electricity, I strongly believe that many small concerns, for reasons best known to themselves, will not be bothered with heating and cooking loads. In several places the tariffs are by no means encouraging, and this seems to indicate that my suspicion is well founded. The retailers and distributors of electricity can undo many of the most ambitious schemes of the Electrical Development Association.

Before a contractor of repute can quote with certainty or compete with others in a strange area, he

has to make himself acquainted with the whims of the local supply authority. There is no compulsion for any supply authority to accept even the I.E.E. installation rules, and the many devices that are brought out to aid economy are being defeated by conservative opposition.

The minds of such authorities are often undecided as to the use of switches at plug points. Unless plug and switch are interlocked, the purpose of the switch alongside a plug point is often defeated. Where apparatus is provided with switches to control all elements, the cost of a switch, if it is not going to be double pole, may as well be saved. This is especially true of circuits not exceeding 10 A capacity at 240 V a.c. Here the arc consequent on breaking full current at the plug points is not severe, and it is a rare occurrence for a short circuit to result between the poles.

To stabilise business and to make the procedure a definite matter for the contractor, a set of regulations should be printed and made available on demand, by each authority, or a set of minimum requirements should be drawn up, which would be capable of universal application. These would represent the average practice of all parts of the country, and all should be compelled by legislation to observe them as final. The I.E.E. Rules are not sufficiently flexible to cover all the different types of installations of one class. The wide difference of opinion and storm of protest that the last issue of rules provoked are surely indicative of the need of adjustment. The stringency of these rules has brought about a very natural result: average practice in the class dealt with shows a surprising lack of uniformity, and the regulations are honoured more in the breach than the observance.

The procedure for obtaining the connection of supply, or the extension of installations, is by no means uniform, though here it must be said that each authority states more or less definitely what it requires.

The allocation of service costs has often decided the question of a proposed installation to the disadvantage of the supply company.

The description of the usual standing charge as "meter rental" is somewhat of a misnomer, and its interpretation is a matter for tactful decision when dealing with the individual parties concerned.

Delays in meeting new demands are often a cause of dissatisfaction. These few points, together with those mentioned by other authors, show very forcibly the need for some control over the conservative, and in many instances exasperating, quibbles of petty urban and rural electricity authorities.

The relative reliability of underground cables and overhead lines has recently been considered with direct reference to continuity of service. Stoppages of supply are inevitable, but the number of stoppages per annum in some cases is far from reasonable. The reliability of service is often a matter of bad or good organisation, and the majority of private companies in this connection show a marked difference in the management of their undertakings and in courtesy towards their consumers.

A Russian Electrical Manufacturing Concession.

Agreement with a Swedish Company.

It was mentioned in this journal some time ago that negotiations were proceeding between the Allmänna Svenska Elektriska Aktiebolaget and the Soviet authorities with a view to the former embarking upon the construction of electrical machinery, &c., in Russia. It is stated by Director Edström, of Vasteras, that the company during the war started the erection of manufacturing works at Yaroslaff, but the work naturally stopped on the outbreak of the revolution. It is now intended, among other matters, to put this particular works into operation, apart from the contracts which have been carried out in Sweden and those which still remain to be executed for Russian account.

The negotiations have been conducted for Swedish interests by Mr. E. Lindgren, who now becomes the principal of the Russian works, and the concession was signed by the Soviet Concessions Commission in Moscow on May 25th in the presence, it is said, of the Swedish Minister in that city. Under the concession, the A.S.E.A. is granted the right to construct, equip and work in the town of Yaroslaff an electrical engineering works for the construction of alternating-current machines of a size of from ¼ to 700 h.p., the concession being for a period of 35 years.

According to the details published in the official organ of the Council of Labour and Defence of May 26th, the company is placed under the obligation to begin the construction and equipment of the works within a period of three months in order that their productive capacity may be 2,000 tons in the year 1929-30 and 4,000 tons in the following year. The importation of the necessary equipment for the works, free of import duties, will be permitted for a period of four years, and the right is also granted to import basic and raw materials necessary for production, on the payment of import duties and licence fees, but only on condition that such products cannot be furnished within the limits of Russia.

The agreement provides for the importation by the company of some electrotechnical articles from abroad and their sale within the country. However, this right of sale is restricted to State and co-operative organisations and share companies in which State capital is interested. The profits resulting from such sales are not to be sent out of the country, but must be invested in the concession undertaking. In return for the grant of the concession, the company will pay to the Government a share in the value of the products sold in accordance with a scale provided for in the agreement, but the amount of this is not specified in the Moscow newspaper. In the event of the net profits of the undertaking exceeding this scale, the agreement provides that a supplementary share shall be paid to the Government. All taxes and imposts will be paid by the concessionnaire company on the same level as in the case of State undertakings which are conducted on a commercial basis.

On the expiration of the concession all the undertakings, in good condition and in accordance with the productive capacity which was reached during the last two years, will pass free of charge and clear of debt into the possession of the Government, which will only pay to the concessionnaire the unredeemed part of the expenditure incurred by the company in the last

five years, subject to the proviso that such outlay has been carried out in agreement with the Government.

Apart from the preceding information from an official Russian source, it may be noted that, according to a statement ascribed to Mr. Edström, the agreement also contains a clause that the company has the right of employing Swedish workmen and has a free hand in this matter.

Since the preceding notes were written some further information has become available as a result of the return from Moscow to Sweden of Mr. A. Linden, deputy managing director of the A.S.E.A., who is reported to have stated that it is the works which the company started in Yaroslaff in 1916 which is now to be completed. This works was never nationalised and the company all the time has maintained connections with Russia through its office in Leningrad and consequently has a good knowledge of the economic development in the Soviet Union. According to the agreement, the company will turn out exclusively standard motors for alternating current of sizes up to 700 h.p., and the capacity of the works will be about 30,000 motors per annum of an average size of 10 to 12 h.p. Mr. Linden is further reported to have stated that special engineers, foremen and workmen will be transferred from Sweden to the Russian works. The profits of the undertaking up to 25 per cent. per annum will be retained by the A.S.E.A., while out of the surplus over this amount a part will pass to the Russian Government according to a fixed scale; and the company will have the right to transfer the profits abroad. (This, however, does not agree with the Russian version, as given above.) In order to carry out the scheme Mr Linden states that it is intended to form a special Swedish company with a share capital of Kr. 10,000,000 to which the concession and the works will be transferred. Besides having the right to import into Russia a certain quantity of semi-finished products, the company is authorised to import manufactures made at the company's works in Sweden to be sold at current prices, and as a result of the agreement the company will now be able to take advantage of its former investments in Russia, which are unofficially stated to amount to Kr. 10,000,000.

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

Wages in the Electrical Contracting Industry.

The National Federated Electrical Association informs us that the variation in the cost of living since the last announcement justifies a reduction of 27½ per cent. in the basic rates of wages in the electrical contracting industry. The new rates, which will come into effect on the second pay day in June, and will remain in force up to and including the period covered by the first pay day in October, are as follows, the existing rates being shown in parentheses:—Grade A, 1s. 9¾d. (1s. 10¾d.); Grade B, 1s. 7½d. (1s. 8½d.); Grade C, 1s. 6¼d. (1s. 7d.); and Grade D, 1s. 4¾d. (1s. 5¼d.). Mates' wages are at the rate of 80 per cent. of the journeymen's rates.

Wages in the Engineering Industry.

In pursuance of the instructions of the National Committee of the Amalgamated Engineering Union to continue negotiations for increased wages with the Engineering Employers' Federation, the Executive of the union has asked for a further conference with the employers. This has been agreed to, and will be held on June 14th. It is the intention of the A.E.U. to submit any offer which may be made to a ballot of its members.

Recent Contracts.

JACKSON BOILERS, LTD., Leeds and Westminster, have recently received many important orders for electrically-heated boilers. Among these is an installation at the Carlton Theatre, Haymarket, S.W.1. Fitted in the servery attached to the stalls bar is a "Jackson" boiler fitted with coffee-making machine and milk container. During the evening performances at the theatre this installation is used principally to provide coffee and hot milk, but during the matinées it is also required to supply boiling water for tea-making. The machine is self-feeding direct from the cold water main, whilst the current is automatically switched on or off according to the demands on the apparatus. In the balcony bar there is a "Jackson" café fountain boiler, automatically controlled as described above, which is used to supply the boiling water for matinée teas.

In connection with the recently-inaugurated electric lighting scheme at Tobermory, Island of Mull, the HART ACCUMULATOR CO., LTD., supplied a battery of 122 11-plate cells.

There has been delivered at the power station of the Glasgow District subway railway, operated by the Corporation Tramway Department, the second of two steel cables, each nearly seven miles in length, 56 tons in weight, and nearly 1½ in. in diameter. The first cable which was delivered a month ago, was manufactured by MESSRS. J. & E. WRIGHT, LTD., Birmingham, and the second by MESSRS. R. S. NEWALL & SON, LTD., Liverpool. The cables replace those at present used for hauling the subway trams and have no joint or splice all through their respective lengths.

Municipalities and Foreign Cables.

At a recent meeting of the Coventry Town Council a report was presented by the Electricity Committee recommending that the Council should rescind its decision that the lowest British tender for cables should be accepted, and that the Committee should be allowed to purchase low-pressure cable in "the open market." After some discussion a resolution giving the recommendations effect was carried by a large majority. During the discussion it was pointed out that a "fair wages" clause was inserted in all contracts with British firms, while the payment of fair wages by foreign manufacturers could not be assured. For the Electricity Committee it was stated that it considered its patriotism was being traded upon.

The subject of foreign cables was raised at the meeting of the Doncaster Town Council last week, when the Electricity Committee reported the acceptance of a tender for Dutch cables put in by Messrs. Hogan & Wardrop. The price (£2,621) was said to be £822 less than the lowest British tender. The chairman of the Committee (Ald. E. Dowson) said that three years ago tenders for about £1,500 worth of British cable exhibited differences of as much as £200, but now the offers were all practically the same. The Committee was willing to deal with British manufacturers if they quoted reasonable prices. Ald. Dowson also said that the Dutch company concerned conformed to trade union rates of wages and hours and was thus on a level with British firms.

A Notice to Travellers.

Travellers calling on Messrs. J. A. Crabtree & Co., Ltd., the well-known firm of Walsall electric switch manufacturers, are advised to be honest in their own interests. Outside the inquiry office of the company there appears the following notice: "We find that many representatives (and particularly those introducing new lines) refuse to state their business, claiming that they wish to see the principals on important private business. In future, principals will terminate immediately ordinary business interviews obtained under such false pretexts and representatives are warned that any possibility of future business will be seriously prejudiced by their action."

The Enforcement of Wage Agreements.

At the annual meeting, on June 2nd, of the Association of Joint Industrial Councils and Interim Reconstruction Committees, it was reported that the Minister of Labour had written to all Industrial Councils asking them for their considered opinions of the proposal to give legal force in the whole of the industry concerned to wage agreements arrived at by the Councils.

Social Events.

A golf match between Edinburgh electrical men (the "Jocks") and Newcastle electrical men (the "Geordies") took place at Goswick Golf Course, Northumberland, on May 30th, 1927. Mr. Walter Finlay brought ten players from Edinburgh, and a party of eighteen went up from Newcastle. Ten games were played, the "Geordies" winning by six games to three, with one game halved.

The eighth annual sports meeting of the London establishments of the General Electric Co., Ltd., is being held to-morrow (Saturday) at the G.E.C. Sports Ground, Wembley.

On the following Saturday (June 18th), the Hackbridge Electric Construction Co., Ltd., is holding its third annual athletic meeting at the works ground, Hersham, Walton-on-Thames.

The French Electrical Industry.

M. Zetter, delegate of the General Syndicate of Electrical Construction, has communicated to the *Journée Industrielle* the results of the inquiry which he has made into the position of the different groups belonging to the Syndicate. The Syndicate of Electrical Machine Manufacturers reports that the reduction in business is from 20 to 40 per cent. Unemployment is small, but working hours have been reduced by from five to ten hours a week. The Syndicate of Manufacturers of Electric Accumulators, Batteries and Carbons announces that in this branch of industry the tonnage of orders has not decreased very much. On the other hand, the margin of profits has been considerably lessened, and the Syndicate attributes this to insufficient Customs protection for these manufactures. The Syndicate of Manufactures of Insulators for Electricity, &c., says that the crisis that followed the revalorisation of the franc has resulted in a 20 per cent. decrease in production and sales, as compared with August and September last year. The number of workers has been reduced in a similar proportion. It may be said, however, that present conditions approximate those of last year.

The Chamber of Constructors of Meters, &c., says that this industry has experienced a decline in business without precedent during the past few months and business is still below normal. Better business was done during the first six months of 1926, and several manufacturers were able to spread deliveries over a long period, keeping unemployment low; it still amounts, however, to about 10 per cent. The lamp industry reports decreased sales, mainly due to the fact that stocks have not been replenished in expectation of a decrease in prices. The Chamber of the Iron and Steel and Associated Industries of the Department of the Rhone and Region (Electricity Group) reports that there had been a rather large decrease in orders and price inquiries up to January 15th. Since March 15th, however, there has been a slight revival at most establishments.—*Reuter's Trade Service* (Paris).

The British Export Society.

British Industries states that Col. the Hon. F. Vernon Willey presided at the annual luncheon of this Society on May 18th. In welcoming the gathering, which consisted largely of those engaged in the export trade, Col. Willey referred to the objects of the Society which are, briefly, "to secure the more efficient marketing of British goods overseas by encouraging practical co-operation between exporters and by acting as a clearing house for the mutual exchange of ideas, information and experiences." He said he was encouraged to see what a large proportion of the younger men were members of the Society. There was a great field for its activities and energies, for he was convinced that our industrial problem had ceased to be one of production, and had become one of distribution.

An Important Indian Contract.

A £300,000 order in connection with the main-line electrification of the Great Indian Peninsula Railway (Indian State Railways) has been placed with Messrs. W. T. Henley's Telegraph Works Co., Ltd. It comprises the supply and erection of 269 miles of overhead line on lattice steel towers. The conductors, of steel-cored aluminium, are for a working pressure of 110,000 V. Two parallel double-circuit lines will be run from Kalyan power station to Kalyan, a distance of 2½ miles. From there, two parallel single-circuit lines, one on each side of the railway track, will be run in a northerly direction to Igatpuri, 50 miles away, and two parallel single-circuit lines in a southerly direction to Kirkee, 82 miles away. These lines will supply electricity to the railway from Igatpuri to Poona.

"Amplion" on the Continent.

Graham Amplion, Ltd., has sent us a list of Continental events for which the "Amplion" public speech and band repeater equipment has been or is being installed. Among these is an important tennis event at Knocke, Belgium.

Merchandise Marks Applications.

The Board of Trade has referred to the Standing Committee (General Merchandise) applications for Orders in Council to be made requiring indications of origin in the case of, *inter alia*, electric lamp-holders, wall plugs, switches, and similar household fittings and metal parts thereof. Representatives of any interests substantially affected by any of these applications who desire to be heard in opposition should communicate with the secretary to the Committee, Mr. E. W. Reardon, New Public Offices, Great George Street, S.W.1, not later than June 24th.

Unemployment.

The reduction of the number of registered unemployed to 978,200 during the week ended May 23rd brought the total to the lowest level since 1920. The decrease during the week was 28,820. The total upon the corresponding date of last year was 1,597,679, but this was just after the general strike, and the coal dispute was in progress.

Trade Discount Abuse.

The Medical Supply Association, Ltd., of Gray's Inn Road, W.C.1, informs us that it having come to its notice that a municipal electricity supply undertaking in the provinces had been abusing the wholesale discounts given to the trade by passing the benefit of such discounts on to the retail consumer, it recently wrote to the engineer objecting to this abuse. The company wished it to be distinctly understood that the trade discount was intended for the benefit of the trader, and that it was a breach of trading conditions for it to be passed on.

A Polish Offer.

The *Chamber of Commerce Journal* states that the Polish weekly journal *Prezemysl i Handel* offers to insert free of charge, under the heading of "Trade Opportunities," inquiries from British firms as to trade activities in Poland, such as offers of goods, demands for goods, agencies, &c. Those interested should address such items to the Editor of the *Prezemysl i Handel*, c/o the Polish Ministry of Industry and Commerce, Warsaw.

Irish Free State Electrical Imports.

The Irish Free State Ministry of Industry and Commerce has now issued detailed figures of imports for the whole of the past year, comparing them with 1925. From these we have compiled the appended table showing the value of the total imports of electrical machinery and apparatus into the Free State and the amount attributed to the United Kingdom as country of shipment, but not necessarily of manufacture:—

			U.K. Share.	
	1926.	1925.	1926.	1925.
	£	£	£	£
Electric wires and cables	115,545	123,620	62,848	92,367
Telegraph and telephone instruments and apparatus ...	40,430	28,691	35,788	27,909
Electric lamps and parts	56,995	58,917	52,645	56,878
Batteries and accumulators	39,014	36,418	34,575	34,048
Radio sets and parts	90,211	84,966	86,085	83,125
Other electrical goods and apparatus ...	108,054	70,703	75,462	67,455
Generators	28,953	18,042	11,665	13,822
Motors	37,822	23,465	21,090	22,811
Other electrical machinery	85,740	73,873	72,966	63,261
Totals ...	£602,764	£518,895	£453,124	£461,676

It will be seen that, with the exception of electric lamps, and electric wires and cables, the importation of all classes of goods showed a marked advance over 1925, the total representing an increase of £83,869. Of the imports £453,124, or approximately 75 per cent., came from ports of the United Kingdom, leaving £149,640 for foreign countries. Of this balance the bulk (£133,933) is credited to Germany, £4,430 to Belgium, and £11,277 to "other countries."

A French Electrical Exhibition.

Under the auspices of the Association Française pour le Developpement des Travaux Publiques and the electrical section of the Association Amicale des Anciens Elèves de l'Ecole Centrale of Paris, the fourth exhibition of electricity and its applications is to be held in that city in July next. The exhibition, of which particulars can be obtained at the Association Française, 60, Rue de Londres, Paris, will include sections for electro-chemistry, electro-metallurgy, electrolysis, &c.

A Russian Order Canard.

At a meeting of the Preston Town Council on May 16th, the bulk of unemployment in the town was attributed to the shortage of orders at the English Electric Co.'s works, and it was stated that by the abrogation of the trading agreement with Russia the company would lose an order over £2,000,000 in value. The English Electric Co., Ltd., assures us that it has no knowledge of any such order.

Local Exhibition.

Eastbourne.—The Corporation Electricity Committee has decided to hold an electrical exhibition in the Manor House grounds during the period of the forthcoming flower show.

"Putting Price in its Place."

An address bearing this title was delivered by Mr. A. F. Waller, managing director of the National Electrical Manufacturers' Association (U.S.A.), at the recent annual meeting of the Association. After illustrations of the fact that price is not the only consideration, taken from such widely-separated directions as lamp equipment and insurance, he proceeded to adapt his deductions to the electrical industry, stating that "the system described, with variations to suit, may be used in connection with buying or selling almost any kind of apparatus imaginable. I have applied it to the purchase of sand-blasting machinery, electric furnaces, electric motors, bank stock, and automobiles. It puts price in its place simply because it makes price one of a number of essential points entering into a definite transaction. When the high and low extremes in competitive bids have been established, the interest immediately centres upon the spread in price. What features exist to justify the difference? It is desirable to consider this difference not only in dollars, but in per cent. . . . On the question of the purchase or sale of material, anyone can do it who will first find out what are the essential points, and then take the trouble to get exact information in regard to them. Every salesman or sales engineer who has to sell goods in a competitive market should personally and individually compile information of this kind regarding certain key sizes of the line he handles, comparing them with the competition he has to meet. Such a study serves several purposes, among which are:—1. Informing himself as to the actual work he has in hand. 2. Selling his product to himself on an 'index' basis. 3. Development of a realisation that price in its place is only one necessary item relating to a transaction, and not the predominating feature."

Unemployment in Germany.

The Berlin correspondent of *The Times* says that the number of persons in receipt of unemployment relief in Germany on May 15th was 972,000, as compared with 1,217,000 on April 15th, a decrease of 20 per cent.

The Swedish Ericsson Company.

The report of the Telefon Aktiebolag L.M. Ericsson states that 1926 was characterised by favourable activity. The stock of orders increased from a value of 14.9 million kronen in 1925 to 19.3 millions last year, while the deliveries rose from 15.7 millions to 19.1 millions in the two years respectively, and the number of persons employed from 2,288 to 2,834. As a result of the extent of the orders, the services of the company's foreign works were utilised in a greater measure for the completion from Stockholm of deliveries to foreign customers. The foreign subsidiary and sale companies showed progress with the exception of the French works and the Polish sales company, which had to contend with specially keen competition on the part of foreign makers. The report states that the French company was unable to compete with other French works. As a consequence an agreement was made at the beginning of 1927 with one of the largest French electricity companies, which has entered as a shareholder in the Société des Téléphones Ericsson, and in connection with this step the share capital of the French company has been doubled.

Book Notices.

"Touring by Motor Coach" (100 pp. and map), Lancashire United Transport & Power Co., Ltd., price 6d.—This annual publication is an indication of the advent of summer; it contains copious notes and illustrations of beauty spots within the wide area covered by the company's services.

"Technologic Papers of the U.S.A. Bureau of Standards." Vol. 21, No. 335, "Thermal Expansion of Graphite" (5 cents).

"Electric Wiring Diagrams for Motor Vehicles." By M. A. Todd. Third Edition. Pp. iv + 241; figs. 241. London: E. & F. N. Spon, Ltd. Price, 4s. 6d. net.

"Alternating Current and Electrical Engineering," by P. Kemp. Third edition. Pp. xi+575; figs. 423. London: Macmillan & Co., Ltd. Price 15s.

Scientific Papers of the U.S.A. Bureau of Standards.—Vol. 21, No. 546, "Magnetic Reluctivity Relationship." Vol. 22, No. 547, "A Spectrophotometric Analysis of the Lovibond Glasses."

"Magneto Manual," by H. R. Langman. Pp. x + 221; figs. 85. Price 7s. 6d. net. "Domestic Electric Heating," by E. G. Solomon. Pp. vii+116; figs. 50. Price 3s. 6d. net. "Modern Ignition," by H. H. U. Cross. Pp. 144; figs. 58. Price 4s. net. London: Crosby Lockwood & Son.

A new edition (two volumes) of "Steam and Gas Turbines," by A. Stodola and L. C. Lœwenstein, is announced by the McGraw-Hill Publishing Co., Ltd., London, to appear on July 1st. The price as from that date is £3 15s. net, but for all orders placed before July 1st it will be £3.

"Dielectric Phenomena," by S. Whitehead. Pp. 176+42 diagrams. London: Ernest Benn, Ltd. Price 12s. 6d. net.

Fires.

The Times reports that the works of the Whitfield Electrical Company, Ltd., Park Street, Barnet, were destroyed by fire on June 2nd.

Fire broke out at the works of the Mirrlees Watson Co., Ltd., Glasgow, on June 5th. The outbreak originated in an open yard which was stacked with valuable patterns, and spread to four separate buildings, including a large joiners' shop The firemen prevented the flames from reaching the power station of the Corporation underground railway. No casualties are reported. The damage is estimated at £20,000.

New Swiss Company.

The Emerit Gesellschaft is the name of a new concern which has been formed at Birmensdorf, Zurich, to manufacture electrical insulating material under the patents of Herr Max Haefeli, of Basle.

Patent Application.

Application has been made for the restoration of Patent No. 193,604 of 1922, granted to F. C. Raphael, for "Improvements in electric fittings and means for fixing same.

Trade Announcements.

The London sales organisation of Newtons' Dynamo Works will, from July 1st, be removed from 219, Tottenham Court Road, W.1, the address of Messrs. Baxter & Caunter, Ltd., to 224, Shaftesbury Avenue, W.C.2, which is the office of the firm's associated company, Messrs. Joseph Lucas, Ltd. Mr. S. G. Mundy, formerly with Messrs. Baxter & Caunter, will be in charge of the organisation. The telephone number of the new address will be: Regent 8033 (three lines).

Metro-Vick Supplies, Ltd., 155, Charing Cross Road, W.C.2, announces that no deliveries of material will be made from the afternoon of June 17th until June 20th inclusive, as its London offices, stores, trade counter and showroom will be closed for annual stocktaking.

Messrs. J. Macgregor & Co. state that they have registered the name "Usym" No. 480,113 (Class 13) for the lamps supplied by them.

Messrs. Frederick Thomas & Co., Hampstead, N.W.1, have opened at 9, Charlotte Square, Newcastle-on-Tyne, a trade showroom, where a large range of their electrical fittings are displayed.

Catalogues and Lists.

Messrs. Wingrove & Rogers, Ltd. (British Electrical Vehicles), 63, Queen Victoria Street, E.C.4.—An illustrated folder depicting "B.E.V." electric locomotives and trucks in use in various parts of Australia.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, S.W.1.—June calendar-blotter, illustrating and describing the "No. 154" electric wash-boiler.

Messrs. Hugh J. Scott (Belfast), Ltd., Ravenhill Avenue, Belfast.—Stock lists of a.c. motors and d.c. motors and generators. Priced.

Messrs. Mavor & Coulson, Ltd., 47, Broad Street, Mile End, Glasgow. — June calendar-blotter advertising the "M. & C." gate-end loader for electrical or pneumatic power.

The Variable Speed Gear, Ltd., 6, Broadway, S.W.1.—An illustrated brochure describing a variable delivery pump of improved design.

Messrs. Herbert Morris, Ltd., Loughborough.—Book 33, containing illustrated particulars and prices of the company's goods-handling equipment.

Brook Motors, Ltd., Empress Works, Huddersfield.—Booklet No. 158, giving particulars and prices of "Brook" motors for mine use.

Messrs. Siemens Bros. & Co., Ltd., Woolwich, S.E.18.—Pamphlet 550A, describing some of the special features of the mounting arrangements used for selectors and relay sets in the automatic telephone equipment for London exchanges.

Hopkinson Induction Motors, Willesden Lane, North Acton, W.3.—June stock list of squirrel-cage and slip-ring motors.

Messrs. Wheeler & Sons (Engineering), Ltd., St. Stephen's House, Westminster, S.W.1.—A pamphlet describing the company's "Eleconomic" radiators. Illustrated and priced.

Philips Lamps, Ltd., 145, Charing Cross Road, W.C.2.—Leaflet No. 82, advertising the company's battery charger for high-tension accumulators. Priced.

The Mullard Wireless Service Co., Ltd., Denmark Street, W.C.2.—Four illustrated and priced leaflets dealing with the construction and performance of the company's U.15, V.U. 150, S.4 and S.6, and U.12 valves.

Z Electric Lamp & Supplies Co., Ltd., 73, Newman Street, Oxford Street, W.1.—A list announcing reduced prices of the company's wires and cables.

Messrs. Marelli & Co., Ltd., 19 and 20, Garlick Hill, Queen Victoria Street, E.C.4.—Pamphlets Nos. L/711, 722, and 733, describing many examples of the company's fans, including domestic, office, cabin, railway carriage and other types.

The Marconiphone Co., Ltd., 210-212, Tottenham Court Road, W.1.—A coloured poster announcing the company's new 2-V valves. Priced.

The Runbaken Magneto Co., Tipping Street, Ardwick, Manchester.—A priced and illustrated leaflet describing two radio battery chargers (a.c. type).

THE CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, near Manchester.—Publication No. 86/8, dealing with the use of batteries in connection with "safety lighting" in kinemas. Also a blue and sepia photogravure poster advertising "Exide Monobloc" batteries.

THE L. P. S. ELECTRICAL CO., LTD., Avenue Road, Acton, W.3.—A pamphlet illustrating the company's universal test and battery clips. Priced.

THE ATHOL ENGINEERING CO., Seymour Road, Crumpsall, Manchester.—A circular letter announcing reductions in the prices of various radio components.

MESSRS. BAXTER & CAUNTER, LTD., 219, Tottenham Court Road, W.C.2.—June price list of electrical equipment and accessories of numerous types, including domestic appliances.

THE LONDON ELECTRIC WIRE CO. & SMITHS, LTD., Playhouse Yard, Golden Lane, E.C.1.—A list announcing reduced prices of "Litz" wire of various sizes.

THE AEROGEN CO., LTD., 36, Bolsover Street, Great Portland Street, W.1.—An illustrated brochure dealing with the "Kiesselbach" high-pressure thermal storage for boiler plant. The company holds the sole licence for the manufacture and sale of the plant in this country.

THE HART ACCUMULATOR CO., LTD., Stratford, E.15.—June calendar blotter advertising the company's batteries.

Bankruptcy Proceedings.

FRANCIS HUSBAND, "The Hollies," Sandpit Lane, St. Albans, engineer.—The public examination of this debtor was held recently at the Court House, St. Albans. The statement of affairs showed gross liabilities of £4,109, of which £4,074 was expected to rank, while the assets, estimated to realise £35, were all absorbed by preferential claims. Debtor attributed his failure to liability under guarantees on behalf of a limited company, judgments obtained against him under a building contract entered into by his wife, expenses of his wife's illness, bad debts and unemployment. In 1915 he and another formed a limited company with a nominal capital of £1,000 to carry on business as electrical engineers and manufacturers, debtor being allotted 700 £1 shares partly for £350 cash and partly as consideration for services to be rendered; he was appointed managing director of the company. In February, 1920, the concern went into voluntary liquidation. It had been successful at first, but later a slump occurred. Debtor was liable for debts amounting to £3,134 as guarantor on behalf of the company. The liquidator had stated that the assets of the company had been insufficient to meet the debenture holder's claims. Debtor said that between 1921 and 1926, with the exception of a few months' employment as an engineer, and while he was engaged on a contract for the supply of switchboards, he was without remunerative employment. In July, 1926, judgment was obtained against him for the balance of the purchase price of his house, which had since been taken possession of by the mortgagees. He regarded the purchase of this house as his wife's transaction. In November, 1926, a further judgment was obtained against him. The examination was adjourned.

L. BELL, trading as Charles Bell, Joseph Street, Bradford, mechanical and electrical engineer.—The public examination of this debtor was held recently at the County Court, Bradford. The statement of affairs showed ranking liabilities of £3,067, and there was a deficiency of £1,360. Debtor attributed his failure to bad trade, the coal strike, and insufficient capital. He stated that he commenced working with his father and uncle as mechanical and electrical engineers. For two years during the war he worked at various shell-filling factories, and on the death of his uncle returned to the firm. Subsequently the business was formed into a limited company with a nominal capital of £15,000. In February, 1926, the company went into voluntary liquidation and a dividend of 7s. 6d. in the £ was paid. Debtor then took over the stock, machinery and plant from the liquidators and commenced business on his own account. To enable him to pay the purchase price his father advanced him £1,680 on loan. He had since borrowed a further £150 from his father. During his trading the business showed a net loss of £184, and he became aware of his position early in January last. The examination was adjourned.

A. L. WEEKES, 13, Crescent Road, Luton, electrical engineer. The public examination of this debtor was held recently at the Court House, Luton. The statement of affairs showed liabilities of £527 and a deficiency of £524. Debtor stated that he commenced business on his own account in 1905, raising about £6,000 on a reversionary interest. In 1916 the business was formed into a company with an authorised capital of £10,000. Debtor realised the whole of his personal estate to pay off a bank overdraft of £10,000 in 1924, and the company then went into voluntary liquidation. The business was sold for £4,500, and the company was afterwards reconstructed. Debtor was appointed managing director, but subsequently he left that position. The examination was adjourned.

E. G. BATT, electrical engineer, 20, Iverna Gardens, Kensington, and Magnet House, Kingsway, W.C.—This bankrupt, who failed last November, applied on June 1st at the London Bankruptcy Court for an order of discharge. Mr. Walter Boyle, Senior Official Receiver, reported that the provable debt amounted to £2,911, and no assets were disclosed. The applicant, except from 1916 to 1919, when he was serving in the army, had been employed since 1915 as engineer to an electrical company, at a salary latterly of £720 per annum. He attributed his insolvency to his own personal extravagance. The application was opposed by the Official Receiver on statutory grounds, including unjustifiable extravagance in living. After hearing Mr. Stable on behalf of the bankrupt, Mr. Registrar Warmington granted an immediate discharge subject to a judgment for £300, to be satisfied by a cash payment and revoked an existing order under which the bankrupt had to pay £100 per annum for the benefit of the creditors.

E. MACKINTOSH, electrical engineer, 57, Broughton Road, Edinburgh.—The estates of the above-named debtor were sequestrated by the Sheriff of Peebles on May 23rd; a meeting to elect a trustee and commissioners was held at 18, George Street, Edinburgh, on June 1st. Particulars of claims by September 23rd. Mr. R. F. Calder, agent, 12, Gayfield Square, Edinburgh.

E. M. LANCASTER, electrical engineer, 21, Hanover Lane, Leeds.—First meeting June 13th, at the Official Receiver's office, 24, Lower Bond Street, Leeds; public examination, June 28th, at the County Court House, Leeds.

H. L. SMITH, electrician, 156, Tredegar Road, Bow, E.—Application for discharge to be heard at Carey Street, W.C., on June 28th.

J. F. LYONS, electrical engineer, 25, Palmerston Street, and Front Street, Consett, Durham.—Trustee, Mr. C. Woollett, Official Receiver, Pearl Buildings, 4, Northumberland Street, Newcastle-on-Tyne, released July 27th, 1926.

B. G. THOMPKINS, radio engineer, Armstrong's Buildings, Stanley, Durham.—Trustee, Mr. R. W. Cave, Official Receiver, 81, St. Mary's Place, Newcastle-on-Tyne, released May 26th.

F. LENG (F. Leng & Co.), electrical and mechanical engineer, 12, Godstone Road, Rotherham.—First meeting to be held to-day (Friday) at the Official Receiver's offices, Figtree Lane, Sheffield. Public examination, July 7th, at the County Court Hall, Sheffield.

W. K. COXON (separate estate), trading with E. R. Weare as Western Manufacturing Co., wireless apparatus manufacturer, Nurshill, Lydney, Glos.—First and final dividend of 4s. 2½d. in the £ payable June 20th at 78, New Oxford Street, W.C.1.

G. C. LAZENBY, wireless engineer, 29, Old Town Street, Plymouth.—Receiving order made June 2nd, on debtor's own petition.

Company Liquidations.

CONRADI & BRAUN, LTD., radio manufacturers, 52, Theobald's Road, W.C.1.—A meeting of creditors was held on May 31st at the offices of Messrs. Fincham, Partridge and Co., 3, Warwick Court, Gray's Inn, W.C. Mr. F. W. Fincham, the liquidator in the voluntary liquidation of the company, reported that the liabilities were £1,181, all due to unsecured creditors. There were net assets of £1,137, leaving a deficiency, so far as the creditors were concerned, of £44. The company was registered in March, 1925, with a capital of £3,000, and acquired a business previously carried on by Mr. Braun. The assets were valued at £4,493, including £1,000 for goodwill. The liabilities were £1,495, leaving a surplus of £2,998. The company agreed to discharge the liabilities and the vendor was allotted fully-paid shares of the value of £2,998. The company continued the business and had had a fairly good turnover. Accounts for the period from October, 1924, to July, 1925, showed sales of £8,500 and a gross profit of £1,717. During the 12 months to July, 1926, the sales were £11,900, and the gross profit £2,964. Since August 1st of last year the sales had fallen off, and had only totalled £6,600, with a gross profit of £965. After allowing for all the expenses, there was a total net loss of £1,335. In May, in order to safeguard the assets, a resolution for voluntary liquidation was passed. There were only two shareholders, Mr. L. F. Braun and Mr. F. S. Conradi; they had been directors since the inception of the company. The chairman stated that the creditors would receive a substantial dividend, and the assets were not charged in any way. He did not think that there was any possibility of selling the business as a going concern. He proposed to close down the establishment at the end of that week, and realise the assets as quickly as possible. It was decided to confirm the voluntary liquidation of the company, with Mr. Fincham as liquidator.

SPRINGFIELD ELECTRIC MOTORS, LTD.—A meeting of members is called for July 1st at the offices of Messrs. Hepworth and Chadwick, 14, Butts Court, Albion Street, Leeds, to hear an account of the winding up from the liquidator, Mr. V. Walton.

S. M. F. ELECTRICAL SUPPLIES, LTD.—A meeting of members is called for July 2nd at 43, Oozells Street North, Birmingham, to hear an account of the winding up from the liquidator, Mr. E. J. Milton.

Yates & Thom, Ltd., Blackburn.—A resolution for the voluntary liquidation of the company was passed at a meeting of shareholders on May 31st; a liquidator is to be appointed at a confirmatory meeting to be held at the end of this month. The chairman, Sir William Thom, said that the company would pay 20s. in the £ to creditors, shareholders, and stockholders. It is stated that the company intends to pay off the preference shares on June 30th, and at the same time to pay 10s. on account to the ordinary shareholders.

Correcta Light Co., Ltd.—Winding up voluntarily. Liquidator, Mr. C. A. Charlier.

Electrical Wholesale Supplies (Leicester), Ltd.—Winding up voluntarily. A meeting of creditors is called for June 14th at the offices of the liquidator. Particulars of claims by June 30th, to the liquidator, Mr. J. A. Hopps, 25, Friar Lane, Leicester.

Private Arrangements.

T. C. Price, wireless dealer, Horse Street, Dowlais, Glam.—A meeting of creditors was held on May 26th, when the representative of the General Electric Co., Ltd., was elected to the chair. The statement of affairs presented showed ranking liabilities of £621 and assets of £165, leaving a deficiency of £456. The debtor commenced business as an electrician in 1923, and later started a wireless business. During the year ended May, 1926, his turnover was £1,700, whilst during the year to May last the sales were £1,409. The expenses had aggregated approximately £600 per annum, that figure including drawings of £270. Debtor's wife and mother-in-law were shown as cash creditors, but it was stated that their claims would probably be withdrawn. A recent fire caused damage to the extent of about £45, but only £20 was received from the insurance company. A deed of assignment had previously been executed. On behalf of the debtor an offer was made of a composition, and a resolution was passed agreeing to accept 10s. in the £, payable in three instalments. It was also decided that Messrs. S. E. Clutterbuck and J. Williams should be appointed joint trustees, with a committee consisting of the representatives of the General Electric Co., Ltd., the South Wales Wireless Co., and Messrs. Capel and Co. The following are creditors:—

	£		£
Siemens Bros. & Co., Ltd.	23	Marconiphone Co., Ltd.	34
South Wales Wireless Co., Ltd.	44	Houghton-Butcher, Ltd.	24
Sloan Electrical Co., Ltd.	45	General Electric Co., Ltd.	39
Oldham & Sons, Ltd. ...	29	Brown Bros., Ltd. ...	37

Edward Pincott, trading as E. Pincott & Co., electrical and wireless engineers, 91, Queen Street, Exeter.—A meeting of creditors was held recently at the offices of Messrs. Popplejon, Appleby & Hawkins, 4, Charterhouse Square, E.C., when an approximate statement of affairs was submitted by Mr. E. H. Hawkins, which showed liabilities to the trade of £2,084, and cash creditors for £401. The net assets were £1,155. It was stated that three suppliers had levied execution, whilst other proceedings were threatened. A deed had been executed to Mr. Hawkins to protect the assets. The debtor attributed his present position largely to losses which he sustained on a branch business at Taunton, which had now been disposed of. The debtor estimated those losses at approximately £700, and he had also suffered through ill-health during the last three years. The cash creditors were relatives, and their claims would be withdrawn if the estate was dealt with under the deed. A resolution was passed confirming the deed with Mr. Hawkins as trustee, whilst a committee was also appointed, consisting of the representatives of the Chloride Electrical Storage Co., Ltd., the Sloan Electrical Co., Ltd., and Callender's Cable and Construction Co., Ltd. The following are creditors:—

	£		£
Sloan Electrical Co., Ltd.	156	General Electric Co., Ltd.	42
Siemens Bros. & Co., Ltd.	53	S. G. Brown, Ltd. ...	48
W. C. Hands & Sons ...	21	Walsall Hardware Mfg. Co., Ltd.	88
British Thomson-Houston Co., Ltd.	27	S.T. Valves, Ltd. ...	25
Granic Electric Co., Ltd.	26	Chloride Electrical Storage Co., Ltd.	302
Automobile Accessories, Ltd.	94	Callender's Cable & Construction Co., Ltd. ...	153
Metro-Vick Supplies, Ltd.	31	Falk, Stadelmann and Co., Ltd.	62
Wholesale Fittings Co.	150	Simplex Conduits, Ltd.	118

G. R. Hinks, 74, Gravelly Hill North, Erdington, Birmingham, wireless dealer, &c.—At a recent meeting of creditors a statement of affairs was presented which showed liabilities of £381 due to unsecured creditors, and net assets of £83, leaving a deficiency of £298. It was stated that the debtor was at one time in the employ of a firm of wholesale dealers in Birmingham, but started trading on his own account in February, 1925, with little or no capital. The profits had not been sufficient to meet the expenses. In addition to the business, the debtor had been travelling on commission. He had been pressed by creditors, and in order to protect the estate a deed of assignment had already been executed to Mr. F. Sharratt, C.A., 174, Corporation Street, Birmingham. The business had been advertised for sale, and it was hoped that it would be disposed of at a figure which would allow of a reasonable dividend being paid to the creditors. The deed already executed was confirmed.

J. Murray Young, electrical engineer, 9, Foundry Lane, Perth.—A meeting of creditors was held recently at the offices of Mr. J. T. Douglas, solicitor, Perth, when a statement of affairs was submitted which disclosed liabilities of £401 and net assets of £94, leaving a deficiency of £307. The statement therefore showed an apparent dividend of 4s. 8d. in the £, subject to expenses of realisation, &c. It was stated that a trust deed had already been executed by the debtor, and it was decided to confirm it. A committee of inspection was also appointed, consisting of Mr. C. E. P. White (representing Messrs. Frew & Co., Ltd., Perth), Mr. J. McDavid, and Mr. R. Scott Dempster.

Dissolutions of Partnership.

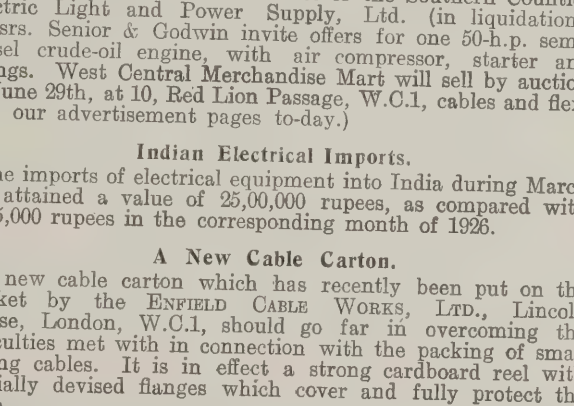
Green Lane Wireless Stores, retailers of wireless apparatus and accessories, 54, Green Lane, Derby.—Messrs. P. and F. W. Whitehead have dissolved partnership. Mr. F. W. Whitehead will attend to debts and continue the business.

Alan Bantock & Co., electrical contractors, 34, Greenside Road, Shepherd's Bush, W.12.—Mr. A. Bantock, Mr. W. Henson, and Mr. T. E. Russell have dissolved partnership. Mr. Bantock will attend to debts and continue the business.

Ackerman & Crawford, electrical and mechanical engineers, 32, Hockliffe Street, Leighton Buzzard.—Mr. A. C. Ackerman and Mr. R. K. Crawford have dissolved partnership.

For Sale.

By order of the Official Receiver of the Southern Counties Electric Light and Power Supply, Ltd. (in liquidation), Messrs. Senior & Godwin invite offers for one 50-h.p. semi-Diesel crude-oil engine, with air compressor, starter and fittings. West Central Merchandise Mart will sell by auction on June 29th, at 10, Red Lion Passage, W.C.1, cables and flex. (See our advertisement pages to-day.)



Indian Electrical Imports.

The imports of electrical equipment into India during March last attained a value of 25,00,000 rupees, as compared with 25,65,000 rupees in the corresponding month of 1926.

A New Cable Carton.

A new cable carton which has recently been put on the market by the Enfield Cable Works, Ltd., Lincoln House, London, W.C.1, should go far in overcoming the difficulties met with in connection with the packing of small wiring cables. It is in effect a strong cardboard reel with specially devised flanges which cover and fully protect the cable.

The flanges have slightly flexible cardboard rims, each extending half the distance between the two flanges, with rolled edges meeting in the centre and forming "lips." The rims are placed at right angles to the flanges, and have sufficient resilience to ensure a dust-tight joint at their meeting edges,

"Enfield" Cable Carton.

while allowing the easy withdrawal of the wire. As the cable is fed out the "lips" close, the unwound length being retained on the reel, and remaining always under cover of the rims. The cable draws out without kinking, and each turn is centralised on the reel as it is drawn out. It is claimed that it is impossible for the wire to become entangled by several turns slipping the reel and causing an unnecessary quantity of wire to slack off. The carton is sent out with an outer protecting wrapper around the rims, which the wireman simply tears off. Each carton carries a black or red label, according to the colour of the cable inside.

Prices of Raw Materials.

Messrs. F. Smith & Co. report, June 8th:—Copper (electrolytic) bars, £60 10s., 5s. inc.; ditto ditto sheets, no change; ditto ditto wire rods, £70 10s., 5s. inc.; ditto ditto h.c. wire, 8 15/16d., 1/16d. inc.

Messrs. James & Shakespeare report, June 8th:—No change in the prices of copper bars (best selected), sheet and rod; English pig lead, £26 10s., 15s. inc.

Messrs. Edward Till & Co. report, June 8th:—No change in the price of India-rubber, Para fine.

Lighting and Power Notes.

Australia.—BRISBANE (Q.).—The report on the working of the City Council's electricity undertaking (general manager: Mr. J. H. Hindman) for the year ended December 31st, 1926, shows a total revenue of £163,496, and expenditure, including interest, depreciation and renewals, of £141,646, leaving a net surplus of £21,850. The greater portion of the energy required is obtained in bulk from the Brisbane City Electric Light Co., Ltd. The sales of electricity amounted to 7,231,607 kWh, and the average price obtained was 5.453d. per kWh. During the year 12 miles of h.p. and 40 miles of l.p. mains were erected and 21 distribution transformers installed, increasing the total capacity to 1,825 kVA. A publicity department was inaugurated during the year with a view to increasing the demand for supply, and a deferred payment system was introduced.

Barrow.—ELECTRICITY EXTENSIONS.—At a meeting of the Town Council on May 31st it was reported that the Electricity Commissioners had not only sanctioned the extension of the Corporation electricity works, at a cost of £60,000, but had now sanctioned the loan. The £60,000 is made up as follows:—6,000-kW turbo-alternator, switchgear, pipework, and auxiliary plant, £30,000; boiler and auxiliary plant, £16,750; coal-handling plant and bunkers, £3,000; cooling tower and foundations, £2,000; pipework, £2,500; engine-room cranes, £750; contingencies, £5,000.

Birkenhead.—LOANS SANCTIONED.—The Corporation Electricity Committee has received sanction to the following loans:—£1,979 for the provision of a transformer station at Moreton; £1,495 for a transformer station at the Plymyard Estate, Eastham, and £5,558 for kiosks, transformers, and switchgear.

MAINS EXTENSIONS.—The Committee is to carry out extensions of mains at a cost of £3,845.

Blackburn.—INQUIRY.—In view of Dr. S. L. Pearce's inability to conduct the proposed inquiry into the administration of the Electricity Department, the Corporation has invited Mr. A. H. Dykes, consulting engineer, to do it.

Burnley.—ELECTRICITY SUPPLY.—The borough electrical engineer has been authorised to lay an e.h.p. feeder from the sub-station to the kiosk at Habergham Pit at an estimated cost of £3,200, and a feeder from the sub-station to Stephenson Street, at an estimated cost of £540.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—The Montreal Island Power Co., Ltd., has been formed for the purpose of developing a water-power site on the Rivieres des Praires, about seven miles from Montreal. With a head of 26 ft., it is estimated that the plant to be constructed will be capable of developing 65,000 h.p. Work on the new plant will be started at once, and 40,000 h.p. will be available for delivery by the end of 1929. The output will be increased to 65,000 h.p. as required. All distribution problems have been eliminated by a long-term contract with the Montreal Light, Heat and Power Consolidated for purchase by this company of all power available.

Continental.—LUXEMBURG.—From the recently-issued report of the Compagnie Luxembourgeoise d'Electricité, principal attention was given last year to the construction of h.p. transmission lines for electricity supply in the Belgian provinces of Namur and Luxemburg. In the Namur province the main transmission line between On and Monceau, about 32 miles, is now in operation, together with three branches, totalling about 18 miles. In Luxemburg province a line is in use between On and Champlon, a distance of nearly 25 miles, together with four branches aggregating 13 miles. It is expected that the erection of the h.p. lines will be completed this year, and the company is now laying the l.p. distribution system.

BELGIUM.—In the recently-issued annual report of the Société des Centrales Electriques des Flandres, the directors state that as a result of the satisfactory results obtained with the experimental high-pressure boiler and turbine installed some time ago at Langerbrugge, they have decided to alter the whole of the steam-raising plant to the high-pressure system. With this object in view they have given orders for three boilers each capable of producing 99,000 lb. of steam per hour at a pressure of 796 lb. per sq. in., and at a temperature of 450 deg. C., and a first-stage single-casing turbo-generator of 66,000 kW capacity, at 3,000 r.p.m. The steam from this turbine will be afterwards utilised in three existing 284-lb. per sq. in. 6,600-kW turbo-generators. When the new plant is installed the Langerbrugge power station will have a total capacity of 38,000 kW, and its steam efficiency will be about 23 per cent.

BULGARIA.—The General Council of Tirnovo has decided to arrange an international competition for the electrification of the department of Tirnovo. Special attention will be paid to the question of cost and the system of electrification. Detailed regulations for the competition are being prepared, and projects must be received before January 1st, 1928. Two prizes will be awarded.—*Reuter's Trade Service* (Sofia).

Doncaster.—LOAN SANCTIONED.—The Electricity Commissioners have sanctioned the borrowing by the Town Council of £5,951 for sub-station building, mains, services, plant and meters.

Epsom.—LOAN SANCTIONED.—The Urban District Council has received sanction to a loan of £3,100 for laying mains on the Horton housing estate.

Eastbourne.—ELECTRICITY SUPPLY.—The Corporation Electricity Committee has received a letter from the Electricity Commissioners intimating that, as the result of further consideration, they are not satisfied that the proposal to lay a single-phase, 11,000-V main is one which can be approved. They state that, having regard to the developments which will take place in the course of the next two or three years they are of opinion that the Council should provide for a 3-core ring main in order to bring its system into line with modern practice, and introduce a 3-phase system of supply. The Committee has decided to inform the Commissioners that it is prepared to recommend the adoption of a 3-core main and that, having regard to the urgency of the matter, they be asked to sanction the borrowing of the amount required for the h.p. cable for the ring main, *viz.*, £10,413, as soon as possible, and that the electrical engineer submit a revised application on the lines indicated.

Grampian Electricity Scheme.—EXTENSION OF TIME.—The *Financial News* reports that the Grampian Electricity Supply Co. has presented a petition to the Secretary of State for Scotland asking him to issue a Provisional Order extending for five years, from August 4th next, the time stipulated in 1924 within which the company must acquire the necessary land in the counties of Perth and Inverness for the construction of the generating stations and other works required for the completion of the Grampian Electricity Scheme.

Guildford.—LOANS.—The Corporation Electricity Committee is applying for sanction to the borrowing of the following sums:—Mains, £7,500; meters, £2,500; public lamps, £500.

Haslingden.—BULK SUPPLY CHARGE.—The Corporation has asked for a reconsideration of the price charged by Accrington for electricity supplied in bulk. Mr. Clegg (borough electrical engineer) is conferring with the officials concerned regarding the terms of the existing agreement.

Isle of Wight.—REVOCATION OF ORDER.—The Minister of Transport has revoked the Newport, Ryde and Sandown, and Shanklin Electricity (Bulk Supply) Special Order, 1925, the revocation to take effect from May 27th.

Leeds.—NEW ELECTRICITY CHARGES.—The Corporation Electricity Committee has recommended the following new charges for electricity for heating purposes:—First 2,000 kWh per quarter, 1½d. per kWh; next 1,000 kWh, 1½d.; next 2,000 kWh 1d.; over 5,000 kWh 0.9d. per kWh.

PROPOSED SUBWAYS.—At a joint meeting of the Corporation Committees consideration was given to a proposal to construct subways to carry the cables and pipes of all the city's services and it was decided that the city engineer should obtain information on the subject.

London.—LEWISHAM.—The Borough Council has accepted the offer of the South Metropolitan Electric Light & Power Co. to install electric lighting at 34 houses at Grove Park and for public lighting. Each house is to have a prepayment meter, and the charges are to be 6d. per kWh, or 8½d. per kWh inclusive of rental of wiring, plain fittings, lamps, and one heating plug, or 1½d. per kWh with complete wiring fittings, &c., and an additional charge per week of 1s. 2d. for a five-roomed house, and 1s. 1d. for a four-roomed house. For street lighting the charge is to be £4 15s. per 80 c.p. lamp per annum.

ST. MARYLEBONE.—The Borough Council has received sanction to the borrowing of £8,400 for transformers and switchgear.

KENSINGTON.—The Highways Committee of the Borough Council has renewed an agreement with the Notting Hill Electric Lighting Co., Ltd., for the supply of electrical energy for the lighting of street lamps at the rate of 1½d. per kWh for the period up to 1931. The Committee has also considered further extensions of electric street lighting and has recommended arrangements for the conversion from gas to electricity of an additional 396 lamps in the borough.

Manchester.—YEAR'S WORKING.—We have received from Mr. H. C. Lamb, chief electrical engineer and manager of the Corporation electricity undertaking, a copy of the abstract of accounts and report on the working of the undertaking for the year ended March 31st last. The total revenue amounted to £1,643,137, as compared with £1,426,238 in the preceding year. Working expenses increased from £789,313 to £984,107, for which the coal dispute was largely responsible, leaving a gross surplus of £659,031 (£636,925). From this surplus the following charges had to be met:—Interest, £256,199; sinking fund, £286,465; income tax, £75,708. The net profit was therefore £40,659, as compared with £32,857 in 1925-26. The capital expenditure during the year amounted to £524,441, the chief items being £329,030 for mains, and £84,692 for transformers and distributing stations. The total now expended on the undertaking stands at £9,141,156. The sales of electrical

energy increased from 300,440,765 to 323,547,741 kWh, and the electricity not accounted for amounted to 59,292,019 kWh, or 14.41 per cent., of the total generated (411,475,210 kWh). The maximum supply demanded was 140,860 kW, an increase of 4,750 kW. The average price obtained per kWh showed a slight increase from 1.12d. to 1.20d. No additions were made to the plant at Barton power station, but substantial advancement was made on preparatory work for the extensions now in progress, which will include a 40,000-kW turbo-alternator. Five new sub-stations were put into commission during the year, and extensions were carried out at 18 other stations. The mains laid amounted to 56 miles, bringing the total to approximately 820 miles. Good progress was made in the development of the cooker hiring scheme, and the number of cookers installed during the year was 1,533, bringing the total up to 3,029.

PROGRESS DURING APRIL.—During the month of April the electricity undertaking showed an increase in connections of 3,136 kW, bringing the total to 319,744 kW; and the number of applications received for supply, including consumers for additional supplies, was 964, representing a total of 2,771 kW. The number of hired cookers connected increased by 146, bringing the total actually on circuit to 3,175. Applications for the hire of cookers totalled 131. Two new sub-stations were put into commission at Blackley and at the works of Messrs. R. & J. Dempster, Ltd., and additional plant was installed at three existing stations.

Newark-on-Trent.—ELECTRICITY AGREEMENT.—The Town Council has entered into an agreement with Messrs. Ransome and Marles Bearing Co., Ltd., to supply a minimum of 850,000 kWh per annum.

New Zealand.—MANGAHAO SCHEME.—The *Electrical Engineer of Australia and New Zealand* states that interesting figures illustrating how the demand for electricity is growing in New Zealand appear in a recent issue of *Board and Council*. They refer to the Mangahao scheme, but may be taken as typical of conditions throughout the Dominion. So great has been the success of the scheme that the estimated power demand at the end of five years has already been exceeded, though the first bulk supply was commenced less than three years ago. These demands have severely strained the capacity of the Mangahao hydro-electric station, particularly as the season has been dry and the full water storage is not yet complete. At certain periods the station has had to be assisted by the steam plant of the Wellington City Council and by crude oil plants run by some of the local authorities.

Oldham.—LOANS—The Corporation Electricity Committee is applying for sanction to the following loans:—Superstructure, £36,575; structural steelwork, £19,500; switchgear, £41,000; economisers, £27,300; overhead travelling crane, £3,100; miscellaneous, including engineering, architects', and legal charges, £15,000; civil engineering work being carried out by direct labour—expenditure to March 25th, 1927, £8,500.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—YORKTOWN AND BLACKWATER.—*The Yorktown and Blackwater Gas and Electricity Co.*—Power: Reduced to a flat rate of 4½d. per kWh.

HEYWOOD.—The charges for electricity have been reduced to those prevailing prior to the coal dispute.

Sheffield.—ELECTRICITY EXTENSIONS.—During May the Electric Supply Committee approved extensions of mains for general distribution purposes at a cost of £11,032.

Shipley.—INAUGURATION OF PLANT.—The new plant which has been installed at the Urban District Council's electricity works is to be formally inaugurated on June 30th.

South Africa.—CAPE TOWN.—According to the *South African Engineer*, the City Council has given its approval to a proposal by the Electricity Supply Commission to build a small hydro-electric generating station near sea level almost immediately below the Steenbras waterworks tunnel exit at Gordon's Bay. This will be fed into the Commission's rural supply transmission system at its sub-station at the Cape Explosives Works, Somerset West. The station will probably contain, in the first instance, three 600-kW sets. The Commission will bear all costs involved in putting the scheme to operation.

The authority of the ratepayers has been received to raise a loan of £500,000 for extensions to the city electricity undertaking during the ensuing three years. The loan is made up as follows:—Land and buildings, £30,000; machinery, £77,750; distribution, £382,250.

South-East Lancashire Electricity Advisory Board.—GLOSSOP.—The Engineering Advisory Committee has received communication from the Glossop Urban Electric Supply Co., Ltd., regarding a proposal to obtain a bulk supply of electricity, and has recommended the company to approach the Mossley, Hyde, Mossley, and Dukinfield Tramways and Electricity Board for a bulk supply.

FRINGE ORDERS.—The Board has been recommended to support the applications for Fringe Orders by Altrincham Electric Supply, Ltd., to supply in Ringway, and Buxton Corporation to supply in Chapel-en-le-Frith.

LEIGH BULK SUPPLY.—The Lancashire Electric Power Co., Ltd., proposes to lay a 33,000-V cable from Hill Top sub-station to a sub-station to be erected at Kirkhall Lane, for the purposes of supplying electricity in bulk to Leigh Corporation. The estimated cost of the scheme is £42,450, made up as follows:—Cable, £32,000; switchgear at Kirkhall sub-station, £3,200; two 4,000-kVA transformers, £6,000; sub-station building, £1,250. The Engineering Advisory Committee has recommended the Board to approve the proposal.

NEW MILLS.—Application is being made by the New Mills Urban District Council for a Special Order to supply electricity in its area, and the Board has been recommended to support the application.

STOCKPORT.—The Committee has received a report from Stockport Corporation on proposed extensions to its Millgate power station. The report states that the Millgate site is capable of being developed to a capacity of from 130,000 to 140,000 kW. The cost of the first section is estimated at £257,620, and would include one 25,000-kW turbo-alternator and four 50,000-lb. boilers. This section would raise the capacity of the station to 57,000 kW. The estimated cost of the whole extensions is £900,000. The Committee has requested the Corporation to furnish particulars which are usually submitted by undertakers in connection with applications for extensions and new stations, and has decided to inspect the station. The minutes of the proceedings of the Engineering Advisory Committee have been approved by the Board.

Special Orders.—Application has been made to the Electricity Commissioners by the Silsden Urban District Council to amend the Silsden Special Order authorising the Council to take over from the Yorkshire Electric Power Co. the supply of electricity in the area outlined in the Order.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising Scarborough Corporation to supply electricity in the urban districts of Scalby and Filey and the rural district of Scarborough, and Chester City Council to supply in the urban district of Tarwin and part of the rural district of Tarwin.

Staveley.—NEW PLANT.—The Staveley Coal and Iron Co. last week installed the second of three 7,000-h.p. gas engines for the generation of electricity for private and public use in the district. Each engine will generate 5,000 kW, and is driven by blast furnace gases, while the exhaust gases are used for producing steam.

Stoke-on-Trent.—ELECTRICITY SUPPLY.—The Corporation Electricity Committee has agreed to give Messrs. Johnson Bros., Ltd., a 3-phase supply at the Imperial and Hanley Potteries, and to lay a 4-core distributor from Franklyn Street sub-station at a cost of £1,300.

The Committee has had correspondence with Mr. T. Riley, electrical contractor of Tunstall respecting a supply to Basford Hall estate, and has decided to lay the necessary mains to the houses subject to the payment by owners or occupiers of £15 per house.

Stourport.—STATION INAUGURATION.—The new generating station of the Shropshire, Worcestershire and Staffordshire Electric Power Co., which is described elsewhere in this issue, was formally inaugurated on June 2nd by the Prime Minister, in the presence of about 1,500 people, who included all the members of the Central Electricity Board and many other distinguished engineers. On arrival of the special train from London the visitors found the town beflagged for the occasion. Following his speech of welcome, Mr. E. Garcke, chairman of the company, presented Mr. and Mrs. Stanley Baldwin with souvenirs of the occasion. The Premier, in the course of his address said: "It has been one of the dreams of my life for many years to see electricity brought into our rural districts in the hope that one day we may find, at any rate, parts of England where electricity plays as great a part in the daily life of the poorest people as it does in Sweden and Switzerland. Apart from cheap production, the chief difficulty lies in bringing together producer and consumer. The country people must be told what electricity can do for them."

Mr. Baldwin described the new station as an integral part of the scheme approved by the Electricity Commissioners for the South-West and Midland districts. The next scheme of the Electricity Board would deal with Central England—a difficult district because it contained highly industrialised portions and an enormous rural area. He was told that the supply from Stourport would go as far as Cheltenham and Tewkesbury, Gloucester, and the Forest of Dean. That would be a natural link with the great industrial area of South Wales, and Stourport would be an essential part of the main arterial system of transmission which must be constructed from end to end of Great Britain.

Sir John F. C. Snell, chairman of the Electricity Commission, and Viscount Ednam also spoke. The proceedings were amplified by B.T.H. loud-speakers and broadcast by the B.B.C. The band of the 8th Battalion of the Worcestershire Regiment provided music during the afternoon, and tea was served in marquees on the lawn.

Tramway and Railway Notes.

Blackburn.—FARES.—The Corporation Tramways Committee has decided to inaugurate as an experiment penny fares for a period of six months on all sections of the tramway.

Continental.—SWITZERLAND.—The directors of the Berne-Neuenburg railway have decided on the electrification of the line. To finance the work the authorities of the Canton of Berne are providing a loan of £88,400, and the Swiss Government one of £136,000, while several other cantonal and local authorities are assisting in the scheme.

Glasgow.—NEW CARS.—The Corporation Tramways Committee has asked the manager, in preparing the specification for the construction of the 50 new cars to be purchased, to confer with the deputation appointed to inspect various tramway systems, and thereafter submit the specification to the sub-committee.

Gravesend.—PROPOSED ABANDONMENT OF TRAMWAYS.—In connection with the proposal of the Gravesend and Northfleet Electric Tramways, Ltd., to abandon the tramways in Gravesend and Northfleet and substitute motor-'buses, Mr. H. H. Brown, town clerk of Gravesend, has had interviews with the representatives of the company with regard to the reinstatement of the roads, &c., and the Highways Committee has recommended that the company be informed that the local authorities are not prepared to consider any offer involving preferential treatment for running of 'buses and adhere to their refusal to accept the company's offer of £2,500, and that if this is its final word they will have no alternative but to lodge a petition against the confirmation of the Provisional Order.

Leeds.—TRAMWAY SCHEME.—The Corporation Tramways Committee is considering a scheme for the construction of sleeper tramway track in lieu of the existing paved track in York Road from Harehills Lane to East End Park.

YEAR'S WORKING.—The accounts of the Corporation tramway undertaking for the year ended March 31st last show a net surplus of £50,736.

Manchester.—YEAR'S WORKING.—We have received from Mr. H. Mattinson, general manager and chief engineer of the Corporation tramway undertaking, a copy of the annual report, together with the abstract of accounts for the year ended March 31st last. The revenue account records a total income of £1,757,522, as compared with £1,787,711 in the preceding year, the decrease being due to the general strike, which was responsible for a loss in revenue of £46,000, and an estimated actual net loss of £26,000. The working expenditure amounted to £1,451,659, as against £1,395,192, leaving a gross profit of £305,863 (£392,519), to which was added interest on investments, &c., unemployment grants, and a balance from the Parcels Department, making a total of £335,814. There was a deficit on the motor-omnibus service, however, of £5,943, leaving £329,871 for disposal. This was dealt with as follows:—Interest, £111,677; debt redemption, £110,321; street improvements—interest and sinking fund, £8,908; rent of leased lines, £27,062; income tax, £26,575. The net surplus was, therefore, £45,328, which was transferred to the renewals account. The previous year's working resulted in a surplus of £116,608. The capital expenditure during the year amounted to £192,897, the chief items being £83,779 for depôt buildings, and £69,003 for rolling stock. The total now spent on the undertaking is £3,767,286. The number of passengers carried decreased from 317,644,753 to 310,559,874, for which the general strike was also responsible, but the car miles run rose from 22,567,759 to 22,783,254. The total revenue per car mile fell from 19.012d. to 18.514d., and the total consumption of electricity increased from 43,261,942 to 43,900,518 kWh. Reconstruction of permanent way was carried out in 22 streets.

Salford.—TRACK CONSTRUCTION.—The Corporation Tramways Committee is seeking approval to lay down the necessary tramway track and construct overhead equipment required to make a connection between the tramway of the Swinton and Pendlebury Urban District Council (now leased to the Corporation) and the light railway of the Barton-upon-Irwell Rural District Council (now leased to the South Lancashire Tramways Co.). The cost is estimated at £4,000.

South Africa.—THE NATAL ELECTRIFICATION.—The Minister of Railways, in introducing his estimates, gave the House some interesting information regarding the results obtained from the electrification of the Natal main line. According to the *South African Engineer*, under electrification the traffic capacity of the Natal main line had increased to 26,700 tons, compared with a limit of 22,000 tons under steam. With additional engines a capacity of 30,000 tons could be handled. The financial results of electrification showed that during the three months July to September, 1926—the first three months of the entire electrified section—there was a surplus of £129,548, whereas the surplus during the corresponding period of 1924, and the last three months under steam working, was £117,364. The extent to which electrification has increased the surplus, after providing for interest on capital and all other charges, is equal to £50,000 per annum.

Telegraph and Telephone Notes.

Bulgaria.—RADIO-TELEGRAPHY.—The Commission appoint to examine the tenders for the construction of wirel stations has recommended that the contract be given to t English Marconi Co., the price being 33 million lev or about £50,000, and the Minister of Posts and Telegrap has confirmed the decision. Two German firms a one French firm also competed for the contract.—*Reut* (Sofia).

Among the apparatus to be installed at the st tions, which will be at Sofia, will be a high-speed transmitt with anode power of 10 kW and a wave-length range b tween 36 and 72 metres. It will be used for communicati with stations which are operated in England by Marcon Wireless Telegraph Co., and through which Sofia will be touch with the principal cities of the world. The Sofia st tions will also contain a high-speed long-wave combin telegraph and telephone transmitter for communication wi Vienna, with a wave range of from 2,000 to 4,000 metre and all the necessary electricity supply equipment and reser generating plant will be installed under the contract. F the receiving station a set of high-speed commercial r ceivers with a combined overall wave range of from 1,200 25,000 metres, and one short-wave non-radiating receiv with a wave range of from 15 to 100 metres, are to be su plied, and one complete set of apparatus for the Central Te graph Office control of the transmitters and receivers whi will be operated by the Postal and Telegraph Administratio

India.—RADIO-TELEGRAPHY.—India has kept well ahead development, says the annual report of the Indian Posts a Telegraphs Department for 1925-26. She has now an efficie system of stations to meet immediate requirements and organisation which will enable full advantage to be tak of future developments. The wireless stations in Burma a the Andaman Islands, which were erected in 1905, we among the earliest in the world for maintaining communic tion between fixed points on land. Coast stations for comm nicating with ships were erected a few years later at t principal ports and were followed by a chain of inla stations linking up the most important towns. Progress h called for a complete revision of regulations since the wa during the last five years a series of licences to suit vario purposes has been brought into existence, and arrangemen have been made for the issue of broadcast receiver licenc on an extensive scale, broadcasting on a temporary ba being carried out by several radio clubs, which are allotted share of the fees derived from licences. As regards n construction, only one large modern high-speed duplex wi less service between Madras and Rangoon has been inaug rated. A temporary direction-finding station was a erected at Karachi, and the results were of great value shipping. Schemes have been approved for completely modelling the coast stations at Karachi and Bombay a constructing permanent direction-finding stations to ass ships and aircraft, which work was in progress at the e of 1925-26, and arrangements have also been made for a te porary direction-finding station at the mouth of the Hoogh River to assist ships bound for the port of Calcutta.—*Reute Trade Service* (Bombay).

Radio Notes.

India.—STATION INAUGURATION.—The Viceroy will vi Bombay on July 23rd and will open the Indian Broadcasti Company's station, which is now practically complete. I will also open on that day the "beam" wireless-telegra service to England.

Regional Broadcasting.—REDUCTION OF STATIONS.—Lo Gainford, vice-chairman of the British Broadcasting Corpor tion, speaking at Truro recently, is reported to have sa that it was impossible to increase the size of the broadca wave-band in view of the just requirements of the Arm War Office, Air, and commercial and marine services. T only alternative was to reduce the number of stations Europe from 170 to 100. He hoped such a change would adopted in the near future. There were 19 stations Britain working on the broadcast wave-band, excludi Daventry. Their proposals were to decrease the number British transmitters using the broadcast wave-band, f which exclusive wave-lengths would be granted to Britai in an equitable international agreement. The objective w to bring to every listener the choice of a minimum of tv contrasted programmes capable of reception on the cheape and simplest apparatus. In addition, there would be t long-wave station at Daventry, giving a total of ten trar mitters altogether. Lord Gainford was referring to t regional scheme under which the whole country will ul mately be served by five, six, or seven high-power statio using ten or more wave-lengths, so that it will be possib for each to send out two programmes on different wav lengths.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the Electrical Review containing the advertisement is given in parentheses below.

Contracts Open.

Aberdeen.—June 13th. Ellon Castle Estates, Ltd. Electrical work at four blocks of houses. Messrs. Tawse and Allan, architects, 10, Bon Accord Square, Aberdeen.

Adwick-le-Street.—June 21st. Urban District Council. Cables, boxes, pillars, &c. (See this issue.)

Australia.—Melbourne.—August 15th. Postmaster-General's Department. One 55-ton 3-motor-type electrically-operated overhead travelling crane. (A.X. 4727.)*

Sydney.—July 18th. Municipal Council. Boiler-house equipment for the Bunnerong power station. (B.X. 3531.)* August 15th. Generator neutral earthing resistance. (B.X. 3550.)*

Cheadle and Gatley.—June 28th. Electricity Department. Static transformer, e.h.p. switch cubicle, and transformer switch and distributor kiosk. (See this issue.)

Dundee.—June 24th. Electricity Department. Three 500-kVA outdoor-type transformers and two sets of 750-kW rotary convertors. (See this issue.)

Egypt.—Egyptian State Railways, Telegraphs and Telephones. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, S.W.1. Telegraph and telephone materials: wire, porcelain insulators, enamelled cable, copper binders and pipes, £E4,000 to £E4,300.—*Reuter's Trade Service* (Cairo).

Glasgow.—June 16th. Corporation. Electric lighting installations for 510 houses at Knightswood. Specifications from Town Clerk.

Greenock.—June 17th. Corporation. Supply and erection of 11,000-V overhead transmission line and transformers. (June 3rd.)

Hull.—June 16th. Electricity Department. Steel coal hunker and conveyor housing. (May 20th.)
Switchgear extensions. (May 27th.)
The Corporation Health Committee is to obtain tenders for the installation of electric stoves and wiring at the Sanarium.

Kirkcaldy.—July 2nd. Electricity Department. L.p. c. distribution, l.p. and e.h.p. cables, boxes, and roadwork. (See this issue.)

Lanark.—June 13th. County Council Housing Department. Electric lighting installations for 100 houses at Carlyle, for 172 at Uddingston. Mr. P. C. Smith, Housing Department, Hamilton.

London.—Stepney.—July 11th. Electricity Supply Department. Boilers and boiler-house accessories, turbo-alternator, condenser, accessories, and switchgear. (June 3rd.)
H.M. Office of Works. June 13th. Fuseboards and fuses. (June 3rd.)

Manchester.—June 13th. Electricity Department. Seven 500-kVA static transformers. Mr. H. C. Lamb, chief engineer and manager, Town Hall, Manchester.

Marlborough. — Electricity Department. Additional underground feeder and overhead feeder. (May 27th.)

New Zealand.—Wellington.—August 9th. Public Works Department. 1,500 suspension insulator strings and 470 strain insulator strings (B.X. 3533.)*

Nottingham. — June 21st. Electricity Department. General stores for 12 months. (June 3rd.)

Oldham.—June 11th. Electricity Department. Water-cooling towers, foundations, tanks, and circulating water pipes. (May 27th.)

Portsmouth. — Electricity Department. Transformers. (May 27th.)

Pudsey.—June 14th. Electric lighting installation at the School of Art. Specification from Education Department, County Hall, Wakefield.

Sheffield.—June 11th. Tramways and Motors Committee. Supply and erection of weighbridge. Mr. A. R. Burnley, general manager, Division Street, Sheffield.

South Africa.—Cape Town.—June 30th. South African Railways and Harbours Board. Gasfilled and vacuum lamps for 12 months. (B.X. 3518.)* Telegraph material. (B.X. 3519.)*

Elliott (C.P.).—June 15th. Municipal Council. Electric lighting plant, including engines and dynamos, steel poles, copper wire, insulators, switchboard meters, house-service fuses and street-lighting brackets and suspension fittings.

Edenburg (O.F.S.).—June 21st. Municipal Council. Electric lighting plant, including engines, dynamos, steel poles, &c.

Southend-on-Sea.—July 6th. Light Railways and Electricity Department. L.p. and e.h.p. cables for 12 months. (June 3rd.)

---

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Birkenhead.—Electricity Committee. Accepted:—
10,850 yd. cable (£2,365).—Macintosh Cable Co., Ltd.

Bolton.—Electricity Committee. Accepted:—
Alterations and repairs to two rotary convertors at Duncan Street sub-station.—Metropolitan-Vickers Electrical Co., Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—
High-tension feeders, transformers, switchgear and low-tension feeders for supply to Stretton, Rolleston and Tutbury (£16,177).—Johnson & Phillips, Ltd.

Doncaster.—Electricity Committee. Accepted:—
L.p. cables (£2,621).—Hogan & Wardrop. This matter is referred to in our "Business Notices."
E.h.p. cables (£364).—Callender's Cable & Construction Co., Ltd.
Circulating-water pipework (£657).—Johnson & Moore.
Water intake from canal, pipework and screen (£1,775). —J. Holmes.

Grimsby.—Electricity Committee. Recommended:—
E.h.p. feeder cable and pilot cable (£2,597).—Johnson and Phillips, Ltd.
L.p. feeder cable (£1,236).—Connolly's (Blackley), Ltd.

India.—Great Indian Peninsula Railway.
269 miles of overhead line on lattice steel towers, for the supply of current to the railway from Igatpuri to Poona (approximately £300,000).—W. T. Henley's Telegraph Works Co., Ltd. Reference is made to this contract in our "Business and Industrial Notes" pages.

Leeds.—Electricity Committee. Accepted:—
Cables (£2,138), Enfield Cable Works, Ltd.; (£2,738), W. T. Henley's Telegraph Works Co., Ltd.; (£1,840), Hackbridge Cable Co., Ltd.; and (£14,047), Macintosh Cable Co., Ltd.
Switchgear (£232).—Yorkshire Switchgear & Engineering Co., Ltd., and (£297), H. J. Fuller & Sons.
Tramways Committee. Accepted:—
Two reciprocating rail grinders (£1,063).—Equipment and Engineering Co., Ltd.
Repairs to economiser at generating station (£1,251)—E. Green & Son, Ltd.
Town Hall Committee. Accepted:—
Electric fan blower for town hall organ (£245).—Abbott and Smith.

Maidstone.—Town Council. Accepted:—
Overhead materials for the trolley vehicle service.—British Insulated Cables, Ltd. (£186), and Wiseman, Ltd. (£162).

Oldham.—Education Committee. Accepted:—
Electric lighting installations at Werneth and Clarksfield housewifery centres.—W. Caton & Sons.

Plymouth.—Electricity Committee. Accepted:—
Transformers.—British Electric Transformer Co., Ltd.
A.c. meters.—Metropolitan-Vickers Electrical Co., Ltd.
D.c. meters.—Ferranti, Ltd.
Cables.—British Insulated Cables, Ltd.

Selkirk.—Town Council. Accepted:—
Electric lighting installation for the Victoria Halls (£319).—Jas. Kilpatrick & Son, Ltd.

Sheffield.—Electricity Committee. Accepted:—
Materials and work for lining steel coal bunkers at Neepsend (£499).—George Longden & Son, Ltd.
Tramways Committee. Accepted:—
20 pairs twin movable connected points (£2,515); 3 standard crossings (£84).—Hadfields, Ltd.
12 leg type crossings (£539).—Titan Trackwork Co., Ltd.
Six leg type crossings (£332).—Edgar Allen & Co., Ltd.

Forthcoming Events.

Physical Society.—Friday, June 10th. Imperial College of Science, South Kensington, S.W. 5 p.m. Ordinary meeting.

Heat Engine Trials Committee.—Friday, June 10th. Institution of Civil Engineers. 6 p.m. Discussion on the Report on the Results of Heat Engine Trials.

Illuminating Engineering Society.—Tuesday, June 14th. Stationers' Hall, E.C.4. 6 p.m. Discussion on "The Relation between Illumination and Fine Work," to be opened by Mr. H. C. Weston.

Institution of Electrical Engineers.—Summer meeting. Newcastle-on-Tyne. June 14th to 17th.

Röntgen Society.—Tuesday, June 14th. 1, Wimpole Street, W. Silvanus Thompson Memorial lecture, "The Structure of the Atom and Radiation." Prof. Sir J. J. Thomson, F.R.S.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

Micro tube heaters.
Daisy washing machines.
Anthony's patent boiler feed pumps as made by Messrs. Robert Warner.

Notes.

Electric Heating in an Operating Theatre.

A successful method of utilising electricity for a special heating purpose in exceptional circumstances has been applied to the operating theatre of the Harwich and District Cottage Hospital. The hospital is equipped with a central heating system and, in order that the operating theatre might be kept at a suitable temperature, it was found necessary to keep the main boiler going practically all the year round and at times when it was not required for the general heating of the hospital. The aim of the managerial staff was to raise the temperature of the operating theatre during periods when the main system was shut down and extra heat was necessary, the process to occupy about 30 minutes, but the problem was accentuated by the fact that whatever system was employed, owing to the lack of space, the apparatus had to be of a type that could be easily and quickly removable after performing its duty. The solution was the adoption of a portable electric radiator, the success of which in actual service has been of a pronounced character. The apparatus is of the "Magnet" type manufactured by the General Electric Co., Ltd., loaded to 12 kW, and the desired temperature is obtained well within the time required. A tray is provided for the flexibles, so that they may be quickly disposed of when the radiator is wheeled out of the theatre. This method of heating should commend itself to many other authorities where similar circumstances exist.

Non-Ferrous Metals Research Association.

The seventh annual report of the British Non-Ferrous Metals Research Association, for the year ended December 31st, 1926, shows that during the year the membership increased from 139 to 144. The income of the Association from its industrial members increased by £1,164 over that fo the previous year to £9,155, and the minimum income cond tion on which the Government grant depends has been fu filled. Over £25,000 was expended during the period unde review on various researches. Considerable efforts hav been made to improve the form of the Association's report and a special conference of the Association's investigato has recently been held to consider this question. During th year forty-two investigators were working on the researche and over fifty research reports have been placed at the di posal of members. The following have joined the Counc by co-option:—Prof. D. Hanson, D.Sc., Mr. J. Leechmar and Dr. C. R. Young. The Association is co-operating in scheme for linking the Government service interests i electro-deposition with industrial developments and applic tions. The arrangements made by the Department Scientific and Industrial Research have provided a sum £5,000 to be expended over three years for the investig tions. The Association is contributing a small fraction the cost and is participating in the results of all the wor

The Shannon Power Scheme.

In a paper on "The Shannon Power Development Scheme, by Prof. S. W. Perrott, M.Inst.C.E., read before the Liverpo Engineering Society, the author gives a *résumé* of the wor which is being done in connection with the Shanno hydro-electric development. It is estimated that the averag flow of the river is about 12,400 cu. ft. of water per second fo the whole year, the flow being very large in the winter an very small in the summer. In the total development, which to produce 180,000 h.p., it is intended to raise the levels Lough Allen, Lough Rea, and Lough Derg, so as to giv a gross storage of 29,800 million cu. ft. From the intake to th power house the head race runs a distance of 6.46 miles. It intended to keep the water level in the head race almost at th same level as in Lough Derg, so as to provide a head of fro 90 to 100 ft. near the power house. The construction of th head race will necessitate the excavation of some six to seve million cu. yd. of earth, and over one million cu. yd. of roc The tail race, which is over a mile long, will entail the re moval of over a million cu. yd. of earth, and the same amou of rock. To provide an even discharge of water from th tail race into the Shannon, the bed of the latter will nee deepening at several points below the mouth of the race, tota ling about 1.2 miles. It is intended to admit boats to the ta race, and beside the power house a ship lift is to be provide to enable the vessels to be raised to the level of the head rac For the full development the calculated water level in Loug Derg is taken as 117 ft. for the highest and 105 ft. for th lowest level. The concreting operations on the constructio of the weir sills, &c., are being carried out with the help of cable way having a 1,300-ft. span, with towers 130 ft. hig The excavation of the head race is being carried out by mean of electric dredgers which are supplied from a 300-metre lengt of loop line running loosely in guards. A portable transforme wagon running on a 3-ft. gauge track is stationed at the en of the line, which it feeds at 3,000 V, transforming from 17,0 V. The main motor of the dredger is fed at the high pressur while a second transformer feeds the compressor and winc motors at 380 V. When a 300-metre section is completed th loop-line wires are pulled through another 300 metres withou causing much delay to the excavating. In this way 600 metre of the canal may be dealt with without changing the positio of the transformer wagon. The bucket excavators consum from 0.5 to 0.9 kWh per cu. m. The temporary power statio at Ardnacrusha, which has been erected to supply electricit to the works, is equipped with seven 560-kVA and two 300-kV. Diesel-driven generators. The paper was illustrated by mean of lantern slides.

Power Transmission by Radio.

"Beams of radio power, criss-crossing a city like searchligh rays and carrying light and power as wires do now," wer discussed as future scientific possibilities, following spectacula demonstrations by two Westinghouse engineers, Dr. Harve C. Rentschler and Dr. Phillips Thomas, to the New Yor Electrical Society recently. Electric lamps held by Dr. Thoma glowed brightly, although not connected to power wires in a novel furnace displayed by Dr. Rentschler chemical r actions possible only in a vacuum were initiated by radi waves; and a disk of metallic tungsten was heated whit hot "in an instant" by the rays. Dr. Thomas, who research engineer of the Westinghouse Electric and Manu facturing Company, U.S.A., generated before the Societ waves as short as 240 centimetres (8 feet) and predicted tha still shorter waves will be produced, capable of being cor centrated into narrow and powerful beams. "We ma visualise," he said, "a parallel beam of radiation 10 cent metres (4 inches across) along which is being sent 10 kV of energy; imagine each house furnished with a half-wav oscillator in line with a parallel beam from a sending statio so that heat and light may be obtained very much as a present, by simply turning a switch, but without the costl transmission wire equipment now required. Again, suppos the beam of highly-concentrated energy should render cor ducting the air through which it passes; then ordinary electri power could be sent along the beam as though the bear were a transmission line and the beam could be directed t any desired spot, with dire results to the target."

The furnace demonstrated to the Society by Dr. Rentschle who is director of research of the Westinghouse Lamp Com

pany, is designed to concentrate large amounts of radio power within a small space; certain metals, although long known to chemists, cannot be prepared usefully in metallic form by ordinary methods because they are combustible when in fine powder form, taking fire in air whenever they are heated. By conducting the heating of these inflammable metals with radio power and in a vacuum, Dr. Rentschler has made them in metallic form and in some quantity. Two of these metals, thorium and uranium, belong to the group of radio-active metals including radium. Now that the use of the vacuum radio furnace has made these peculiar metals available, it is expected to find uses for them, Dr. Rentschler said, in industry. Another use of the radio furnace is to turn metals like gold and silver into gases, so that their individual atoms can be studied and weighed, with results of important value to atomic science.

Rural Development in Warwickshire.

Speaking at the recent opening of the new electricity showroom at Solihull, to meet the convenience and rapidly-growing requirements of consumers in the area of the rural district of Solihull, in which the Birmingham City Electricity Department is now furnishing electricity, Councillor Beale, chairman of the Electricity Committee, stated that 38 miles of mains had been laid in Olton, Shirley and Solihull, and £53,000 spent in the district. 570 consumers were already connected, a good record, seeing that they were not able to commence work until the Order from the Electricity Commissioners was obtained in March, 1926. They hoped to spread out towards Knowle and Dorridge in the autumn, and proposed to construct a ring main so that supplies could be afforded to villages in the neighbourhood if justified by the demand. The agricultural use of electricity was one means by which the demand might be extended.

The Association of Consulting Engineers.

The proceedings at the annual meeting on May 27th and the Committee's report for the year ended April 30th, 1927, indicate the total membership to be 112, new members elected during the year numbering 5. Objection having been raised to the system of classification adopted in order to assist those requiring the services of engineers practising in any particular branches to know which members devote themselves to these special branches, the Committee ascertained the opinion of the whole body of members, with the result that an overwhelming proportion desired no change. The Department of Overseas Trade suggests that when the Association is informed that engineering schemes are under consideration in different places abroad, English consulting engineers should offer their services. Under the rules of the Association and of the Institutions of Civil, Electrical and Mechanical Engineers such a practice is not allowed, but the Department is of the opinion that such a rule, "while doubtless of great use in the United Kingdom, must inevitably lead to loss of opportunities for practice in countries where such a rule does not operate, and where engineers of the same type are normally free to use any legitimate means to influence public authorities to employ them." It is hoped to report more fully to members the result of joint deliberations. Amongst other matters on which the advice of the Committee was sought during the year was as to the proper fees to be charged in certain cases. The Committee has considered the Bill now before Parliament for the registration of architects, which is being opposed by the Institution of Civil Engineers, and has associated itself with the opposition.

Mr. J. W. E. Binnie, chairman, pointed out that the Association would shortly be celebrating its coming-of-age, and he would like to see Mr. A. H. Dykes (hon. secretary) occupying the chair that year. Some discussion took place with regard to the opposition to the Architects' Bill, after which the report was adopted. Mr. S. C. Lewis, hon. treasurer, reported that the financial position of the Association was sound: the income and expenditure account showed a substantial saving in the year; there was a balance in hand last year of £50 on deposit and a cash balance of £154. The income was £475 and the expenditure £403. The accounts were adopted, and the chairman announced that the new members elected to the Committee were:—London members: Mr. H. J. Dean, Mr. S. B. Donkin, Mr. W. Vaux Graham, and Mr. Walter Mansergh; country members: Mr. David Balfour and Mr. Ravenshaw.

Transformer Ratio and Phase Displacement.

In a paper published in the April issue of the I.E.E. *Journal*, Mr. B. G. Churcher, A.M.I.E.E., describes null methods of measuring the ratio and phase displacement of two alternating voltages which are particularly applicable to high voltages and are discussed in connection with the testing of power and potential transformers. An important feature is the use of a capacitance potential divider in place of the resistance type hitherto used; it possesses considerable advantages from the point of view of simplicity and low cost of equipment and ease of operation, while accuracy can be made as high as is desired, and there is practically no limit to the voltage at which capacitance dividers can be used. The theory of a method of measuring the ratio and phase displacement of transformers is outlined and its operation is illustrated by a test on a 66,000-volt potential transformer. Suggestions are made for developing apparatus for routine industrial testing, and it is pointed out that robust construction and adequate safety to the operator could be secured while retaining ample accuracy for commercial purposes. Tapping the secondary winding of a high-voltage testing transformer for the purpose of operating a wattmeter or voltmeter is considered, and a method of determining the ratio and phase displacement of the full and fractional voltages is explained. The testing of high-voltage potential dividers is also briefly considered.

A Low-Fall Hydro-Electric Installation.

Some interesting particulars are given in the *Implement and Machinery Review* of a small hydro-electric installation which has been put down on the site of an old water wheel on the farm of General Hildebrand at Higham, near Colchester, where, at low-water times, a fall as low as 18 in. is utilised. A "Pitman" Francis vertical-shaft turbine of about 12 b.h.p. drives a compound-wound electric generator through bevel gearing. A raw-hide pinion wheel on the lay shaft renders the plant silent in operation. A balanced flywheel and a flexible insulated coupling are used to assist the governing. The turbine has movable guide vanes operated by a "Pitman" oil-pressure governor. The plant runs in conjunction with a battery which supplies electricity for lighting the farm at 50 V. Power for various machines on the farm is supplied from the generator direct at 100 V. The installation was put in by Mr. Percy Pitman, M.I.Mech.E.

Voltage Standardisation in the Dutch East Indies.

The need of some degree of standardisation of voltage has been for some time under consideration, and it has recently been decided that, in the case of direct current, 110, 220, and 600 V are to be the standards with 440 V as a recognised "outsider"; the 110 voltage is intended for small individual installations, 220 V for general use for lighting and power purposes, and 600 V for power distribution, including street-railway supply. In the case of alternating current, 50 periods is to be the standard frequency and 220 V for power, 127 V for lighting, and 380 V for large power installations, with expert supervision; existing a.c. installations at 110, 190, and 500 V are still to be recognised and provided for. As regards h.p. installations, 6,000 V is to be regarded as the limit for large generators and distributing systems, 10,000 V having been found too high, owing to the climatic conditions. For h.p. overhead transmission purposes 30,000 V is to be the standard with recognised "outsiders" of 3,000, 15,000, and 25,000 V.

Fatality.

Whilst watching the boats on the Thames from the riverside gardens of the Sun Hotel, Richmond-on-Thames, on June 7th, Paul Barrett, of Chiswick, grasped a wire which ran from a flagstaff connecting it with electric wires used in the illumination of the gardens, and received a fatal electric shock.

Broadcast Radio Coverage of City Areas.

Mr. Lloyd Espenschied, of the American Telephone and Telegraph Co., recently published in the A.I.E.E. *Journal* some of the results of a systematic study which was made of the "coverage" of the New York metropolitan area, which portray some of the general requirements of a broadcasting system. Two types of transmission wave component are involved: one delivers directly to the receiving area immediately surrounding a broadcasting station a field capable of reliable high-grade reception; and another, transmitted through the higher altitudes, permits distant reception, but not with the reliability and freedom from interference required of high-grade reproduction. The day and night fields are roughly the same: fading commences between 50 and 100 miles from the stations and the range of the fluctuations increases to the maximum distance observed. A fact of importance is that "fading," which ordinarily is noticed at distances of the order of 100 miles, may under some conditions become prominent at distances as short as 20 miles from the transmitting station. Such short-distance fading appears to be a case of unusually high attenuation, caused by a tall building area greatly weakening the directly transmitted wave so as to enable the effect of the indirect wave component to become pronounced at night.

1. Field strengths of the order of 50,000 or 100,000 μ V per m appear to be about as strong as one should ordinarily desire; fields much stronger than this impose a handicap upon those wishing to receive some other station.

2. Fields between 50,000 and 10,000 μ V per m represent a very desirable operating level, which is ordinarily free from interference and may be expected to give reliable year-round reception, except for occasional interference from nearby thunderstorms.

3. Below 1,000 μ V per m reception becomes distinctly unreliable, and is generally poor in summer.

A 5-kW station may be expected to deliver a field of 10,000 microvolts some 10 to 20 miles away, and a 1,000-microvolt field not more than 50 miles, which fact indicates clearly the need for the employment of higher transmitting powers. The range goes up with the increase of power disappointingly slowly; even were no absorption present in the transmitting medium, the range in respect of overcoming interference would increase only as the square root of the increase in power. To extend the 10,000-microvolt field from 15 to 30

miles would necessitate an increase in the radiated power from about 5 to 100 kW. The "shadows" cast by the areas of high buildings are prominent; distribution effected from a location well outside of the suburbs is an attempt to encompass within the range of the station a widespread area and so to include the city within that area as to effect a more uniform distribution over it than is possible when transmitting from a location within the city.

Regarding the important factor of frequency selectivity for multi-station operation, receiving circuits group themselves into three classes in the order of their selectivity merit as follows:—

1. The single-tuned circuit (non-regenerative and regenerative), and the combination of two tuned circuits coupled together.
2. Circuits employing radio-frequency amplification with tuned circuits between stages.
3. The double-detection or superheterodyne type of circuit.

Attention is called to the fact that the various circuits attenuate *within* the desired transmission band of 5 or 10 kilocycles, which means that the higher-frequency components of the side band will be reduced (after detection) with corresponding distortion of the reproduction; the distortion is greater for the more highly selective sets, following from the nature of sharply-tuned circuits. Selective circuits, capable of approximating the filter type of characteristic, are to be desired.

Loud-speaker reproduction indicates that ordinarily a level of the average of the undesired signal 40 TU (power ratio) lower than that of the desired signal, while not introducing noticeable interference at times when the desired signal is strong, does permit the undesired signal to "show through" when the programme rendition is weak; reducing the undesired signal to 60 TU below the desired signal prevents this interference for the volume ranges which are now commonly transmitted.

When locating a new transmitting station it should be possible from a knowledge of the relative field strengths of other stations in the vicinity to predict approximately what the interference area will be for different types of receiving sets. In this connection there should be recognised the advantage from the interference standpoint which exists in grouping together the broadcast transmitting stations in one location, and in equalising their powers, to enable receivers to obtain substantially equal fields from all of the stations and minimise the selectivity which they are required to possess. While it is impracticable to accomplish this result completely, it is hoped that a better understanding of the mutual advantage to be gained from reducing interference will lead naturally to better co-ordination.

Flies and Dust.

In a letter to the *Daily Telegraph*, Mr. A. Moore Hogarth, chairman of the College of Pestology, says: It is gratifying to remark that the Prime Minister in his reference to electricity emphasised the note of cleanness. There is something within us all which responds to things clean; we may not be conscious of it, but a clean shop, a clean factory, a clean man, a clean house, gives us a feeling of wholesomeness and evokes an immediate response. I doubt if there is a more clean place in the world than our London electric railways; flies are practically an unknown quantity there, and it would seem that the ozone generated by the electric current is inimical to pests, but whether this be true or not it is certainly true that before flies and other living minute evils reach maturity they are capable of being completely annihilated by electricity harnessed into various forms, by which these particles of living dirt can be sucked out of their nurseries. Just recently I incubated one dram weight of dust from a suction sweeper, and I got as a result two flies and one flea. There is nothing to stir the imagination in such a small result, but there it is as an evidence of possibilities.

The Manufacture of Aluminium in Canada.

A large plant for the manufacture of aluminium has been established at the new township of Arvida in Quebec, by the Aluminium Company of Canada, in which a part of the enormous power of the River Saguenay will be utilised. The raw material will be cryolite from Greenland and bauxite from South America, and both of these materials will be previously refined and ground before being sent to Arvida, the bauxite being received in the form of pure alumina. The process is electrolytic, and consists briefly in passing a direct current through a molten bath of cryolite in which alumina to the extent of about 15 per cent. is dissolved, thus forming the electrolyte, to which fluorspar or other fluorides may be added in order to reduce the melting point of the mixture below the temperature desired for furnace operation. The current passes from carbon anodes through the electrolyte to the baked carbon lining of the furnace, which serves as the cathode. The metallic aluminium accumulates in a molten condition at the bottom of the furnace, where it is protected from oxidation by the bath of cryolite above it.

Provision is made for recovering the carbon of the used electrodes, for separating the iron therefrom by magnetic separators, and also for utilising other material, such as the green scrap from the hydraulic presses used in electrode manufacture. This used and waste material is conveyed to the mixing room, together with fresh supplies of ground coke and pitch, to be blended, pressed, and baked. The production of new electrodes is an essential part of the operations, and occupies a considerable proportion of the plant layout.

At Arvida there will be ultimately 40 furnace rooms, each containing 100 furnaces all running electrically in series; the voltage drop through any one pot is about 6 volts. Considerable skill is required in properly starting up a furnace room, and the electrolytic process must be very carefully controlled, especially in noting what is called the "anode effect." As electrolysis proceeds the concentration of alumina dissolved in the cryolite necessarily decreases, and ultimately reaches a point at which the anode effect occurs. The resistance of the furnace then rises sharply, the voltage jumps to several times its normal value, the electrolyte no longer "wets" the anodes, and the latter appear to be surrounded by a gaseous film through which a kind of glow discharge takes place. The duration of this anode effect must be reduced to a minimum, and is achieved by means of a system of lamp signals which indicate at once when the "effect" begins. The crust of "frozen" electrolyte on the surface of the bath is then broken with a crow-bar and stirred into the electrolyte beneath, thereby increasing the strength of the solution. Necessary anode adjustments are also made, and a small quantity of powdered aluminium is sprinkled on the surface of the newly-formed crust and stirred in at the next working. Theoretically it is possible to dissolve nearly 20 per cent. of alumina in molten cryolite, but this is not possible in practice, as the rate of solution is slow, and there is a risk that undissolved alumina may settle through the electrolyte to the bottom of the furnace. The maximum concentration of the solution must therefore be kept low, and the anode effect consequently occurs at frequent and regular intervals if the furnace is properly worked.

In the manufacture of one pound of aluminium about ¾ to 1 pound of carbon is used, and the energy consumption is probably in the neighbourhood of 12.5 kWh, but this has not yet been definitely determined at Arvida. A group bonus scheme has been introduced to speed-up output. The tapping of the furnaces and the collection of the molten aluminium are comparatively simple operations, but require great care and also strict analytical control of the resulting product to ensure that it is up to quality and free from iron and other impurities. The ultimate capacity of the Arvida plant is estimated at 300,000 tons of metallic aluminium per annum, or about twice the present world output. Numerous new uses and a great expansion of present uses will have to be found to absorb such an output.

Electric Steel Works in India.

In an instructive paper recently read before the Royal Society of Arts, on "The Iron and Steel Industry of India," Mr. R. Mather, B.Met., late metallurgical inspector, Government of India, points out that the industry is based entirely on indigenous materials with sufficient reserves to provide all the steel required by the country for at least one hundred years. The erection of electric steel works (of which the proprietors are Sir Sarupchand Hukumchand & Co.) was commenced in 1920 and the manufacture of steel began in 1922; the plant is situated at Ballygunge, a suburb of Calcutta, and consists of two 2-ton electric furnaces and a foundry for the production of steel castings. Electric power is obtained from the Calcutta Electric Power Corporation at rates which would not exceed ½ anna per kWh if the works were in full and continuous operation; the output of steel has never been more than a small proportion of the capacity, the production of castings having been about 510 tons in 1924, 760 tons in 1925, and 390 tons in 1926. During the last year, however, the works produced also about 150 tons of steel for springs, as it has acquired small rolling mills (20, 16 and 10-in., respectively), part of which it proposes to erect for the purpose of producing spring bar and other kinds of high-carbon bar.

The development of the steel-making plant and rolling mills at Jamshedpur, 157 miles west of Calcutta, of the Tata Iron and Steel Co., which produces two-thirds of the pig iron and almost all the steel made in India, has been important; the original open-hearth plant has been enlarged. The rolling mills originally erected by the Company were all steam-driven and of relatively small capacity; they have now been supplemented and almost superseded by the large equipment of new mills, all electrically driven, which came into operation in 1923 and 1924. Of nearly 35,000 tons of rolled steel produced in a recent month less than 5,000 tons were rolled on the old mills.

Standardisation in France.

A lecture by M. Tribot-Laspière, general secretary of the Union des Syndicats de l'Electricité, reported in *Génie Civil*, deals with the Association Française de Normalisation, which was formed last year, and corresponds with the B.E.S.A. in this country. It is pointed out that standardisation has been carried out in Germany for several years, with the help of the Government, which recently allotted a sum of 2½ million marks to the purpose, and that there is a risk that foreign buyers will adopt German standards and purchase German goods. Many standards have been promulgated in France by various bodies, including 41 set up by the Union des Syndicats de l'Electricité, but there was no central organisation for the purpose until the Association was formed ("A.F. Nor"). It will furnish information regarding French stand-

ards to foreigners, and regarding foreign industries to French manufacturers, and will be able to take part in the International Standardisation Association which is likely to be established in September next.

Appointments Vacant.

Engineer for the electrical department of the Government of the Punjab. Showroom sales and publicity superintendent (£300) and lady showroom demonstrator (£220), for the Leyton Corporation Electricity Department. Temporary shift engineer for the Eccles Corporation electricity works. Borough electrical engineer and manager (£1,250), for the Bolton Corporation electricity undertaking. (See our advertisement pages to-day.)

Institution Notes.

Institution of Electrical Engineers.

North-Western Centre.—The report of the Committee for the 1926-27 session shows that 10 meetings were held during the session, with an average attendance of 112, in addition to the Faraday Lecture and the annual dinner. At the annual general meeting the following officials and new committee men were elected for the 1927-28 session:—*Chairman*, Mr. A. B. Mallinson; *vice-chairmen*, Messrs. W. J. H. Wood and T. E. Herbert; *hon. secretary*, Mr. J. D. Peattie; *committee*, Messrs. H. Hawkins, A. L. Lunn, O. Howarth, H. Cobden Turner, and G. A. Juhlin; *hon. treasurer of benevolent fund*, Mr. A. S. Barnard. The officials for the Students' Section for the new session include: *Chairman*, Mr. G. R. Millward; *vice-chairman*, Mr. W. L. England; *hon. secretary*, Mr. H. W. Hardern.

Council's Nominations.—The Council's nominations for election to the Council to fill the vacancies which will occur on September 30th, 1927, are as follows:—*President*: Mr. A. Page; *vice-president*: Capt. J. M. Donaldson; *hon. treasurer*: Lieut.-Col. F. A. Cortez Leigh; *members of Council*: Major B. Binyon, Messrs. J. R. Beard, P. V. Hunter, H. Marryat, H. T. Young, and D. N. Dunlop.

Institution of Heating and Ventilating Engineers.

The Institution is holding its Summer Meetings on June 20th, 21st, and 22nd at Bournemouth.

Association of Mining Electrical Engineers.

The annual meeting was held held last week at Harrogate, Mr. D. Martin (Glasgow) presiding. The membership was reported to be 2,023. In his presidential address, Mr. G. M. Harvey (Birmingham) said that it was now universally acknowledged in the mining world that the increased application of electricity was the key by which they could attain greater production, thus enabling them to meet foreign competition without reducing wages. He suggested for consideration the possibility of adapting American methods, where practicable, in order to increase output. The Association's gold medal was awarded to Major E. I. David for a paper on "Protection of a.c. Systems Against Short Circuits." Messrs. F. Anslow (Glasgow) and J. C. Crawshaw (Dewsbury) were elected vice-presidents.

North-East Coast Institution of Engineers and Shipbuilders.

Summer Meeting.—The Institution will hold a summer meeting in Glasgow jointly with the Institution of Engineers and Shipbuilders in Scotland from June 20th to 23rd inclusive. The programme includes the reading and discussion of papers, visits to electrical and other works, and excursions specially arranged for ladies.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements

Birthday Honours.

In this year's list of Birthday Honours, which was published on Friday last, the great distinction of Order of Merit was conferred upon Sir Chas. Parsons, F.R.S., and Sir Harry Renwick received the honour of a Baronetcy. To these we refer in our leaderettes to-day. Other honours in the list are as follows:—Sir H. F. Heath, K.C.B., late Secretary to the Department of Scientific and Industrial Research, and Sir Richard Threlfall, K.B.E., F.R.S., receive the distinction of G.B.E.; Lt.-Col. G. W. Humphreys, C.B.E., Chief Engineer to the London County Council, is made a K.B.E.; Mr. H. Sparkes, O.B.E., Controller of Stores, G.P.O., receives the C.B.E.; Lt.-Col. A. G. Lee, M.C., M.I.E.E., Staff Engineer, G.P.O., Mr. V. E. Pullin, Director of Radiological Research, War Office, and Major J. J. Munro, Deputy Inspector-General of Telegraphs, Egyptian Government, receive the O.B.E.; and Mr. C. H. Klyne, Assistant Electrical Engineer, Admiralty, Mr. H. M. Johnson, Assistant Telegraph Engineer, Sudan Telegraphs, and Mr. R. Moffatt, Assistant Engineer, Posts and Telegraphs Department, Palestine, become M.B.E.

We reproduce herewith a portrait of Mr. W. J. H. Wood, who, as reported in our last issue, has been appointed engineer-in-chief to the County of London Electric Supply Co., Ltd. Mr. Wood received his early training at the Crystal Palace School of Practical Engineering, at the Phœnix Works, Antwerp, and with the Cie. Hydro-Electrique, Antwerp. He entered municipal electrical service as a junior engineer with the Edinburgh Corporation, and two years later went to Bolton as assistant engineer, being appointed engineer and manager in 1913. Mr. Wood was appointed chairman of the Engineering Committee of the South-East Lancs. Electricity Advisory Board in 1925, when Dr. S. L. Pearce resigned the position upon becoming an Electricity Commissioner. Since the formation of the North-Western Area District Industrial Council and the District Joint Board for the electricity supply industry, in 1919, Mr. Wood has represented a group of the largest undertakers. He is a member of the Institutions of Electrical and Mechanical Engineers, and of the Textile Institute. He

Mr. W. J. H. Wood,
Engineer-in-Chief to the County of London Electric Supply Co.

is senior vice-chairman of the North-Western Centre of the I.E.E., and a member of the Council of the Incorporated Municipal Electrical Association. As electrical engineer of Bolton he was directly and solely responsible for the design and construction of the Back-o'-th'-Bank generating station, and since his appointment the annual output of the undertaking has increased by about 46 million kWh.

The *Manchester Guardian* states that Mr. John Lee will retire from the controllership of the Central Telegraph Office this month. He was attached to the Secretary's office, London; in 1917 became Postmaster of Belfast, and in due course controller of the C.T.O., London. "Mr. Lee has done much to develop Whitleyism in the Civil Service."

The second Mascart medal has been awarded to Prof. Sir J. J. Thomson, F.R.S., by the Société Française des Electriciens, and was presented at the Sorbonne on Friday last. The medal, which commemorates the famous French physicist, is awarded once in three years; the previous award was to M. André Blondel.

Sir Donald MacAlister, Bt., and Sir Otto Beit, K.C.M.G., have been reappointed as members of the Governing Body of the Imperial College of Science and Technology for a further term of four years, and Lord Rayleigh, F.R.S., is appointed to be a member for a similar period.

Sir R. T. Glazebrook, F.R.S., has been appointed a member of the Advisory Council to the Committee of the Privy Council for Scientific and Industrial Research.

Mr. W. Tyson, who has been a member of the research staff of the Standard Telephones and Cables, Ltd., of Woolwich, has been appointed agent and consultant for Great Britain for the Société Industriale de Téléphones, of Paris.

The Bromley (Kent) Town Council has decided to appoint Mr. W. G. Trend as borough electrical engineer for one year as from April 1st last, at an inclusive salary of £750 a year.

Mr. J. J. O'Horan, one of the mains engineers of the Calcutta Electric Supply Corporation, Ltd., has resigned his post after seven years' service with the company to take up an appointment on the engineering staff of a large motor-cycle manufacturing concern in this country.

Mr. Henry Reginald Williams, managing director of Messrs. Lindsay & Williams, Ltd., Manchester, was married at Chapel Allerton, Leeds, on June 1st to Miss Mary Ellen Coggan, of Sheffield.

Mr. C. W. Eve, sales promotion manager, Standard Telephones and Cables, Ltd., has been elected chairman of the Incorporated Society of British Advertisers.

At the annual meeting of the Ayrshire Electricity Board, ex-Provost Matthew Smith was unanimously reappointed chairman and Sir Alexander Walker vice-chairman. Police Judge Andrew Hunter and ex-Bailie David Jones were re-elected as conveners of the Finance and Engineering Committees respectively.

County Alderman T. E. Higham, of Accrington, chairman of the Mid-Lancashire Electricity Board, and chairman of Accrington Electricity Committee, has been selected as the jubilee Mayor of Accrington.

Will.—The late Mr. Albert Gay left £1,599 net and £2,184 gross personalty.

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Irish Radio Stockists, Ltd.—Private company. Registered in Dublin, May 26th. Capital, £1,000 in £1 shares. Objects: To acquire the business now carried on by the Irish Radio Stockists, and to carry on the business of dealers in wireless apparatus, &c. The subscribers (each with one share) are:—H. J. Farrell, 131, Emmet Road, Inchicore, Dublin, manufacturer's agent; J. Matthew, 99, Botanic Road, Dublin, clerk; H. J. Shirley, 55, Rose Mount Terrace, Kilmainham, Dublin, shop assistant; W. J. Byrne, 5, Lower Buckingham Street, Dublin, radio engineer. The first directors are not named.

British Curtis Radio, Ltd.—Private company. Registered May 28th. Capital, £2,500 in £1 shares. Objects: To acquire the business of manufacturers and merchants of wireless and telephonic apparatus now carried on by Peter Curtis, Ltd., at 11, Red Lion Square, W.C., and elsewhere. The first directors are:—A. E. Blackwell, "Dunromin," Dalmeny Lane, Carshalton, Surrey (director of the Vulcan Chemical Co., Ltd.); G. W. Croot, "Balmoral," Ashton Gardens, Chadwell Heath, Essex. Qualification, £1.

Artandia, Ltd.—Private company. Registered May 28th. Capital, £26,250 in 25,000 ordinary shares of £1 each and 25,000 "B" shares of 1s. each. Objects: To adopt an agreement with Don Gabriel Gonzalez de Andia-Yrarrazaval, of 24, Park Lane, Mayfair, W., providing for the purchase of certain inventions, patent rights, and registered designs in relation to sound reproducing and amplifying apparatus, and provision of certain services, and to carry on the business of manufacturers of and dealers in apparatus, instruments, &c. The first directors are:—Marquis Gabriel Gonzalez de Andia-Yrarrazaval, 24, Park Lane, W.1 (permanent); Rt. Hon. Baron Ridesdale, 26, Rutland Gate, S.W.7; Col. J. C. Brinton, C.V.O., D.S.O., Badminton, Glos. (nominee of Marquis Andia-Yrarrazaval); G. T. Bowles, 2, Ryder Street, St. James, S.W.1. Remuneration: 10 per cent. of the net profits divided between them. Solicitors: Hasties, 65, Lincoln's Inn Fields, W.C.2. Registered office: 38, Bedford Street, Strand, W.C.2.

Sifam Electrical Instrument Co., Ltd.—Private company. Registered June 1st. Capital, £1,000 in £1 shares. Objects: To acquire and carry on in the U.K., the Irish Free State, and British Colonies and Dependencies, the business hitherto carried on by La Société Industrielle pour la Fabrication d'Appareils de Mesure (a company incorporated in France), and to carry on the business of manufacturers, importers and exporters of and dealers in all kinds of electrical measuring apparatus, switchboard control instruments, &c. The subscribers (each with 2 shares) are:—J. P. McKenzie, 21, Leyland Road, Lee, S.E.12, engineer; A. J. Wheatland, 110, Dalzell Road, Brixton, S.W.9, solicitor's clerk. The subscribers are to appoint the first directors. So long as La Société Industrielle pour la Fabrication d'Appareils de Mesure holds £500 shares, it may have two representatives on the directorate. No share qualification required. Solicitors: Bulcraig & Davis, Amberley House, Norfolk Street, W.C.

Herne Bay and District Electricity Supply Co., Ltd.—Public company. Registered May 31st. Capital, £70,000 in £1 shares (50,000 ordinary and 20,000 deferred). The objects are to acquire a transfer from A. J. Hunt, A. W. Hunt, A. G. Hunt, Daisy E. Hunt, and Emmie Hunt, or other parties entitled thereto, of the Herne Bay and District Electricity Special Order, 1926, and the undertaking authorised by such Order, for £315 cash, to develop and turn to account the undertaking, and to carry on the business of electricians, mechanical engineers, manufacturers and workers of and dealers in electricity, motive power and light, &c. The minimum cash subscription is 7 shares. The first directors (to number not less than 4 nor more than 9) are:—Sir Thomas O. Callender, J.P., Bidborough Court, near Tunbridge Wells (managing director of Callender's Cable & Construction Co., Ltd.); P. V. Hunter, C.B.E., Springhurst, Addington (assistant manager of Callender's Cable & Construction Co., Ltd.); A. J. Hunt, 65, Mortimer Street, Herne Bay, engineer; Daisy E. Hunt, 65, Mortimer Street, Herne Bay, engineer (secretary of Hunt and Sons). Qualification: £500 shares or stock. Remuneration (except managing director) £100 each per annum (chairman £150), and a sum equal to 5 per cent. of the net profits in each year when a dividend of not less than 6 per cent. is paid on the ordinary and deferred shares, divided between them. Secretary: H. Foulds. Solicitors: Drake, Son & Parton, 24, Rood Lane, E.C.3. The registered office is at Hamilton House, Victoria Embankment, E.C.4.

Radio Electric Co. (Bournemouth), Ltd.—Private company. Registered June 2nd. Capital, £1,000 in £1 shares (250 7½ per cent. cumulative preference and 750 ordinary). Objects: To carry on the business of radio engineers (wireless), including television, and any other invention in connection with radiology. The first directors are:—Major A. G. Smith, 10, Rushton Crescent, Bournemouth; M. C. Barber, "Burwood," New Milton, gentleman; Miss Marion R. Smith, 10, Rushton Crescent, Bournemouth; S. H. Pearce, 24, Derby Road, Bournemouth, commercial tutor (all permanent). Qualification: £100. Secretary: M. R. Smith. Solicitors: J. and W. H. Devitt, Bournemouth.

R. J. Sinclair & Co. (Glasgow), Ltd.—Private company. Registered in Edinburgh, May 27th. Capital, £500 in £1 shares. Objects: To carry on the business of electrical engineers and contractors, &c. The directors are:—J. Sinclair, 96, Camphill Avenue, Langside, Glasgow, accountant; G. Dalrymple, 80, Bellgrove Street, Dennistoun, Glasgow, cabinet maker. Qualification: £10 shares. Secretary: J. Sinclair. Registered office: 178a, Bath Street, Glasgow.

Electric Repairs (Glasgow), Ltd.—Private company. Registered in Edinburgh, June 2nd. Capital, £500 in £1 shares. Objects: To carry on the business of electricians, mechanical engineers, &c. The first directors are:—A. M. Maclachlan, 1, Woodburn Place, Glasgow, electrical engineer; Kate Maclachlan, 1, Woodburn Place, Glasgow; H. G. Allday, 15a, Edenhurst Road, Mile End, Stockport, mantle merchant. Registered office: 105, Bothwell Street, Glasgow.

Official Returns of Electrical Companies.

County of London Electric Supply Co., Ltd.—A trust deed has been registered, dated May 19th, 1927, to secure £4,250,000 5 per cent. debenture stock (with power to issue further debenture stock from time to time, by supplemental trust deeds, but the aggregate amount of stock secured is not at any time to exceed the total amount paid up in cash in respect of the company's share capital, plus any amounts standing to the credit of the company's reserves and of sinking funds provided under the London Electricity (No. 1) Act, 1925). Property charged: The company's undertaking and property, present and future, including uncalled capital, coupled with a covenant by the company that it will not, without the previous sanction of an extraordinary resolution of the stock-

holders, create any mortgage or charge on any of its assets ranking in priority to or *pari passu* with the charge created by the above deed, except only charges (whether specific or floating) for securing temporary loans raised by the company in the ordinary course of business up to a total not at any time exceeding 10 per cent. of the nominal amount of the aggregate stock and of any additional stock ranking *pari passu* therewith in point of charge from time to time outstanding. The trustees are: The Electric and General Investment Co., Ltd., of Falcon House, Aldersgate Street, E.C.1; and the Law Debenture Corporation, Ltd., of 24, Old Broad Street, E.C.2. The stock was issued at 96 per cent., and the company paid to Messrs. W. Greenwell & Co. and Messrs. Foster and Braithwaite an underwriting commission of 1¼ per cent., and an overriding commission of ¼ per cent. on the nominal value of the stock.

Siderman Electrical Supplies, Ltd.—Debenture dated May 9th, 1927, to secure £500, charged on the company's property, present and future, including uncalled capital. Holder: A. Siderman, 51, Cleveland Street, Fitzroy Square, W.1.

British Resistor Co., Ltd.—Capital, £1,000 in £1 shares. Return dated January 28th, 1926 (filed April 13th, 1927). All shares taken up. £1,000 paid. Mortgages and charges, nil.

Valco, Ltd.—Capital, £100 in £1 shares. Return dated December 31st, 1926 (filed April 1st, 1927) Two shares taken up. £2 paid. Mortgages and charges, nil.

Darimont Electric Batteries, Ltd.—Capital, £18,000 in 62,000 ordinary shares of 5s. each, and 50,000 deferred shares of 1s. each. Return dated December 28th, 1926. All shares taken up. £8,999 16s. paid on 34,666 ordinary and 6,666 deferred shares. £9,000 4s. considered as paid on 27,334 ordinary and 43,334 deferred shares. Mortgages and charges, nil.

Gas and Electricity Development Co., Ltd.—Capital, £2,000 in £1 shares. Return dated December 31st, 1926 (filed March 22nd, 1927). All shares taken up. £2.000 paid. Mortgages and charges, nil.

Adelaide Electric Supply Co., Ltd.—Capital, £2,250,000 in 500,000 ordinary, 1,250,000 preference and 500,000 preferred ordinary shares of £1 each. Return dated November 24th, 1926 (filed February 9th, 1927). All shares taken up. £2,120,000 paid on 370,000 ordinary, 1,250,000 preference, and 500,000 preferred ordinary shares. £130,000 considered as paid on 130,000 ordinary shares. Mortgages and charges: £1,073,217.

Vee Cee Dry Cell Co., Ltd.—Capital, £5,000 in £1 shares. Return dated October 17th, 1926 (filed May 2nd, 1927). 1,450 shares taken up. £1,200 paid, £250 considered as paid. Mortgages and charges, £1,000.

Electric Cables, Ltd.—Capital, £2,000 in £1 shares. Return dated December 31st, 1926 (filed March 22nd, 1927). £1,000 shares taken up. £1,000 paid. Mortgages and charges, nil.

Johnson, Ross & Co., Ltd.—Particulars filed of £1,000 debentures dated May 9th, 1927, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £500.

James Keith & Blackman Co., Ltd.—Satisfaction in full on May 14th, 1927, of debentures dated June 12th, 1914, and May 9th, 1922, securing £775.

J. Brent & Co., Ltd.—Capital, £1,000 in £1 shares. Return dated November 30th (filed December 14th), 1926. 776 shares taken up. £576 paid. £200 considered as paid. Mortgages and charges, nil.

Turner, Atherton & Co., Ltd.—Capital, £140,116 in 62,861 preference and 77,255 ordinary shares of £1 each. Return dated August 17th, 1926 (filed January 21st, 1927). 49,172 preference and 51,597 ordinary shares taken up. £26,487 paid on 7,259 ordinary and 19,228 preference shares. £74,282 considered as paid on the remainder. Mortgages and charges, nil.

Milldale, Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926 (filed April 6th, 1927). 740 shares taken up. £740 paid. Mortgages and charges, nil.

Forest City Electric Co., Ltd.—Capital, £5,000 in £1 shares. Return dated February 25th, 1927. 2,642 shares taken up. £2,202 paid. £440 considered as paid. Mortgages and charges, nil.

Mexican Hydro-Electric Development Syndicate, Ltd.—Capital, £26,000 in £1 shares. Return dated October 14th (filed December 28th), 1926. 25,350 shares taken up. £7,450 paid. £17,900 considered as paid. Mortgages and charges, nil.

Sydney W. Bussell, Ltd.—Mortgage or charge on the company's undertaking and property, present and future, including uncalled capital, dated May 24th, 1927, to secure £850. Holders: Pedestros, Ltd., 26, Langham Street, W.

I. D. Morison, Ltd.—Capital, £1,000 in £1 shares. Return dated December 31st, 1926 (filed January 21st, 1927). 500 shares taken up and fully paid. Mortgages and charges, nil.

Bestolamps, Ltd.—Capital, £3,000 in 2,500 preference shares of £1 each and 10,000 ordinary shares of 1s. each. Return dated December 31st, 1926 (filed April 2nd, 1927). 1,300 preference and 10,000 ordinary shares taken up. £500 paid on 500 preference shares. £1,300 considered as paid on 800 preference and 10,000 ordinary shares. Mortgages and charges, nil.

Wheatley, Smith & Co., Ltd.—Debenture dated May 18th, 1927, to secure £300, charged on the company's undertaking or property, present and future, including uncalled share capital. Holders: J. J. Eastick & Sons, Eelex House, Bunhill Row, E.C.

Jersey Electric Lighting and Power Co., Ltd.—Particulars filed of £15,000 debentures authorised May 5th, 1927, charged on the company's undertaking and property, including uncalled capital, the amount of the present issue being £12,000.

Abies Battery Co., Ltd.—Capital, £2,000 in £1 shares. Return dated August 14th, 1926 (filed April 21st, 1927). 878 shares taken up. £378 paid. £500 considered as paid. Mortgages and charges, nil.

Electrical Contracts and Maintenance Co. (1925), Ltd.—Capital, £3,000 in £1 shares. Return dated March 23rd, 1927. 2,075 shares taken up. £2,075 paid. Mortgages and charges, £250.

Quality Radio, Ltd.—Capital £100 in £1 shares. Return dated December 31st, 1926 (filed March 24th, 1927). 76 shares taken up. £76 paid. Mortgages and charges, nil.

W. Skewes & Co., Ltd.—Capital, £1,000 in £1 shares. Return dated March 23rd, 1927. All shares taken up. £650 paid. £350 considered as paid. Mortgages and charges, nil.

Artic Fuse and Electrical Manufacturing Co., Ltd.—Capital, £5,000 in 4,700 ordinary and 100 deferred ordinary shares of £1 each and 4,000 founders' shares of 1s. each. Return dated December 31st, 1926 (filled March 1st, 1927). 2,433 ordinary, 100 deferred ordinary, and 1,933 founders' shares taken up. £2,079 13s. paid on 1,983 ordinary and 1,933 founders' shares. £550 considered as paid on 450 ordinary and 100 deferred ordinary shares. Mortgages and charges, nil.

Wickford and District Electricity Supply Co., Ltd.—Capital, £5,000 in £1 shares. Return dated December 31st, 1926 (filed February 4th, 1927). 2,206 shares taken up. £2,206 paid. Mortgages and charges, nil.

Kinetic Elutriators, Ltd.—Capital, £500 in 1s. shares. Return dated December 31st, 1926 (filed March 29th, 1927). All shares taken up. £100 paid. £400 considered as paid. Mortgages and charges, nil.

H. W. Dutton & Co., Ltd.—Capital, £2,000 in £1 shares. Return dated December 31st, 1926 (filed April 9th, 1927). All shares taken up. £1,415 paid, being £1 per share on 50 shares and 14s. per share on 1,950 shares. Mortgages and charges, nil.

Harrison Brothers (Electrical Engineers), Ltd.—J. H. Anderson, C.A., of Zetland Road, Middlesbrough, was appointed receiver on May 20th, 1927, under powers contained in debenture dated June 22nd, 1926.

C. J. Thursfield & Co., Ltd.—Second charge on the company's undertaking and property, present and future, including uncalled capital, book debts, and unpaid calls, dated May 13th, 1927, to secure all moneys for which the mortgagees (R. C. S. Jansie, 106, Trafalgar Road, Moseley, and two others) may become liable under a guarantee to company's bankers.

Airedale Electrical and Manufacturing Co., Ltd.—Equitable mortgage on freehold property No. 392, Bowling Old Lane, Bradford, dated May 11th, 1927, to secure all moneys due or to become due from the company to Bank of Liverpool and Martins, Ltd., not exceeding £700. This security is in addition to debentures granted to the above bank on November 28th, 1923.

Yarmouth (I.W.) Electricity Supply Co., Ltd.—Capital, £5,000 in £5 shares. Return dated March 21st, 1927. 361 shares taken up. £1,805 paid. Mortgages and charges, nil.

Gent & Co., Ltd.—Capital, £50,000 in 20,000 preference and 30,000 ordinary shares of £1 each. Return dated March 15th, 1927. 4,427 preference and 20,876 ordinary shares taken up. £6,887 paid on 957 preference and 5,930 ordinary shares. £18,416 considered as paid on 3,470 preference and 14,946 ordinary shares. Mortgages and charges, £16,500.

Wellingborough Electric Supply Co., Ltd.—Capital, £50,000 in £10 shares. Return dated March 9th, 1927. 4,500 shares taken up. £45,000 paid. Mortgages and charges, £17,500.

Smithfield Markets Electric Supply Co., Ltd.—Capital, £100,000 in 60,000 ordinary shares of £1 each and 8,000 ordinary shares of £5 each. Return dated March 9th, 1927. 60,000 £1 ordinary shares taken up. £60,000 paid. Mortgages and charges, £13,040.

City Notes.

Shanghai Electric Construction Co., Ltd.

The annual meeting of this company, whose report was dealt with in our issue of May 27th, p. 852, was held on June 1st. Mr. J. S. Haskell, the chairman, in the course of his speech, said that comparison of the past year's results with those of 1925 were of no value owing to the abnormal conditions prevailing in the latter year. Against 1924, however, there was a net improvement of £11,024 in the operating profit. The increase in the operating expenses was out of proportion to the growth of traffic, because there had been a general tendency towards higher wages and prices of supplies. The participation in the Singapore Traction Co., Ltd., made the substantial addition of £10,000 to their earnings. Although the profits would have justified a higher dividend, it was thought prudent to restrict it to 10 per cent. on account of the unprecedented conditions in Shanghai, coupled with a bank overdraft of £82,000. The time was not appropriate for a new issue to repay the bank, but the necessity for it, at the proper time, was realised. The company's business had been gravely handicapped by recent events in Shanghai, but he (the chairman) was glad to say that there had been an improvement lately, and with the advent of more settled conditions the company had been able to augment its services to bring them nearer the normal level. In view of the conditions, an application was made to the Municipal Council for a revision of tariffs. That was granted, and the new fares were put into force on May 1st and were understood to be satisfactory. Referring to the Singapore Traction Co., Ltd., Mr. Maskell said that the first year's results were good. The replacement of the trams by trolley 'buses was expected to be completed in the spring of next year. Since the end of March there had been a falling-off in receipts owing to a boycott by the Chinese. Upon the whole, conditions were not so unfavourable as they might have been, and although they were by no means free from anxiety, there were indications of a general improvement.

Madras Electric Supply Corporation, Ltd.

This company's report was reviewed in our issue of May 27th (p. 852). The annual meeting was held on May 30th, when the chairman (Mr. James Gray), in the course of his speech, said that the improvement in the sales of energy (7 per cent.) was considered satisfactory. The necessary equipment for the supply of energy to the workshops of the Madras and Southern Mahratta Railway had arrived, and the supply should be available during the latter half of the year. Negotiations were being conducted with another railway company for the supply of power in connection with the proposed electrification of the system. The first of the new 6,000-kW sets was put into commission in January, and the erection of the second was proceeding. The first 40,000-lb. boiler was put into operation in July last; a second was approaching completion and two others were to follow. During the year the capital was increased to £800,000 by the issue to shareholders of 110,000 ordinary £1 shares at 25s. 6d. each.

Dealing with the Madras Electric Tramways, the chairman said that only the preference dividend was paid for 1926. There had been no material change in the position, although there were indications that the opposition was relaxing. The management had granted various privileges to passengers to attract traffic back to the tramways; they were confident that in the end the tramways would come into their own again. The report and accounts were adopted.

Oriental Telephone and Electric Co., Ltd.

The annual meeting was held on June 3rd, Sir A. H. McMahon, G.C.M.G. (chairman) presiding. In moving the adoption of the report and accounts (which were dealt with in our last issue, p. 896), the chairman said that in view of the conditions the results of the past year's working were satisfactory. There was good reason for anticipating steadily-improving results as normal trade conditions returned. The available balance showed an increase. Of the two branches directly worked by the company that at Singapore had done very well, the gross revenue increasing by over £11,000; it had become necessary to consider the provision of additional equipment to meet the anticipated growth. The Mauritius branch unfortunately showed no signs of returning animation. The company was handicapped by its obligation to provide communication between the central exchange at Port Louis and exchanges in other parts of the island which had developed beyond expectation. Repeated application had been made to the Government for sanction to increase the rates, but this had not so far been granted. In addition, Mauritius had been passing through a period of depression. There were, however, some indications of improvement. After dealing with the operations of the subsidiary companies, the chairman mentioned the institution of a staff provident fund and the appointment to the board of Sir Thomas Catto in succession to Mr. G. Parker Ness, who had resigned.

Rangoon Electric Tramway and Supply Co., Ltd.

The annual meeting of this company was held on May 30th. Mr. P. Henstock (chairman), who presided, referred to the deaths of Mr. F. Tobin and Sir J. Harmood-Banner, who had been connected with the company. Turning to the report (*vide* ELEC. REV., April 29th, p. 691), Mr. Henstock said that the shareholders fully subscribed an issue of 100,000 ordinary shares, at Rs. 16 per share, which was made during the year. The year's capital expenditure amounted to £105,003, of which over £85,500 was incurred in the power-house plant and the cable system, including sub-stations. With the estimated expenditure of 15 lakhs during the current year, the total capital expenditure would reach £746,666. The scheme for modernising the Ahlone power house was nearly finished. The last set put in, which would shortly be ready for trials, brought the capacity of the station up to 16,500 kW. As a result of modernisation, in spite of higher fuel costs, the cost per kWh had been lowered. The economies effected had enabled them to make a reduction of about 9 per cent. in the charges. The same policy of modernisation was being extended to the boiler plant. They had had to spend Rs. 11 lakhs in connection with the supply of condensing water, which had made an appreciable addition to the production costs. The main tramway depôt was being constructed and brought up to date. The rate of increase in traffic had not been maintained, owing mainly to the exceptional floods which kept visitors away, and to motor-'bus competition. The company was running 'buses experimentally, and the services would be extended when the vehicles were received. To counteract the overloading of the mains, the pressure of supply was to be raised. In conclusion, the chairman said that the company proposed to contribute Rs. 15,000 towards the Rangoon University Endowment Fund.

Cawnpore Electric Supply Corporation, Ltd.

Mr. J. G. B. Stone (chairman) presided at the annual meeting on May 30th, and in moving the adoption of the report (ELEC. REV., May 27th, p. 852), said that there was a growing demand for industrial supply, and the sales of energy had risen by 18 per cent. Bulk supply consumers had benefited from a considerable reduction in the price of coal. The experimental 'bus services had proved unremunerative and were being discontinued; it was found that their object—to act as feeders to the trams—was not being fulfilled. The sales department, which made a profit of £865 in 1925, incurred a loss of £70 during last year. That department, in addition to carrying out installation contracts, was employed generally in the work of assisting and advising existing consumers, and in obtaining new ones. Owing to industrial depression, a large proportion of the plant lay idle for some time, but towards the end of the year there was an increased demand. The maximum demand had reached 6,708 kW, which was about half of the capacity of the Riverside Station, allowing for spare plant. At the end of April the demand was 33 per cent. more than at the corresponding date of last year, and further improvement was anticipated.

British Electric Traction Co., Ltd.

The gross profit for the year ended March 31st last amounted to £301,044, as against £300,544 in 1925-26, and after deducting general expenses, loan, interest, &c., there is a balance of £173,008. A dividend of 8 per cent. is declared on the ordinary stock, as for last year, leaving a surplus of £24,143. The directors recommend that a further non-cumulative dividend of 2 per cent. be paid on the preference stock (making 8 per cent. for the year), which will require £14,255, leaving a balance of £9,888 to be added to undivided profits account, making that account £304,378. The directors further recommend that £132,626, equal to 10 per cent. on the ordinary stock, be distributed out of undivided profits account to the ordinary stockholders in fully-paid deferred ordinary stock. It is also proposed to convert the ordinary stock into an equal amount of 8 per cent. non-cumulative preferred ordinary stock, ranking for dividend as from April 1st, 1927, and having priority both as to capital and dividend over the deferred ordinary stock. The amount standing to the credit of reserve account is £520,000. Meeting: June 21st.

North of Scotland Electric Light and Power Co., Ltd.

The report for 1926 states that during the year the Inverness Town Council completed the purchase of the local undertaking. The balance of general reserve account brought forward, together with the sums available for application to the Inverness undertaking, enabled the company to distribute a bonus of £71,250 to the shareholders. After providing for interest, preference dividend, &c., there remained a balance of £6,845. The total ordinary dividend is 7 per cent., free of tax; £3,000 has been transferred to renewal reserve account; and £345 is carried forward. Mr. F. E. Gripper has resigned from the board owing to ill-health; his place has been taken by Mr. C. H. Jones.

Kalgoorlie Electric Power and Lighting Corporation, Ltd.

The profit for the year ended December 31st last was £25,899, as compared with £22,138 for 1925. After providing for interest and depreciation and placing £3,000 to reserve and adding the balance brought forward, there remains £3,978. It is proposed to pay a dividend of 6 per cent. on the ordinary shares, leaving £978 to be carried forward. The meeting was to be held yesterday (Thursday).

Ever-Ready Co. (Great Britain), Ltd.

The annual meeting was held on May 31st, Mr. C. H. C. Moller (chairman) presiding. In presenting the report (ELEC. REV., May 13th, p. 770), the chairman said that, in spite of the adverse conditions, they had had a successful year. They were able to market their goods at prices with which small manufacturers were unable to compete. Every step was taken to improve production methods and reduce costs while maintaining quality. The properties, plant, machinery, &c., appeared in the accounts at a low figure, this being based upon pre-war values. The reserve now stood at £170,000, and the reserve for contingencies at £15,000. The contribution of £5,000 to a staff benevolent fund was a new item; the fund would enable the pensioning of employés to be dealt with in a systematic manner. Their Government securities now totalled £245,000; it might be necessary to realise some of these during the year to provide for expansion of the business.

Stock Exchange Notices.

The Committee has ordered the following to be officially quoted:—

Calcutta Electric Supply Corporation, Ltd.—136,671 ordinary shares of £1 each, fully paid, Nos. 1,366,711 to 1,503,381.

Shropshire, Worcestershire and Staffordshire Electric Power Co.—250,000 "A" ordinary shares of £1 each, fully paid, Nos. 860,001 to 1,110,000, and 150,000 "B" ordinary shares of £1 each, fully paid, Nos. 650,001 to 800,000.

Llanelly and District Electric Supply.—£279,581 5 per cent. first mortgage debenture stock.

North Metropolitan Electric Power Supply.—850,000 ordinary shares of £1 each, fully paid, Nos. 1 to 850,000.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

International Telephone and Telegraph Corporation.—$36,040,700 capital stock in shares of $100 each.

Metropolitan District Railway.—£250,000 new five per cent. redeemable debenture stock, 1933-43.

Electric Construction Co., Ltd.

The report for the year ended March 31st last records a net profit of £19,703, after providing for debenture interest and depreciation. To this is added £21,537 brought forward, making £41,240. It is proposed to pay a final ordinary dividend at the rate of 9 per cent. per annum, making 7½ per cent. for the year, as against 10 per cent. for 1925-26, when the net profit was £37,520. A balance of £14,345 is carried forward. Severe competition both in home and overseas markets was experienced during the year. This was intensified by the prolonged coal dispute, which was also responsible for an increase in production costs. The meeting was to be held yesterday (Thursday).

Bromley (Kent) Electric Light and Power Co., Ltd.

The report for the year ended December 31st last states that the outstanding debentures have now been redeemed. During the latter part of last year negotiations were entered into with the Bromley Town Council for a settlement of the purchase price for the undertaking and since the end of the year an agreement has been reached. After the payment of debenture interest, &c., the profit for the year was £27,491. To this is added £11,108 brought forward, making £38,599. It is proposed to pay a dividend of 10 per cent., free of tax, and to carry forward a balance of £29,599. Meeting: June 13th.

Ruston & Hornsby, Ltd.

The profit for the year ended March 31st last was £89,196, and after providing for debenture interest and depreciation and adding £28,307 brought forward, there remains £49,310. A year's dividend is to be paid on the 5 and 6 per cent. preference shares, and a balance of £25,810 is carried forward. The directors state that the improvement of the previous year was not maintained, and they are therefore unable to recommend a dividend on the ordinary shares. For 1925-26 a dividend of 2½ per cent. was paid.

Callender's Cable and Construction Co., Ltd.

The accounts for 1926, subject to final audit, show a profit of £356,590 against £368,643 in 1925. From this it is proposed to pay a total dividend for the year of 15 per cent. (3s. per share) on the old and new ordinary shares, of which 1s. per share has already been paid. The previous year's dividend on the old ordinary shares was 15 per cent.

Lima Light, Power and Tramways Co.

The report for 1926 shows a net profit of £P.114,477, and the addition of £P.12,912 brought forward, makes available £P.127,389. After providing for bond amortisation and preference share dividends, a balance of £P.11,158 is carried forward.

Stanton Ironworks Co., Ltd.

The final dividend on the ordinary shares is 6 per cent., free of tax, making 10 per cent., free of tax, for the year, as for 1925.

Anderston Foundry Co., Ltd.

A dividend of 6¼ per cent. has been declared out of a net profit of £7,894 for 1926-27.

Fellows Magneto Co., Ltd.

There was a net profit of £10,827 for 1926, but the aggregate debit balance at the end of the year was £253,000. In view of this and the necessity for working capital it has been decided to form a new company with the title "Fellows Manufacturing Co., Ltd." This company will have a capital of £175,000, and shareholders of the existing company will receive, if they elect to do so, a 10s. preferred ordinary share with 7s. credited paid for every preference share and one deferred 2s. 6d. ordinary share with 6d. credited paid for every ordinary share. The calls for the further amounts will be spread over four months. Meeting: June 15th.

Telephone Manufacturing Co., Ltd.

The accounts for 1926 show a net profit of £5,426, as compared with a loss of £21,212 for 1925. It is proposed to devote £4,094 of the profit and £23,275 from a special reserve to writing down the expenses of the new issue, the balance of profit being carried forward. The benefit of contracts delayed by the general strike will be felt during the current year. It is stated that the capital now consists entirely of ordinary shares and the whole of the assets are free from all charges.

Sir W. G. Armstrong, Whitworth & Co., Ltd.

It was reported on the Stock Exchange last week (says the *Financial Times*) that the International Paper Company (a New York concern) had made an offer for the Newfoundland interests of the company.

Reduction of Capital.

MARCONI'S WIRELESS TELEGRAPH CO., LTD., AND REDUCED.—A petition has been presented to the High Court for the confirmation of the reduction of the capital of the company from £4,000,000 to £2,374,954, and will be heard in London on June 14th.

Mirrlees, Bickerton & Day, Ltd.

A dividend of 6 per cent. has been declared on the ordinary shares. Last year the shareholders received 12½ per cent. under the amalgamation agreement with the Mirrlees-Watson Co.

Quebec Power Co.

A dividend of $1¾ per share has been declared on the common shares for the quarter ending June 30th. It is proposed to convert each $100 common share into four shares of no par value.

Guest, Keen & Nettlefolds, Ltd.

A final dividend of 1s. per share is recommended on the ordinary shares, making 10 per cent., free of tax, for the year, as for a number of years past.

Aron Electricity Meter, Ltd.

The directors recommend a dividend of 6 per cent. upon the ordinary shares in respect of the year ended March 31st last. The 1925-26 dividend was the same.

Northern Mexico Power and Development Co.

Dividends of 1¾ per cent. and 1 per cent. respectively have been declared on the preference and common stocks in respect of the current quarter.

Shawinigan Water and Power Co.

A dividend of $0.5 per common share has been declared in respect of the quarter ending June 30th.

O. C. Hawkes, Ltd.

An interim dividend of 6 per cent. per annum, free of tax, has been declared on the ordinary shares.

Stocks and Shares.

TUESDAY EVENING.

STOCK Exchange business suffered interference through the Whitsun holidays occurring in the long "account" that tempts men to remain away from town when the circumstances permit. There is not a great deal to engage business energy in Stock Exchange markets, although some few markets are very busy. Marconis have attracted a noticeable degree of interest. Brazilian Tractions continue active and strong. New issues are not able to count now, as they were a month or two ago, upon certainty of success. In a couple of cases within the past fortnight, underwriters were left with 94 per cent. of their obligations: in two others, the public took 50 per cent. of the one and 15 per cent. of the other. This had a sobering effect upon promotions, and a lull in the rush of new-comers is welcomed by people who want to dispose of previously-subscribed scrip which they had stagged.

The rise in Marconi shares follows the argument of three weeks ago that, at anything under 20s., the price showed reasonable chance of responding to the quiet accumulation of shares that was then noticeable. The effect of this earlier buying made itself felt as the public began to come into the market, and the shares rose sharply to 22s. 6d. Concurrently, Canadian Marconis jumped nearly 1s. to 5s. 3d. The reason

for this mild enthusiasm is that already mentioned here, *viz.*, the hope of an early dividend declaration, and the confidence that, with personal differences no longer disturbing the internal policy of the company, the Marconi undertaking can develop the advantages that it unquestionably possesses. Marconi's, too, have obtained an important contract in competition with French and German firms, for wireless communication with Bulgaria.

Brazilian Tractions are up 6, at 160, a price which is about 60 points higher than that of a year ago. Sir Alexander Mackenzie, president of the company, stated in a newspaper interview that the board had not considered the question of capital reorganisation. He spoke very favourably of the position, financial and physical, of Brazil. The Stock Exchanges of London and Toronto continue to assume that a bonus of some kind will be forthcoming, either in the shape of a scheme for splitting the shares, or a "melon-cut" of assets. The market for this group is buoyant and excited, Brussels speculation supplementing the bullishness of other quarters. Brazilian Traction preferred are up to 135. Barcelona Tractions improved to 51.

Henleys gained half-a-crown on the news that the company had obtained a contract worth £300,000 from the Great Indian Peninsula Railway in connection with electrification of the main line. The announcement came the more pleasantly by reason of the disappointment recently caused by the Southern Railway's acceptance of a foreign firm's tender for machinery required on its system. Henley's now stand at 91s. 3d., at which the yield on the money is about 4⅜ per cent. This is the same as Callenders afford at 68s. 9d. The Callender's Cable and Construction Company has declared 15 per cent. for the year, the same as before, and the profits of £356,000 are £13,000 less than those of the previous year that ended with December, 1925. In view of the coal strike and general upheaval, Callender's can be congratulated upon having come out of 1926 so well. The coal strike and severe competition are set down as the explanation of the Electric Construction Company's diminished profits shown in the report published the other day. For the year ended last March, the net profit came to £19,700, against £37,600 and £43,000 in the two preceding years, 1925 and 1924 respectively. The dividend, as recorded here last week, is 7½ per cent. against 10 per cent., and the price of the shares has eased off to 27s. 6d., at which the return on the money is 5⅓ per cent. General Electric 6½ per cent. preference strengthened to 24s. in the movement, now general, that is lifting all good preference shares on to a higher plane.

Yorkshire Electrics are better at 30s. The list of prices in the London group shows no change. Urban 4½ per cent. debenture is 6 points up at 92½. County of London Electric new debenture stands at 1¼ premium. The company's chairman and managing director, Sir Harry Renwick, K.B.E., received a baronetcy in last week's birthday honours, and, as recognition of a man who has done so much for the development of the electrical industry, the distinction will be deemed peculiarly fitting.

Resumption of vigorous buying of United River Plate Telephones resulted in a fresh gain of 7s. 6d., which took the price to 9¾. Orientals have rested after their jump last week.

Automatic Telephones are better at 47s. 6d., and Internationals at 40s. Telephone Manufacturing at 6s. 9d. are unchanged.

Cable stocks keep very firm. Anglo-American deferred is ½ higher. Eastern Telegraph ordinary is up a point. Globe preference gained ⅛, but, on the other hand, Great Northern Telegraphs at 28½ are 15s. lower. International Telephone and Telegraph shares just gained ground at 146¼.

British Electric Traction ordinary is 1 up at 149. Underground Electric Railways £1 shares have risen to within a shilling of their par value. The support for these shares serves to keep alive the expectation of early retirement of the company's 6 per cent. income bonds which, when carried out, should make a marked difference to the dividend prospects of the £1 shares. Other Home Railway stocks are still leaning to the lower side, and the rumbles of possible trouble amongst the miners is the latest addition to the market's handicaps. Metropolitan Consolidated has dipped to 60½, being now a point lower than Districts. That same apprehension of labour trouble has caused a slight decline to 52s. 6d. in Babcock and Wilcox, other shares in this division being similarly dull. Armstrongs remain at 3s. 6d.: there is talk of the likelihood that an American company may acquire the Newfoundland Power and Paper Company interests at present owned by Armstrongs, and which have hitherto proved more of a hindrance than a help to the company, whose annual meeting will be held on Thursday in this week.

Mexican Utilities have hardly varied, and the only movement in Argentines is a small advance in Anglo-Argentine Tramways 5 per cent. debenture stock. British Columbia issues are holding their ground, and the preferred retains its last week's gain of 2½ points. Amongst the lower-priced tramway descriptions, London & Suburban Traction ordinary nearly doubled in price, with a rise from ninepence to the present one-and-six. La Plata Trams keep at 4s. 9d. The rubber share market is dull and heavy; a decline in the price of the raw material caused surprise and mystification. Amongst new issues, Electric Finance preference rose from 3d. premium to 10½d. premium, and the debenture strengthened to 2 premium. Buenos Aires Lacroze debenture changes hands fairly frequently around 10s. premium.

The Incorporated Municipal Electrical Association.—III.

Annual Convention at Buxton.

ON Wednesday, June 1st, Mr. T. Roles read extracts from his long paper on "Recent Developments in Power Plant Design," of which an abstract llows, and an excellent discussion took place. The ıthor passed in review the chief developments of recent ars in every stage from the coal pile to the condenser, ving special attention to the economies that may be ob-

Members of the I.M.E.A. assembling at the Opera House, Buxton.

ined from the use of higher steam pressures and temratures, together with the difficulties met with in their option and the methods of coping with them. He owed that a net increase of efficiency of 13.8 per cent. ght be expected as the result of raising the steam essure from 200 to 1,500 lb. per sq. in., corresponding

Mobilising for a visit to the Waterworks.

saving of 0.17 lb. of coal (11,000 B.th.u. per lb.) kilowatt-hour generated. He pointed out, however, t the additional cost of the high-pressure plant could be stated in general terms, as such plant was not available in the market; the better the load factor, higher the steam pressure that could be economically loyed. Particulars were given of the plant designed work at 1,100 lb. per sq. in. which Mr. Roles is inling at Bradford, and many details in connection with feed-heating by partially expanded steam, reheated steam, boiler furnaces, air pre-heaters, pulverised fuel, and automatic boiler control were dealt with in the paper.

In the afternoon most of the members drove to the Derwent Valley waterworks, in charabancs and in their own cars, by routes through picturesque and interest-

Posing for the official photograph in the Pavilion Gardens.

ing scenery; the weather left something to be desired, the sky being overcast and the air misty, but the trip was very enjoyable. For the evening there was no special programme, the time being spent very happily in dancing and conversation; the organising ability of

The I.M.E.A. at the Derwent Valley Waterworks.

Mr. Hewlett, the manager of the Palace Hotel, in this connection was very much appreciated.

At the annual business meeting, which was held in private, Mr. Frederick W. Purse, M.I.E.E., chief engineer and manager of the electricity department of the County Borough of West Ham, was elected president for the ensuing year; and Mr. A. Nichols Moore, borough electrical and tramways manager, Newport, Mon., was elected vice-president.

Distribution over an Extensive Area.

Discussion on Mr. Wm. C. Bexon's Paper.

Mr. J. W. BURR, M.I.E.E., Swansea, in opening the discussion, said that economy in all transmission lines was dependent upon the voltage adopted, the object being to erect a line at the least possible capital cost, and with the lowest annual loss of energy. He did not think that for very long transmission lines the 1,000-V per mile rule would apply. Unfortunately, in transmitting energy over large areas it was almost impossible to have overhead construction throughout the whole distance, and hence underground cables often had to be used. Troubles were undoubtedly being experienced in the use of cables working at 33,000 volts and above. The frequent and sometimes lengthy interruptions which took place in the supply, due to cable failures, not only involved the users and manufacturers in financial loss, but had also delayed the electrical development of certain areas for years. The faults might be due to the method of construction, or they might be due to resonance in the line, or to a combination of the two. It must be borne in mind that on all large transmission systems both induction and synchronous machines were running in parallel and the conditions might at times be favourable to resonance, which need not be produced with the fundamental, but with higher harmonics with which the fundamental waves were frequently accompanied. It might, of course, be that the supply authorities were asking for trouble by offering a reduction in the price of electricity supplied at a high power factor, particularly if a bonus were allowed for leading wattless components. In voicing his preference for the star connection for transformers, Mr. Burr said that should a fault occur to earth on a star-connected line it was possible, as with a delta-connected system, to give a supply in the case of emergency by disconnecting the earth connection and running with the faulty phase earthed. He thought the phase on which the fault occurred should be permanently earthed until the fault was removed. He agreed with the author that the continuity of supply was an all-important factor, but how was this to be obtained? With regard to the suggestion that in a transmission system a duplicate feeder on the same transmission poles was the most economical proposition, he asked whether the author took the six lines into each consumer's premises, what arrangements he had for isolating a faulty line, and how he repaired a fault without shutting down the line. Mr. Burr said his own view was that whenever possible a ring main with directional relay protection was the best proposition. While the ring main with the protective apparatus would cost more than a single six-wire line, it would serve a much larger area and would certainly give greater security from interruption due to the necessity for overhaul. Unless collieries and large works generally were assured that continuity of supply could be reasonably relied upon no large electrical developments would take place in the future, however low the cost of the energy might be. The electrical development of many areas had been set back for years through the repeated interruptions in the supply. In giving small supplies to farmers near a transmission line, he suggested that the most economical proposition was to give the supply to a small company consisting of farmers and others interested, and let them distribute it themselves. A single supply to a farm from a 33,000-V line was not likely to be a paying proposition. He held the view that, generally speaking, a feeder pressure of 6,600 volts was better than 3,300 V, or it might be that 11,000 volts would even be more economical. Regarding the construction and costs of overhead l.p. distribution, he suggested that by developing the domestic load it might be possible to lay underground mains in preference to the overhead, which had its limitations. In his district they found that it paid to run underground mains and not extend the overhead system. He thought that the many regulations with which the electricity authorities had to comply might be modified considerably in connection with overhead lines without interfering to any extent with the safety of the public. The time had arrived when a bold policy should be adopted by all undertakings in regard to the liberal spending of money on distribution and transmission systems, both with a view to assuring continuity of supply and allowing for all reasonable development in both the industrial and domestic loads likely to take place in the near future.

Mr. W. A. TURNBULL, M.I.E.E., Aylesbury, said he had adopted 11,000 V in his undertaking for overhead transmission. He was experimenting with a new kind of pole at Wendover, and so far with success.

Captain J. M. DONALDSON, M.C., M.I.E.E, chief engineer of the North Metropolitan Electric Power Supply Co., said he was particularly interested in overhead lines because he had just put up 100 miles of them. He suggested that the Ministry of Transport should issue a small document explaining various points with regard to overhead lines; also that a form of consent should be prepared by the Ministry which would free supply undertakings from heavy legal charges.

Mr. T. HALL, Burton-on-Trent, said he had had a tremendous number of insulators broken. In one meadow there were over 27 of them smashed by colliery boys in one day. He had changed the colour from white to brown, but still the nuisance went on.

Mr. R. BORLASE MATTHEWS, M.I.E.E., East Grinstead, congratulated Mr. Bexon upon the initiative and enterprise he had shown in his undertaking. Mr. Bexon had over 73 farm consumers, the largest number in any one area. Tw years ago there were only 200 farmers using electricity this country, but to-day there were 700, and the number wa rapidly increasing. In the rest of the world there were abou a million farmers using electricity to-day. He had had th advantage of talking to farmers as a farmer, and every one h had spoken to was satisfied that electricity was far cheape than other forms of power. Mr. Matthews suggested that i all the rural distribution areas they should have power demon strations of all the appliances that could be reasonably use by farmers. He considered that there was a tendency to sup ply farmers with electricity too cheaply.

Mr. BEXON, in reply, said he had tried white, brown, green and glass insulators and an unbreakable insulator, but th last named would not stand up to the high pressure and h had to substitute porcelain. One week-end he had over insulators broken. The Scotch farmer was beginning to tak electricity for power and lighting. One paid him over £ for power last year and another for lighting paid him ove £44. The farmer had not realised that electricity would enab him to do work in one day that it would take three month to do under the old conditions.

Mr. R. B. MITCHELL, M.I.E.E., Glasgow, proposed a vote o thanks to Mr. Bexon, and said he admired his courage an enterprise in developing his areas. He had no overhead tran mission lines in his own area, but the paper came at a ver opportune time, when so much attention was being paid to th question of supplying areas that were not purely industrial.

Mr. BEXON briefly replied.

Recent Developments in Power Plant Design.

Their Effects on the Economy of Generation.

By THOMAS ROLES,
City Electrical Engineer, Bradford. (*Abstract.*)

HAVING been invited to prepare a paper on the abov subject, the author assumes that the reason underlyin his selection for the task is that certain extension which are now being made to the plant in the Bradford Co poration's Valley Road power station have aroused interes as it has been decided to install plant designed to work at higher steam pressure and temperature than any other plan previously put down in this country. Also last year th author had the opportunity of visiting a number of the larges and most efficient steam-operated generating stations in th United States, but he has had little or no actual workin experience with much of the power-station equipment whic will be commented upon.

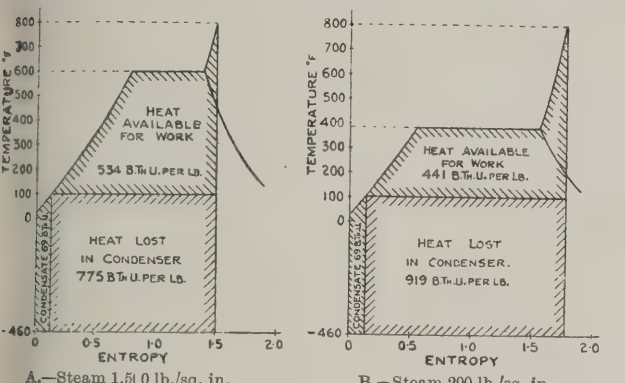
The Valley Road power station as at present equipped operating under steam conditions of 200 lb. pressure pe sq. in., with a total steam temperature averaging abou 630 deg. F. It is also working under what is generall regarded as a disadvantage, in that the circulating water fo the condensers is cooled by means of towers. Under thes conditions the thermal efficiency of the station for the yea ended March 31st, 1927, based on units generated, was 16.6 per cent., the British thermal units per unit generated bein 20,450, and the station load factor 29.5 per cent.

In connection with modern generating stations, the chie developments during recent years have been as follows:—

In the turbine room: Higher steam pressures and temper tures; higher rotational speeds for large turbines; steam extraction from turbines for feed-heating purposes; re-heate steam; and improvements in the design of condensers.

In the boiler house: Higher steam pressures and temper tures; increased capacity of boiler units; re-heater boiler water-cooled furnace walls; air pre-heaters; regenerative fee heating; pulverised fuel firing; improved types of stoker and automatic combustion control.

The Newcastle-upon-Tyne Electric Supply Co., Ltd., on th advice of Messrs. Merz & McLellan, some ten years ag decided to adopt a working pressure of 475 lb. per sq. in in connection with a station to be erected by them at Nort Tees, near Middlesbrough, which was put into service in 192 In the United States of America and on the Continent, how ever, stations are being operated at higher pressures. I 1925 the Edison Electric Illuminating Company, of Bosto U.S.A., started up their new Edgar station at Weymouth containing a plant designed to operate at a gauge pressur of 1,200 lb. per sq. in., and a few months ago, at the Lak side station of the Milwaukee Electric Railway and Ligh Company, a plant of more than double the capacity of th at Boston was put into operation at a working pressure o 1,400 lb. per sq. in. There are also in the United State several stations designed to operate at pressures of from 5 to 650 lb. per sq. in., the total plant capacity for workin at these pressures in that country, either running or pro jected, being close on one million kilowatts.



Although American engineers have gone well ahead i respect of the utilisation of higher steam pressures, they hav not for the most part adopted higher total steam temper tures than are employed in this country. Generally speakin the steam temperatures in use in their modern stations ar from 700 to 750 deg. F., and in very few instances has temperature as high as the latter figure been adopted.

With regard to Continental practice, the outstanding example of high steam pressure is the Langerbrugge station of the Centrales Electriques des Flandres, near Ghent, where since 1925 plant has been in operation at a working pressure of 800 lb. per sq. in. gauge and a total steam temperature of 840 deg. F., this being, so far as the author is aware, the highest steam temperature at which any power-station plant in the world is normally operated.

From what has been seen and learned in the course of his investigations, the author has come to the conclusion that the practical difficulties incidental to the working of extra-high-pressure steam plant are by no means insurmountable or likely to prevent the extended use of such pressures.

The English Electric Co., Ltd., in connection with the Benson plant at Rugby, made experiments with steam at a pressure of about 3,200 lb. per sq. in., which is known as the critical pressure, when the densities of water and steam are equal and the water passes into steam without ebullition. Very useful data have been obtained, but not published.

In considering the economy which theoretically may result from the use of higher steam pressures, a reference to the temperature entropy diagrams, fig. 1, will be useful. These

A.—Steam 1,500 lb./sq. in. Vac. 28 in. Hg.

B.—Steam 200 lb./sq. in. Vac. 28 in. Hg.

Fig. 1.—Heat Distribution per lb. of Steam.

diagrams have been prepared from figures obtained from "The Enlarged Callendar Steam Tables," and are based on steam at a temperature of 800 deg. F. and on a vacuum of 28 in. The hatched area in fig. 1A represents the total heat in one pound of steam at a pressure of 1,500 lb. per sq. in. absolute, *viz.*, 1,378 B.th.u. The area similarly treated in fig. 1B represents the total heat in one pound of steam at a pressure of 200 lb. abs., *viz.*, 1,429 B.th.u. The upper portions of the hatched areas in these diagrams represent the heat available for work, which at 1,500 lb. per sq. in. is 534 B.th.u., or 1.2 times the heat available at 200 lb. per sq. in., which is 441 B.th.u. The rectangular figures forming the lower portions of the hatched areas represent the heat rejected to the condenser, which is 775 B.th.u. at 1,500 lb. pressure and 919 B.th.u. at 200 lb. pressure, or 15.7 per cent. less in the case of the higher pressure. The diagrams therefore indicate that at the higher pressure the total heat in one pound of steam is 3.57 per cent. less than at the lower pressure, but, on the other hand, the heat available for work is 21 per cent.

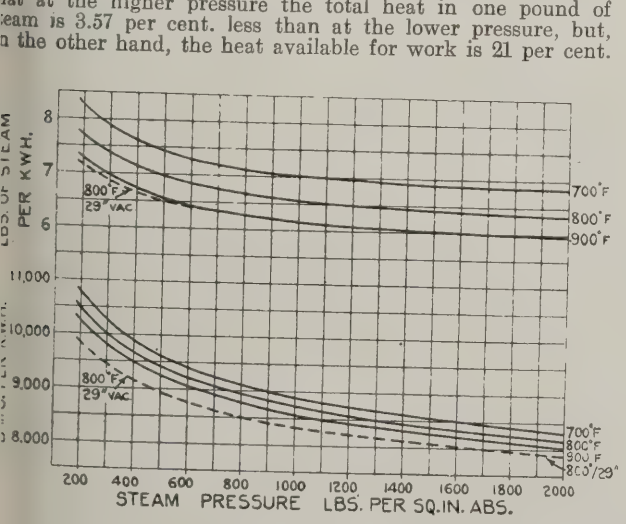


Fig. 2.—Consumption Variations with Steam Pressure.

greater, or, putting the matter in another way, it can be said that in the utilisation of a B.th.u. of heat in steam at a pressure of 1,500 lb. per sq. in., 26 per cent. more work is done than in the utilisation of a B.th.u. in steam at 200 lb.

The full-line curves in fig. 2 show the theoretical steam and heat consumption per kWh at various initial steam pressures between 200 and 2,000 lb. per sq. in. abs. when working with a vacuum of 28 in. and temperatures of 700, 800, and 900 deg. F. The curves given in dotted lines show such consumptions at the various pressures when the steam temperature is 800 deg. F. and the vacuum 29 in. The curves clearly indicate the increases in efficiency which may be obtained as the steam pressure and temperature are raised. From the curves in fig. 2 those in fig. 3 have been produced, illustrating the percentage rate of decrease in heat consumption with steam at various pressures of from 200 lb. to 1,600 lb. per sq. in. abs., superheated to a total temperature of 800 deg. F.

The operating efficiencies likely to be obtained in connection with various portions of extra-high-pressure steam plant may be compared with the efficiencies of lower-pressure plant.

Dealing first with prime movers, it is impossible to convert all the heat available in the steam into useful work at the turbine coupling, as losses take place in all turbines between the stop valves and exhaust branches, as well as in the bearings and by radiation. The best efficiency at the turbine coupling known to the author as having been actually obtained under such conditions is about 81 per cent.

It is not at present possible in a turbine built for a high pressure to abstract work from the expansion of the steam so efficiently as can be done in a turbine constructed for a lower initial steam pressure, and it is doubtful whether it ever will be possible to produce a high-pressure turbine as efficient as one built for pressures of, say, from 180 to 300 lb. per sq. in.

High-pressure turbines have to deal with steam of much greater density than normal-pressure machines, consequently the blade windage and disk friction must be greater. The steam guide passages and blade heights must be smaller and the clearance spaces of greater relative proportion, with consequent increased leakage loss. It would appear that in all probability high-pressure turbines will prove from 5 per cent. to 10 per cent. less efficient than normal-pressure turbines of the same capacity operating under other similar conditions.

With boilers working at high steam pressures the temperature of the flue gases leaving the steam-generating surfaces must of necessity be higher than with normal-pressure plant. This disadvantage, however, can be largely obviated by the use of larger economisers or air pre-heaters, or by a combination of both. Boiler-plant efficiencies under any conditions of pressure cannot be expected to exceed 90 per cent., as this figure closely approaches the physical limit. With high-steam-pressure plants the feed pumps require considerably greater power for their operation than pumps used for dealing with equal quantities of water in connection with normal-pressure boilers. It is not, however, possible at present to

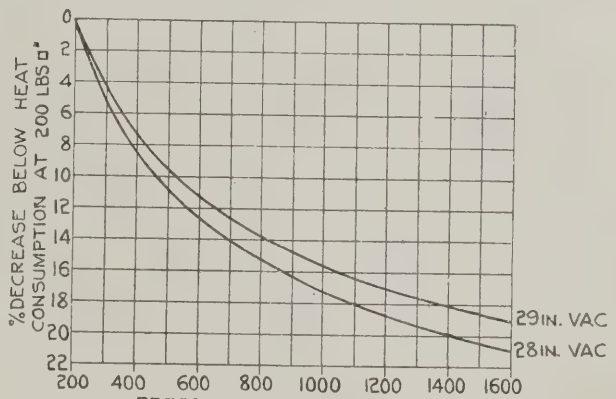

Fig. 3.—Relation between Heat Consumption and Steam Pressure.

obtain pumps for high-pressure working equal in efficiency to those suitable for operating at normal pressures. On the whole, it may be said that the efficiency of a high-pressure boiler should be little below that of a normal-pressure one.

After making the necessary allowance for the difference in efficiency between high- and normal-pressure turbo-generators, it may be taken that the original figure of 26 per cent. will be reduced to 16.41 per cent. if the following turbine and generator efficiencies are assumed:—Efficiency of high-pressure turbine, 74 per cent.; efficiency of normal-pressure turbine, 80 per cent.; and efficiency of electrical generator, in each case 95 per cent. The figure 16.41 per cent. is, however, only a measure of the increase in efficiency which may be realised by the utilisation of steam at higher pressure. The ultimate economy must be shown in terms of coal consumed.

If it be assumed that the efficiency of a boiler plant for normal pressure is 90 per cent., a figure of 88 per cent. may be taken as the efficiency of a high-pressure plant, both figures being based on the net calorific value of the fuel. On this assumption the figure of 16.41 per cent. is reduced to 13.8, and it may therefore be said that one may reasonably expect to obtain from the utilisation of a B.th.u. in a plant constructed to work at 1,500 lb. per sq. in. at least 13.8 per cent. more work than from the utilisation of a B.th.u. in a plant constructed for working at a pressure of 200 lb. This corresponds to a reduction in overall heat consumption of 1,870 B.th.u. per kWh, and assuming that the boiler is fired with coal having a calorific value of 11,000 B.th.u. per lb. net, the saving in coal per kWh generated would be 0.17 lb.

With regard to capital charges, the price paid for the plant determines the amount of the annual interest payments to be made on the capital expenditure, while the probable life of the plant fixes the sum to be set aside for depreciation.

The author considers that the additional cost per kW will increase in greater proportion the higher the pressure and the temperature adopted. From this it follows that in giving

consideration to the installation of high-pressure plant the question of the load factor at which the plant is to be run must receive careful thought. The load factor will determine the extent to which it is economical to adopt high-pressure plant in connection with any particular undertaking.

This fact has resulted in two different methods being adopted in which high-pressure steam is utilised in connection with large power plants. Under the first method the whole of the plant is laid out for high-pressure working, and under the second method high-pressure plant (used in connection with an appropriate proportion of normal-pressure plant) is installed of only sufficient capacity to deal with the base load of the station, the remaining load of poor load factor being dealt with by normal-pressure and, therefore, cheaper plant. In the first case each turbine—usually a multi-cylinder machine—receives steam direct from high-pressure boilers. In the second case only one or two turbines of comparatively small size are operated at high pressure, and the steam is exhausted from them into the normal-pressure steam range and utilised in any of the normal-pressure turbines coupled to that range.

Fig. 4 represents diagrammatically the second method, which the author has adopted in connection with extensions which are now taking place at the Valley Road station.

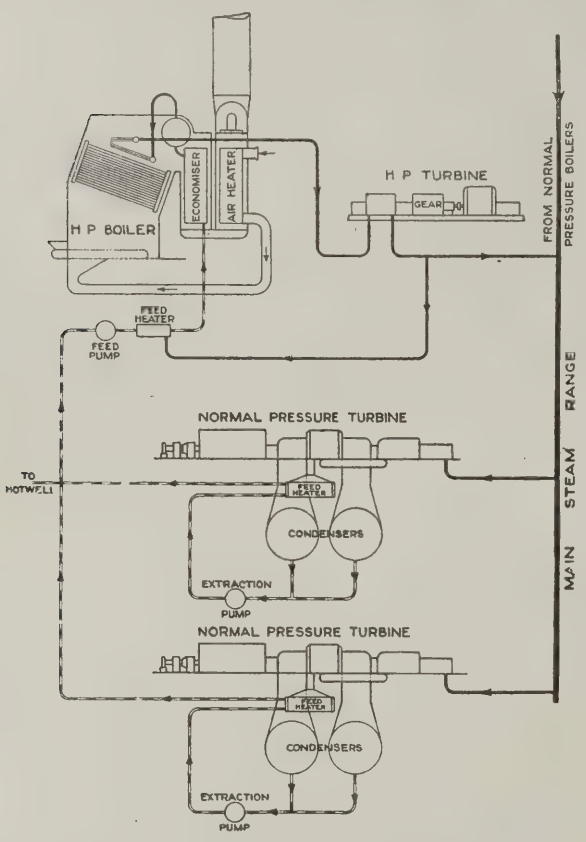

Fig. 4.—System for using both High- and Normal-pressure Steam.

It would appear that capital charges and the cost of repairs and maintenance will be somewhat higher in the case of h.p. plant than in that of normal-pressure equipment, and that the higher the price of fuel the greater are the monetary savings which can be effected. Assuming each type of plant to be run under equal conditions as regards vacuum, the lower the vacuum the greater is the saving attendant upon the use of h.p. plant.

Among the advantages gained by the use of machines having a speed of 3,000 r.p.m. over machines of similar capacities designed for lower rotational speeds are the following:—Lower initial cost; lower steam consumption; greater reliability; and greater ease of overhaul owing to weight of moving parts being less.

It is a fortunate fact that the tendency to increase the rotational speed of turbines harmonises with the movement in the direction of an increase in steam pressures, as in high-speed machines disks of smaller diameters can be employed and almost complete circumferential admission can be adopted, which, amongst other factors, and in view of the density of steam increasing with its pressure, make for greater efficiency in the utilisation of high-pressure steam.

The extent to which regenerative feed heating can be used depends, among other factors, upon the method adopted for firing the boilers. It is impossible to design a station to work at the highest efficiency unless the functions of the turbines and auxiliaries are properly correlated to those of the boilers and auxiliaries. With the introduction of regenerative feed heating the relationship between the turbine and boiler rooms becomes far more intimate and still closer if re-heating of the steam is carried out. This fact will in future cause responsible engineers considerable difficulty when dealing with contracts for the installation of new plant; in the event of failure to obtain a certain anticipated overall efficiency from the coal bunker to the switchboard it will be difficult to attach respon sibility to any particular contractor when different portions the plant have been installed under separate contracts.

It is now generally the practice in modern power statio to increase the temperature of the steam, at whatever pressu it is generated, from saturation temperature to from 550 t 700 deg. F. To attain the best results with regard to efficienc and to prolong the life of the blading, it is desirable that som degree of superheat should be retained in the steam up t the last expansion, and that the steam should enter the cor denser in a dry saturated condition. Unfortunately it i impossible to obtain this desideratum even when stear utilised at as low a pressure as 200 lb. per sq. in. is supe heated to a total temperature of 800 deg. F.

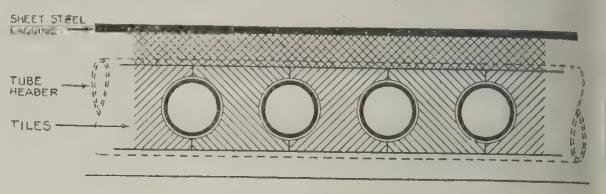

Fig. 5.—Water-cooled Furnace Wall (Bradford).

The question of re-heating or otherwise can only be settle after carefully considering whether the expenditure of th additional capital involved in the provision of such plant wil be justified, having regard to the saving in coal which ma be effected by increased thermo-dynamic efficiency and by reduction in the cost of turbine maintenance consequent upo the greater life of the blading in the low-pressure stages o the turbine. In the opinion of the author such justificatio will not be found except in the case of certain h.p. plants.

Generally speaking, it may be said that the justificatio for the use of boilers of large capacity is found in the reductio in capital expenditure for a given output, and in the greate ease of operation, rather than in any increase in therma efficiency. It is the author's opinion that with a boiler having an evaporative capacity of about 60,000 lb. per hour, one ca obtain a thermal efficiency as high as is practically an economically possible.

The introduction of pulverised-fuel firing has greatly assiste in the construction of boilers having large outputs, but com paratively small heating surfaces. It is doubtful whether i would have been possible to build boilers of such huge capacity as those which are in use in America and to operate them efficiently if any other method of coal firing had been adopted.

As a consequence of the greater efficiency attained in con nection with boiler plant and of higher rates of combustio in boiler furnaces, the cost of maintaining the brickwork used in combustion chambers designed on lines which proved fairly satisfactory for less efficient boilers and lower rates of com bustion has considerably increased. As the combustion chamber of a modern boiler is usually of far greater capacity in proportion to the heating surface than was the case some years ago, the amount of refractory material is necessarily also very much greater, and the cost of maintaining it is corre spondingly higher. In order to keep the cost of furnace repairs down to a reasonable figure and to enable boilers to be continuously operated over long periods without the neces sity of furnace repairs, furnaces have recently been designed to maintain the walls at a sufficiently low temperature to prevent rapid deterioration of such materials. The methods most usually adopted are:—the provision of ducts in the brick work of the walls, through which cold air is passed; walls constructed partly of refractory material and partly of steel tubes; and walls made up entirely of steel tubes of special design unprotected by refractory material.

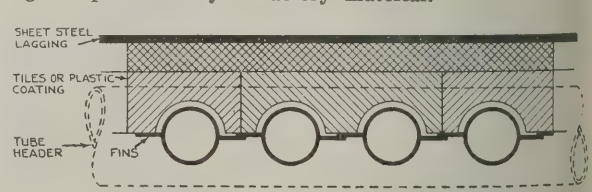

Fig. 6.—Murray Fin-tube Furnace Wall.

The h.p. boiler which is to be installed at Bradford is being fitted with water-cooled furnace walls of the refractory-material and steel-tube type, fig. 5. The desirability of utilising air pre-heaters has arisen largely as a result of the adoption of regenerative feed-water heating, and, as this method is being increasingly employed, air pre-heaters would appear likely to be much more commonly used in the future than they have been hitherto. Fig. 6 shows a section of a wall of a Murray Fin-tube furnace.

It would appear that where air pre-heaters are employed in connection with stoker-fired boilers, the grate area could be somewhat reduced, and in connection with pulverised-fuel-fired boilers the combustion chamber might be of somewhat smaller capacity, thus in each case reducing the capital cost.

It will probably be agreed that the greatest innovation in recent years in connection with boiler houses of power stations has been the introduction of pulverised-fuel firing. The following appear to be the principal claims made in favour of the use of pulverised-fuel plant:—Extreme cleanliness of

operation; ease of control; ability quickly to follow highly fluctuating loads; fuels of variable qualities mixed together in the same bunker can be better dealt with; low-grade fuels can be burned more satisfactorily and utilised more efficiently; a high sulphur content or a high ash content of the coal does not affect combustion to the extent it does with stoker firing; banking losses are considerably reduced; moving parts and mechanism are eliminated from the furnaces; furnace refractories last longer, owing to the fact that the highest temperature is in the centre of the furnace away from the walls; higher outputs per square foot of heating surface can be obtained from the boilers; and a higher average boiler efficiency can be maintained than that maintained by the use of stokers which under test conditions would give equally good results as regards efficiency.

In deciding whether or not to adopt pulverised-fuel firing the chief matters for consideration are the capital cost and the costs of operating and maintaining the plant, as compared with similar costs in respect of stoker plant.

The author reluctantly came to the conclusion that at Bradford the generation of electricity could be effected more cheaply in the immediate future by the adoption of stoker firing than by the installation of pulverised-fuel plant. He, however, realises that the present conditions may not be permanent, and, therefore, has arranged for the boiler furnace to be so constructed that pulverised-fuel firing can be adopted at a later date if then found desirable.

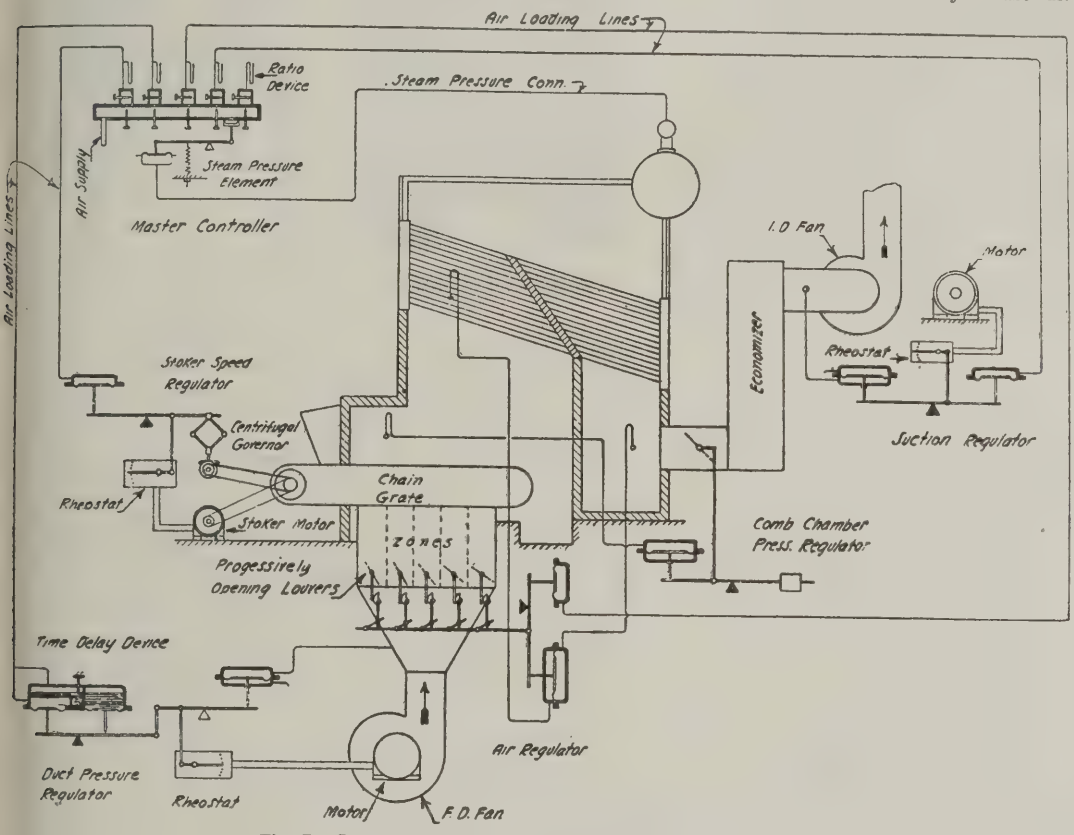

Fig. 7.—Lay-out for Smoot Automatic Combustion Control System.

The type of stoker which the general consensus of opinion in this country deems most suitable for the burning of British coals under water-tube boilers is that known as the chain or travelling grate. During recent years methods have been devised of enclosing the grates, which have also allowed of their use with air pre-heated to a temperature of about 250 deg. F.

So far as the author is aware, no system of automatic boiler control has yet been installed in Great Britain. Such installations to a large number, however, have been put into use in America, with, it is claimed, a marked gain in efficiency. The principle on which these automatic installations work is the maintenance of a constant steam pressure at all loads. Any variation in the steam pressure is transmitted to a number of regulators, whose combined function is to bring the pressure back to normal.

The two systems of automatic combustion control which appeared to the author to be most generally employed in the United States were those made by the Smoot Engineering Corporation, of New York, and the Bailey Meter Company, of Cleveland. In the Smoot system the variations in pressure are transmitted from the master controller to the regulators by air-pressure impulses. The regulators consist primarily of a diaphragm, one side of which is under air pressure transmitted from the master controller and is balanced by some force which bears a direct relation to the load on the boilers for the function which that individual regulator has to perform. The movement of the diaphragm is transmitted by levers actuated by an oil relay to the various rheostats, dampers, and other devices. Fig. 7 shows in diagrammatic form a lay-out of the Smoot automatic combustion control, as arranged for a stoker-fired boiler.

Discussion on Mr. Roles's Paper.

Mr. I. V. Robinson, of the B.E.A.M.A., said there was no doubt that high-pressure plant would cost more than plant of normal pressure. Both the Bradford Corporation and the manufacturers who were installing the h.p. equipment there were to be commended for their enterprise. Not until things had settled down should we be able to get with any degree of accuracy the difference in the costs of normal- and high-pressure plant. He suggested that it would be an advantage to the industry if a single-cylinder machine were used for outputs very much in excess of anything that had been attempted in this country, with an efficiency of 80 and not 83 per cent. A single-cylinder machine could be used for up to 50,000 kW with a normal-pressure plant. Undue emphasis was being put on thermal efficiency, which had been forced upon the engineers by the publication of tables by the Electricity Commissioners, and this, he thought, was not in the best interests of the industry. If thermal efficiency were the only thing we were working for, then there was no doubt which stations would win—those with internal-combustion engines. But thermal efficiency was not the goal we were striving for. He suggested that it might be possible to grade stations on the average price per unit, but it would be unfair to compare the average prices of purely residential districts with areas that were solely industrial. Would it not be possible to grade and classify the stations according to the percentage sold for lighting purposes? That would not only take into consideration thermal efficiency, but also initial costs. Referring to the re-heating of steam, he said there seemed much still to be done before re-heating was a success. The question of steam being re-heated by superheated steam was a matter that was worthy of consideration. He doubted the suggestion that the efficiency of the condenser had reached its maximum, in view of the improvements that were being made.

Mr. R. A. Chattock, M.I.E.E., said that for the past 18 months he had been engaged on the design of a new power station at Birmingham, and he found that he had been following to a very great extent along the lines given in the paper. When he was at the Valley Road station they had a thermal efficiency of 10 per cent.; now Mr. Roles had got it up to 16.68 per cent. The new Birmingham station was designed for a thermal efficiency of 23 per cent., which would be obtained quite easily, even with the use of cooling towers. The high efficiency would be obtained largely by the bleeding of the turbines and heating the feed water in that way. He did not think that the method of re-heating steam was likely to be generally adopted. The idea of placing the contracts for the whole of the plant with one main contractor had been adopted at Birmingham.

Mr. Chittenden, of the English Electric Co., pointed out that at Rugby they were generating steam at 3,200 lb. per sq. in. and using it at 1,500 lb., and they got an efficiency of over 80 per cent. without using a re-heater or other things. He had seen tests recently on a high-pressure boiler on which 88 per cent. efficiency was reached. There were a number of stations in this country which could not put on feed heating, because the turbines were not designed for it, nor could they alter the vacuum; but they could add a small percentage of high-pressure plant.

Mr. J. H. Bowden, M.I.E.E., Poplar, gave some details of a boiler he had seen in Berlin. It was designed to work at 3,250 lb. pressure and the firm expected to get an increase over and above the existing plant in thermal efficiency of 14 or 15 per cent. The quantity of water in the boiler was only 80 gallons, and it was fired by pulverised coal.

Mr. W. Bayliss, of Messrs. Babcock & Wilcox, Ltd., said the pressure that had been adopted at Bradford was not the highest that had been used commercially in connection with power generation. The contractors were out to help the electrical engineers of this country in any developments they desired to make. Probably at the present time there was a limited number of cases where conditions justified the disfavour which was accorded to h.p. delevelopment, and where

capital costs were a serious factor. Twenty-five years ago the maximum steam pressure was in the neighbourhood of 225 lb. per sq. in., but to-day plant was operating at 1,200 lb. He said we must go on in this country, we had to lead the world. There were engineers to-day willing to go beyond the pressures and temperatures mentioned in the paper. Mr. Bayliss asserted that although everyday improvements were being made in the detailed plants associated with pulverised fuel, it was a fact that at the present time there was no pulverised-fuel plant in this country that could show as high an efficiency as had been obtained from stoker-firing plant.

Mr. A. Q. CARNEGIE, of Messrs. C. A. Parsons & Co., said that re-heating had been tried in this country, but up to the present not wholeheartedly. A re-heating plant had been put up at North Tees, the steam temperature being raised 150 deg. F. The recently completed contract for Chicago aimed at 750 deg. F. for the re-heat. He could not see any advantage in re-heating by live steam. If it were possible to raise the temperature of the re-heated steam to 1,000 deg. F., it was also possible to take that steam into the turbine direct, which would have the same effect as taking the steam out of the turbine later and re-heating it. Most of the first-class engineering firms were always anxious with the pioneer in any new development to bear a fair share of the cost. He hoped that when Mr. Roles had got his h.p. system working he would give a paper on its results.

Mr. D. WILSON, of International Combustion, Ltd., said he was still prepared to defend the mechanical stoker in its useful sphere of influence, but he had no hesitation in following the predictions the author had given. The whole question was one of capital costs, which were rapidly tumbling down.

Dr. S. Z. DE FERRANTI reminded the members that an engineer named Perkins once ran a boiler and engine in this country on 1,000 lb. steam pressure a long time ago. He had devoted considerable time to the question of economy of generation. In the Deptford station they adopted 200 lb. pressure 38 years ago. There had been a large amount of money spent on electric supply, but he did not see any alternative to what was being done at present. In 1910 they put down at one of the Vickers works in Sheffield a 3,000-kW machine, 1,500 r.p.m. They only had a 200-lb. pressure, but they had one stage of re-superheating to 750 deg. F., the l.p. steam being at about atmospheric pressure. They then introduced a steam regenerator between the condenser and the turbine exhaust, and also went in for four stages of progressive feed heating, which obviously involved air heating. All these things were embodied in the 3,000-kW plant. They found afterwards that there was a serious steam leakage owing to the construction of the machine. He had found no solution for the problem of re-superheating, which he considered satisfactory. The New York Edison Co. in its latest station had not adopted re-superheating. It had adopted regenerative feed-water heating, but it had only gone in for 375 lb. boiler pressure. He was very much surprised at that.

Mr. HENMAN said the system of re-heating by the use of oil had great future possibilities, and one of its big advantages was that it required smaller pipes.

Mr. R. B. MITCHELL, Glasgow, felt that the day would come when base-load stations would have a working pressure all through of something like 1,000 lb. at least. He suggested that a case had been made out for a combined plant consisting of some stoker boilers and some pulverised-fuel boilers.

Mr. POTTER, of Messrs. Simon-Carves, Ltd., said it was generally admitted that the grit from the pulverised-fuel chimneys was much finer and there was no nuisance through the emission of the grit.

Mr. ROLES, replying, said that unless they were going to deal with basic loads it would not be economical to put in a very highly-efficient plant. The point was that the matter had been dealt with by the Coal Conservation Committee. There had been no Committee set up to consider the question of the conservation of capital. In America, probably due to the fact that the undertakings were in the hands of companies and not municipalities, they had developed rather faster than we had done. Municipal Committees should consider the question of development and pioneering.

Ald. J. A. G. BEAUMONT, St. Marylebone, in moving a vote of thanks to Mr. Roles, said he was hopeful that some day he might hear a paper read by someone who would be able to show that as new ideas increased capital costs decreased.

The I.M.E.A. Exhibition.

(*Continued from page* 905.)

The JACKSON ELECTRIC STOVE CO., LTD., exhibited a complete range of eleven domestic cookers for families of from two to fourteen persons. It is interesting to note that there are 20,000 Jackson cookers on simple hire in this country, and that this make is exclusively to be offered on simple hire by the Buxton Corporation. A breakfast cooker specially designed for hire purposes was shown, as were also immersion heaters designed for use in existing hot-water tanks and cylinders.

Wash boilers of various designs, including a new model which is specially designed to eliminate dirt traps, with a japanned steel outer case and a tinned copper interior, were included in the exhibit. A feature was the "Perco-Wash" device which is designed for use with wash boilers to clean clothes by percolating action. Other items on this stand included a new type of fire with plug-in elements, specially designed for hiring purposes, and a water heater with a low continuous loading controlled by a thermostat. This is heavily lagged and designed to meet the increasing demand for this class of apparatus.

On the stand of MESSRS. MOORWOODS, LTD., in addition to the "Moorwood" electric cooker, was a range of attractive

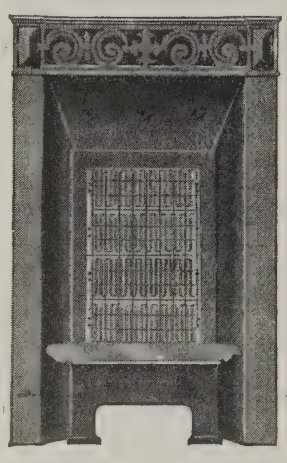

Fig. 6.—Moorwood Electric Fire.

Fig. 7.—New "Creda" Cooker.

electric fires. Fig. 6 shows one of the exhibits, which is specially designed for fitting in any room in place of the coal fire.

The principal features of interest on the stand of MESSRS. CREDENDA CONDUITS CO., LTD., were to be found in a range of "Creda" cookers. Included was a new model, C.43, fig. 7, which has an oven 12 in. by 9¾ in. by 9½ in., and a hob containing one of the new "Creda" patented enclosed boiling plates, 1,800 W, and a separate grill. The new "Creda" enclosed boiling plate embodies some special patented features making, it is claimed, for efficiency and long life. Nichrome spirals of unusual length and particularly low-current density are laid in china formers, and the whole are embedded in special non-hygroscopic and heat-conducting cement. The insulation is said to be particularly good, and all the plates are flashed at 2,000 V before dispatch. The plate is interchangeable with the "Creda" open-type appliance. The new model is made in sections, each approximately 8 in. by 4 in., two sections being employed to form the standard plate. One section only is on circuit for medium heat, thus enabling small cooking receptacles to be used economically. The shape of the plates permits two or more pots to be kept going in medium heat on the one section. The makers guarantee the plates for two years.

MESSRS. SANTON, LTD., exhibited a range of electric geysers in addition to a variety of connecting plugs and service boards and the "Santon" electric tank-belt. The last-mentioned device, fig. 8, is a simple apparatus for use in conjunction with an ordinary kitchen range hot-water system. It consists of a flexible metal belt with an asbestos-lined cover, which can be slipped over the tank and clamped in position

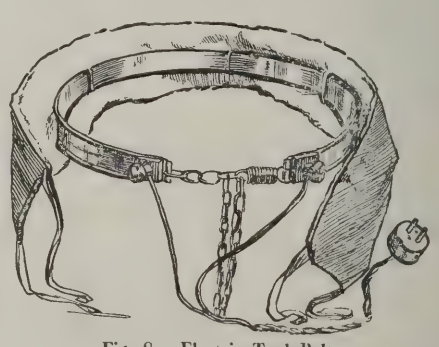

Fig. 8.—Electric Tank-Belt.

by means of a spring and chain attachment. It is supplied with 500-, 750- or 1,000 W loadings. It can easily be slipped up or down the tank as required, and two belts can be fitted and used together or separately. It is supplied complete with a length of flexible lead and a plug connection. The standard service board is fitted with two 30-A s.p. fuses and a rotary switch specially designed for heavy currents.

Reviews.

X-Rays, Past and Present. By V. E. PULLIN and W. J. WILTSHIRE, members of the Research Department, Woolwich. Pp. 229; figs. 43. London: Ernest Benn, Ltd. Price 12s. 6d. net.

The title indicates the wide and important field covered in the work by the authors, who are prominent members of the Radiological Research Department, Woolwich. The first four chapters are devoted to the early development and history of radiology; subsequent chapters deal with the application of X-ray methods to crystal lattice structure, spectroscopy and the practical applications of X-rays in surgery, medicine, and industry. The order of the subjects is well suited to the purpose of the book, and the authors write with evident experience of many of the difficulties of the subject.

When we consider that modern scientific resources enable us to enumerate with precision the constituent particles of an atom, and further to calculate the velocity of the particles and the ratio of their charge to their mass, we realise the romance of scientific investigation and the genius of the great investigators.

When a discovery of the first rank is made, the ultimate consequences always exceed anticipation. The X-ray was a discovery of this kind. At the time no one could have expected that these rays would provide us with a means of exploring the innermost secrets of atomic structure. Within a few years of their discovery, however, J. J. Thomson and Townsend had used the X-rays to convert air into an electrolyte, and had thus determined the value of the atomic charge, whilst later on Moseley and others, by the same means, had investigated the electrical constitution of matter with fertile observations and astonishing success.

The first aim of X-ray crystal analysis is to determine the classification of the atoms and molecules in the crystal unit, and to account for the properties of the crystal in terms of that classification. X-ray methods tell us directly the number of molecules in the crystal unit cell and the mode of their arrangement with such determination of length and angles as are required to define the structure completely. During the early history of the X-rays, the development of apparatus for their production was chiefly influenced by the requirements of medical radiologists; more recently the application of X-rays in physical research has become of outstanding importance. The analysis of a beam of X-rays into its constituent radiations by reflection at a crystal face provides a means of obtaining radiation of definite wavelength, and of such intensity as to enable its absorption coefficient in different materials to be measured with accuracy. Ingenious X-ray methods of qualitative analysis have been devised, exhibiting extraordinary delicacy and sensitiveness whilst dealing with infinitesimal quantities of matter. Industrially X-ray methods are finding increased application in metallurgy, consequent on the classical researches of Bragg, Ettisch, Polanyi, and others on the structure of metals, alloys, and steels. These methods are no longer of purely scientific interest; they are now utilised in several industries, including papermaking, explosives manufacture, and the leather, tanning, and textile industries.

The chapter dealing with the "Application of X-Ray Spectroscopy" is highly instructive. It contains an account of how Lane's inspiration and Professors Sir W. H. and W. L. Bragg's manifold applications of the method have already proved of the greatest practical value, not only in the advancement of scientific knowledge, but also in their application in several industrial and manufacturing operations.

As already pointed out, the book is intended for the layman, and is consequently not sufficiently detailed to be of special service to the expert. The volume is intentionally more or less elementary in design and is written to form an introduction to, rather than to supersede, standard works on the subject. It is, however, well suited for the purpose in view, and on the whole the book is probably the best available in its own particular line. The value of the descriptive matter is considerably enhanced by numerous illustrations, but the volume is practically devoid of references to the original work which has been consulted. The skill with which the authors have evaded mathematical difficulties and complexities allows one to recommend the volume as an interesting and generally accurate *aperçu* for the general reader.

History of Radio-Telegraphy and Telephony. Written and illustrated by G. G. BLAKE, M.I.E.E., A.Inst.P. Pp. xix+425. London: Radio Press, Ltd. Price 25s. net.

Nearly all books on radio communication contain a historical summary, but Mr. Blake has given us a really comprehensive historical treatise. The book is arranged essentially for reference as opposed to arm-chair study, but much of it is written so interestingly as to fit in with the latter form of reading as well.

There are 1,125 references to books, papers, patent specifications, &c. These references appear in the text as numerals which refer to a table of titles at the end of the book. There are also an excellent index and full chapter headings, and, in fact, for purposes of reference the book could not be better arranged. The general production, printing, and illustrations are first class.

This book is intended "to be a history of principles and invention rather than a record of commercial wireless," and the author's aim is "to bring into prominence almost forgotten schemes and devices in the hope that new ideas may spring therefrom."

The aim of the book may thus be taken as accounting for some apparent anomalies which would otherwise give grounds for criticism. For instance, we notice that the index contains more references to the author's own work than to that of Mr. Marconi, and again, far more space is given to inventions and suggestions which have proved of no commercial value than would have been the case in a strictly historical treatise. No outstanding practical work, however, has been omitted so far as this country is concerned, but it is impossible, as the author says, to make mention of all who have contributed to the development of radio communication. Developments in other countries are naturally dealt with less fully, but, remembering the author's aim, we consider that they are dealt with adequately, though, indeed, in describing theories of the upper atmosphere, Prof. Kennelly's name might well have been mentioned.

We are glad to see that the great pioneer work of Hughes receives full recognition, usually lacking in histories of radio, and in more recent times the work of Professor Eccles.

The book is full of interesting historical facts not realised by many recently recruited experimenters, such as Mr. Marconi's prediction in 1903 of radio communication with Australia, its realisation as long ago as 1918, a reference to piezo-electricity by Theophrastus in 300 B.C., the fact that the Eiffel Tower has been transmitting radio time signals for 17 years, and that telephotography over land lines has been in use for 23 years. These few extracts taken at random, in conjunction with the fact that there are 1,125 references, will help to give some idea of the thoroughness with which the author has dealt with his subject, and we have no hesitation in saying that his book will be found of great interest and value to every one who is engaged in the technical development of radio communication.

High-Frequency Electric Furnaces.

Prof. Ribaud's Experimental High-Temperature Equipment.

WITH the object of producing high-frequency electric furnaces capable of attaining a temperature of 3,000 deg. C., and permitting material under treatment to be easily removed or pyrometrical examinations to be conducted without being inconvenienced by smoke or fumes, Prof. G. Ribaud, of the Institut de Physique of Strasburg, has for some time past been conducting experiments with various forms of industrial

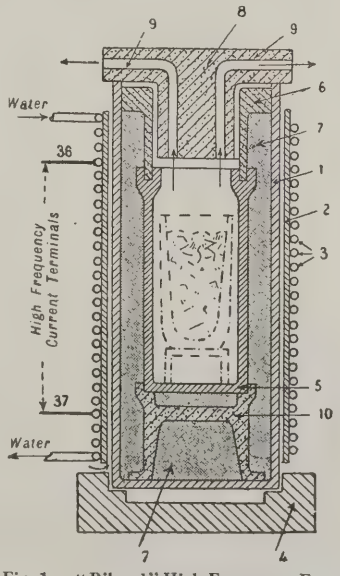

Fig. 1.—"Ribaud" High-Frequency Furnace.

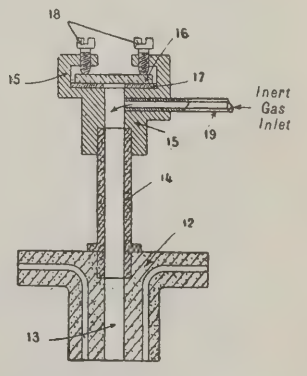

Fig. 2.—Special Testing Cover.

porous carbons. Such carbons, when composed of fairly large particles and also slightly agglomerated, are only slight conductors of heat and electricity, and are able to withstand temperatures exceeding 3,000 deg. C. On the other hand, by reason of their high porosity, they are combustible, and when red hot cannot be allowed to long remain in contact with air. At the same time their thermal conductivity is so low that the cover of the furnace, with the internal temperature referred to, which can be attained within three minutes, can be removed by hand. Fig. 1, reproduced from the *Journal de Physique et le Radium*, shows one of Prof. Ribaud's experimental furnaces. Its

essential components are an insulating cylinder made of melted quartz or other insulating substance capable of withstanding the high temperature, and a cylinder 2 on which is mounted the winding 3 for the high-frequency current, this winding taking the form of copper tubing. The two cylinders 1 and 2 are mounted on a base 4. The graphite crucible 5, heated by the induction, is prolonged at the upper end by a porous carbon cylinder 6, the outer surfaces of the crucible and the carbon being heated through the medium of the soot packing 7. The cover 8 is made of a piece of porous carbon, in which passages 9 are formed to act as outlets for the gases. The crucible rests on a piece of porous carbon 10, which is shaped so as to render it a poor conductor of heat.

The idea of making the external electrical winding of copper tubing was to enable water to be circulated through it, while in the course of experiment it was found necessary to extend the winding well above and below the crucible in order to keep the walls of the furnace as cool as possible, and so prevent burning. In order to reduce as far as possible any unnecessary increase in the self-induction, the source of high-frequency current was not connected to the extremities of the winding, but at the points marked 36 and 37. The outer cylinder is fixed at such a height above the base as to permit air to circulate between the two cylinders and so facilitate the cooling.

In furnaces in which it is desired to make pyrometrical tests the special cover shown in detail in fig. 2 is used in place of the cover 8 (fig. 1). In this case the cover 12 is provided with a central hole 13, in which is mounted a hollow extension piece 14 of porous carbon or other refractory material. This is surmounted by a special metal piece 15, in which is fitted a glass 16 supported on an elastic washer 17, and secured by two screws 18. A lateral tube 19 enables inert gas to be led into the inspection chamber and so drive from the latter any smoke that might detrimentally affect the inspection tests.

In furnaces of the Ribaud type the heating rapidity and the attainment of maximum temperature depend, of course, on the dimensions of the furnace and the available high-frequency power. For a furnace with a fixed interior capacity the heating-up speed is greater as the thickness is reduced. The maximum temperature attainable depends on the amount of available current, the consumption increasing at a greater ratio than the rise in temperature. Thus, in the case of a furnace with an interior volume of 100 cu. cm., while about 2 kW is necessary to give a temperature of 2,000 deg. C., approximately 7 kW is required to give 3,000 deg. C. With an available power of 10 kW the maximum temperature reached with graphite has been in excess of 3,000 deg. C. in the case of a furnace of a volume of 100 cu. cm., 2,500 deg. C. with one of 500 cu. cm., and 1,800 deg. C. with a 3,000-cu. cm. volume furnace. On a loading of 18 kW a temperature of 2,300 deg. C. has been reached in a 3-litre furnace, and 2,000 deg. C. in one of 5 litres capacity. As compared with a carbon-resistance furnace such as is used in the National Physical Laboratory in England, in which a temperature of 1,700 deg. C. can be attained in a 500-cu. m furnace on a consumption of 10 kW, Prof. Ribaud claims to be able to attain a temperature of 2,000 deg. C. in a furnace of similar size and with the same power.

Electrical Calculator Charts.

Two Charts devised by the electrical staff of Messrs. J. Lyons & Co., Ltd., for easily ascertaining motor loadings and cable volt-drop.

IT is often necessary to know the current taken by motors of varying h.p., and also to ascertain easily the voltage drop for a given length and size of cable, and in this connection the charts reproduced below, which have been prepared by Mr. Gordon Douglas, assistant electrical engineer, and Mr. A. B. Shirley, of the Electrical Department of Messrs. J. Lyons & Co., Ltd., for use in their own works, should prove interesting to many engineers.

By means of the chart, fig. 1, the current required by any motor of from 1 to 150 h.p., working at 90 per cent. 80 per cent., 72 per cent., and 64 per cent. efficiencies on either d.c., single-, two- or three-phase circuits can be directly read. The h.p. at the various efficiencies is found on the horizontal scale, the current in amperes on the vertical scale and the supply voltage and system on the curved scale. A transparent cursor (not shown), on which a central hair line is engraved, is pivoted at the point of origin. In order to find the current required by a certain motor, set the cursor with the line passing through the voltage of the supply system on which the machine is to operate, and find the h.p. at the desired efficiency on the horizontal scale. By looking down the chart to the cursor line and then along from this point to the current scale, the result in amperes is found. Similarly, if the h.p., current, and voltage of a motor are known, the efficiency of the machine can at once be obtained by

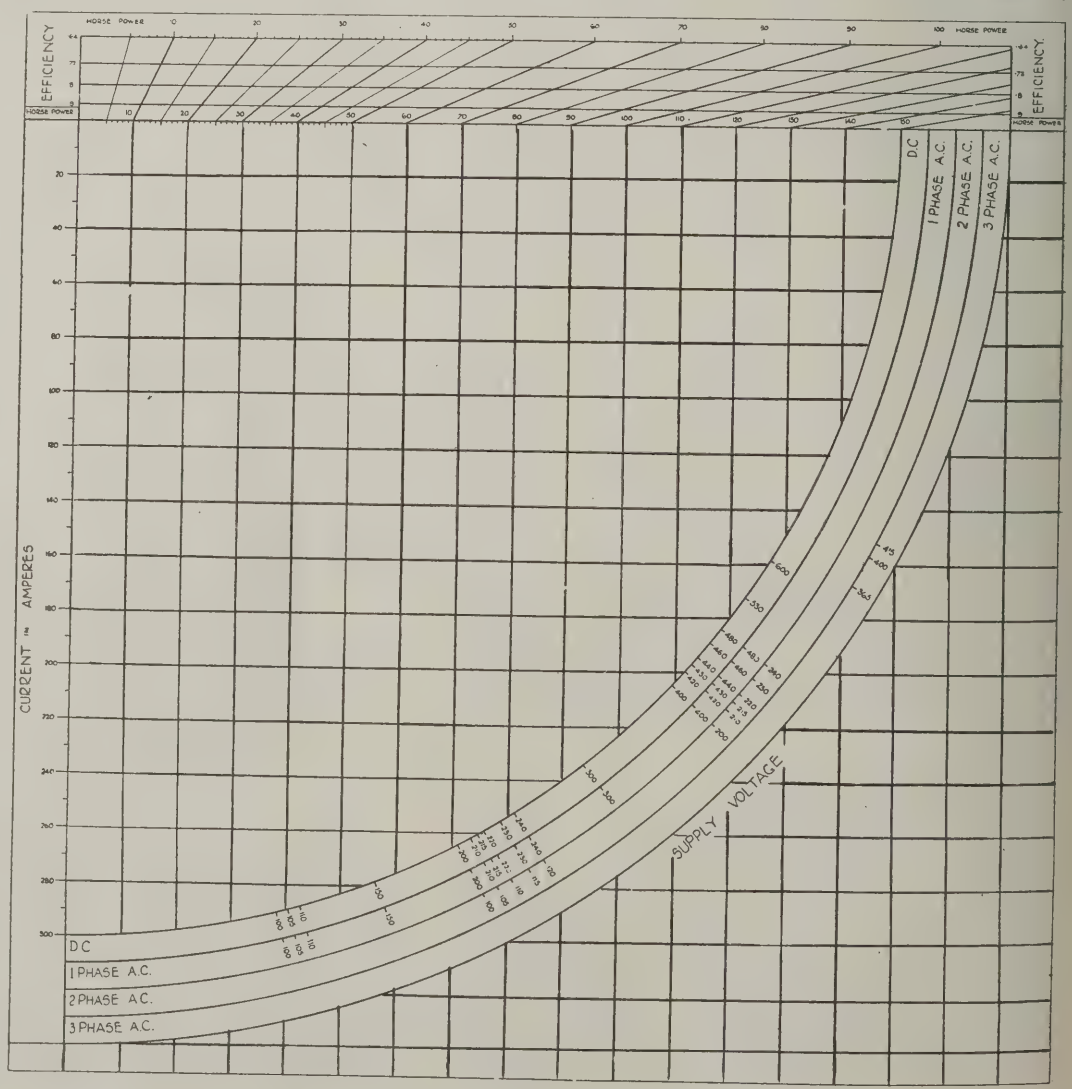

Fig. 1.—Motor Loading Chart.

reversing the method of reading.

With the volt-drop chart, fig. 2, it is easy to ascertain the drop per 100 yards run direct, not lead and return, for any size of cable from 1/.036 to 127/.103 carrying any current from 0 up to 150 amperes on d.c. single- or three-phase circuits. The size of cable is found on the horizontal scale, the current in amperes on the vertical scale, and the drop per 100 yards run of cable on the curved scale. A cursor similar to that used with the other chart is provided. To find the volt-drop the cursor is set so that the line passes through the point of intersection of the horizontal and vertical lines from the current and cable-size values, and the drop per 100 yards run is read off the curved scale. By reversing the method of working, the size of the most suitable conductor to carry a given current at a predetermined volt-drop may also be found.

For the sake of obtaining open scales in each case three columns are provided in colours, but to facilitate re-production these are shown blank.

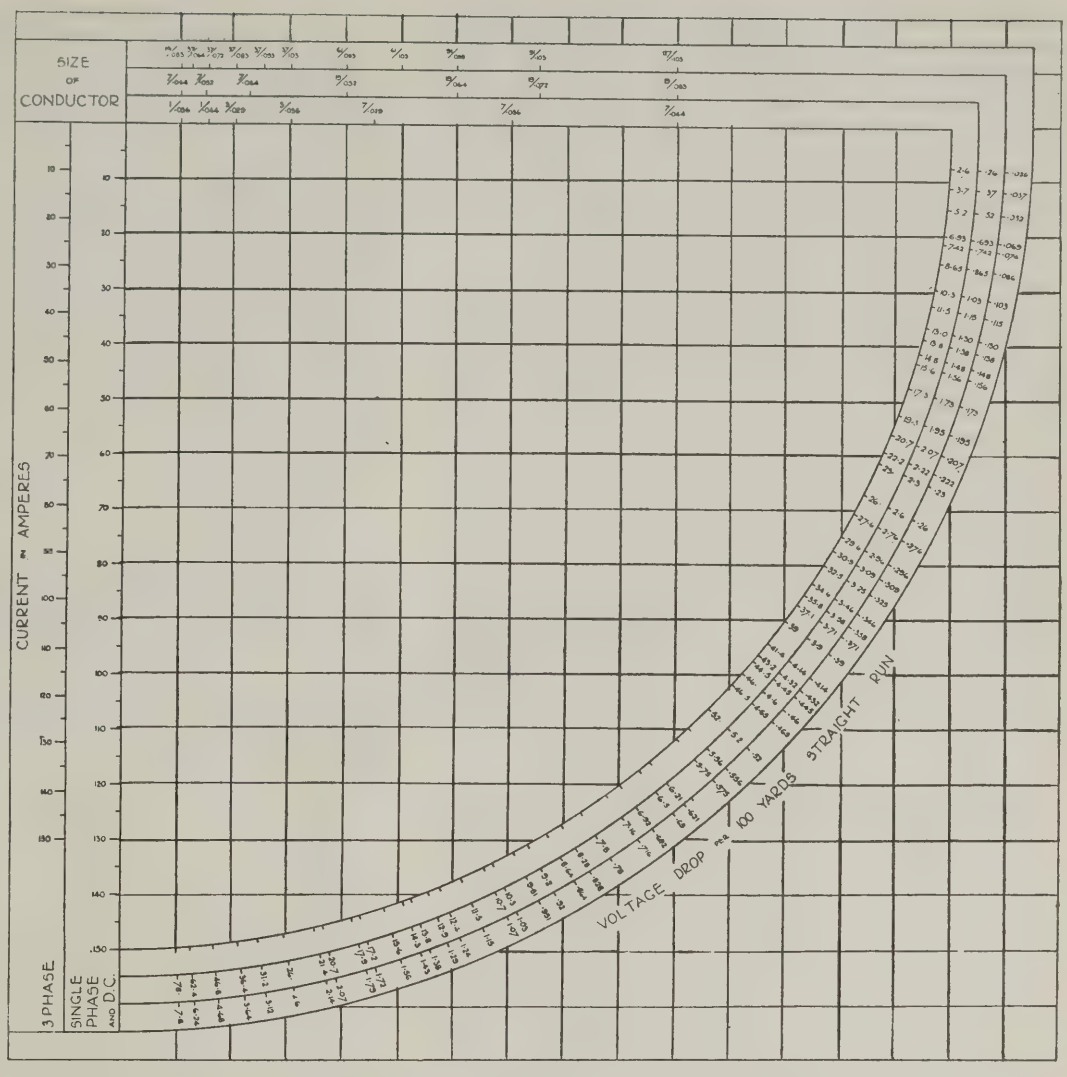

Fig. 2.—Cable Volt-drop Chart.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

A New Portable Receiver.

The reputation of their standard apparatus is sufficient recommendation for any new product of Messrs. Burndept Wireless, Ltd., who recently placed upon the market a new receiver that can not only be termed truly portable, but is also well suited for permanent home installation. The three batteries are totally enclosed in the polished oak cabinet, which is provided with a carrying strap, their weight being equally distributed in order to facilitate carriage; a 2-volt, 20-amp.-hour "Exide" S.P.7 unspillable accumulator is employed to heat the filaments, together with dry-cell grid-bias and 108-volt anode batteries. The five valves, two of which are h.f. and two l.f. amplifiers, are of the low-consumption class, and the speaker incorporated in the set is provided with a contorted horn no less than 3 ft. 2 in. in length, constructed on the exponential principle; it terminates behind a grill, as indicated in fig. 1, which also shows that the top front portion of the cabinet hinges upwards to give access to the three controls: a single geared tuning-condenser dial in the centre and a volume (reaction) knob on the left, the switch on the right having a threefold purpose: in the top position it allows of normal broadcast-wave reception, and in the bottom position it permits of the longer-wave stations being heard, while in the central position it disconnects all batteries. The pair of terminals on the extreme left is for the connection of an external loud-speaker, if desired, and the pair on the right for the use of an external aerial and earth connection, although the set normally operates with an enclosed frame aerial wound round the inside of the cabinet. The latter is 18 in. wide, 17 in. high, and 8 in. deep, its back being hinged to form a door to give access to the valves, &c. Fitted to one side of the cabinet are two sockets which are connected to the internal accumulator; should it be required to operate the instrument in one particular place for any lengthy period, a larger capacity external accumulator may be connected to these sockets without removing the internal accumulator, or the sockets may be used for re-charging the internal accumulator without the

Fig. 1.—The New Burndept Portable Receiver.

necessity of removing it from the instrument, and a row of terminals is provided internally, although easily accessible, to which larger capacity dry batteries or a mains unit may be

attached. This facility is particularly desirable when the instrument is permanently installed in the house throughout the winter months. The set is primarily intended for reception from Daventry within 200 miles of that station, but it should generally enable several Continental stations to be heard in Southern and Eastern England also, in addition to those operating on the lower broadcast wave band, so that there should be few places where the instrument will fail to make several alternative programmes available. A recent demonstration in a far from favourable location created an excellent impression of the capabilities of this new receiver.

An "Amplion" Cone Speaker.

Realising the fact that a considerable number of the receiving sets at present in use in this country are inherently incapable of operating certain types of cone loud-speaker, and that their owners are reluctant to purchase new receiving apparatus, MESSRS. GRAHAM AMPLION, LTD., have deliberately designed their latest models so as to give good results when used in conjunction with any good receiving set of normal construction. As an example their AC.5 type cone, which is visible through an open fretted grille, is "old gold" finished in contrast to the dark oak cabinet, the dimensions of which are only 15½ by 6½ in., whilst the overall height is 14 in. The electromagnetic unit is adjustable and the cone diaphragm is made of a strong seamless fabric, not paper, which is claimed to be impervious to climatic changes and temperature variations. The absence of the so-called "megaphone effect" is due to the elimination of the sound conduit, or horn, and one of the peculiar qualities of the cone speaker is its capability of reproducing the lower notes in the musical scale; manufactured in a variety of styles, this make of speaker obviates the necessity for a special or unusual design of circuit, and the sample lent us for trial functioned satisfactorily on a simple receiving set.

The "Gecophone" Battery Eliminator.

An anode-battery eliminator for operating off domestic a.c. electricity supply mains must, of course, incorporate a rectifier. A recently-evolved type employs a special valve containing a rarified gas in which rectification occurs by means of a species of glow discharge, such an arrangement representing a considerable saving of the energy required to operate the eliminator; indeed, the valve possesses no filament at all, and its life is therefore independent of the risk of filament fracture. An example of this system is marketed by the GENERAL ELECTRIC CO., LTD. After rectification, which is full-wave, the percentage ripple remaining superimposed depends on the efficiency of the smoothing, or filter, circuit, which consists of a large reservoir condenser and choke coils having a large inductance, the resistance of the choke being kept as small as is consistent with reasonable cost. An interesting feature is the means by which the output voltage of the eliminator (*i.e.*, voltage applied to the anodes of the valves in the receiver) is prevented from

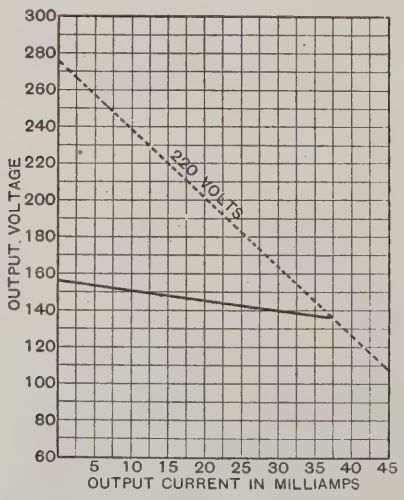

Fig. 2.—Battery Eliminator Characteristic "Curves."

falling very rapidly as the current taken from the eliminator increases; for example, if the anode current of any valve were changed, say, by altering the grid-bias voltage, the anode voltage would also change very appreciably. The accompanying characteristic "curves" were taken from a "Gecophone" eliminator attached to 220-volt a.c. mains; the dotted line shows the type of characteristic that would be obtained without the aid of the voltage regulator employed, from which it will be seen that as the output current increases from zero to 37 milliamps the voltage drops from approximately 280 to 150 volts, whereas with the voltage regulator in use the drop is comparatively small, being denoted by the slope of the thick black line. The regulator takes the form of a special "Osglim" neon lamp shunted across the output of the eliminator, and the important point is that on a multi-valve wireless receiver any grid-bias adjustments may be made, or valves substituted, with the knowledge that the anode voltage on each valve will remain constant.

Correspondence.

Correspondents should forward their communications as early as possible. *No letter can be published unless we have the writer's name and address in our possession.*

Energy Consumption in Small Houses.

Estimates of energy consumption, costs, &c., have been published from time to time in your pages, but so far as the writer recollects, there has been nothing which gives a fair indication of the consumption in a moderate-sized house which is not wholly "electric." The following average monthly consumption figures may be of use to contractors and others who are endeavouring to persuade possible customers to change over from gas to electricity for general purposes.

The house consists of two living rooms, three bedrooms, kitchen, and scullery. It is a modern semi-detached house costing £975.

The electrical equipment consists of:—

5.3-kW cooker.
2.0-kW portable fire.
.75-kW bowl fire.
Vacuum cleaner; iron.

The total wattage for lighting is 510. The 2-kW fire is used for occasional heating in the dining-room, such as breakfast time in the winter, and chilly evenings in spring or autumn. It is also used in the drawing-room in the winter, when the use of this room is required as well as of the dining-room.

The following average consumption is taken from daily meter readings, and is based upon the time the house is actually occupied, *i.e.*, allowance is made for holidays, week-ends, &c.:—

Date. 1926.	No. of days.	Units.	Average units per day.
March	31	168	5.42
April	27	134	4.96
May	31	138	4.45
June	28	138	4.92
July	29	102	3.52
August	27	104	3.85
November	30	169	5.63
December	31	191	6.16
1927.			
January	26	146	5.64
February	28	157	5.6
March	25	108	4.32
April	30	134	4.46
May	31	130	4.2

During the period under review, a total of 3 tons 12 cwt. of coal has been purchased. This is used only for the dining-room and kitchen. The number of residents in the house is two, but for about four months during this period an elderly relative has been living in the house also.

As only one meter is fitted, lighting consumption cannot be given separately, but this is estimated to be about 120 units. I trust these figures may be of use to readers of your paper.

A.M.I.E.E.

June 6th, 1927.

The Ideal Wiring System.

I have read with great interest the article and subsequent letters on the above subject. My reason for preferring steel conduit is because of the experience of a friend of mine, who had to re-wire a country house owing to rats having eaten away the lead sheathing and wiring too. Rats would have little difficulty in eating a way through rubber sheathing, but would find steel conduit a stiff proposition.

W. Garratt.

Bloxwich, *May 31st*, 1927.

Metal-clad Draw-out Switchgear.

I was very interested in the article on "Metal-clad Draw-out Switchgear" in your last issue.

Mr. T. Carter is evidently biased in favour of the horizontal type, which gives the impression that he, personally, is interested in its manufacture.

Might I point out that horizontal gear is no more British than the vertical type, although the author endeavoured to convey another impression? British ships of oak played an important part in our history, but our present-day Dreadnoughts are no less British, although the amount of oak used in their construction is a negligible quantity.

The author refers to metal-clad switchgear as "the ideal British standard and a pattern for the world to follow," but ideals and standards are apt to vary due to changing conditions, and I venture to prophesy that in a very short time the majority of the progressive firms will have decided in favour of the vertical type, however reluctant they may be at present to scrap existing designs and tools.

H. Whitehead.

Cardiff, *May 31st*, 1927.

Mr. Carter's article which appeared in a recent issue of the Review contained many convincing arguments in favour of the horizontal type of metal-clad gear, as against the vertical type, and any further points which I may attempt to advance in favour of the horizontal type may appear to be superfluous. I would, however, like to avail myself of the opportunity of relating a recent experience.

A few months ago, I had occasion to witness a series of short-circuit tests on various sizes of oil circuit breakers. These tests were carried out by throwing dead short circuits across a 45,000-kVA turbo-alternator. It was proposed to determine the limit at which some of the smaller breakers would fail to clear, and during one group of tests one of the breakers interrupted two consecutive "shorts" with a two-minute interval. When, however, the breaker was closed on the "short" for the third time, the effect was surprising. The complete breaker became enveloped in a cloud of flame approximately 10 to 12 feet in diameter and rising 30 to 40 feet high. The heat was so intense that those of us standing within 25 or 30 yards of the pit had to move further back. When the flames were extinguished, one naturally expected to find the breaker completely wrecked. This, however, was not the case; the tank was still in position, and the top cover and enclosure were found mechanically sound (in fact, these parts were used for subsequent tests).

The most remarkable revelation was the small quantity of oil lost, since, although such a large volume of flame followed the breaker's attempt to clear the short, only a few pints of oil were actually missing from the tank. It should be noted that the breakers tested were reasonably flame-proof; in fact it was difficult to account for the emission of such a large volume of flame in such a short interval of time.

If the advocates of vertical-type metal-clad gear, having busbars mounted directly above the oil circuit breaker, had an opportunity of witnessing such oil-circuit-breaker tests, they would undoubtedly insist on having gear in which the busbars are mounted as far as possible away from the top of the breaker, *i.e.*, as they are on the horizontal draw-out type. Moreover, they would hesitate before installing vertical-type gear, with oil-filled busbars, directly over the breaker.

Mr. Carter condemns a design in which connections from the main and auxiliary busbars are brought into a common circuit-breaking tank. Such an arrangement could be incorporated in the horizontal type of gear, just as easily as in the vertical type. It is doubtful, however, whether responsible engineers and manufacturers will be persuaded to jeopardise their designs by introducing a feature so contrary to established circuit-breaker practice. The effects produced by a breaker interrupting a large short-circuit current are now fairly well known, and one can only have very grave doubts regarding the efficiency and soundness of the second breaker after the first has operated under fault conditions. This, in effect, would be equivalent to the operation of one breaker on a fault putting two breakers out of commission.

Horizontal draw-out metal-clad gear (with compound-filled busbars) has stood the test of time, and it is significant that the supply undertakings which have had the most experience with metal-clad gear are refusing to change over to a new style. Novel ideas are always attractive, and may be sound, but their success requires a very keen imagination to predict all the conditions and combinations which are likely to be encountered in the future. The horizontal type of gear has long since passed through the experimental stage, and if, during the last 20 years, it had failed to meet all the conditions of service, it would not have reached its present unassailable position in the switchgear world.

D. R. Davies.

Manchester, *June 6th*, 1927.

A Mysterious Occurrence.

In answer to Mr. Hinsley, I do not think that his is the correct solution, as there was no sign of any creeping along the cables, at either the switch or transformer end of the cables. Further, each cable was covered with a film of white dry dust.

The h.p. cable is a 3-core armoured one, and is not old, having been installed new in 1923; the cores are separated before entering the transformer.

The l.p. cables are v.i.r. type, also new in 1923.

On leaving the transformer, all the cables rise upwards above the top of the transformer. The connections are made above the oil level; the ends of the cables are sweated into lugs and bolted to the lugs of the transformer coils.

June 4th, 1927. **W. H. M.**

Single-phase Induction-Motor Starting Devices.

Mr. G. Windred, by his article in your issue of June 3rd, would appear to be hopelessly out of date on this subject, as quoting from his article will show: "and to describe briefly a starting arrangement giving greatly superior characteristics to any of those at present in use" . . . "It is evident that the arrangement has not obtained the sphere of use in this country which its superior characteristics warrant, and it is with the object of bringing the arrangement to the notice of the engineers concerned that the present article has been written, giving, in the author's belief, a description of the method and its application hitherto unpublished in this country."

I have before me a copy of "Electric Motors" by H. M. Hobart, which I purchased 17 years ago, and which on page 614 describes, exactly, what your contributor calls the Ferraris-Arno method; it also states clearly that the author, H. M. Hobart, in co-operation with C. S. Bradley, carried out tests on this system in the year 1893. The book also quotes an article from the *Electrical Times* for December 13th, 1905, page 855, giving particulars of factories running two-phase motors from a single-phase supply and a pilot motor, by engineers of the West Ham electricity supply station, higher efficiencies and higher starting torque resulting from this. The article concludes as follows: "The idea is also described in Ferraris and Arno's B.P. 7504 of 1895," but, as already stated, the arrangement was proposed and tested at Lynn, U.S.A., by Bradley, in 1893.

W. S. Daniels.

Leeds, *June 4th*, 1927.

The Preservation of Historical Electrical Plant.

I believe I am correct in saying that many of the older locomotives which took part in the 1925 Railway Centenary celebrations owe their preservation to chance. They remained, in some cases, almost forgotten in sheds and sidings, until the flight of time gave them a value which was suddenly realised, and to-day they could not be bought for mere money.

There is not much hope of this kind of thing occurring in the electrical industry, however; sites are restricted and ground space is valuable, so that old plant is ruthlessly scrapped to make room for new.

These conditions render it impossible that a chief engineer of, say, the year 1950, will be able to make the discovery that the strange-looking machine, perhaps the pride of the station at the time of its building back in the 'nineties, but now dirty and neglected in a remote corner of the station, has a value which has passed from the local to the national.

One goes to the Science Museum at South Kensington and sees the history of electrical generating plant represented in very meagre fashion. Some of the early experimental apparatus is to be found, it is true, but of commercial types down to the present day, practically nothing.

Yet during the last few years many old generating sets have been advertised for sale in the Electrical Review, and these have doubtless all gone "under the ball." Siemens, Ferranti, Crompton, and Mordey alternators, types never to be seen again, but important in the history of electricity generating plant, have been going one by one, until now their numbers must be small in the land.

Similarly, too, many old switchboards, Manchester and Ferranti types for example, must have been broken up, and soon none will exist, if they have not all gone already.

In your current issue we read that at Deptford "the pioneer high-voltage plant of the world . . . the last two original Ferranti generating sets are now being dismantled, and the remaining historic Partridge switchgear will soon be displaced." The sending of these relics to the junk merchant will, in the writer's opinion, be an act of vandalism which later generators will find it difficult to excuse. Every effort should therefore be made, either by individual or joint action, to prevent this occurring, and to preserve these links with a past, which, although recent in number of years, yet is remote when measured by standards of progress.

In conclusion, your readers may have observed, during recent months, references in the newspapers to the passing of the old Brighton locomotive "Gladstone" to preservation in the Railway Museum.

Where is the electrical industry's museum, or has this industry less soul than the railways?

Ernest F. Smith.

Dunfermline, *June 4th*, 1927.

Cheap Electricity.

My letter on this subject, which appeared in your issue of April 29th last, has been a little misconstrued, as my object was not in any way to be personal or to attack anyone, but rather to draw attention to the great difficulty there is in refuting the arguments put forward in favour of the small independent plant. This trouble is largely due to the fact that it is not easy to include *all* the items of cost. Still I realise that in my hurry I did not express myself quite as I should, in reference to your correspondents; I must therefore apologise to them for my writings not having properly conveyed my intentions. I fully appreciated that Mr. Mountain's paper was written as a counterblast to the Electricity Bill. Mr. Mountain had told me that Messrs. Ruston and Hornsby had asked for a number of copies of his paper for distribution, and I understood that also a suggestion had been made to redraft and republish it. Hence I wrongly assumed that this new publication was the edited copy.

Shortly after writing my letter, I received closer information than that now given by Messrs. Ruston & Hornsby, Ltd., as to who had actually compiled the pamphlet. My opinion is, and was, that the data contained in both pamphlets are to be thoroughly relied upon as regards the accuracy of the figures quoted, for the authors are both authorities. The

point I wished to make was the great difficulty of including *every* cost, so that a figure might be arrived at, that would enable current to be supplied profitably to another independent party. I have been associated with the installation of a number of Diesel plants and consider that there is a very big field for them—but not in the area of a properly organised central station supply. I happened recently to be looking at a map which showed the electricity supply areas of this country, and in discussing one of them with a prominent engineer, he casually remarked, apropos of one public electricity supply station, "That works will of course have to be closed down, when the mains reach that town, as it is a Diesel station." Verb. sap.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Department of Overseas Trade.

Viscount ELIBANK has given notice that he intends, on June 16th, to call attention to the proposed termination of the separate existence of the Department of Overseas Trade and to move a resolution urging the Government to reconsider the proposal and retain the Department in its present form.

The Whitsun Recess.

The House of Commons rose for the Whitsuntide Recess on June 2nd, and will reassemble on Monday, June 13th. Mr. BALDWIN, the Prime Minister, announced on June 1st that it would be impossible to prorogue the Session in the summer, as had been hoped, and to start a new session in the autumn. He now hoped that it would be possible to adjourn at the end of July for the summer recess, and to continue the present session in the autumn.

Key Industry Duties.

On May 31st, Sir P. CUNLIFFE-LISTER, President of the Board of Trade, presented a statement showing the value of the goods upon which key industry duty was paid in the periods January-April, 1926, and January-April, 1927, respectively. This included scientific instruments, gauges and measuring instruments of precision, £34,620 and £48,326; wireless valves and similar rectifiers and vacuum tubes, £57,488 and £44,393; ignition magnetos and permanent magnets, £16,438 and £11,545; arc-lamp carbons, £9,343 and £6,973; and metallic tungsten, ferro-tungsten, manufactures of metallic and rare earth compounds, £5,760 and £13,636.

Breaking-up of Streets.

On June 1st, Sir R. THOMAS asked the Minister of Transport whether any steps were being taken towards unification of working among the various Metropolitan authorities controlling electricity, gas, water, and any other services which involved the laying of pipes and cables, with a view to reducing to a minimum the public inconvenience caused by the continual breaking-up of the streets.

Colonel ASHLEY said that his powers under Section 4 of the London Traffic Act, 1924, with regard to the control of the opening of streets in the London Traffic Area by public utility services were limited. Those undertakers, however, voluntarily supplied his Department with a considerable amount of information as to any street works of importance which they contemplated carrying out, and every effort was made to co-ordinate them with other street works as far as was reasonably practicable.

London and Home Counties Electricity (No. 2) Bill.

The Committee of the House of Commons which is considering this Bill, continued its proceedings on May 31st. During the day evidence was given by Sir John Snell (Chairman of the Electricity Commission) as to the attitude of the Commissioners towards the proposal to erect a station at Chiswick, in view of the London Power Co.'s proposal to erect another large station at Battersea (about five miles from Chiswick). The view of the Commissioners was said to be that both stations would be necessary if future demands were to be met.

Evidence was given on behalf of various rowing clubs which use the part of the river near the Duke's Meadows site, in opposition to the Bill, and the Committee adjourned until after Whitsuntide.

Yorkshire Electric Power Bill.

It is reported that this Bill, which has passed the House of Lords, is to proceed through the House of Commons as an unopposed measure. The Bill empowers the Yorkshire Electric Power Co. to raise a further £2,000,000 in share capital and £1,000,000 in loan capital. It also authorises the board to borrow to the extent of one-half instead of one-third of its existing authorised capital of £4,000,000.

Legal.

Hart Accumulator Co., Ltd., v. Berton & Onions.

IN the Bow County Court on May 30th, before Judge Snagge, the Hart Accumulator Co., Ltd., sued H. A. Berton and A. H. Onions, trading as the D.A.S.H. Wireless Service, Birmingham, for £10 5s. 3d. for goods supplied.

Mr. ATKINS, for the plaintiffs, said that the claim was for electrical and wireless goods supplied in November, 1926. Mr. Berton, one of the defendants, had made an affidavit stating that at the time the goods were ordered he was no longer a member of the D.A.S.H. Co., having dissolved partnership on June 10th. The dissolution was advertised in the *London Gazette*, which was sufficient to release him from any liability. Mr. Atkins submitted that a notice should have been sent to every firm with whom they had been trading. Mr. Onions had not appeared, and judgment would have to be entered against him, even if his Honour was against the plaintiffs as to the liability of Berton. His clients had received the order for the goods on D.A.S.H. Co. paper, with the names of the two alleged partners still on it, and no intimation had been received that Berton was no longer a partner.

Mr. GALLOP, for Mr. Berton, submitted that his client knew nothing whatever of the transaction, and said that the plaintiffs had no right to presume that Berton was a partner in November, and they therefore had failed to make out a *prima-facie* case.

Judge SNAGGE, in giving his decision, said it was an interesting point as to whether publication in the *London Gazette* was sufficient, but he was bound to come to the conclusion that the plaintiffs had not established a *prima-facie* case that Berton was a partner and liable, and therefore in his case there would have to be judgment for him with costs, but he would enter judgment for the plaintiffs for the full amount claimed against Onions, with costs.

Reid v. Dalrymple.

THE *Railway and Tramway Journal* reports that in the Court of Session recently, Lord Murray fixed the first week in July for the trial of the action by Councillor Reid, a member of the Glasgow Town Council, for slander, against Mr. James Dalrymple, the late general manager of the Glasgow Corporation tramways.

Aberdeen Suburban Tramways Co. v. Aberdeen Town Council.

THE First Division of the Court of Session has recalled the interlocutor of Lord Moncrieff in the action by the Aberdeen Suburban Tramways Company against the Aberdeen Town Council for payment of £26,800 for loss and damage to the pursuers' tramway track caused by the defenders' operations in connection with a new aqueduct, and assoilzied the defenders from the conclusions of the action with expenses. Their lordships took the view that the action was barred by Section 8 of the Aberdeen Suburban Tramways Confirmation Order Act, 1902, which provides that the Corporation (the defenders) shall not be liable for any damages the company may sustain through the acts of the Corporation—through the reasonable exercise of any rights, functions, powers, or privileges, vested in the Corporation, except in so far as such damage may be due to the fault or neglect of the Corporation.

The Danish Electrical Industry.

MR. H. KERSHAW, O.B.E., Commercial Secretary at Copenhagen, has submitted a report upon the economic situation of Denmark (dated February, 1927) to the Department of Overseas Trade (Stationery Office, 1s. 6d. net). In a general survey, Mr. Kershaw states that Denmark is slowly recovering from the effects of deflation, but is still confronted with serious social and industrial problems, one of the chief of these being the heavy burden of taxation. There is a widespread movement in favour of British goods, Denmark wishing to retain this country as her best customer; but British exporters must recognise the special conditions of the market. The national independence of thought necessitates intensive advertising, which means that higher commissions have to be paid to agents.

Electrical Production and Imports.

Denmark holds a strong position in the range and quality of her electrical products and, except in the case of heavy machinery for generating stations, would enjoy a larger measure of independence in the matter of imports if manufacturers could bring down their production costs. The constant overhauling of the numerous power stations and the construction of new ones provide good openings, but British prices, though more favourable now than for many years, were too high in the case of recent contracts. German, Swiss, and partly Swe-

lish machinery is still considerably cheaper. The Danish lectrical industry consists of about 55 factories, employing ,000 hands. During 1926 there were produced 278 dynamos, alued at kr. 1,374,000 (kr. 18.2 to the £); 455 transformers kr. 573,000); and 26,770 motors (kr. 9,700,000). The imports f electrical machinery in 1926 were 809 metric tons, valued at bout kr. 4,000,000. About a third of these consisted of acuum cleaners of German, Swedish, and Canadian origin. Germany and Holland dominate the lamp trade, notwithstanding the efforts made by the Danish manufacturers. In porcelain fittings German producers have again started to compete ery severely with Danish firms, and as regards insulating naterials, in addition to German and Italian firms, British nanufacturers have entered the market with excellent qualities t competitive prices. British firms have also improved their osition in the supply of switchboard material, pyrometers, nd certain other special instruments, but a few other foreign rms have been successful in countering the price-cutting by he Danish cable and wire works. There is an opening for ood-quality enamelled wire. Notwithstanding German competition, British accumulator makers have made a certain mount of progress. To avoid a higher rate of duty, German nakes are imported in parts for assembly. For large power tation batteries Germany still leads, but British portable types re gaining over the American and German makes. There s little to be done in primary batteries. In 1926 Denmark roduced (or assembled) 325 metric tons of portable accumuators, valued at kr. 684,000. The total production of primary ells amounted to 2,920 tons, valued at kr. 7,000,000, of which ome kr. 6,000,000 worth were exported.

There are about 150,000 registered radio-receiving sets in Denmark, but an impetus is expected to be given to broadasting when the new station at Kallundborg is completed. This station is being erected by a British firm. There are signs hat the market is leaning towards quality goods, which may avour British products at the expense of cheap German and Danish goods. American sets, while good, are handicapped by heir usual limitation to wave-lengths below 600 metres. Danish radio manufacturers are paying royalties up to 10 per ent. to American patent holders. The annual importation of adio apparatus, excluding batteries, is valued at about r. 3,000,000 and the home production at about kr. 1,750,000. he Danish output of batteries for radio purposes is valued at bout kr. 3,500,000 per annum.

Electrification.

The report states that most Danish agricultural undertakings ave been electrified in spite of the fact that the power proluction is mainly by means of imported fuel. This has been ccomplished by co-operation between the farmers themselves. Most of the electricity works are equipped with Diesel engine lant, and only the large factories and h.p. stations use steam urbines. A new 50,000-V cable, with a capacity of 17,000 kW, as been laid in the Oersund for the transmission of power etween Sweden and Denmark, a distance of 135 km. It is aid that this will result in the annual saving of about 25,000 ons of coal.

Published Specifications.

ompiled expressly for this journal by a firm of Chartered Patent Agents. he numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1925.

28,064. "Prepayment electricity, gas, and other meters." Chamberlain nd Hookham, Ltd., and S. James. November 7th, 1925. (Cognate applicaon 30,904/25.) (270,467.)

28,495. "Electric fuses." B. Hesketh. November 12th, 1925. (270,969.)

1926.

1,271. "Electric tumbler switches." A. B. Reeves and F. E. Minton. nuary 16th, 1926. (Cognate application 25,915/26.) (270,781.)

1,315. "Telephone systems." Automatic Telephone Manufacturing Co., d., and J. E. Ostline. January 16th, 1926. (270,782.)

3,484. "Control of apparatus at an electric power sub-station from a ntral control office." Automatic Telephone Manufacturing Co., Ltd., and Remington. February 6th, 1926. (Addition to 252,231.) (270,788.)

3,653. "Adjustable grid conduit boxes for electric switches." J. P. nacker. February 9th, 1926. (270,792.)

3,842. "Telephone systems." Standard Telephones & Cables, Ltd. (G akin and L. Polinkowsky). February 10th, 1926. (270,794.)

3,951. "Apparatus for converting alternating current into unidirectional rrent." R. S. Atherstone. February 11th, 1926. (270,797.)

3,994. "Circuit arrangements for use with high-frequency currents." E. een. February 11th, 1926. (270,800.)

4,015. "Radio-transmitting apparatus." Standard Telephones & Cables, d. April 7th, 1925. (250,539.)

4,333. "Wave-distorting systems for electric signalling." Standard Teleones & Cables, Ltd. (Western Electric Co. Inc.). February 15th, 1926. 0,817.)

4,583. "Ringing arrangement for telephone systems." Standard Telephones d Cables, Ltd. (Western Electric Co. Inc..) February 17th, 1926. (270,825.)

4,835. "Steam-driven electric generating plant utilising exhaust steam for xiliary purposes." International General Electric Co. Inc. February 21st, 26. (247,984.)

5,042. "Container and handling means for storage batteries and the like." R. Palmer. February 22nd, 1926. (270,833.)

5,043. "Terminal assemblies for telephone exchanges." Siemens Bros. and ., Ltd., and C. Lambert. February 22nd, 1926. (270,834.)

5,108. "Electric pushes." J. Sax & Co., Ltd., and J. E. Abbott. February d, 1926. (270,836.)

5,388. "Induction regulators." English Electric Co., Ltd., and W. E. M. res. February 25th, 1926. (270,839.)

5,542. "Electromagnetic relays." Tyer & Co., Ltd., and J. W. Punter. ruary 26th, 1926. (270,843.)

6,298. "Electrically driven slicing machines." Berkel & Parnall's Slicing Machine Manufacturing Co., Ltd,, and H. Thomas. March 6th, 1926 (270,854.)

7,154. "Quick-action electric switches." A. J. Veall. March 17th, 1925. (249,517.)

7,447. "Wireless apparatus." W. C. Butler and R. W. Angel. March 17th, 1926. (270,864.)

8,898. "Wireless telegraphy and telephony." Bowden Wire, Ltd., and A. H. Nisbett. April 1st, 1926. (Cognate application 22,573/26.) (270,871.)

9,590. "Method of and means for interrupting electric circuits." G. S. Marston. April 12th, 1926. (270,879.)

10,378. "Dynamo-electric generators." F. Kesselring. April 18th, 1925. (250,972.)

10,277. "Electric dryers." Eastern Laboratories Inc. April 28th, 1925. (251,612.)

11,081. "Insulating material for electric condensers and the like." J. Lahousse. May 8th, 1925. (251,970.)

11,615. "Electrode for medical purposes, particularly for use in diathermic treatment and process for the production thereof." Dr. E. Last. November 14th, 1925. (261,335.)

11,832. "Variable static transformers provided with a variable magnetic circuit." G. Burnengo. May 5th, 1925. (251,998.)

12,063. "Plug and-socket connectors." C. L. Arnold and M.K. Electric, Ltd. May 10th, 1926. (270,899.)

12,093. "Connection systems for telephone plants with automatic counting of the calls." Automatische Fernsprechanlagen-Bau-Ges. February 15th, 1926. (265,912.)

12,101. "Gasfilled electric lamps." Siemens & English Electric Lamp Co., Ltd., and P. D. Oakley. May 10th, 1926. (270,900.)

12,192. "Armouring for single-core alternating-current cables." Felten and Guilleaume Carlswerk Akt. Ges. June 13th. 1925. (253,496.)

13,084. "Electric conductors for signalling purposes." Felten & Guilleaume Carlswerk Akt. Ges. July 9th, 1925. (255,025.)

13,900. "Electrical resistances or rheostats." Morgan Crucible Co., Ltd., and C. C. Gow. June 1st, 1926. (270,908.)

15,111. "Variable condensers and like instruments." W. Rogers and Wingrove & Rogers, Ltd. June 16th, 1926. (270,914.)

19,784. "Thermionic and like amplifiers." S. Y. White. August 11th, 1925. (256,967.)

23,808. "Exhausting apparatus for the production of a high vacuum." E. W. Moss (Akt. Ges. Brown, Boveri et Cie.). September 27th, 1926. (270,947.)

24,972. "Automatic thermal circuit-breaker for an electric circuit." G. Maire. October 7th, 1925. (259,593.)

25,421. "Diaphragm sound-reproducers for wireless apparatus, gramophones, and the like." Ritter & Uhlmann Akt. Ges. October 15th, 1925. 259,966.)

27,485. "Armouring for single-conductor alternating-current cables." Felten & Guilleaume Carlswerk Akt. Ges. April 21st, 1926. (Addition to 259,536.) (269,842.)

27,713. "Armouring of electric cables." Felten & Guilleaume Carlswerk Akt. Ges. April 21st, 1926. (Addition to 259,536.) (269,843.)

27,829. "Mounting for the electrodes of closed electric furnaces." I. G. Farbenindustrie Akt. Ges. December 28th, 1925. (263,756.)

27,844. "Modulation systems applicable for wireless signalling." Marconi's Wireless Telegraph Co., Ltd. November 28th, 1925. (262,076.)

28,660. Magnetic separators." F. Krupp Grusonwerk Akt. Ges. November 14th, 1925. (261,410.)

30,188. "Electric ignition systems for internal-combustion engines." J. De Coster. December 5th, 1925. (262,420.)

30,980. "Wired radio transmitting system." Wired Radio Inc. December 23rd, 1925. (263,777.)

30,802. "Fluid-tight electric switch." N. Munthesen. December 4th, 1926. (270,980.)

1927.

529. "Electric heating units." British Thomson-Houston Co., Ltd. January 7th, 1926. (264,172.)

1,046. "Electric resistance annealing furnaces." Akt. Ges. Brown, Boveri et Cie. May 19th, 1926. (271,003.)

1,078. "Scales for radio vernier-control apparatus." C. Nehrke. June 29th, 1926. (271,004.)

1,615. "Method of and apparatus for navigating aircraft by wireless." H. Junkers. February 12th, 1926. (265,940.)

1,628. "Arrangements for feeding the filaments or incandescent cathodes of discharge tubes." Naamlooze Vennootschap Philips' Gloeilampenfabricken. January 29th, 1926. (265,183.)

6,978. "Containers for storage batteries and the like." T. R. Palmer. February 22nd, 1926. (Divided application on 270,833.) (271,019.)

7,946. "Electromagnetic acoustic apparatus." N. W. McLachlan. February 9th, 1926. (Divided application on 270,421.) (271,021.)

10,479. "Electric motors intended to work in an explosive medium." Ateliers de Constructions Electriques de Charleroi. April 19th, 1926. (269,592.)

Trade Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from June 1st. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Duophragm. No. 477,742. Class 8. Telephone diaphragms.—Duophragm Syndicate, 92, Cannon Street, E.C.4.

Accuratune (lettering and design). No. 472,671.* Class 8. Radio apparatus and parts thereof, namely, condensers, transformers, rheostats, variometers, vario-couplers, coils, grid leaks, antenna equipment, graduated dials, potentiometers and battery chargers.—Mydor Radio Co., Newark, New Jersey, U.S.A. (Hans & Danielsson, 121, St. John Street, E.C.1.)

System Zeiler (lettering and design). No. 476,351. Class 8. Galvanic cells, dry cells, dry batteries, refill batteries, and electrical accessories and parts.—Die Batterien & Elemente Fabrik System Zeiler Gesellschaft, Berlin. (Marks & Clerk, 57-58, Lincoln's Inn Fields, W.C.2.)

Spiovisor. No. 478,416. Class 8. Apparatus for use in transmitting views, scenes or images to a distance by telegraphy.—Television, Ltd., Motograph House, Upper St. Martin's Lane, W.C.2.

Zampa. No. 479,800. Class 8. Instruments and apparatus for use in connection with radio-telegraphy and telephony.—Mic Wireless Co., White Horse Place, Market Street, Wellingborough.

Domeno. No. 479,969. Class 8. Flash lamp batteries.—Runwell Cycle Co. (London), Ltd., 16, Great Eastern Street, E.C.2.

Viclaire. No. 479,727. Class 13. Ordinary electric lamps.—Michel Tchacon, Paris. (McKenna & Co., 31-34, Basinghall Street, E.C.)

Rheco. No. 476,148. Class 13. Electric lamps (ordinary), lamp fittings and shades, electric bells and fittings, electric switches and switch plates, wall and ceiling fittings, contacts and terminals, cut outs and similar electrical fittings and accessories, electric cooking and heating appliances.—Robinson & Hands Electrical Co., Ltd., 54, Barwick Street, Birmingham.

Insol. No. 478,945. Class 50. Radio-telegraphic fittings, and electrical fittings, all being goods made from condensation products of phenol and formaldehyde.—Die H. Römmler Gesellschaft, Berlin. (Wheatley & McKenzie, 40, Chancery Lane, W.C.2.)

New Work for Contractors.

Particulars of new works and building schemes for the use of electrical installation contractors in search of work and all interested in the sale of electrical and allied plant and other products.

Publication in this list is no guarantee that electrical work is definitely included. Alleged inaccuracies should be reported to the Editors.

BEXLEY.—44 bungalows, Pickford Lane, for the U.D.C.; W. T. Howse, surveyor.

BILLINGHAM.—Additional 120 houses, for the U.D.C.; surveyor.

BIRKENHEAD.—Police station and 16 houses, for the T.C.; C. Brownridge, borough engineer.

BIRMINGHAM.—Welfare centre, Charlotte Road, Stirchley; R. Fenwick, Ltd. 86 houses, Spring Road, Tyseley; W. Edwards, Contractors (Birmingham), Ltd. Extensions, Salvage depôt, Lifford; Muirhead, MacDonald, Wilson and Co., Ltd. Church, Tyseley; Bishop's Commission. Extension, Central Technical Institute, Suffolk Street; Education Committee.

BEXHILL.—Houses, Cooden Drive, Magdalen Road, and De la Warr Roads; Harrison Smith Buildings, Ltd.

BOLTON.—Palais de Danse, Bridge Street, and St. George's Road; W. Worsley.

BOSTON.—Wesleyan church, Sutterton; W. E. Norman Webster, architect, Spalding; S. Favell, builder, Kirton End.

CHATHAM.—Sewage pumping station, &c., for the T.C.; W. H. Radford & Son, engineers, Albion Chambers, King Street, Nottingham.

CHESTERFIELD.—Houses (50), for the T.C.; James Leaver and Sons, Ltd., builders, Sheffield.

COULSDON.—50 houses, Westleigh Avenue; U.D.C. surveyor.

COVENTRY.—Additional 98 houses, for the T.C.; E. H. Ford, city engineer. School hall, Radford (£3,198), for the Congregational trustees; Jervis Bros., builders. Extensions, Stoke schools (£15,000), for the City E.C.; the clerk.

DERBY.—Extension of boiler house at the Institution; H. Lea & Son, consulting engineers, 151-153, Edmund Street, Birmingham.

DEWSBURY.—Extensions, Mitchell Laithes Hospital, for the Joint Hospital Board; H. Dearden, borough surveyor.

DUMBARTON.—Clinic at Duntocher (£1,400), for County Council; the county clerk.

EASTBOURNE.—Development of Redoubt as music garden with shelters and bathing pool; borough engineer. Alterations, Cavendish Hotel, Grand Parade; Pimm Hotels, Ltd. 96 houses, Victoria Drive Estate; borough engineer.

EDINBURGH.—Conversion of building at 60, Princes Street into furniture warehouse for J. Woodhouse & Son; the manager. Aerated water factory at Hutchison Road; Mr. Alexander Robb.

FALKIRK.—Infirmary (£100,000); W. J. Gibson, O.B.E., architect.

GLASGOW.—Two schools, Knightswood; Education Committee. 96 tenements, Parkhead; housing director. Academy of music; Sir D. M. Stevenson, Bt.

GRAVESEND.—Alterations, Wellington Brewery, Wellington Street; Charrington & Co., Ltd.

HANLEY.—Extensions, Foundry Street; Sentinel Newspaper Co.

HEDNESFORD.—Catholic church (£30,000); Harrison and Cox, architects, Birmingham.

HEMSWORTH (YORKS.).—Laundry, for the Joint Hospital Committee; W. T. Lynam, architect.

HILL & CAKEMORE.—School (£16,935), for Worcestershire E.C.; W. Jackson, builder, Langley Green, Oldbury.

HULL.—Heating at Mental Hospital; Rosser & Russell, consulting engineers for Corporation. 120 houses, New George Street clearance scheme; city architect.

HUTHWAITE.—Housing scheme (44), for the U.D.C.; G. Bostock, surveyor.

ILKESTON.—80 houses, Rutland Estate, and 76 on Southern Estate; borough engineer.

IRISH FREE STATE (CORK). Carnegie library; P. Monahan, city commissioner.

IRLAM (LANCS.).—Housing scheme (40), for the U.D.C.; surveyor.

KIDDERMINSTER.—Model dairy (£5,000) for Co-operative Society; secretary.

LANARKSHIRE.—Extensions to County Hospital, including two pavilions (104 beds), operating theatre, and nurses' home extensions, for the C.C.; the clerk, Glasgow.

LEEDS.—Dance hall showrooms, &c. Sheepscar Street; Vernon Gash, Ltd. Weights and Measures offices, George Street; C. F. Bowman & Son, architects. Electric hare course, Elland Road; Leeds Greyhound Racing Association, Ltd. Billiard hall and dance hall, Kirkstall Road; W. Ogden. Palais de Danse, Roundhay Road; William Hill & Sons (Carriers), Ltd. Cinema, music hall, shops and ballroom, Harehills Lane and York Road; Shaftesbury Cinema (Leeds), Ltd.

LONDON (BARKING TOWN, E.).—70 houses, Shirley Road; J. R. Leftley.

(W.C.).—Theatre, Leicester Square. (£300,000). H. Ds M.P.

(ILFORD, E.).—Extensions, dust destructor works; borou engineer. Motor body works, Eastern Avenue; W. Oram. Research laboratories, Britannia Works, Rod Street; Ilford, Ltd. 30 houses, Clifton Road; Triplete.

(LEYTONSTONE, E.).—Dining hall, bakery and workshops, f West Ham B.G.; G. A. Allan, architect, 1, Staple In Holborn.

(WEST HAM, E.).—268 flats, Memorial Estate, for the T.C borough engineer.

(E.C.).—Improved accommodation, police reserve office Bunhill Row; city engineer.

(FINCHLEY, N.).—110 houses, estate near Summers Lan Harper & Smith.

(ST. JOHN'S WOOD, N.W.).—Block of flats, Park Roa H. W. Wills & W. Kaula. 22, Southampton Street, W.

(ST. MARYLEBONE, N.W.).—Extensions, Queen Charlotte Hospital, Marylebone Road; governors. Extension Regent Street Polytechnic in Titchfield Place (£170,000 trustees.

(WOOLWICH, S.E.).—53 houses, Eltham Estate; borou engineer.

(FULHAM, S.W.).—Garages site of 923-931, Fulham Roa G. R. Farrow, Amberley House, Norfolk Street, W.C.

(WIMBLEDON, S.W.).—Extensions, King's College Scho (£26,000), for the governors; the clerk.

MAIDSTONE (LEEDS).—Servants' hostel, &c., with electric work, for the Hon. Mrs. Wilson-Filmer, Leeds Castl

MALVERN.—Extensions, Assembly Rooms (£16,000), for th U.D.C.; surveyor.

MANCHESTER.—48 houses, Kingsway Estate, for Corpor tion; F. W. Woolfenden, Didsbury. Tramway office Failsworth; Corporation tramway manager. Dinin hall, &c., Oxford Road Hospital; governors. Centr heating at 32 school departments; Education Com mittee.

MAXWELLTOWN.—Extensions, High School, for Kirkcu bright E.C.; education architect, Castle-Douglas.

MORECAMBE.—Refuse salvage scheme; borough engineer.

MOTHERWELL.—Secondary school, Jerviston, for Lanark shire E.C.; John Stewart, master of works, 20, Alber Street.

OLDHAM.—30 houses, Merton Avenue; W. Makin. Conver sion Greenacres Lodge into maternity home; Willian Lees (Oldham), Ltd.

PRESTON.—Central schools, Deepdale, for the borough E.C. B. Widdows, architect, Derby; George Hill & Sons Ltd., builders.

QUEENZIEBURN (KILSYTH).—Housing scheme (40), fo Stirlingshire C.C.; D. W. Glass, architect, 76½ Por Street, Stirling.

RICHMOND (YORKS.).—Bakery, garage and staff hostel, Cat terick Camp; Navy, Army and Air Force Institute.

RIPON.—Proposed swimming baths, shelters, café, and thea trical stage for Spa; Corporation Special Committee.

ROTHERHAM.—Shops and offices, Corporation Street, fo the T.C.; Vincent Turner, borough engineer.

ROTHWELL.—Secondary school, for West Riding E.C. director of education, County Hall, Wakefield.

SHEFFIELD.—Housing scheme, fifth section, Longley estate city architect. 36 houses, Dykes Hall Estate; city architect. New central library; city architect. Abattoir and wholesale meat market (£179,000); G. Longden and Son, Ltd.

SWINDON (WILTS.).—Hospital extensions (£25,000), for the governors of Victoria Hospital; secretary.

TANDRIDGE (SURREY).—Club house (£7,000), for the Golf Club; secretary.

TRUSTHORPE (LINCS.).—Hotel (£7,000); Messrs. Bush builders, Nottingham.

WHALLEY.—Nurses' hostel and extensions, Calderstones institution, for Lancashire Asylums Board (£31,000); the clerk, Preston.

WEST BROMWICH.—Drill hall and staff quarters, for Staffs Territorial Army Association; the secretary, Stafford.

YSTRAD MYNACH.—Central offices and 30 official residences, for the Powell Duffryn Co., Ltd.

The

Electrical Review

VOL. C. JUNE 17, 1927. No. 2,586.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE M.I.E.E., A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

For List of Foreign Agents for the ELECTRICAL REVIEW see Advertisement Supplement.

The Electrified Home.

THE paper read by Mr. H. H. Berry at the I.M.E.A. Convention and the discussion that followed, which are reported elsewhere in this issue, fully maintained the interest that had been manifest at the two previous meetings. The author advocated what one speaker described as "a sort of half-way house," but three parties were represented in the discussion—those who agreed with him, those who, with Dr. Ferranti, favoured the (literally) "all-electric" house, and those who realised the difficulties that stood in the way of attaining that ideal, principally in point of cost.

It must be recognised, as the women especially urged, that the vast majority of actual consumers and the far greater number of potential consumers live in houses that are already built, most of which are rented, and that the cost of installing, extending, or modernising a hot-water system is beyond their means. Undoubtedly the ideal system is such a one as hundreds of the visitors were privileged to inspect at Baslow Hall, thanks to the courtesy of Dr. and Mrs. Ferranti, to whom both the E.A.W. and the I.M.E.A. are greatly indebted. But that unique installation was carried out at a heavy capital outlay and under expert supervision. What is to be done in the normal case?

Frankly—and as we have said on previous occasions—we feel bound to vote for the "half-way house." Where a supply of electricity can be obtained, as at Glasgow, during restricted hours for little more than $\frac{3}{8}$d. per kWh, electricity may be used for general heating; and where one owns the house and can afford the outlay, or where the house is as yet unbuilt, it may be equipped for that purpose to great advantage—but those are exceptional conditions, and in the ordinary case, numbered by the million, the all-electric ideal must be forgone in favour of a compromise. Mr. Berry, with inimitable eloquence, argues in favour of a central-heating and convector system, admirable in its way, but as the lady speakers remarked, of no use to the masses who live in existing houses. Leaving apart, however, the question of distributing hot water about

the house, there appears to be little room for doubt that, given a supply of electricity for heating at a reasonable price (certainly not more than 1d. per kWh), the most economical course to follow, as regards both initial outlay and running cost, is that which was recommended by the Advisory Committee on Domestic Supplies of Electricity, in the report which was quoted in Mr. Berry's paper—namely, to use coal or coke "in well-designed grates or furnaces for heating and mass production of hot water at one or two points in the house, the cooking being carried out on the electric range, occasional room warming with electric fires, and much of the housework by means of electrically driven appliances."

"Houses equipped in this manner," says the Committee, "give the occupants great satisfaction, and generally consume about ten times as much electricity in the year as they would for lighting alone." Be it noted that this system does not include the use of water for heating the house. It has been very widely adopted, and it has been shown by the Electrical Development Association that the saving in chimneys, &c., to which Mr. Berry also refers, pays for the cost of the complete electrical installation in a new house. Moreover, the system is suitable for even the smallest houses, and has indeed been employed in thousands of dwellings built under housing schemes. It is the nearest feasible approach to the ideal all-electric house for those of small and moderate means, and—a matter of the greatest importance—it can be applied to existing houses.

Although Mr. Berry appears to identify the Advisory Committee's system with his own proposition, the "Colectric system," it appears to us that the latter essentially employs central heating with convectors, which do not necessarily form part of the former. We accept his system as an admirable one for those who can afford it, a particular case of the problem; but in general that condition is not fulfilled, and the practicable must take precedence of the preferable.

In dealing with this question we think attention should be drawn to two points made by a woman Councillor—Mrs. Gregory, of West Ham—in the discussion—namely, that more women should be appointed on municipal electricity committees, to give the woman's point of view; and that domestic electrical appliances should be cheaper. Women can be co-opted, if they are not available as Councillors, and we think the inclusion of one or more women on a Committee would undoubtedly prove beneficial to domestic consumers. With regard to the latter suggestion, whilst the extending use of electrical apparatus certainly tends to lower the cost of production, the process is slow; there is no question but that the high prices of many electrical appliances present an insurmountable obstacle to their introduction into small houses, and manufacturers would serve the public interests if, without reducing the safety factor, they placed on the market in addition to the devices with which we are familiar, simple appliances constructed on the most economical lines.

The Patent Office Report.

THE forty-fourth annual report of the Comptroller-General of Patents, Designs and Trade Marks, issued under date May 9th, 1927, contains the usual full information about the activities of that department of Government, and sets it forth in a clear and concise manner which might well be an example to less useful branches of the Civil Service.

The number of patent specifications applied for constantly rises, having increased from 21,839 applications in 1918 to 33,080 in 1926. Of these applications about half were eventually sealed. On page 16 a table of mortality is given which probably corresponds fairly closely with the mortality statistics amongst the actual inventors. From this interesting table it appears that half the patents applied for up to 1922 reached the age of 5 years, 17 per cent. lived to be 10 years of age, and only 4.8 per cent. reached maturity in their sixteenth year. This table conjures up a painful vision of inventors expiring in garrets and cellars at a comparatively early age from failure, disappointment, and inability to pay the sums demanded for renewal fees. The report shows that from this notoriously struggling and impecunious fraternity the Treasury managed to extort no less a sum than £98,813, being the balance of receipts over expenditure which passes as in former years into its hands. We have referred before to this large surplus handed over year by year by the Patent Office as a "brain tax," and we are still of the opinion that the description is justified. Probably every pound so obtained by the Treasury represents a loss of hundreds in ordinary income tax which would have been secured had the patents and the patentees not been taxed out of existence at an early stage in their development.

As we have many times pointed out, the Americans know better; their fee of £7 down secures for the inventor a patent, carefully edited, after a most elaborate and complete search, which is then his undisputed property for a period of 17 years without any other fees or taxes whatever. Eventually, if he succeeds, he becomes an important taxpayer, but if he fails his "intellectual property" is not taken away from him because he is unable to find large and increasing contributions year by year from the start.

We turn with relief to a pleasanter side of this report. While the total cost of the staff is £254,000, it will be observed from the complete list which is furnished that nobody is overpaid. An immense amount of work is carried through at the Patent Office, and on the whole with wonderful efficiency. The publications issued by the Office, of which this report is a fair sample, are exceedingly useful and well arranged, and every facility is given to the poor inventor to make searches on his own account if he cannot afford to take the safer course of employing a patent agent.

Time after time we have called the attention of the Government of the day to the opportunities of development of business and consequent large revenue which they are missing by their short-sighted policy of the brain tax, and we venture once again to urge upon the present Government that it would be a business move to pass a short Act establishing the patent fees on a similar basis to that prevailing in America, when we venture to predict that similar results in the matter of revenue and valuable inventions would follow.

The Necessity for Adequate Wiring.

THE supplier of electrical goods has a very direct interest in the number of outlets that are installed in the house that is wired for electricity. To be possessed of a number of outlets means for the user the ability to apply electricity in all the rooms for many purposes, and paves the way for the sale by the dealer of a host of domestic electrical appliances. There are thousands of houses using electricity to-day that are inadequately wired, simply because they were wired years ago, when the use of electricity was practically restricted to lighting. The majority of these homes would make a far greater use of electricity for heat and power if only they had the necessary extra outlets. House agents will glibly advertise houses as "wired for electricity," when every electrical man knows that these houses generally contain about a quarter of the wiring equipment which is necessary if the occupants are to obtain the fullest advantage from the use of electrical labour-saving devices. The housing demand is by no means satisfied yet; in the course of the next few years thousands of new residences will be going up, and the adequate wiring of these means thousands of potential electrical sales. In this connection the builder assumes importance. He should be asked to appreciate the fact that where, for example, the title of the property remains in his own hands, it is made more valuable in the event of sale by the provision of a complete electrical service. Much could be done in this way that at present is left undone.

Frederick Walter Purse,

President of the Incorporated Municipal Electrical Association, 1927-28.

At the annual convention of the Incorporated Municipal Electrical Association at Buxton, Mr. F. W. Purse was elected president for the year 1927-28, and we have pleasure in reproducing his portrait herewith.

Like his immediate predecessor in the presidential chair—Mr. R. W. L. Phillips—Mr. Purse is a native of Bristol; he was educated at the Merchant Venturers' Technical College (which has since become the University of Bristol), where he won both junior and senior scholarships, and whilst at College he obtained many certificates in various engineering subjects, including the Honours Diploma of the City and Guilds of London Institute for electric light and power distribution. He entered the service of the Bristol Corporation Electricity Department in 1897, and was there associated with Mr. Phillips; two years later he became assistant engineer at Bath, and subsequently held the post of deputy-chief at Warrington for seven years. In 1908 he was appointed chief electrical engineer at Watford, and in 1913 he accepted a similar position at Carlisle; after spending six years in that position he returned to the south as chief engineer and manager of the Electricity Department of the County Borough of West Ham—the largest municipal electrical undertaking within 100 miles of London—and still occupies that post, having now spent 30 years continuously in municipal service, during 19 of which he has been in the seat of authority.

Photo by] *[Russell.*

Mr. F. W. Purse, M.I.E.E., M.I.Mech.E., President, I.M.E.A.

In addition to his normal duties Mr. Purse has for many years shouldered a heavy burden of public service, serving on various committees in connection with the British Engineering Standards Association and the Institution of Electrical Engineers; as vice-chairman of the I.E.E. Wiring Rules Committee he has played a prominent part in the formulation and revision of the rules, which, in his opinion, ought to be made compulsory and binding upon electrical contractors and supply authorities in general. He is also a member of the National Registration Board of Electrical Installation Contractors, hon. treasurer of the Associated Municipal Electrical Engineers, and past-president of the Greater London Centre of the A.M.E.E. He is a member of the Institutions of Electrical and Mechanical Engineers, and President of the Rotary Club of West Ham.

During the war Mr. Purse served as Captain with the 4th Vol. Battalion, Border Regiment, and chairman of the Carlisle Area Road Transport Committee; he was also a member of the East Cumberland Munitions Committee, and of the Management Committee of Carlisle National Shell Factory, and was a district engineer under the Coal Department of the Board of Trade. His literary activities have taken the shape of numerous papers and articles on problems connected with public electricity supply, his latest essay in that direction having been the article on "The Ascertainment of Kilowatt Maximum Demand" which was published in our issue for May 13th—a question of great importance to supply authorities which under the terms of the Act of 1926 will be called upon to give or take a bulk supply of electricity.

Under a somewhat blunt and uncompromising manner Mr. Purse conceals a warm heart and a sincere desire to serve his fellow-men, taking keen interest in the welfare of his subordinates and fighting the battles of the "under-dog"; in past years he has strenuously contended for the interests of the younger members of the Institution of Electrical Engineers, and has resisted the increase of their burdens at the annual meetings, which he never fails to attend—though latterly he has not had occasion to offer adverse criticism. At an earlier stage in his career, in collaboration with Mr. A. Nichols Moore (now vice-president of the I.M.E.A.), Mr. Purse championed the cause of the smaller municipal undertakings and ultimately secured for them direct representation on the Council of the Association. Since his promotion from the small to the large class of station, Mr. Purse has carried on at West Ham a progressive and energetic policy, directed towards the increase in efficiency of his undertaking and the reduction of cost to the consumer; he now controls generating plant aggregating 43,500 kW, with a maximum load of 24,500 kW, and an annual output of over 77 million kWh, serving a population of 318,000, with a large industrial load (the load factor is 35.8 per cent.). The prices charged for lighting, power and domestic purposes in West Ham are just about half those demanded over a large proportion of the Metropolitan area, and it will not be the fault of Mr. Purse if electricity is not universally adopted in the County Borough. Plain-spoken and business-like, he will conduct the affairs of the Association with efficiency and dispatch, and his period of office will be one of prosperity and achievement for the Association.

During the past year the President, Mr. Phillips, was kept so busy with the Electricity (Supply) Bill that he finally came to loathe it, and at the annual dinner of the Association he referred to the difficulties that would be experienced in the working of the Act; it falls to the lot of Mr. Purse to be in office while the Act is being brought into operation, and it is safe to say that he will have plenty of work to handle. With the support of a public-spirited and hard-working Council, he may be relied upon to do his utmost to ensure the success of the national scheme.

Stourport Electric Power Station.

A new 25-cycle capital generating station capable of extension to an ultimate capacity of 250,000 kW, designed to serve, in conjunction with other plant, the Central England district, a scheme for which is being prepared by the Electricity Commission.

(*Concluded from page* 917.)

THE circulating water for the condensing plant is conveyed to the pumps by twin ferro-concrete culverts, each measuring 62 sq. ft. in area, having a connection from the river at the one end, through fish screens and penstocks, to screen chambers, in which are two Waller 27-ft. diameter rotary screens. The discharged water is carried by a single ferro-concrete culvert, 59½ sq. ft. in area, to the river at the down-stream end of the site.

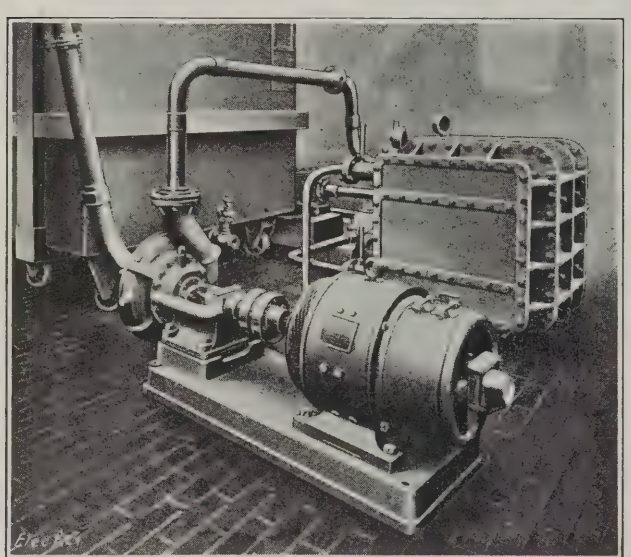

Fig. 8.—Main Transformer Oil Cooler.

designed for a steam pressure of 325 lb. per sq. in with 246 deg. F. superheat, capable of carrying 25 p

Fig. 10.—Halesowen Sub-station, 33,000 Volts, B.T.-H. Switchgear.

The 6,000-r.p.m. house turbo-generator drives through gears a multi-pole d.c. generator normally rated at 750 kW, 600 r.p.m., 1,630 amperes, 460 volts,

cent. overload fo two hours. Its con denser was supplie by Cole, Marchent Morley, Ltd., t maintain a 28-in vacuum when dealin with 9,800 lb. o steam per hour, wit circulating wate supply at the rate o 58,700 gallons pe hour at 70 deg. F. it has a cooling sur face of 1,300 sq. ft. and in order to b able to raise th vacuum quickly th plant is fitted wit Edwards 3-throw ai pumps having cylin ders of 12 in. di ameter by 12-in stroke, running a 120 r.p.m., being driven by a B.T.-H motor rated at 8 h.p., 600 r.p.m., 46 volts d.c. The circu lating pump is driven direct by a B.T.-H. 15-h.p. motor running at 1,000-1,100 r.p.m., on a 460-volt circuit. A 750-kW rotary converter has also been installed.

For stepping up the output of the generating sets from 5,550 V to the distribution pressure of 33,000 volts, two 3-phase banks of transformers have been supplied by the Metropolitan-Vickers Electrical Co., Ltd.,

Fig. 11.—Coal Elevator, with Ash and Soot Bunkers Below.

each of a capacity of 22,500 kVA, consisting of three single-phase shell-type units of unusually large size on account of the low-frequency; each unit, with its tank and oil, weighs 33 tons. The tanks are of boiler iron with cast-iron covers and sealing bells for the entry of lead-covered cables on both the h.p. and l.p. sides: each has its own oil conservator and a calcium-chloride breather, and two sets of oil-cooling equipment accompany each bank, figs. 8 and 9, one cooler of each pair being normally in operation at a time, the other acting as a stand-by for use during overhauling and cleaning. The temperature of the oil is shown on dial-type indicating thermometers.

Apart from the metering instrument transformers and neutral earthing gear, no control switchgear is provided between the generators and main transformers, which are protected on the circulating-current system in addition to time-limit overload devices. Part of the station's output is reduced

Fig. 13.—A Typical Section of Overhead Power Transmission Line.

from 33 kV to 11,000 V, two transformers supplying the neighbourhood of the station and a third the station auxiliary plant; this local supply is further reduced by two 500-kVA transformers to 400 volts. The 25-cycle transformers supplied by the Brush Electrical Engineering Co., Ltd., include one of 2,500-kVA, 3-phase, and six single-phase forming two 4,500-kVA 3-phase banks, ratio 33,000/11,000 volts; also two of 1,500 kVA 3-phase ratio 33,000/11,000 V; one of 825 kVA 3/6-phase for use with the B.T.-H. rotary convertor, ratio 11,000/343 V with 20 per cent. internal reactance; and two of 500 kVA 3-phase, ratio 11,000/400 V for station service. All of them are of the oil immersed self-cooled core type, the boiler plate tanks being of the outdoor pattern with domed lids, expansion chambers, and calcium chloride breathers, and on the 33,000-volt cable boxes an expansion chamber and calcium chloride breather are fitted. All the transformers are of the outdoor type with distant thermometers in the control room; each stands in a brick cubicle without roof to localize trouble

Fig. 12.—Halesowen Sub-station, 33,000/5,500-volt Brush Transformers.

in the event of a tank bursting, with a pit below to trap the oil. The transformers stand on rails and a special truck facilitates removal (see fig. 6, last week).

All the switchgear in the station has been supplied by the British Thomson-Houston Co., Ltd. Single-core 33,000-volt cables are brought into the basement, through current transformers, and up to the main busbar floor; the gear is of the cellular type with duplicate busbars and, in the case of the generator and feeder circuits, with duplicate circuit breakers, one being alloted to each busbar. The remaining circuits which are at present only equipped with one breaker each are arranged so that the second breaker can be added at a future date without necessitating any considerable alteration. On the upper floor of the building the oil circuit breakers are erected in two rows, each corresponding to one of the two sets of busbars, which run along both outside walls on the floor below in cubicles. Above the busbars are their isolating switches and on this floor the centre bank comprises the incoming cubicles and the potential transformer cubicles which also house the mechanically-

operated circuit breaker selector switches. So far as has been practicable each separate piece of apparatus forming a hazard has been mounted in a separate compartment fitted with sheet steel doors and lined with "Uacolite" slabs. The isolating switches are all mechanically operated with mechanism arranged to operate the switches in groups of three by convenient levers attached to the fronts of the cubicles on the bus-bar floor; they are furnished with interlocking gear and auxiliary switches for the purpose of indicating their positions by means of automatic electrically-operated relays on the indicating panels of the control board.

The potential transformers are mounted complete with their fuses and current-limiting resistances on draw-out trucks, obviating the necessity for potential-transformer isolating switches. Current transformers on the 33,000-volt gear are of the single-turn primary type mounted in earthed metal cases and threaded over the single-core lead-covered cables, being located with the neutral earthing equipment in the basement. All current transformers on both 33,000- and 11,000-volt equipments are fitted with a special testing winding to enable load conditions to be reproduced when they are out of commission. In the control room overlooking the turbo-generator room the panels are wired with asbestos-braided wire coloured in accordance with the I.E.E. standards.

type, and the oil circuit breakers for the earthing equipment are solenoid operated from the main control boards.

The switchgear in section A comprises the 33,000-volt side of the step-down 33- to 11-kilovolt transformers (fig. 6, last week). Sections B and C of the gear are operated at 11,000 volts, section B being provided for the control of outgoing cables for local distribution while section C controls the alternating-current auxiliaries and workshop plant in the power station in addition to obtaining its supply through a step-down transformer from section A it can also be interconnected with section B, and l.p. distribution in the station is controlled by special switchboards; one portion is fed from two 500-kVA 3-phase transformers controlled on their 11,000-volt side by switches in section C, delivering energy at 400 volts. A d.c. board is also provided receiving its supply from the 750-kW turbo-generator the 750-kW rotary convertor, and from the 250-kW d.c. auxiliary generator directly coupled to each main turbine. From this 460-volt 3-wire system the lighting supply is normally taken, but in times of emergency by means of throw-over switches the principal lighting circuits can be supplied from the battery. Both in the case of a.c. and d.c. low-voltage boards the control is divided into two, the first switchboard controlling

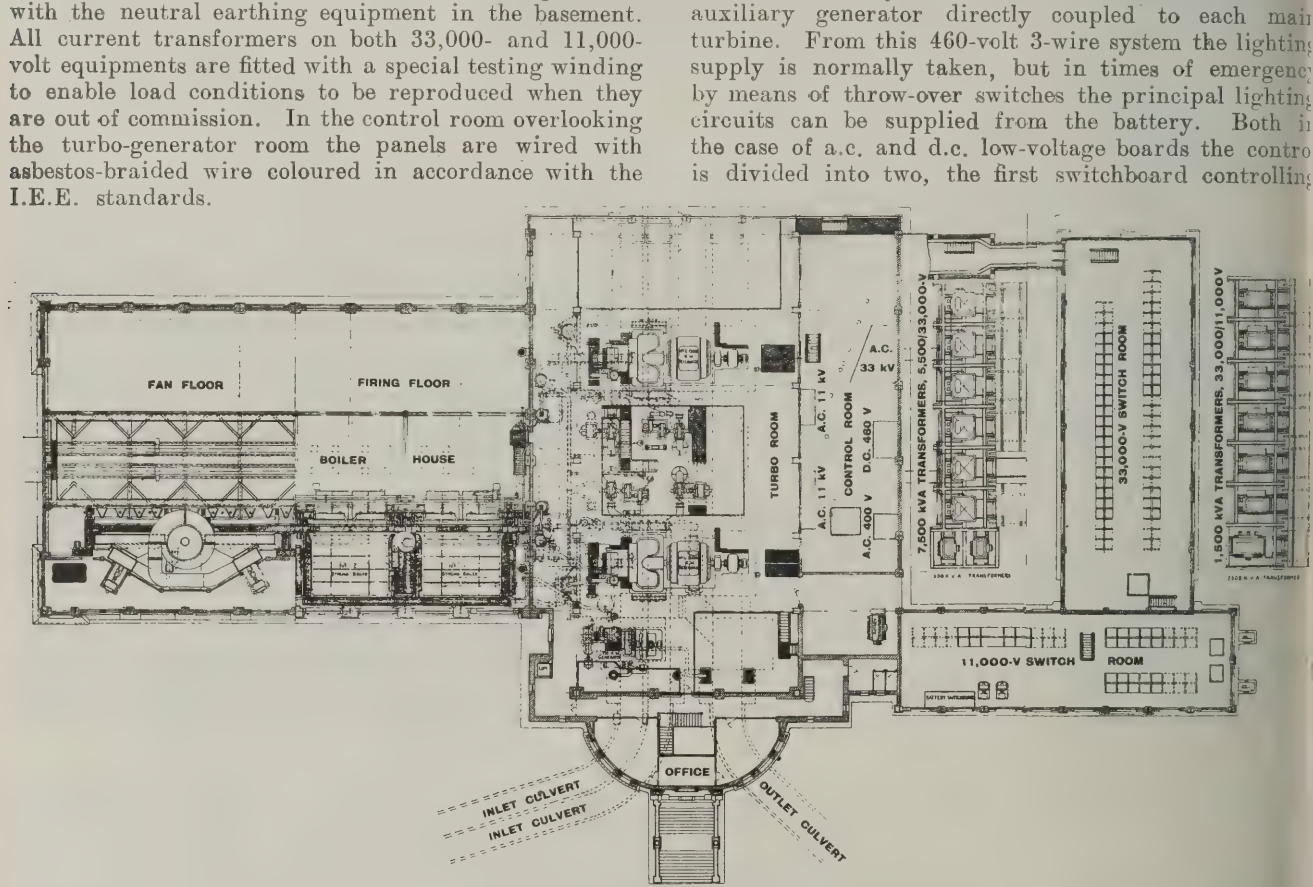

Fig. 14.—Plan of Stourport Generating Station.

The 11,000-volt switchgear on the secondary side of the 33-kV transformers controls the outgoing cables for local distribution and for auxiliary plant in the power station. It is also cellular with busbars in duplicate at the top of the structures, one set on each side of the dividing wall; below are the mechanically-operated selectors and below these are mounted the oil circuit breakers and the instrument transformers and line side isolating switches on the other side of the dividing wall. The breakers consist of three single-pole units coupled together and operated by solenoid mechanism outside the cell. Switchgear has been provided for earthing the neutral of the 5,500-volt generators and the 11,000- and 33,000-volt systems, including banks of resistances of such a capacity as to permit of the dead earthing of any phase of the system for thirty seconds without a dangerous rise in temperature while passing sufficient current to operate the protective devices of the faulty circuit. As the main transformers are star connected on the 33,000-volt side, the neutrals are employed for the purpose of earthing the system, but in the case of the 11,000-volt system the corresponding windings are delta connected and it has been necessary to provide earthing reactances for the purpose of obtaining a neutral point, of the oil-cooled outdoor

the input and transmitting it by bus cables to the second board from which all circuits around the power station are controlled.

For operating the h.p. switches duplicate Exide batteries are situated in the basement of the switch house, each of 350 ampere-hours capacity at the five-hour rate of discharge, for which the milking motor-generator sets were supplied by Mawdsleys, Ltd.

Besides those mentioned, other contractors included British Insulated Cables, Ltd. (interconnecting cable), R. A. Evans, Ltd. (electric passenger lift), Gent & Co., Ltd. (electric clocks), Messrs. B. French (lighting and power wiring), Laurence, Scott & Co., Ltd. (motors), Brookhirst Switchgear, Ltd. (control pillars), Allen, West & Co., Ltd. (controllers), and cranes were supplied by Stothert & Pitt, Ltd., Vaughan Crane Co., Ltd., and J. M. Henderson & Co., Ltd.

For the sub-station at Halesowen, which is equipped with B.T.-H. switchgear and as fig. 10 shows is of the outdoor pattern, and that at Oldbury, which are connected to the Stourport generating station by 33-kV underground cables, the Brush Co., has supplied two banks of single-phase 25-cycle, 33,000/5,500-volt transformers, each of 7,500 kVA capacity, and fig. 12 shows one of them assembled in their outdoor cubicles.

In addition to supplies furnished by underground cable to the industrial portion of its area, represented by the southern part of the Black Country, the company has constructed many miles of 11,000-volt 3-phase power lines carried overhead on wood poles, and similar low-voltage distributors in the more rural districts. There are over 100 miles of such standard lines in south Worcestershire and Shropshire, of which fig. 13 is a typical representation; some of them have been built to operate at 66,000 volts.

Villages on either side of the line routes are supplied through step-down transformers. For the 3-phase, 25-cycle, 11-kV lines stranded bare copper 0.1-sq. in. conductors are used spaced 3 ft. apart in the case of single-circuit lines and 2 ft. 6 in. in that of double-circuit lines, the maximum spans being 240 ft. and 300 ft. respectively. Single "A," and "H" type creosoted red-fir poles are employed with Buller pin type and double-link strain insulators. As a safety precaution galvanised steel wire is erected underneath the line wires and connected to four earthing bars per mile throughout.

The expenditure in respect of land, buildings, machinery, mains, and other equipment, including interest during construction and the cost of special Acts and Orders, amounted to approximately £2,500,000. In addition to the new plant, the company has a large station at Smethwick and another at Redditch; it operates the supply section of the Kidderminster and District Electric Lighting and Traction Co., Ltd., and the power stations of the Halesowen Lighting and Traction Co., Ltd., the Tewkesbury Electric Light Co., Ltd., and the Ludlow Electric Light Co., Ltd., besides being associated with the B. & M. Joint Committee of Electricity, Tramways and Motor-Omnibus Undertakings, its system being interlinked with them and also with that of the Birmingham Corporation. The company has undertaken the standardisation of frequency in the western portion of its area, but it is interesting to note that both its new station and that of the Birmingham Corporation at Hams Hall, which will no doubt be "selected" by the Central Electricity Board for its national scheme, are equipped with 25-cycle a.c. generating plant.

Portable Radio Receivers.

Some Features of Modern Instruments to which the Trader's Attention is Directed.

By PAUL D. TYERS.

DURING the past year very considerable progress has been made in the design of portable broadcast radio-telephone receivers. Until recently only a small proportion of sets of this pattern were really efficient, but this season there is a surprising number of new and really good instruments. The trade as a whole is making a considerable feature of a summer sales campaign, and, accordingly, retailers would be well advised to consider the sale of portable receivers really seriously.

The capabilities of portable receivers are somewhat limited, which is a point the trader would do well to impress upon his clients. The "pick-up" of a small frame, or indoor, aerial, compared with that of even a moderately efficient outdoor aerial, is exceedingly small, and the public, being accustomed to the normal type of aerial, is rather apt to overlook this fact. Of course, it is possible to obtain excellent results with a small aerial, provided that considerable amplification is employed, which must necessarily increase the complication and cost of the apparatus.

Portable receivers can broadly be divided into three classes: (1) really lightweight portable sets, (2) sets intended for reception from the London and Daventry stations only, and (3) comparatively complicated and heavy multi-valve sets, usually working on the super-heterodyne principle, which are capable of receiving from great distances. The very small portable sets, which are frequently enclosed with all batteries and even the loud-speaker in a leather attaché case, may be said to be truly portable; the other sets are also certainly portable, but to a more limited degree. When considering the purchase of a portable set, the probable use to which the client will put it should be borne in mind: a man who owns a motor-car is not likely to trouble very much about the size or weight of the set, but it is no good suggesting a set of this description for the man whose means of conveyance is the train, motor-'bus, or bicycle. One very good attaché-case portable receiver is provided with headphones only, although it will work a small loud-speaker satisfactorily at short range; others incorporate a loud-speaker in the lid, and give satisfactory loud-speaker results when reproducing the London and Daventry transmissions, whilst still others are built into a wooden case and provided with a leather carrying strap. Several of the larger firms are marketing portable sets also, some of which are made in two portions: the set itself is in one carrying case, and the amplifier and loud-speaker in another, which, perhaps, rather limits the portability of the apparatus.

The greatest obstacle encountered when attempting the production of a portable set designed to be as efficient musically as the ordinary type is the provision of the necessary power. Most portable sets utilise fairly small valves, and the size and weight factor necessarily limits the size of the high-voltage battery which can be used. If the loud-speaker type of portable set is to be worked so that it will give reasonably distortionless reproduction, it means that a heavy demand will be made upon the anode battery, which will constantly need replacing owing to its small size.

Since portable receivers are fitted with frame aerials, the high-frequency side of the receiving circuit is less highly damped than in the case of a set used with an outside aerial. This usually means that the set is slightly more difficult to stabilise, particularly in the case of a multi-valve receiver. For this reason it is advisable that only the valves recommended by the makers should be used; some valves, of course, have larger inter-electrode capacities than others, or amplify to a greater degree, and makers usually recommend the valves which particularly suit their circuits. Any attempt to substitute other valves, or, perhaps, cheap ones, may make a vital difference to the functioning of the apparatus, and it is quite conceivable that the performance of a really good set might be very materially limited by so doing; accordingly purchasers should be reminded that it is advisable to examine and probably replace the battery at more frequent intervals than might possibly be imagined to be necessary. The same might be said of large-sized dry cells if they are fitted for supplying the filament current instead of an unspillable type of accumulator; in the writer's opinion, the unspillable type of accumulator gives greater satisfaction than a large-capacity dry cell. The difference in weight is not likely to be very considerable.

Recent Lighting Installations.

Electric lighting schemes for the new Indian Legislative Assembly, Delhi, and the Church of St. Mary the Virgin, Ashford, embodying cornice and flood-lighting respectively.

THE interior illumination of churches and public buildings, where beautiful architecture is a predominating feature of the structural design, usually presents problems which are somewhat outside the province of ordinary installation work, each case bringing its own peculiar difficulties. That such problems can best be dealt with by electric lighting is nowadays evident, and in this connection the following particulars concerning two electric lighting schemes recently carried out are of interest.

One is that at the new Indian Legislative Assembly (Indian House of Commons) at Delhi, where the first essential was to provide good general lighting without shadows. This has been done very effectively by means of cornice lighting, which also gives a very impressive tone to the surroundings, as indicated in figs. 1-3.

Fig. 1.—Indian Legislative Assembly, Council Chamber.

Fig. 2.—Council Chamber Walls and Ceiling.

The illustrations are reproductions from untouched photographs which were taken after dark by the light from the cornice system only.

Fig. 1 shows the interior of the council chamber. The beautiful stone fretwork ceiling of this room is brought into prominence at night time by the artificial lighting, as indicated by fig. 2. The interior of one of the Committee rooms is shown in fig. 3. It will be seen that the illumination of the ceiling is absolutely uniform. In addition to the foregoing, the Chamber of Princes, the Council of State, and the library, which has a dome of 90 ft. diameter, are all illuminated on the same system. "Emvee" cornice reflectors, supplied by Messrs. Metro-Vick Supplies, Ltd., are installed throughout. They are specially designed to overcome the streaky effect which is sometimes produced by cornice lighting.

The average service illumination on the tables and desks is 4 ft.-candles, the installed wattage being 45 per foot run of cornice. Each reflector is 13 in. long, and is fitted with two 30-W vacuum lamps in a twin holder served by one pair of terminals, thus reducing the wiring to a minimum. The wire is brought out at the back of the reflector, a convenient wiring channel bein cut in the concrete. A strip of corrugated mirro runs the whole length of the front of the reflecto and serves a double purpose. It spreads the ligh laterally so that patchiness from the individual lamp is obviated, and it reflects the light in the correc direction to give a uniform illumination on the ceilin above. The mirror is coated with pure silver an heavily backed with electrolytically deposited copper It is claimed that the surface remains permanentl bright and is unaffected by climatic conditions. Eac section of the troughing can be removed independently Clear cover glasses are provided to prevent dust accumu lating in the interior of the reflector, and to facilitat cleaning. The reflector is designed to be suitable fo a small cornice.

The installation was carried out by the Public Works Department under the direction of Sir Herbert Baker, A.R.A., the responsible architect for the premises.

The second installation is that at the church of St. Mary the Virgin, Ashford, where the architecture is a combination of the decorated and plain perpendicular styles, with some traces of Norman or early English. It was decided that the system must serve the dual purpose of providing adequate light for the congregation and bringing out the structural details of the ancient pile. In this connection the vicar, the Rev. Hy. Blackburne, D.S.O., consulted Capt. A. Mayne, M.I.E.E., who, in collaboration with the Illuminating Engineering Department of the General Electric Co., Ltd., drew up a scheme for flood-lighting the chancel, nave, and transepts by means of "Gecoray" flood-light projectors equipped with 150- and 200-W white gas-filled lamps.

The lighting of the nave, fig. 4, is carried out by means of these units installed at the clerestory level, nearly 40 ft. from the floor, each being focused by means of adjustable brackets attached to the transverse beams at suitable angles to light the pews on opposite

sides of the nave. The effect is an absence of glare or dazzle in the eyes of the congregation, yet a beautifully soft illumination of even intensity renders, it is claimed,

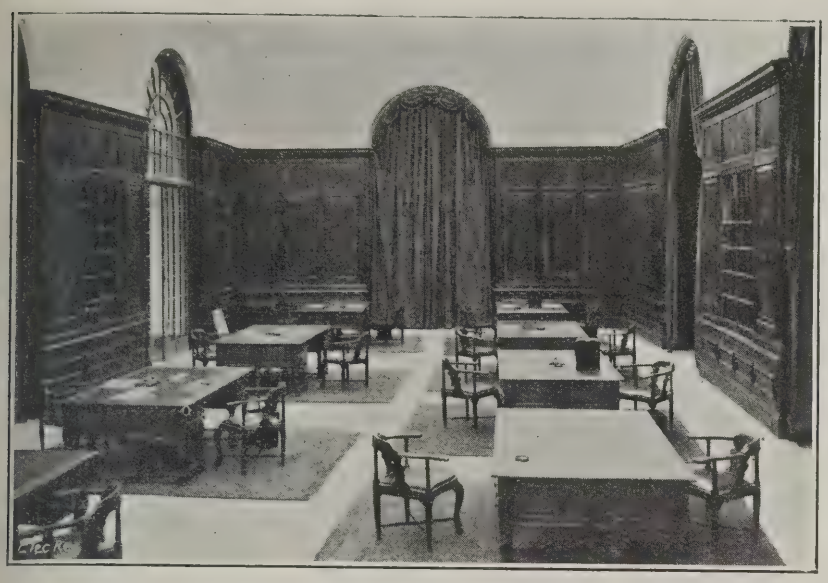

Fig. 3.—Committee Room at Indian Assembly.

the smallest print legible in the pews. The choir stalls are illuminated on the same lines as the nave, the richness of the architecture and carved woodwork being brought out to the fullest extent.

The lighting of the chancel and reredos, fig. 5, has been accomplished by installing flood-light projectors on the eastern side of the main chancel pillars. Three "Gecoray" projectors, equipped with 200-W white gasfilled lamps, are neatly fixed to each pillar, out of sight of the congregation, and focused at suitable angles; the result is a particularly uniform light on the altar and reredos. The north and south transepts are illuminated in a similar manner to the nave, the

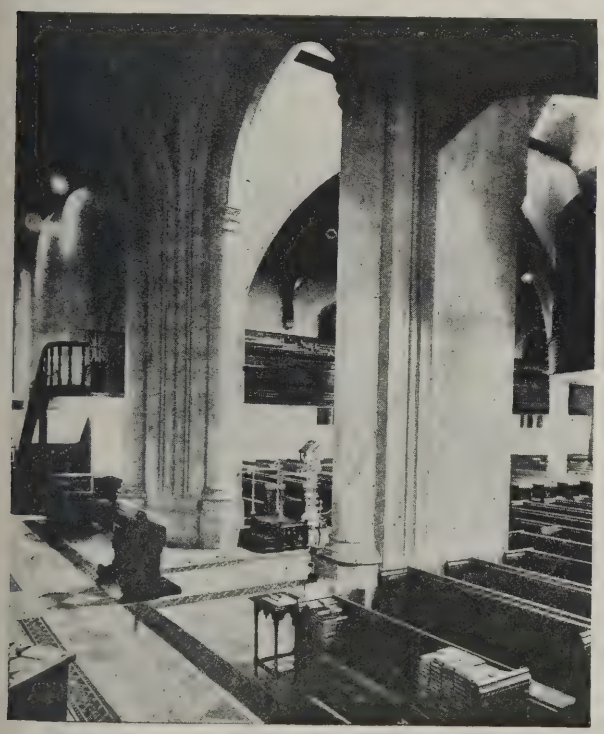

Fig. 4.—Church of St. Mary the Virgin, Nave Lighting.

flood-lighting of the "Smythe" monument in the south transept being pleasingly effective. Two flood-light projectors, equipped with 150-W lamps, are installed on the top of the rood to illuminate it and the richly-decorated roof.

The gallery illumination called for special consideration, as it was there necessary to provide a separate system; this was also the case for the seating accommodation underneath the gallery, running parallel with the nave. In the upper chamber are installed specially designed spun-aluminium "Gecoray" reflector units fitted with glazed "Morocco"-pattern diffusing glass doors, each equipped with 150-W lamps. Below, where the roof slopes inwards towards the nave, similar units of copper of octagonal design are installed. These are fitted with 150-W white sprayed lamps and provide particularly even and well-diffused illumination.

Messrs. Hayward & Co., local contractors, were responsible for the installation, which was carried out under the personal supervision of Mr. G. Dowling, and they are to be congratulated on the particularly praiseworthy manner in which the work was executed. Thanks are also due to the vicar for the facilities granted for securing the photographs which we reproduce.

A very interesting example of up-to-date electric lighting is the installation recently completed to provide efficient and uniform illumination for two hard tennis courts for the employés of Messrs. Cadbury Bros., Ltd., at Bourneville. Fifteen B.T.-H. "Dispersa" lanterns, each fitted with a 1,000-W Mazda gasfilled frosted lamp, have been installed. They are arranged in three lines of five lanterns each, one line on each of the outer sides of the courts, and one between the two courts, no units being suspended over the courts themselves or behind the service lines. The centre row of lighting units is mounted 30 ft. high, and the two side rows 24 ft. high. The side units are tilted at an angle of 10 deg. towards the centre of the courts. The installation work was

Fig. 5.—Illumination of the Chancel and Reredos.

carried out by the electrical staff of Cadbury Bros., to a specification prepared by the British Thomson-Houston Co., Ltd.

According to information obtained from the players, no glare is encountered during play, even when playing very high strokes, and the installation is in every way satisfactory.

Ideal Electricity Supply.

The importance of high Load Factor, and a method of attaining it by heat storage during light-load hours.

By GEO. WILKINSON, Harrogate.

THE forward movement for the development of national electricity supply has received official recognition and stimulus by the passing of the Electricity (Supply) Act, 1926, which is now part of the law of the land. The Act paves the way for shutting down uneconomical generating stations and the substitution of modern works equipped with the most economical generating plant obtainable. These new stations, wisely placed and provided with well-designed e.h.p. transmission lines and distribution networks, should give advantages in the shape of lower costs of production.

By far the more effective method of producing economy, however, lies in increasing the load factor of every generating station by eliminating the long periods of each twenty-four hours when, at present, they are—with few exceptions—working on extremely light loads at a dead loss to the undertaking. These daily losing periods have to be set against the remaining periods of heavier load, with the result that the average tariffs to-day are abnormally high.

Turn these periods of light load into periods of heavy load and the whole outlook of electricity supply will be radically improved.

Such a change, if it can be accomplished, will not impose any additional burden on the business in salaries, wages, or capital charges in the generating station. The only increased expense will be the extra amount of fuel consumed—plus a negligible item for slightly more oil and stores. Therefore these extra units can be sold at fuel cost plus a reasonable profit thereon, say of thirty three and one third per cent.

We can get a clue as to the method of achievement by considering the gas undertakings of the country. Where would their profits be, and what would the supply tariff be, if they worked on the same method as obtains to-day in the electrical world? They would at once have prohibitive outlay in the provision of additional retorts, to be put in and out of commission as the demand for gas rose or fell. Such a method at once provokes ridicule, and everybody recognises that the whole commercial success of the gas service lies in the making of gas at an average rate and storing the amount not required at any particular time in gas-holders until the time arrives when there is a heavier demand. Thus the rate of manufacture is an average one while the demand is a fluctuating one. Unlike electricity supply, the economy of production is maintained at a high value by average production in retorts working at high efficiency and the levelling-up between supply and demand by a reasonable amount of gas storage.

When electrical engineers are wise enough to imitate the gas engineers in this particular, the dawn of really cheap electricity will come. The object of the writer is to indicate some methods whereby this desirable end may be achieved, at least in a substantial degree.

It is true that there are no methods known to science to-day which enable large accumulations of electricity to be made and drawn upon excepting under prohibitive terms of capital outlay and storage loss. In the case of gas, a few holders furnish the means for effective and economical storage which is denied to electricity works.

It is, however, open to the electrical interests to secure a close parallel advantage by storing the electrical energy during periods of small demand in the shape of heat, the heat so stored being arranged so that it can be usefully employed the next day instead of taking the equivalent amount of energy from the generating station during the periods of heavy demand. Thus a double advantage is to be realised; first, the efficient employment of machinery during long periods, which are now hours of small and uneconomical demand, by converting them into periods of heavy and efficient demand by means of heat storage. Secondly, the reduction of the amount of generating plant required for the heavy-load period, due to the fact that the heat storage already effected serves during the heavy-load hours to reduce the amount of generating plant required to make up a given aggregate output.

No scheme for effecting this improved condition of working appears to have been entertained hitherto, and the economy realisable thereby has yet to be recognised. It is true that gas storage is easily effected within the gas works' domain, whereas heat storage in connection with electricity supply must necessarily be effected in smaller amounts on the premises of the consumers; nevertheless, the economies in each case are comparable, although the balance of advantage must remain with gas, because in the other case there is a change in the form of storage which in itself means loss.

Some attempts have been made to average up the electrical loads by offering current during the light-load hours at reduced cost, and allocating the proper times for the respective supplies by means of time switches. This method cannot, however, in any event meet the case. For a full realisation of the possible benefits, the supply taken during the, at present, periods of light load, must be conserved until the periods of heavy load and vended during these periods, thus reducing the maximum load imposed upon the generating station. In this way there will be two valuable gains, one, due to a good load factor at all hours and the other, due to the reduced top-load. The latter means less capital outlay for generating plant, both in the boiler house and the turbine room, together with a less costly building for its accommodation.

If trouble be taken to study the requirements of the all-electric house and, to a less extent, of the all-electric office, it will be found that from 70 to 75 per cent. or thereabouts of the electricity taken is required for the furnishing of low-grade heat, *i.e.*, for hot water and room heating. Such low-grade heat can be efficiently and cheaply stored during the hours of low loads and used next day during the hours of high demand upon the electricity works. As already shown, this out-of-hours supply can be given on perfectly sound commercial lines at coal cost plus a reasonable profit, and on these terms it is within the capacity of the householder to buy it for heat storage purposes.

The author suggests that the question of efficient super-stations should not be allowed to monopolise the attention of technical and commercial minds, but that consideration can with greater benefit be given to the aspect of the problem that he has ventured to set out.

It is essential, inasmuch as the sale of electricity at cheap rates is involved, that the cost of the extra equipment on consumers' premises and especially the extra outlay imposed on the generating authority should be kept low.

In a future article the author may have an opportunity of describing some details and equipment which have been designed to meet the new order of business herein outlined.

One factor in the proposition has already been described in the Press under the designation of the "dispensable circuit," but the eventual development will undoubtedly be the provision of what, for want of a better name, the author has designated a "change" circuit. This will be an alternative network of limited extent supplying a variable amount of electrical energy at a low rate per unit for heat storage purposes.

The amount of current supplied through this network will be the difference between the maximum load on the generating station and the demand for the time being on the ordinary supply network.

During the period of top load the supply to the "change" circuit would cease entirely. Moreover, the "change" circuit will suffer no disadvantages due to fluctuations in either pressure or current.

The more the possibilities of such a network are considered the better for both the industry and the community.

The Foreign Agency.

Some Points which are often Overlooked in Overseas Arrangements.

By A. J. SMITH.

THE perusal of any considerable number of foreign agency agreements of different engineering firms points very clearly to the advantages which would be derived from some method of pooling experience through the medium of a central organisation, as well as the need of a generally-accepted type of agency agreement capable of meeting the reasonable requirements both of a normal manufacturer and an average overseas agent. Although the greater portion of the overseas trade of this country in engineering material is probably transacted under some form of sole agency agreement or other, and there must be thousands of such agreements in existence, many of them show a distinct lack of provision for some of the most ordinary happenings which arise under such arrangements, and which could in most cases have been readily settled in the preliminary negotiations. Nothing is lost in facing the fact that the interests of the parties are in certain contingencies opposed, and when such cases are viewed in the initial stages as abstract propositions, it is far easier to agree upon the procedure than it is when an actual incident has occurred, and a decision results in one party being a loser.

The Description.

The first point which calls for consideration is the actual word employed to describe the second party to the agreement. Though the use of the word "agent" in this connection has attained the sanction of commercial usage, it is really a misnomer, as is readily apparent when the wide legal powers attributed to an agent are considered. The party of the second part, or selling agent, in the more restricted commercial acceptation of the term is either a distributor who possesses the sole buying or importing rights of a particular make of article for a defined territory, or alternatively he may be a sole representative in that territory for the purpose of introducing the goods to the notice of buyers. In the motor-car industry, such words as "distributor" and "sole concessionaire" are beginning to be used for designating the duties and powers of such an importer, although they are American terms which have not yet attained general acceptance in commercial phraseology. While in most agreements, and in these notes, the word "agent" is still used, it is becoming increasingly common for an extra clause to be inserted in the document which expressly disclaims the full legal meaning of the word, and defines the exact duties and powers which attach to the term.

Exclusive Arrangements.

Another question which frequently arises relates to the exclusive nature of the arrangement on both sides. The agent undertakes to deal only in goods of a particular class made by one manufacturer, and the latter transacts all business for a certain territory through the agent there. In the complete observance of this reasonable stipulation, however, the manufacturer works under certain difficulties which are not always apparent to the agent who may not be fully acquainted with the ramifications of export trade apart from that concerning his own territory, and these difficulties render certain exceptions necessary.

It is not a difficult matter to refer to the agent all inquiries and orders received *direct* from an agency territory for attention, but a very large volume of export business comes to the average British manufacturer through merchant-buying houses in England, the makers often being to a great extent unaware of the exact destination for which the goods are required. The policy of first inquiring the destination in all such cases, and refusing to quote if the goods are intended for an allotted market, which is the plan often seriously advocated by agents when the position is explained to them, is open to certain objections. In the first place, the merchant house may already be a regular buyer, fully conversant with current prices, and therefore not needing to put through the usual inquiry before ordering. In the next place, a merchant house does not always care to name the destination in the inquiry stage, and further the manufacturer who seeks to take up the attitude of picking and choosing which inquiries he will quote for and which he will refuse, is not likely to have such opportunities presented to him more than once or twice. As a consequence of refusing to quote a merchant house for comparatively unimportant markets such, for instance, as Turkey and Bolivia, the maker may, as a consequence, miss altogether the much more important business which the same merchant may have to place for other destinations. The agency agreement should therefore always contain a provision that the manufacturer may continue to do business through the merchant houses of this country, even if it is necessary to pay a small commission upon such trade.

Names of Users.

It is not an unreasonable request that the manufacturer should be kept informed of the names of the ultimate customers to whom his goods are sold through an agency, in such trades where the procedure is possible, though, generally speaking, there is a disposition on the part of many agents to keep the manufacturer in the dark as much as possible. As a consequence, there are instances of makers, after doing a regular trade for a number of years with a certain territory, who, following a rupture with the agent, are left entirely ignorant of who their customers have been or the terms upon which the business has been done. It is therefore advisable for the agreement to provide for the name of the ultimate purchaser to be disclosed, and for regular efforts to be made to ensure the arrangement being adhered to.

Government Orders.

Another frequent point of difference between the principal and the agent arises in connection with certain business of the class similar to that regularly placed in London by overseas railway companies, by

the Crown Agents, by large foreign shipyards financed by British capital, and occasionally by large armament firms abroad. Much of this class of business originates, and is settled entirely in this country, without any special reference to the territory to which it is to be sent. If there is any definite work done by the agent in originating such business, there are not many manufacturers who would object to including it in the ambit of the agreement, but where it originates and is settled entirely between the maker and the buyer in this country, there is a not unnatural disposition in manufacturing quarters to regard it as being outside the scope of the arrangement. It is a point in any case which should be discussed and settled when the terms of the arrangement are being negotiated, and, in addition, the agent would be acting in his own interests to keep the makers advised upon the details of any propaganda work he may undertake with establishments of the type described, and where the business may ultimately have to be referred to authorities in London for settlement, rather than waiting for the *fait accompli* of an order before making a claim.

In connection with agency agreements generally, it is an unfortunate fact that there is not enough co-operation between manufacturers in a particular trade, either in regard to standardising conditions or pooling the results of experience. In a somewhat similar field, the electrical industry has led the way by providing an agreed set of conditions of sale for various classes of export business, and what has been done in the electrical industry in this respect could be paralleled in other exporting trades by the provision of a standard form of agency agreement which, if it could also be passed by an organised body of importers in some overseas market, would be the means of striking a happy medium between conflicting interests.

The Lay-out of the Contractor's Shop.

By ERIC N. SIMONS.

THE interior of the shop is one of the most important factors in electrical retailing. The deep gloom common to many electrical dealers' shops must be avoided. Sometimes it is caused by the heavy character of the stock, but as a general rule it can safely be ascribed to inefficient window-dressing, poor lighting, and faulty arrangement of fixtures. Inefficient window-dressing means that the articles in the window are so tightly packed, and the window itself so crowded with opaque objects, that very little light gets into the shop from outside, even on the sunniest day.

Bright and cheerful shop interiors put people into a more generous frame of mind. They feel more disposed to buy optimistically. Artificial light employed in day-time is not only expensive but also depressing. It makes the assistants look pallid and the shop less attractive.

Bad lighting increases the gloom. In one electrical shop known to the writer, all the upper windows, which were put in originally to throw light towards the back of the shop, were covered with black paper, so that something could be done to them outside. Naturally, the gloom was fierce. It is often the case that slight structural alterations would vastly improve the lighting of a shop. For example, an extra skylight or window, costing comparatively little, would soon repay its cost in increased sales. Some retailers imagine that because they deal in electrical appliances, they ought to have electrically lighted shops both day and night. No fallacy could be greater. Electric light is for night, not for the day, and the wan appearance it has in the latter instance tends to damage rather than help its appeal.

Bad stock arrangement can easily be altered. Piles of bulky objects or stacks of big boxes and cases, placed too near the source of light, cast deep shadows, exclu sunlight, and make gloomy corners where none necessary.

Overcrowded floor space is another great fault many electrical retail shops. Sometimes one ha literally to tiptoe one's way to the counter, steppin over this and that and the other package, evading pack ing cases that ought not to be there at all, and ofte going in fear of catching a big pile of boxes with one elbow and bringing it down with a crash. Again, man retailers leave only a few inches of clear space on thei counters, so that the customer burdened with glove stick, handbag, other parcels, or whatever it may be, i unable to rest them anywhere while negotiating o examining goods. These things make shopping uncom fortable, and the electrical retailer's business is to mak shopping easy. Generally, this condition is due t under-staffing by the retailer, so that his goods are no stocked, unpacked, distributed, and so forth, as quickl as they ought to be, with the result that they are lef encumbering the selling spaces.

The retailer should have some regard for the comfor of his customers. It is astonishing how few electrica retailers have chairs on which their customers may sit if they have to wait any time. Again, many fail t afford proper facilities to their customers for the in spection of the appliances they wish to buy. Ofte owing to the crowded counter already mentioned ther is no room to demonstrate an appliance.

Shelving by its design and arrangement affords great deal of attraction to the shop. If oak shelving stained dark, is too costly, stained deal may be used t advantage.

The shop floor is very important. The ordinar wooden planking covered with linoleum is not ver satisfactory. It wears quickly, looks unsightly after little wear, takes a great deal of keeping clean, and i fairly costly. Many electrical retailers are beginnin to favour a polished hardwood floor, sometimes covere by rugs here and there. This wears well. Best of all perhaps, is the rubber carpeting now being used i many shops. This quietens the shop, and so enables th words of salesmen to be better heard, and the remark of the customer to be less costly in effort.

Efficient Drawing-Office Lighting.

The correct illumination of a drawing office presents a number of special problems which necessitate careful scientific treatment. An installation recently designed by the General Electric Co., Ltd., and carried out by Messrs. Tyler & Freeman, exemplifies the application of such treatment. The approximate ceiling height of the offices in question from floor level is 9 ft., and on account of this the working plane is situate only about 5 ft. below the lamp filament with the fittings mounted direct on to the ceiling. The spacing was so arranged as to provide each drawing bench with right-hand, left-hand, and frontal lighting. The fittings are of the "Unalux" enclosed pendant type, made by the G.E.C., in which the 16-in. diameter glass bowl is supported by bronzed metal work, each fitting containing a single "Osram" 200-W gasfilled lamp. The fittings are equipped with standard ventilating galleries. The average intensity approximates to 46 ft.-candles; the scheme was designed to provide an ultimate average of 30 ft.-candles on the working plane. Tests carried out on a number of the drawing boards resulted in its being impossible to detect, or even to create, anything in the nature of objectionable shadows. It was proved that the finest lines could be drawn with perfect ease and precision from either the right- or the left-hand side of a set square. Altogether there are 191 lighting points, each of 200 W. 38,000 watts in a drawing office is in itself something new in office illumination. There are over 100 draughtsmen employed in these offices, which are situated on two floors.

The Institution of Electrical Engineers.

Summer Meeting at the North-Eastern Centre.

THE early contingents of the 290 members and their ladies from the various I.E.E. Centres who are participating in the summer meeting of the Institution, under the presidency of Dr. W. H. Eccles, F.R.S., forgathered on Monday evening last in the banqueting hall of the Central Station Hotel at Newcastle-upon-Tyne, to initiate the week's proceedings by meeting the Committees of the North-Eastern Centre and Tees-side Sub-Centre, whose chairmen are, respectively, Mr. J. Rosen and Mr. W. R. Cooper. The establishment of the Centre dates from 1899, and in 1912 its activities were enlarged by the inauguration of a Students' Section; the present membership is 510. The Tees-side Sub-Centre was formed in 1912, and its membership is 96.

Standing on the line of the Roman wall which was built across country from coast to coast as a defensive obstacle to the northerners, ending at Wallsend-upon-Tyne, Newcastle's distinctive name originated from the "new" castle of Norman times, as distinguished from the old castellum of Pons Aelii, the family name of the Emperor Hadrian, who visited Britain in A.D. 120, which was shared by the Roman bridge that crossed the river at that spot and the camp on the hill above. The district is to-day renowned chiefly for the winning and export of coal, naval and mercantile shipbuilding, the production of iron and steel, and ordnance, while the coast line can boast of some of the finest harbours and docks in this country. The locality was early associated with the introduction of steam traction and the development of the steam locomotive by William Hedley, Timothy Hackworth and George Stephenson, and with the invention of the Parsons steam turbine, and Sir Joseph Swan publicly exhibited electric lighting on a large scale by means of incandescent lamps for the first time in Newcastle. Although the manufacture of electrical products cannot be described as a staple industry, the production of electrical machinery and appliances nevertheless occupies a prominent position in local industry. Apart from its industrial aspect and the historical remains extant, the Centre is within easy reach of some of the most picturesque parts of the kingdom; the Northumberland coast and moors have a charm of their own, and the Durham and Yorkshire dales are perhaps too little known.

On the Tuesday morning alternative visits were paid to the Heaton works of Messrs. C. A. Parsons & Co., Ltd., and to those of Messrs. A. Reyrolle & Co., Ltd. Although the late Alphonse Reyrolle established a small workshop in London in 1886, it was not till 1901 that the first works were built on the present site at Hebburn-on-Tyne. Beginning with two or three small single-storey buildings, they grew apace until in 1922 they occupied 150,000 sq. ft. of floor space on a site of 5½ acres which was nearing its economic limit. Accordingly, it was not only decided to equip a fresh factory, but to take the opportunity thus afforded of thoroughly modernising the existing one. An already acquired site of 4½ acres not far from the Hebburn works, which had been used as a recreation ground for the workpeople and staff, was laid out to accommodate all the machine tools, except the minor services incidental to the assembly of the apparatus, and this site now forms part of the ground of the New Town works; when it was built upon, a new and larger recreation ground was laid out to take its place. Fig. 1 is an aerial view of both factories.*

Fig. 1.—Aerial View of Messrs. Reyrolle's Old Town and New Town Works and Sports Ground.

The new buildings are light and airy, with provision for the safety and welfare of the workmen; they comprise nine bays, each from 200 to 250 ft. long and from 30 to 40 ft. wide, the total area being 72,000 sq. ft., with ample space available for extension to 200,000 sq. ft. when required. The machine tools installed are of modern type, and the arrangement of the bays and equipment is designed to reduce handling to a minimum, cranes having been provided for the transport of material and finished parts; a battery locomotive with a haulage capacity of 75 tons deals with inter-works traffic, both the old and the new works being alongside the London and North-Eastern Railway. An aggregate of 100 tons of metal (steel, cast-iron, copper, brass, &c.) is every week wrought into switchgear, the combined factories being capable of an output of 210,000 kW of gear per annum. At present the works provide employment for some 2,000 workpeople, engaged upon the production of metal-clad switchgear for pressures ranging up to 132,000 volts and breaking capacities up to 2,000,000 kVA. Fig. 2 shows the general arrangement of the bus-bars and sectionalising switch of the 12,000-V, 1,500-A, 3-phase, solenoid-operated, draw-out, twpe A.2 gear supplied for the South African railways.

The Company has applied strong principles to one branch of the engineering industry: the basis of its switchgear design simply consists of the complete enclosure of all fittings and conductors which would be dangerous to handle, in such a way that they are rendered inaccessible when "alive," the enclosure being of earthed metal: but merely working to a general principle would avail but little if it were not backed by thoroughness in all detail of both design and workmanship. Its work having at first been regarded as eccentric, the position to-day is that not only are metal-clad principles being extensively adopted for the largest power- and sub-station equipments in this country and

* See also Elec. Rev., January 12th, 1923, p. 59.

the British Dominions, but also that some very large American manufacturers have taken up the production of corresponding apparatus, amongst whom the Allis-Chalmers Company manufactures under licence to Reyrolle designs.

The Heaton works of Messrs. C. A. Parsons & Co., Ltd., were founded in 1889 for developing the steam turbine for land use; the first ship's turbines were constructed in those works also, but in 1898 an additional site was chosen for marine work, which was taken over by the Parsons Marine Steam Turbine Co., Ltd. In 1889 the Heaton works occupied an area of 2 acres, the original shop being no more than 170 ft. long by 50 ft. wide, and the entire staff numbered 48 all told; to-day the acreage is 18 and over 1,200 men are employed. The record of the Company is indeed one of continuous pioneering work*; the output of turbines for use on land alone (manufactured at Newcastle and throughout the world under licence) cannot aggregate less than 50,000,000 h.p., noteworthy sets being those of 20,000 h.p. at Treforest, of 55,000 h.p. at Barking, and of 70,000 h.p. at Chicago.

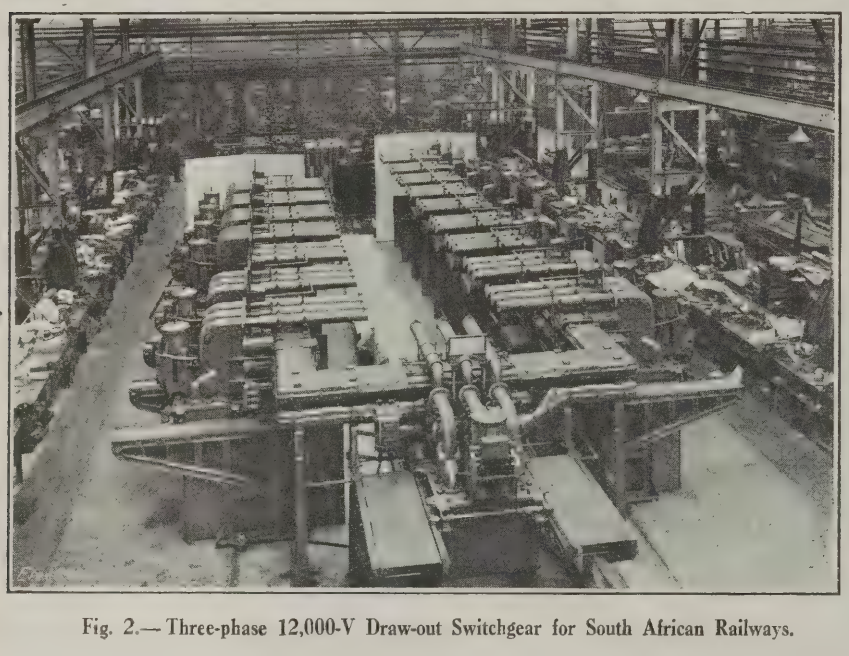

Fig. 2.—Three-phase 12,000-V Draw-out Switchgear for South African Railways.

Other products include surface condensing plant, high-speed centrifugal fans, compressors, blowers, exhausters, &c.; d.c. dynamos, low- and high-speed a.c. generators, and air coolers for the last named: the fact that 3,000-r.p.m. machines of over 28,000 e.h.p. are being constructed at present is indicative of recent development. The insulating materials are prepared from the raw materials entirely in a department specially ventilated and maintained free from dust, the stranded stator conductors being encased in insulating troughs by special machines evolved in the Heaton works. Besides the principal shops, which consist of three 385-ft. and one 416-ft. bays, two new shops were built in 1924 for the erection of electrical transformers which the Company has recommenced to manufacture. Searchlight reflectors have been one of the Company's standard products since its foundation, and in order to meet the British and Allied Government's requirements during the late war the shops devoted to their manufacture were enlarged to three times their previous capacity, which enabled the output to be increased tenfold, up to 100 mirrors per week, ranging from 10 in. to 5 ft. in diameter.

Two balancing houses enable alternator rotors to be run at 33 per cent. over-speed and turbine shafts and disks 50 per cent. above normal. The various shops are interconnected by full-gauge railways, electrified on the overhead d.c. trolley-wire system, power being mainly purchased and delivered to two works sub-stations which transform the 5,750-V a.c. supply to 440 volts for shop services: d.c. is also available for driving motors and lighting from motor-generator sets, whilst a reserve d.c. supply is obtainable from three condensing turbo-generators in the test house, which can also be run as back-pressure machines to feed steam to the works for heating purposes. Automatic telephones are employed throughout the establishment, and a works school was commenced in 1919 as a development of the apprentice scheme, the custom of the Welfare Department being to pass every "trade" apprentice through the school and to encourage further study at evening classes and at college by financial aid.

At mid-day the whole party assembled outside the Armstrong College, where an official photograph was taken, and after luncheon at the Grand Assembly Rooms, Barras Bridge, those who had visited Messrs. Parsons's works during the morning toured Messrs. Reyrolle's, and *vice versa*, tea being served at both works by the respective Companies. In the evening there was a civic reception by the Lord Mayor (Councillor A. W. Lambert, M.C.) and the Lady Mayoress, dancing being indulged in to a late hour.

(To be continued.)

* ELEC. REV., January 26th, 1923, p. 130.

Metal-Clad Draw-out Switchgear.

Another Point of View, with Reasons.

By J. R. WILKINSON, B.Sc.Tech., A.M.I.E.E., A.M.C.T.

IN his interesting, though perhaps somewhat biased, article appearing in the May 27th issue of the ELECTRICAL REVIEW, Mr. Thomas Carter comes to a number of conclusions which to my mind do not by any means represent the full facts of the situation. From his opening paragraph it would appear that he has only recently come into close touch with the various types of metal-clad switchgear. He states himself that this is a question where experience counts enormously, and I venture to suggest that the experience of a large number of operating engineers does not bear out his contentions. As personal opinions are of very little weight without a backing of solid reason, I propose to deal with the points raised in Mr. Carter's article, in the order in which they occur.

Horizontal-type gear is dependent on its rails for guidance and alignment, and it is more difficult to obtain perfect contact where the whole weight of the moving part is on the guide than where it is allowed to centre itself freely about a vertical axis. The lifting gear on the vertical type is extremely simple, is an integral part of each unit, and serves the dual purpose of isolating the breaker and lowering the oil tank. With horizontal gear recourse has still to be

had to the despised vertical principle for removing the tank or the complete breaker, but in this case it takes the form of a cumbersome separate lift. Surely it is preferable to have one mechanism rather than two, especially when the latter only permits one switch to be inspected at once. With regard to the point that two motions are required with vertical gear, this is only the case when the oil tank or switch is completely withdrawn. It is not necessary for routine inspection.

I agree that, so far as practicable, switchgear should be made for man and not *vice versa*. Its primary function is, however, the control of electrical energy, and I imagine that most engineers will agree that the vertical type best combines these functions. The point about orifice inspection is immaterial, as with properly constructed gear there is hardly ever any necessity to do this. When necessary, it is almost as easy with one type as the other, and it is far easier to leave stray nuts, &c., in the horizontal spouts.

Strong exception must be taken to Mr. Carter's statement that plug changing is the simplest and most rapid method of busbar selection. On the contrary, it is one of the crudest, and is quickly becoming obsolete. Change-over cannot be made without shutting down the circuit and isolating the breaker, and it is difficult, complicated, and expensive to provide an interlock to prevent two plugs only being changed over. Oil-immersed selector switches interlocked with the circuit breaker are a distinct advance, but do not allow change-over under load without the use of a separate bus-coupler switch. With double circuit breakers change-over is effected with the utmost ease and rapidity, and complete control is centralised in the control room. A whole station can be changed-over from one set of bars to the other in far less time than is taken by transferring a single unit using the plug method. Moreover, a separate coupler is not essential, and the second breaker acts as a spare should the contacts of the first be damaged by a "short." More than one important operating engineer was initially prejudiced against metal-clad gear, due chiefly to the lack of facilities for busbar selection, but has been converted by the double-breaker principle. On the rare occasions when it is necessary to change the complete circuit breaker the advantage again lies with vertical gear, as the breaker has to be lowered only and not racked out and then lowered.

The lifting mechanism on the vertical type is sufficiently robust to support the circuit breaker in the operating position. The additional catches or brackets are merely additional safeguards and for supporting the breaker top plate in the "isolated" position when it is desired to lower the tank only. With both types the operating gear is equally accessible, but the arrangement of the vertical type is such that this can be mounted on the fixed portion of the unit, thus eliminating auxiliary plugs and sockets and giving complete interchangeability of the fully-protected breakers.

Mr. Carter complains of the height of the cable box on vertical gear, and almost in the same breath refers to the use of basements for switchgear. I would remind him that such basements seldom have a cable floor beneath them, and all supply engineers now realise the risk of bending cable at too small a radius. This height, whilst not detracting from the accessibility of the box, enables a bend of large radius to be used.

Dealing with the question of floor space occupied, I agree that with both types it is essential to have a passage way in front of the units. On the horizontal gear, however, the brackets which support the breaker in the isolated position project permanently into the passage, which has to be widened accordingly. On the vertical gear the circuit breaker is merely drawn out temporarily and then removed. Moreover, for contact inspection on vertical gear the breaker is not withdrawn, but only lowered. This will probably occur a hundred times for one removal of the complete breaker.

One of the great advantages of vertical-type gear is the shortness of the conductors and the minimising of the "loop" formation, thus giving great robustness under short-circuit conditions. The circuit breaker is firmly clamped between the lifting mechanism and stops on the fixed portion to prevent movement under shorts. All forces on the fixed portion are direct as against the cantilever action on the spouts and bushings of the horizontal gear. In this connection I cannot do better than refer to a paper read by Messrs. Sporn and St. Clair before the American Institute of Electrical Engineers early this year. Fig. 17 of this paper shows the destructive effect of these forces on the busbars, rather contradicting Mr. Carter's conclusions.

The question of the methods of bus selection on duplicate busbar systems has already been dealt with. It should, however, be pointed out that with double breakers the interlocks are far simpler and more robust than with a separate oil-immersed isolator. I am afraid Mr. Carter's remarks about two breakers in a common tank indicate lack of experience on this gear. It has been conclusively proved by short-circuit tests of high capacity that if the two busbars of such a unit are connected to two unsynchronised supplies, heavy shorts may be broken on one without in any way tending to spread to the other. These tests were carried out at 33 kV, under the worst possible conditions. It is also interesting to note that many systems have been operating successfully for a considerable time, in which a separate source of supply is maintained in each set of busbars, and the double breaker selects the supply to which the circuit shall be connected.

Coming to the question of the comparative weather-proofness of the two types of gear, I agree that the problem is not so much the danger from dripping water as the humidity of the atmosphere and sweating. It appears to me that it is equally difficult to solve this with either of the types in question, and that only a hermetically sealed chamber will absolutely prevent the ingress of moisture.

The experiences of operating engineers carry great weight in matters of this kind, and accordingly it is interesting to note the following comments of an operating engineer of a large station where vertical type gear has been installed for some years. In his view the weight to be handled and supported has not presented any difficulty in operation, and it is simply a question of suitable mechanical design. Isolation and removal of the oil tank is rapid and convenient in operation, and there is a saving in time due to special tank-lowering tackle being dispensed with. The interchanging of the oil circuit breaker is readily carried out. The space required is a minimum, and far fewer horizontal units could be accommodated. The question of being able to change-over from one set of busbars without interrupting the supply is of the utmost importance to the operating engineer. Although the switch house in question is not a particularly dry place, no trouble has been experienced due to moisture; the insulators have been in continual service for two years without cleaning, and were remarkably clean at the end of that period.

In conclusion, I cannot agree that the fact that the pioneers of metal-clad switchgear still hold to the horizontal principle indicates any superiority of principle. It is well-known that the manufacture of a range of metal-clad switchgear entails an enormous outlay on jigs and tools, and there is a natural reluctance to make so drastic a change even where a better principle is involved. One large manufacturer of metal-clad gear actually commenced with the horizontal type and then abandoned it for the vertical gear.

Metal-clad gear is now being developed on the Continent and in the United States of America, and it is significant to note that in these places the tendency is towards the vertical principle.

I trust that I have made it clear from the above that the argument is by no means as one-sided as Mr. Carter would have us believe, and that taking all things into consideration the balance undoubtedly lies with the gear designed on the vertical principle. It is extremely probable that the future will see the wholesale development of the vertical type of switchgear.

D

Business and Industrial Notes.

The Week's Electrical Trade News from all Sources. Commercial and Industrial Developments, Business Changes, Market Prices for Materials, Trade Openings, New Publicity Literature, Liquidations and Failures.

The Contractors' Convention.

The second annual convention of the E.C.A. Allied Associations is to be held at Scarborough from Wednesday next until the following Friday. A very successful gathering is anticipated; the registrations up to the end of last week were in excess of those for last year's conference at Brighton.

Demand for Higher Australian Tariffs.

A Sydney correspondent of *The Times Trade and Engineering Supplement* states that at a recent meeting of the Chamber of Manufactures, a resolution in the following terms was adopted:—"The Electrical Manufacturers' Section views with alarm the protracted delay in dealing with requests for effective tariff protection, and respectfully urges the Council of the Chamber to use every effort in its power to expedite the tabling in Parliament of the Tariff Board's reports already submitted to the Minister, and the early reference to the Tariff Board of all outstanding applications." The Chamber reports that only nine matters which it has asked to be referred to the Tariff Board have not yet been so referred; these include air-break ironclad switches, switch-fuses, and circuit breakers.

Engineering Wages in Australia.

The Australian engineering trade unions recently made an application to the Commonwealth Arbitration Court for the application of the 48-hour week wages to the present 44-hour week. The employers made a counter-application for an entirely new award which would recognise a bonus or payment-by-results system. Mr. G. B. Clerk, managing director of the English Electric Co. of Australia, Ltd., in his evidence, said that Australian electrical manufacturers could not compete with overseas manufacturers who had lower wage rates and a wider market. His company had made over 200 traction motors and had lost at least £47 on each of them. They had, therefore, abandoned the manufacture of the machines until conditions altered. He held that the most satisfactory method of payment in the engineering industry was to guarantee a regular hourly wage and pay a bonus depending upon output.

The Importance of Argentina.

To illustrate the predominant position which Argentina holds in South America, the *Journal* of the British Chamber of Commerce in the Argentine Republic quotes a number of notable facts. It is shown, for instance, that in 1924 over half of the foreign trade of the Continent was attributed to Argentina, and in 1923 the amount of foreign trade per head of population amounted to $159 gold in the case of Argentina and only $33 in respect of the whole of the remainder of South America. The Republic had 60 per cent. of the railway merchandise traffic; 42.7 per cent. of the railways—37.7 km. per inhabitant against 29.3 km for the remainder; 45 per cent. of the telephones; and 58 per cent. of the motor cars.

The Anglo-German Industrial Conference.

Last week-end representatives of British and German industries met at Leverkusen, near Cologne, to continue the discussions opened in this country in October last. Dr. Duisberg was the host, and the British steel and engineering industries were represented by Sir William Larke and Sir Archibald Ross. Among the matters dealt with were the European steel cartel, the eight-hour day, and the re-establishment of European industry.

Chinese Notes.

The net profit for 1926 of the Pootung Electric Supply Co., Ltd., was $41,047. A total dividend of 11 per cent. has been paid. The company has a subscribed capital of $300,000.

It is proposed to broadcast music, news, &c., in Peking and Tientsin, and offices have been established to take charge of the system. Any person who desires to install a receiving set must register at one of these offices, and pay an annual fee of from $6 to $12. Importers and sellers of radio equipment also have to be registered.

The Chapei Electricity and Waterworks Co., Ltd., Shanghai, earned a net profit (including $52 brought forward) of $249,115 for 1926. A dividend of 6 per cent. was declared on the deferred and founders' shares. The capital is to be increased from $2,000,000 to $4,000,000.

British Engineers' Association.

A luncheon organised by this Association took place at the Hotel Cecil on Thursday (yesterday), 16th inst. Guests were invited to meet Sir Arthur Balfour, K.B.E., and the Rt. Hon. R. McKenna, P.C.

Unemployment.

There was a small increase (7,320) in the number of unemployed during the week ended May 30th. The total at that date was 985,500, as compared with 978,180 on May 23rd and with 1,614,210 on May 31st, 1926. The last figure was abnormal on account of the coal stoppage. The latest total includes 208,900 women and girls.

Electric Power in Industry.

Railways are the principal subject of Preliminary Report No. 14 upon the 1924 Census of Production, issued as a supplement to the *Board of Trade Journal* dated June 9th. The total value of goods made and work done during 1924 was £70,727,000. This total included:—Telegraphic and telephonic lines, works and apparatus, £1,023,000; electric lines and works, £589,000; and electricity generated for other than railway companies' manufacturing purposes, £1,046,000. The equivalent of the last figure in 1912 was only £371,000. The total capacity of electric generators at railway companies' works was 164,712 kW, as against 83,260 kW in 1907. The aggregate power of electric motors in use was 137,837 h.p., and power was purchased for 52,209 h.p. of these.

The same report also deals with other trades. It is shown that in the blacksmithing trade in 1924 there was only 13 kW of generating plant (against 60 kW in 1907). The motors in use aggregated 4,379 h.p., and power was purchased for 4,370 h.p. of these. The small arms trade did not report any generating plant (there was 981 kW in 1907), but it had in use 2,856 h.p. of electric motors. Electric generating plant rated at 1,917 kW (against 716 kW in 1907) was returned by the bacon-curing and sausage trades. There were also motors with a total capacity of 9,778 h.p. installed, and power for 7,983 h.p. was purchased.

Great Britain's Radio Exports.

Details of the exports of radio apparatus from this country during April are given in the *Wireless Trader* for June 11th. The total value (excluding re-exports) is given as £109,092, which includes valves valued at £21,746. Our principal customer was Australia, whose share is given as £27,230 (valves £8,397); this figure represents a substantial increase. The share of New Zealand—£12,444 (valves £2,087)—was more than double that of the preceding month. The chief foreign customer was Holland, which took goods to the value of £6,503 (valves £89). Although Japan remained in the second place with a total of £4,452 (valves £105) its share again diminished considerably.

The World Economic Conference.

The recently-published final report of this Conference (under the ægis of the League of Nations) surveys the whole field of finance, industry and trade and makes many recommendations. Perhaps the most important section is that relating to Customs tariffs and kindred matters. The reasons for high tariffs are examined and shown to be economically unsound; internal taxes upon imported goods are condemned; and export taxes upon raw materials are also viewed with disfavour by the Conference. Matters of more immediate practicability which are dealt with are the interchange of commercial information and statistics between countries, and "rationalisation" (standardisation and organisation).

Works Visit.

On the occasion of the summer meeting of the Institution of Mechanical Engineers at Birmingham a visit will be paid to the works of the B.T.-H. Co. at Rugby on Friday, July 1st.

Wages in the Engineering Industry.

A further conference between employers and trade union representatives of the engineering industry was held on Tuesday last. The employers expressed their inability to offer more than 2s. a week increase for plain time workers, and the employés' representatives thereupon intimated that the offer would be submitted to a ballot of the unions' members.

New Australian Company.

A company with the title Scott & Co. (Australasia) Pty., Ltd., has recently been registered in Melbourne, with a capital of £25,000, to carry on the business of ironfounders, mechanical, electrical and tramway engineers, &c.

For Sale.

Bath Corporation Electricity Department invites offers for two Babcock & Wilcox (12,000 lb.) marine-type boilers, with underfeed stokers, forced-draught fan, steel chimneys and dust catchers, and 10,000 110-V lamps of various makes and candle power. Messrs. W. Beardmore & Co., Ltd., invite offers for one marine-type cylindrical boiler, two 625-kW Brush-Ljungström turbo-alternators, two 650-V induction motors, and one helical reduction gear. West Central Merchandise Mart will sell by auction on June 23rd, at 10, Red Lion Passage, Holborn, W.C., a quantity of coils of new and perfect cables and 2,000 coils of twin and workshop flex. Preston Corporation Electricity Department has for disposal one 500-kW rotary-convertor, with booster, exciter, and starting motor, &c., and one 1,250-kVA, 3-phase delta star transformer group. Ilford Corporation Electricity Department invite offers for dismantling and removal of battery and booster plant at the Goodmayes sub-station. (See our advertisement pages to-day.)

Local Exhibition.

Morecambe.—A demonstration of electric cooking, organised by the Electricity Department, was given recently. It was stated that during the last twelve months the department had supplied 140 cookers, 20 washing machines, 50 washing boilers, 15 geysers, nine water heaters, and 400 vacuum cleaners, in addition to other miscellaneous electrical appliances.

Russia and British Orders.

It is announced from Baku that Mr. Barinoff, one of the directors of the Azneft (Baku Oil Trust), is reported to have stated that the Trust this year proposed to place with English firms orders of the value of 10,500,000 roubles for electric pumps, compressors, turbo-generators, &c. Now the Trust was only leaving in England orders, the withdrawal of which was undesirable, and which had almost been completed. All the remaining orders would be distributed among other countries. Orders for 2,500,000 roubles which had been destined for England had already been withdrawn and had for the most part been allocated to firms in Germany, America, and Czecho-Slovakia. A further message from Leningrad states that the Electric Current Undertaking (Elektrotok) of that city has discontinued the giving of orders to England, where the Elektrotok has on order two turbo-generators, with accessory mechanical equipment of the value of 2,000,000 roubles. The first set is to be delivered in May, 1928, and the second in July of that year, for installation at the Krasny Oktyaber station now under construction. At the end of May the undertaking is stated to have received confirmation from the Vickers Company that all its obligations would be fulfilled. It is added that the final solution of this question has been handed over for the consideration of the National Committee of Trade, and that further orders required by the undertaking will be placed in Germany and America.

Trade Announcements.

Darimont Electric Batteries, Ltd., has granted the sole manufacturing and selling rights relating to "Darimont" appliances and accessories to the General Radio Co., Ltd.

Automatic & Electric Furnaces, Ltd., has entered into an arrangement with Messrs. G. Blundell & Co., Ltd., of Yokohama, for the sale of the Wild-Barfield electric furnaces in Japan.

Messrs. Lindsay & Co. have removed to 9, Cheapside, Liverpool. Telephone: Bank 52.

The Trelleborg Ebonite Works, Ltd., has removed to Union Place, Wells Street, W.1.

The head offices of the County of London Electric Supply Co., Ltd., and its associated companies, are now at County House, 46-47, New Broad Street, E.C.2.

Catalogues and Lists.

The Piggott Electrical Co., Ltd., 24, New Bridge Street, E.C.4.—A series of illustrated and priced pamphlets dealing with "Imperial" domestic appliances.

The Shipton Automatic Telephone System, Ltd., 37, Totthill Street, S.W.1.—A pamphlet advertising the company's automatic telephone service.

Messrs. Downes & Davies, 1 & 3, Stanley Street, Liverpool.—Folder giving illustrated and priced particulars of the "Palatine Luxray" lighting fittings.

Messrs. E. P. Allam & Co., Ltd., 107-109, Gray's Inn Road, W.C.2.—Monthly stock list of motors for sale and hire.

The Tungsram Electric Lamp Works (Great Britain), Ltd., 72, Oxford Street, W.1.—An illustrated price list of gas-filled and vacuum lamps of various types.

The Walters Manufacturing Co., Ltd., Kensal Road, W.10.—List No. 125, containing full details and prices of "Koda" active and inert batteries.

Messrs. Hopkinsons, Ltd., Britannia Works, Huddersfield. List No. 1870, describing the company's patent "Stamstel" steam valves. Illustrated.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper Thames Street, E.C.4.—June price sheet of electrical materials, accessories, and appliances.

Messrs. Edward Holme & Co., Ltd., Moss Lane, Altrincham.—A well-illustrated catalogue of electrical control gear and contactor equipment for many purposes.

The Burovox Co., 48, Rupert Street, W.1.—Two illustrated pamphlets describing "Burovox" telephones for intercommunication purposes and for installation in automobiles.

Messrs. H. E. Ashdown (Birmingham), Ltd., Perry Barr, Birmingham.—A pamphlet (arranged for overprinting) illustrating and describing the company's shock-proof lampholders.

Messrs. Belbin & Bowden, Ltd., 3, Finsbury Square, E.C.2.—A price list of electrical accessories and appliances of all kinds.

Ateliers de Constructions Electriques de Charleroi, 56, Victoria Street, S.W.1.—June stock list of motors and dynamos.

Messrs. A. Reyrolle & Co., Ltd., Hebburn-on-Tyne.—Pamphlet No. 667, containing illustrated descriptions of examples of the company's large metal-clad draw-out switchgear.

The Cook Electric Co., 2,700, Southport Avenue, Chicago.—An illustrated catalogue of telephone protectors, terminals and supplies.

British Insulated Cables, Ltd., Prescot, Lancs.—Lists Nos. P.213 and 215, illustrating and describing the "Prescot" and "Junior Prescot" ceiling fans respectively.

Mr. F. Tuckett, 87, The Grove, Broadway, Hammersmith, W.6.—A priced leaflet (No. 62) depicting examples of shades, standards, and other lighting fittings.

The Mullard Wireless Service Co., Ltd., Mullard House, Denmark Street, W.C.2.—Two illustrated and priced leaflets advertising examples of the company's valves and one dealing with fixed condensers and resistances.

The London Electrical Co., 1, Sherborne Lane, King William Street, E.C.4.—A net trade price list of electrical supplies; a price list of conduits and fittings; and a leaflet advertising fans, also priced.

The Universal Manufacturing Co., 7, St. George's Circus, S.E.1.—A price list of vacuum and gasfilled lamps and a card bearing examples of colours of the firm's opaque enamels.

Bankruptcy Proceedings.

S. B. Marshall (trading as the Pytram Manufacturing Co.), Dunbar Road, New Malden, Surrey, designer, manufacturer, &c.—Last day for receiving proofs for dividend, June 25th. Trustee, Mr. F. W. Davis, 28, Theobald's Road, W.C.1.

C. J. Nichols (trading as C. J. Nichols & Co.), 7, Park Street, Bridgend, Glam., electrical engineer.—First and final dividend of 2s. 9d. in the £, payable June 20th, at 26, Corporation Street, Birmingham.

Company Liquidation.

Holbrook's Electric Service Co., Ltd., electrical and wireless dealers, 1, Foster Lane, Cheapside, E.C.—A meeting of creditors was held on June 8th, at the offices of Messrs. Chantrey, Button & Co., 61-62, Lincoln's Inn Fields, W.C. Mr. J. Hamp reported that on May 18th last a resolution for voluntary liquidation was passed, and he was appointed liquidator. The statement of affairs which had been prepared showed ranking liabilities of £799, and net assets of £344, or a deficiency so far as the creditors were concerned of £455. The company was registered in 1924 with a nominal capital of £1,000; it was formed for the purpose of taking over a business which had previously been carried on by Messrs. A. E. Snelling and E. Morris for the sale of wireless and electrical fittings. The assets were paid for by a sum of £650 being handed to the vendors, who also subscribed £350 in cash for shares. Mr. J. R. Holbrook became managing director in May, 1924, but he resigned in April, 1926. During the year to April 30th, 1925, the sales were £3,498, and in the following year they fell to £2,628, and in the last twelve months to £2,244. The present position was probably due to the fact that the turnover had been insufficient to meet the expenses. Messrs. Snelling and Morris had advanced to the company sums totalling £264, in respect of which no interest had been paid. There were some inquiries for the business, and if it could be sold as a going concern, a good price might be obtained. If the business could not be sold as a going concern, Mr. Hamp hoped to be able to realise the assets and complete the winding up at an early date. A resolution was passed confirming the voluntary liquidation of the company, with Mr. Hamp as liquidator.

Private Arrangements.

A. H. Dickinson, trading as A. H. Dickinson & Sons, electrical and wireless dealers, &c., Tidworth, Salisbury, and Bulford Camp.—A meeting of creditors was held on June 9th, when the chair was occupied by Mr. W. H. Cork, 19, Eastcheap, E.C., who presented a statement of affairs which disclosed liabilities of £9,850, of which £4,600 was due to trade creditors; there were partly secured creditors for £6,500, who held security valued at £1,250, leaving £5,250 to rank as unsecured. There was also a fully-secured creditor for £2,050, who held security valued at £3,000, showing a surplus of £950. The assets were valued at £7,160, leaving a deficiency of £2,690. Mr. Cork stated that a conference of the principal creditors was held recently, when a resolution was passed to the effect that a deed of inspectorship and assignment should be executed to

him as trustee, with a committee of five of the principal creditors. The debtor started business about 26 years ago. He was successful until 1919, when the trade was adversely affected. A resolution was passed agreeing that a deed of inspectorship and assignment should be executed to Mr. Cork as trustee with a view to the payment of the liabilities in full. A committee of inspection was also appointed consisting of the representatives of Messrs. Brown Bros., Ltd., Colthurst & Harding, Ltd., Falk, Stadelmann & Co., Ltd., Osmond & Matthews, Ltd., and Mr. Hawkins, representing creditors. It was also decided that the business should be carried on for a period of six months on condition that Mrs. Dickinson gave an undertaking that any loss would be discharged by her. The following are creditors :—

	£		£
Barnes & Mullins ...	61	Fox & Co., Ltd., F. F....	26
Brown Brothers, Ltd. ...	336	Mullard Wireless Service Co., Ltd.	28
Brock, C. T., & Co. ...	103	Osmond & Matthews, Ltd.	261
Colthurst & Harding ...	262	Walter & Sons, J. ...	214
Dunn & Co., R.	74	Wholesale Fittings Co., Ltd.	90
Electric Heating Co. ...	28		
Eckart, Ltd., W. & R....	34		
Falk, Stadelmann & Co., Ltd.	230		

Dissolution of Partnership.

John Lightfoot, 94, Oxford Road, Manchester, electrical engineers.—Messrs. J. & R. G. Lightfoot have dissolved partnership. Mr. J. Lightfoot will attend to debts and continue the business.

Recent Contracts.

Following on the recent contracts placed by the Liverpool Corporation with the Metropolitan-Vickers Electrical Co., Ltd., for a second 25,000-kW turbo-alternator set for the Lister Drive No. 3 power station, two further important contracts, covering the transformers and switchgear for the extensions in Lister Drive power station and for the reconstruction of three sub-stations, have now been placed with the company. The transformer contract covers the supply of eight 10,000-kVA, 3-phase core-type units for new feeders from Lister Drive. Two of the units are designed for 6,300/33,000-V operation, and are duplicates of the six main transformers already installed. The other six units are for 6,300/22,000 V. The necessary extensions to the existing forced cooling and oil filtering equipments are included in the contract. Each phase of the transformer windings is enclosed within a supporting cage in which it can be removed from the core as a unit. The switchgear contract provides for a 19-cubicle extension to the 6,300-V switchboard in the Lister Drive power station, 49 6,300-V circuit-breakers for Lark Lane, Beaumaris Street, and Garston sub-stations, together with auxiliary switchgear and spares. The main power station switchgear is a two-floor masonry cubicle arrangement embodying metal-clad circuit-breakers of the fixed type, and the extension will be similar to the 36 cubicles already installed. The circuit-breakers each have a rupturing capacity of 750,000 kVA. The sub-station circuit-breakers are to be metal-clad draw-out units, with duplicate bus-bars, each unit having a breaking capacity of 250,000 kVA.

Among the orders recently given to Messrs. Bolckow, Vaughan & Co., Ltd., are two for tramway materials. The Manchester Corporation has ordered 1,000 tons of rails, and the Brisbane Tramways require 1,525 tons of rails and 90 tons of fishplates. In addition, an order for 10,000 tons of rails and 650 tons of fishplates has been received from the Buenos Aires Great Southern Railway.

W. T. Henley's Telegraph Works Co., Ltd., has received from the Eastern Telegraph Co., Ltd., an order which is said to be one of the most important of its kind placed in recent years. It is connected with the Eastern Co.'s institution of the regenerator system of working for long-distance traffic, and comprises the supply and laying of over 200 miles of armoured cable between Port Said and Suez. The work is expected to be completed within six months.

Food and Cookery Exhibition.

The 30th annual Food and Cookery Exhibition is to be held at the Holland Park Hall from November 15th to 24th next. Particulars can be obtained from the Westminster Advertising Service, Ltd., 26, Bedford Street, Strand, W.C.2.

Electrical Goods for India.

The *British Export Gazette* reports that while the business passing in India in textile machinery and industrial plant has been rather less active than usual during the past few months, electrical machinery of all kinds continues in demand. Among lines customarily handled by the mercantile community, sales of lighting accessories and fittings are on the up grade, and British goods are more than holding their own against German and American competition. Electro-medical apparatus, electric fans, and electric bells are other lines in which business is being done, and the electrical goods trade as a whole is more promising than ever before. Especially significant is the fact that many new power stations are being established throughout the country, and it will probably be some time before the requirements of the new consumers of light and power are satisfied with regard to fittings, &c.

Australia and German Contracts.

The Sydney *Sun* reports that Mr. Hume Cook, secretary of the Australian Industries Protection League, commenting upon the award of contracts to German firms for a dredger and locomotive for the Yallourn electricity works, by the Victorian Electricity Commission, said :—"These orders contribute still another shock to Australian sentiment. As far as I am aware, no inquiries were made in Australia as to whether the dredger or locomotive could be made in Australia. It is also probably correct to say that no inquiry was made in Britain. At the very moment when the people of Australia are filled with enthusiasm for the Empire, by reason of the Duke of York's visit, responsible State Ministers, without a single word of explanation, calmly approve of proposals which make public patriotism look as shoddy as their own."

In a statement issued by the Electricity Commission, as quoted by the Melbourne *Age*, it is said that three tenders were received for the supply of three electric locomotives, one British and two German. "The British tender was found to be 85 per cent. above the more acceptable of the other two, that of Messrs. Gollin & Co., agents for Messrs. Siemens-Schuckertwerke, at £11,793 c.i.f. and including spare parts."

Correction.

In the fan advertisement of the Edison Swan Electric Co., Ltd., which appeared in our issues of May 21st and June 4th, owing to a dropped figure in the advertisers' electro the wattage of fan No. H367 was shown as 5 watts instead of 45 watts.

The Norwegian Cable Industry.

The Norwegian Storting has decided to deprive the home cable manufacturing industry of the protection which it has enjoyed for two years past in the form of an import duty of 10 öre per kilogramme (100 kr. per ton) on lead-covered cables. The Skandinavisk Kabel Og Gummivare Fabrik, which appears to be the chief company concerned, has informed the Storting that as a consequence of the abandonment of the duties the company has been compelled to discontinue activity as the possibility of remunerative working no longer exists. The company further states that foreign dumping in the past few years has assumed such dimensions that even if the workmen and staff were to give their services free of charge, it could not exist without the duties. A total of 8,000,000 kr. has been invested in the undertaking, and one half is stated to have been lost, and it was intended to re-finance it on the basis of 4,000,000 kr.; the factory is a modern one and the production costs are now only slightly different from those of foreign works. During the years 1921-1926 the imports of lead-covered cables into Norway amounted to 36,000,000 kr., of which about 30,000,000 kr. applied to the years 1921-1924, before the Norwegian company had commenced working on any scale. It is further stated that the Association of Electricity Works is not opposed to a duty of 5 öre per kg., and that the imposition of the duty has not had the effect of increasing the prices of Norwegian cables.

Registered Electrical Contractors.

On June 10th the Executive Committee of the National Register of Electrical Installation Contractors accepted the following applications for registration :—

Higginbotham, A., & Sons, Idle, Bradford.
England, Robinson & Co., Ltd., Harrogate.
Binks, T., & Son, Washington Station, Co. Durham.
Pearce, T., Aylesbury.
Cantwell & Hedger, Broadstairs.
Fawcitt, J., & Co., Sunderland.
Myles & McCaffery, Blackpool.
Seddon, H., Blackpool.
Walker, E., Manchester.
Ollier, G., Blackpool.
Rose, E., Miles Platting, Manchester.
Hutchison, W. E., Cardiff.
Lewis & Hall, King's Heath, Birmingham.
Parker, C., Handsworth, Birmingham.
King, W. E., Rathmines, Dublin.
Keatinge & Gaule, Waterford.
Allen & Welsby, Walkden, nr. Manchester.
Robinson, W. G. M., Leicester.
Ward, G. L., & Co., Cardiff.
Kendal, J., Lomax & Co., Ltd., Manchester.

At the same meeting 10 applications were declined.

A German Amalgamation.

It is proposed to amalgamate the Continental Company for Electrical Undertakings and the Electricity Company (late Schuckert), both of Nuremberg. The former was originally formed by the latter as a financing company for its electrical undertakings to be established, at the time when the Schuckert Company was a manufacturing concern, that is to say, before its Nuremberg works were transferred to the Siemens-Schuckertwerke in 1903. As the losses caused by the war have greatly diminished the development possibilities of the Continental company, and its objects are now identical with those of its founder company, it is considered desirable for the latter to absorb the former.

Book Notices.

Tait's "Electrical Directory of Australia and New Zealand." Price 7s. 6d. Melbourne: Tait Publishing Co. Pty., Ltd.—The 1927 edition of this directory is the seventh issue, and is considerably larger than its predecessors. The particulars regarding all existing undertakings have been completely revised, and it is believed that every Government undertaking, municipal council, company or private concern distributing electricity or operating electric traction systems has been included. Certain new features have been added, including maps of the supply areas in the cities of Adelaide, Melbourne, and Sydney, and maps of the various Australian States and of the north and south islands of New Zealand, showing the principal electrically-supplied cities and towns and main transmission systems. There is also a complete schedule of the retail electricity supply tariffs of the State Electricity Commission of Victoria.

"Advertising, Printing and Art in Commerce," by J. F. Preston and E. Arch. Pp. xvi+301; figs. 196. London: Chapman & Hall, Ltd. Price 16s. net.

"Modern Steelwork, 1927: A Review of Current Practice in the Application of Structural Steelwork to Buildings and Bridges." Pp. 275, illustrated. London: Nash & Alexander, Ltd. Price 5s.

The McGraw-Hill Publishing Co., Ltd., has issued a revised edition of its list of books on metallurgy.

Prices of Raw Materials.

The following prices are only general, and they may vary according to quantities and other circumstances:—

CHEMICALS, &c.	Price June 14th.	Fortnight's inc. or dec.
a Acid, Oxalic ... ... per lb.	5¾d.	...
a Ammoniac, Sal ... ... per ton.	£60	...
a Ammonia, Muriate (large crystal) ,,	£52	...
a Bisulphide of Carbon ... ... ,,	...	...
a Borax ... ... ,,	£25	...
a Copper Sulphate ... ... ,,	£25 10s.	...
a Potash, Chlorate ... ... per lb.	4d. to 4½d.	...
a ,, Perchlorate ... ... ,,	5½d.	...
a Shellac ... ... per cwt.	£13 10s.	...
a Sulphur, Commercial ... ... ,,	£9 10s.	...
a ,, Roll ... ... ,,	£9 10s.	...
a Soda, Chlorate ... ... per lb.	8½d to 8¾d.	...
a ,, Crystals ... ... per ton.	£5 to £5 5s.	...
a Sodium Bichromate, casks ... per lb.	4d.	...
METALS, &c.		
b Aluminium, Ingots... ... ... per ton.	£107 to £112	...
b ,, Wire ... ... per lb.	1/6 to 2/-	...
b ,, Sheet ... ... ,,	1/8 to 2/9	...
p Babbitt's Metal and Anti-friction Metal—		
Grade I ... ... per ton net.	£259	£3 inc.
Grade II ... ... ,, ,,	£180	£2 inc.
Grade III... ... ... ,, ,,	£93	...
Brass (rolled metal 2" to 12" basis) per lb.	9⅜d.	...
,, Tubes (solid drawn) ... ,,	11¼d. to 11⅝d.	...
,, Wire, basis ... ... ,,	9⅜d.	...
Copper Tubes (solid drawn) ... ,,	1/0½	...
,, Bars (best selected) ... per ton.	£86	...

Reporting on the lead market, under date June 11th, Messrs. ames Forster & Co. stated:—"The position on the whole oes not seem too adverse. The American market wears a etter tone, and had last week's improvement here been naintained, the price would undoubtedly have been advanced. ermany is consuming about 75 per cent. more lead than a ear ago, and consumption in France is improving. In this ountry demand is still only moderate, but, on the other hand, rrivals during the last six weeks have not been unduly heavy. he position is such that a moderate amount of extra buying y cable-makers would quickly put a different complexion on he market, particularly if, at the same time, there were igns (of which there are none at present) of any curtailent of production."

Social Event.

The eighth annual athletic sports meeting of the London establishments of the General Electric Co., Ltd., was held on June 11th at the company's sports ground at Wembley. The occasion was favoured by excellent weather, and there was a large attendance of friends to witness the keenly-contested events. The programme was a heavy one, including 38 events, and the number of entries was exceptionally large. The various events were run well to time, however, and the programme was carried through without a hitch. It is not possible to give all the events in detail, but the tug-of-war teams (ladies and gentlemen) deservedly attracted general attention, and the ultimate winners were enthusiastically cheered. The prizes were numerous and valuable, and included six handsome challenge cups. Mr. and Mrs. M. J. Railing were among the distinguished visitors, and Mrs. Railing kindly presented the prizes. There was a number of side-shows, and these were surrounded throughout the afternoon by the visitors. The weather, which threatened during the prize distribution to summarily end the proceedings, fortunately held up, and the day was concluded with dancing on the excellent turf. The music during the afternoon and for the dancing was rendered by the band of the 23rd London Regiment, under the direction of Mr. F. E. Poole. The sports officials are to be congratulated on the arrangements made.

Irish Free State Electrical Imports.

The imports of electrical goods, excluding machinery, into the Irish Free State during April last amounted to a value of £23,481, as compared with £30,312 in the April, 1926. The aggregate imports during the first four months of the current year are returned at £131,803, as compared with £159,499 in the corresponding period of last year.

Lighting and Power Notes.

Aldershot.—LOAN.—The Town Council has applied for sanction to a loan of £19,800 for mains, services, meters, and a new feeder.

Barnstaple.—LOAN SANCTIONED.—The Town Council has received sanction to a loan of £1,800 for providing and laying a feeder cable in High Street.

Burton-on-Trent.—LOANS SANCTIONED.—The Corporation Electricity Committee has received sanction to loans of £25,500 for mains and services, and £6,500 for plant.

Buxton.—HIRE-PURCHASE SCHEME.—The electrical engineer (Mr. A. Bishop) has submitted a scheme to the Borough Council for the hire and hire-purchase of domestic appliances, which has been approved, and the chairman and engineer have been authorised to expend up to £250 in the purchase of apparatus.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—In view of the increased demand for power at Port Arthur and Fort William, Ont., the Ontario Hydro-Electric Power Commission is planning to increase the generating capacity of its Nipigon system from 75,000 h.p. to 230,000 h.p. Work is now in progress for increasing the capacity of the development at Alexandra Landing by 55,000 h.p., and an additional 100,000 h.p. will be generated at Virgin Falls and Portage Island.

Tenders have been invited for building the highest-voltage power transmission line yet to be constructed in Canada. The tenders are for the construction of 200 miles of line from the Ontario side of the Ottawa River at Fitzroy Harbour to Toronto. This transmission line will carry power developed on the Gatineau River in Quebec to Toronto at a pressure of 220,000 V.

It is expected that shortly the Duke-Price Power Company will install the last two generators at its hydro-electric plant on the Saguenay River. The plant, which commenced to deliver power in 1925, now has ten generator units in operation with a capacity of 400,000 h.p. Already these units are fairly well loaded and they will be fully loaded when the Shawinigan Water and Power Company takes the 100,000 h.p. which it has contracted for. The Shawinigan Company is building a h.p. transmission line to Quebec, and it is expected that it will be completed by August. The load being carried by the Duke-Price plant has been steadily increasing during the past year due to industrial activity in the Saguenay district, particularly the operations of Price Brothers' pulp and paper mills, the Aluminium Corporation of Canada, and the Port Alfred Pulp and Paper Mills.

Chesterfield.—LOANS.—The Corporation Electricity Committee is applying for sanction to the borrowing of £1,360 for overhead cables to afford an electricity supply to the area of the Brampton and Walton Urban District Council.

Sanction has been obtained to a loan of £1,777 for a sub-station, transformer kiosks and equipment.

Continental.—Latvia.—A recently-issued report of the Department of Overseas Trade on the economic and industrial conditions in Latvia (H.M. Stationery Office, 9d. net) states that the electrification schemes which were the subject of so much discussion a few years ago have made no progress, and although they have not been finally abandoned, they will have to remain in abeyance until general conditions become more satisfactory.

Italy.—The Crown Prince Umberto on June 9th inaugurated the large hydro-electric power station at Mese, which, it is estimated, will have an output of 700,000,000 kWh per annum.—*Reuter* (Sondrio).

Dartford.—Electricity in Bulk.—Recently the Urban District Council approved a recommendation of the Electricity Committee for carrying out proposed plant extensions in order to meet the increased demand on the undertaking, and authorised application for sanction to a loan of £33,480. The Electricity Commissioners have intimated that any loan granted for plant extensions would have to be paid within a period of 10 years. The Committee has considered the comparative annual costs of local generation and obtaining a bulk supply on terms quoted by the West Kent Electric Co., Ltd., and finds that it would be more economical to purchase electricity in bulk than lay out capital expenditure repayable within such a short period, and has therefore recommended that a bulk supply be obtained from the company.

New Plant.—The Committee has also recommended extensions of the converting plant at an estimated cost of £3,750.

Dover.—Supply to Corporation Engineers.—The Electricity Committee has recommended that the borough electrical engineer be required in future to pay for all electricity consumed by him for cooking and heating purposes, and that a previous resolution sanctioning a supply to the power station superintendent and the mains superintendent at 2½d. per kWh be rescinded.

Gravesend.—Change-over.—At a recent meeting of the Corporation Electricity Committee, the town clerk reported that the consent of the Electricity Commissioners had been received to the alteration in the system of supply from 3-wire, d.c., at 460 V and 230 V, to 3-phase, 4-wire, a.c. at a frequency of 50 cycles, and pressures of 400 V and 230 V.

Loan Sanctioned.—Sanction has been received to a loan of £12,647 for boiler plant extensions, &c.

Harrogate.—Inquiry.—An inquiry was held by Col. T. C. Ekin, on behalf of the Electricity Commissioners, at the Royal Spa Rooms on June 8th and 9th, into conflicting applications for Special Orders. The applicants were Mr. R. F. Winder, in respect of an area of a mile and a half from St. James's Church to Boroughbridge; the Electrical Distribution of Yorkshire, Ltd., in respect of Ripon, the rural districts of Ripon, Knaresborough, Great Ouseburn, and part of the rural district of Thirsk; the Harrogate Corporation, in respect of parts of the rural district of Knaresborough; and the Ripon Corporation, in respect of the city of Ripon and the rural district of Ripon less the parish of Sawley. For the company it was stated that it obtained its supply from the Yorkshire Electric Power Co., at a very low rate, and that so far as Ripon was concerned it would be a costly operation to start an organisation, while the Harrogate proposal was unsatisfactory. In support of the Harrogate Corporation's application it was contended that it could supply electricity at as low a rate as any town in England. The Corporation was prepared to change over the system of supply from single- to three-phase a.c., the cost being estimated at £12,000. The Ripon City Council stated that it had provisionally agreed to take a bulk supply from Harrogate. The maximum price scheduled in the Ripon Order was 8d. per kWh, as compared with 10d. in the company's Order. The estimated cost of laying a cable from the northernmost point of the company's system was £18,000. For Mr. Winder, it was stated that plant was already installed at his mill at Boroughbridge, and he was supplying to people in the town. The Commissioners will give their decision in due course.

Hove.—Electricity Extensions.—The borough electrical engineer has submitted a report to the Electricity Committee on extensions to meet the increased demand for electricity in the Aldrington area. He recommends the laying of four feeder cables at a total estimated cost, including additional switchboard panels in the sub-station, of £3,830. The Committee has recommended to the Town Council that application be made for sanction to the borrowing of this sum for the purposes stated.

Irish Free State.—Dublin.—The City Commissioners have issued a report on recent developments of the electricity undertaking. The report states that during the six years from April 1st, 1920, to March 31st, 1926, a sum of approximately £300,000, which resulted from the working of the electricity department, was re-invested in electricity development work. In addition to this, the gross indebtedness of the undertaking was written down from £559,706 to £429,945. During this period the business done was more than doubled, and the energy sold increased from 10,527,000 to 22,000,000 kWh. The G.N.R. and the Dublin Port and Docks Board closed down their generating stations, and contracted with the Corporation for their full supply of electricity. All the new factories and works which started in Dublin also took their power from the city works. Supplemental supplies were also given to Rathmines and Pembroke electricity works, and a larger turn-over from private power plants to the city supply was secured. The revenue of the Department for the year ended March 31st, 1927, was approximately £320,000, exclusive of meter rents, and the surplus is estimated at £55,000, before making provision for reserve, renewals, or contributions to rates. There were no very abnormal items, with the exception of the large excess expenditure on coal due to the coal dispute, amounting to over £50,000. Some £100,000 has been expended since April 1st, 1926, and it is estimated that a further £200,000 may be expended by the end of the current year. Reductions in the charges for electricity are proposed, amounting in the aggregate to, approximately, 25 per cent.

The Free State Ministry of Industry and Commerce has sanctioned the extension of the Pigeon House power station by the addition of another turbine at a cost of £41,000.

Limerick.—The draft agreement in connection with the supplemental supply of electricity by Siemens Bau Union to the Corporation, has now been submitted for consideration. The terms of the draft agreement will come before the Electric Lighting Committee without delay. The cost for making provision for the additional supply is estimated at £25,000, for which a loan will be obtained.

Keighley.—Loan.—The Corporation Electricity Committee recommends the Council to make application for sanction to borrow £90,000 to cover expenditure during the next two years in connection with the electricity undertaking. The items include mains and services, £50,000; main transmission lines, £7,000; transformers and motor, £6,000; sub-stations and equipment, £12,000; erection and furnishing of new showrooms, £5,000; cookers, radiators, &c., for hire, £6,000; and street lighting, £4,000.

Kendal.—Electricity Supply.—The Town Council has decided to make its own arrangements for the supply of electricity for the next few years until a national supply becomes available. This decision has been arrived at after consultation with the Electricity Commissioners, and after consideration of the possibility of obtaining a supply of electricity in bulk.

Leyton.—Loan Sanctioned.—The Town Council has received sanction to a loan of £9,000 for mains and services.

London.—Woolwich.—The Town Council has accepted the estimate of the Electricity Committee for the electrical equipment of 360 new houses which are to be "all-electric," the necessary fittings to be installed at a cost of £7,826.

Southwark.—The *Financial News* reports that the Electricity Commissioners have refused the Borough Council permission to incur an expenditure of £37,500 in developing its electricity undertaking. At the recent inquiry it was contended by the County of London Electricity Supply Co., as ratepayers, and the London Power Co. that a bulk supply would be more economical and a substantial saving to the ratepayers. It was pointed out that the Council's electricity undertaking was a paying concern, but there was a heavy loan, which would be paid off by 1942. The power station was originally built by the Newington Vestry, and supplies power and electricity to only a portion of the borough. Before the formation of the Borough Council, authority was obtained by four companies to supply electricity, and at the inquiry it was contended by them that they were able to meet the increasing needs of the district. The Electricity Committee has decided to ask the Council to consider the position.

Bermondsey.—The borough electrical engineer, reporting on the development of the electricity undertaking since its inception 25 years ago, states that the station was opened in January, 1902, the generating plant consisting of three steam-driven dynamos with a total capacity of 375 kW. The generating and converting plant now amounts to 8,500 kW. The feeders have a total length of 14¼ miles, and the length of distribution cables is now 87 miles. There are also five miles of e.h.p. cables. There is a steady demand for electrical energy for industrial purposes, and at present, 60 per cent. of the energy sold is consumed in factories, &c. The Council some few years ago instituted a free wiring scheme, and 3,500 houses have been connected to the mains under this scheme. The capital expenditure on the electricity undertaking now approaches £500,000. Owing to the limitations of space and unsuitability of the site of the electricity works, the later extensions to the plant have been machinery at the sub-stations at Bermondsey and Rotherhithe for transforming and converting electricity purchased in bulk. The Council will shortly have to make provision for further extensions of plant, which will be machinery of this nature.

Northern Ireland.—Ballycastle (Co. Antrim).—The Urban District Council has referred to the Electricity Commissioners for Northern Ireland the question of the proposed purchase of the electricity works, the local company having refused an offer of £4,024.

Lurgan (Co. Armagh).—The new municipal electricity scheme is nearing completion, and it is expected that an electricity supply will be available before the end of this month. Over 100 consumers have already registered.

Belfast.—We have received from Mr. Johnstone Wright, city electrical engineer and general manager, a copy of his last report on the working of the Corporation electricity undertaking covering the year ended March 31st last. The total revenue amounted to £379,683, as compared with £355,753 in the preceding year. The cost of production was £183,079, as against £144,467. This increase was wholly accounted for by the

abnormal conditions prevailing, the extra cost arising from the coal dispute being £41,794. The gross profit was therefore £196,604 (£211,256), and after meeting capital charges and sundry items, there was a net surplus of £46,422, as compared with £62,402 in 1925-26. The supply to the shipyards fell considerably, owing to bad trade aggravated by the coal dispute, but this was largely counterbalanced by a record increase in the general lighting and power supply, and the sales of electricity therefore only showed a slight decrease, from 45,086,797 to 44,755,828 kWh. In connection with the extension of the Harbour power station, considerable progress has been made, and the piling and foundation contract will be completed shortly. An 18,750-kW turbo-alternator, complete with condenser and auxiliaries, has been placed on order. This extension is timed to be ready for service during the winter of 1928-29.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

BATLEY.—The increase of 5 per cent., imposed owing to the coal dispute, has been removed.

DEWSBURY.—The increases of 5 per cent. in the charges for lighting and 15 per cent. for power and heating, made owing to the coal strike, have been removed.

EGHAM AND STAINES.—*The Egham and Staines Electricity Co., Ltd.*—Lighting: From 9d. to 7½d. per kWh.

SWANSEA.—The Corporation Electricity Committee has decided to revert to the charges in operation prior to the coal dispute.

Spalding.—ELECTRICITY CHARGES.—The Urban District Council, which will commence a supply of electricity on September 1st next, has decided to reduce the provisional charges from 9d. to 8d. per kWh for lighting, and from 4d. to 3d. per kWh for power, subject to the following discounts:—100 kWh, ½ per cent.; 200 kWh, 5 per cent.; 300 kWh, 7½ per cent.; 400 kWh, 10 per cent.; 500 kWh, 12½ per cent.; 600 kWh, 15 per cent.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them granted to the Urban District Council of Criccieth for the supply of electricity by the Electricity Distribution of North Wales and District, Ltd., in the urban district, and the Urban District Council of Bridgend to supply in the rural district of Penybont.

Stoke-on-Trent. — LOAN SANCTIONED. — The Corporation Electricity Committee has received sanction to the borrowing of £25,700 for mains and sub-station equipment.

Sunderland.—NEW SUB-STATIONS.—The Corporation has decided to erect two new sub-stations, with mains, one in Adelaide Place at a total estimated cost of £3,615, and the other in Newcastle Road, on a new housing estate, at a total estimated cost of £7,430. A site for another sub-station near the Empire Theatre has been purchased for £450.

INAUGURATION OF NEW PLANT.—In connection with the new plant recently installed by the Corporation electricity works in Hylton Road, it is proposed to invite Sir John Snell to perform the opening ceremony.

Tilbury.—LOANS SANCTIONED.—The Urban District Council has received sanction to a loan of £32,000 for mains and services and £1,960 for plant in connection with the electricity scheme.

Torquay.—LOAN.—The Town Council has applied for sanction to a loan of £20,860 for extensions to the power station at Newton Abbot.

West Penwith.—ELECTRICITY SUPPLY.—The general manager of the West Cornwall Electricity Supply Co., Ltd., Mr. L. A. Hards, appeared before the Rural District Council at Penzance on June 2nd, to obtain the Council's support to the Special Order for which his company has made application. The clerk mentioned that the Council had entered a protest against the use of overhead lines, and against the proposed charge of 1s. per kWh. Mr. Hards said the company was extending its system in a number of directions, and intended to lay approximately 28 miles of h.p. mains this summer, and was practically doubling its station plant at Hayle. With regard to the rate of 1s. per kWh, it was impossible in such scattered rural areas as West Penwith to supply electricity at a lower rate at present. Before the company could erect overhead lines it had to obtain the consent of owners and local authorities and the approval of the Electricity Commissioners. It preferred to lay mains underground, but it was a question of the cost of distribution. The clerk stated that the Special Order was in respect of Sancreed, Sennen, St. Buryan, Gulval, St. Hilary, Marazion, Lelant, Morvah, Towednack, Zennor, &c. The Council gave its consent to the whole of the company's requests.

Wigan.—ELECTRICITY SUPPLY.—The Corporation has approved electricity mains extension to Gidlow, involving the following expenditure:—Sub-station building, £250; e.h.p. mains, £1,027; l.p. main link, £434; l.p. mains on housing estate, £1,024; transformer, £375; switchgear, £550; transformer kiosk, £250; total, £3,910. The whole of the western district is to be changed over to a.c.

The Electricity Department is negotiating with the Orrell and Billinge Councils with a view to giving a supply of electricity in these districts.

Wimbledon.—LOANS.—The Town Council is applying for sanction to the borrowing of £28,000 for new transformer stations and extensions to existing sub-stations as required, £10,000 for the purchase of domestic appliances, and £2,568 to cover expenditure already incurred in the purchase of appliances.

Tramway and Railway Notes.

Continental.—SWITZERLAND.—The first of a new type of electric locomotive for the Swiss Federal Railways has recently been completed at the works of the Brown-Boveri Co., at Munchenstein. It is one of sixteen which are being built by the firm in conjunction with the Winterthur Locomotive and Engineering Works. The engine, which is known as the 2-D-1 type, comprises a four-wheel bogie at the front, eight centrally-located wheels, each pair being independently driven by electric motors of a total capacity of 3,100 h.p., and a single pair of wheels at the rear. On its trials on the line between Berne and Munsingen a maximum speed of over 73 m.p.h. is stated to have been attained.

Some interesting figures have been issued by the directors of the Rathischen railway, whose system is about 173 miles in length, and which has been electrified since 1922. It is stated that the adoption of electric traction has enabled a reduction of 52 per cent. to be made in the engineering staff at the workshops for the maintenance of the electric locomotives, while there has been a reduction of 48 per cent. in the track maintenance department and of 43.5 per cent. in the service personnel. As compared with steam traction it is estimated that 20,000 tons of coal are being saved each year, and that despite a considerable increase in the price of coal, electric traction is still proving more economical than steam.

The recently-completed electrified section of the Swiss Federal railways between Winterthur and Rorshach, a distance of about 44½ miles, is being supplied with electricity from the power station at Amsteg by means of open air transformer stations at Steinen and Gossau, each of which is equipped with three 3,000-kVA, 66,000-15,000-V transformers. For the supply of power to the 32-mile section between Romont, Freiburg and Berne, the power will be supplied from an outdoor transformer station near the railway station at Freiburg, this being also equipped with three 3,000-kVA transformers.

Glasgow.—INCREASED REVENUE.—The revenue of the Corporation tramway undertaking during the past year amounted to £2,340,836, an increase of approximately £82,000. The number of passengers carried decreased by 5,500,000, but since the introduction of a maximum fare of 2d. the revenue has steadily improved.

FARES.—At a recent meeting of the Corporation it was decided to reintroduce the halfpenny fare, which will be brought into operation almost immediately.

Japan.—OSAKA.—The Government has authorised the Municipality of Osaka to construct 35½ miles of underground railway, at a cost of 162,000,000 yen.—*Reuter* (Tokio).

Lincoln.—YEAR'S WORKING.—The loss on the Corporation tramway last year was £1,642, and the Corporation will shortly be called upon to decide whether the system shall be abandoned in favour of omnibuses, which made a net profit of £1.766 during the last 12 months.

Walsall.—PROPOSED TRAMWAY PURCHASE.—The *Electric Railway and Tramway Journal* states that it is understood that the Corporation is negotiating for the acquisition from the South Staffordshire Electric Tramways Co. of the tramways outside the borough connecting Walsall with Wednesbury and Darlaston, and also the tramway between Wednesbury and Darlaston. At present the Corporation has a joint service over the company's lines to and from Wednesbury and Darlaston, but the route between these two towns in operated solely by the company. Some time ago Walsall took over from the company the tramway between Willenhall and Darlaston, and recently Wolverhampton came to terms for the purchase from the same company of the tramway lines between Wolverhampton, Bilston, and Darlaston, Bilston and Willenhall, Bilston and Sedgeley, and Bilston and Bradley, a total length of 12 miles. Further progress with the Wolverhampton scheme is being held up by the failure of the Corporation to secure the necessary consent from the Bilston Council. It is stated, however, that the intention of Wolverhampton is to run railless cars on all these routes when the present deadlock is removed. Should Bilston maintain its present attitude the Wolverhampton Corporation would have no option but to seek Parliamentary powers. It is hoped that as a result of the gradual municipalisation of road transport services of the Black Country it will be possible eventually to arrange for through running between all the important towns.

Telegraph and Telephone Notes.

Australia.—TELEPHONE SERVICE.—There are now 436,000 telephone subscribers in Australia, according to figures made available recently by the Director of Postal Services (Mr. H. P. Brown). According to the *Sydney Morning Herald*, in March, 1927, 5,719 new subscribers were supplied with telephones, a record for any one month in the history of the Commonwealth. The number of persons who applied for telephones but had not yet been connected was 6,310.

Cable Communication between Canada and Australia.—A *Reuter* message from Victoria, B.C., states that the cable ship *Restorer* sailed on June 10th with 70 miles of cable to complete the link of the second Allied cable connecting Canada with the Antipodes. The Canadian Pacific telegraphs will link up the cable with the newly-completed copper line between Vancouver and Halifax, Nova Scotia, approximately 3,400 miles in length, thus completing duplicate cable communication between Australia and England.

Glasgow.—WIRELESS IN LIGHTHOUSES.—It was reported at a meeting of the Clyde Lighthouses Trust that wireless telephonic communication between Cumbrae and Toward was now in working order. The licence of the Postmaster-General was limited to sending and receiving messages on the private business of the Lighthouses Trust, but the clerk was instructed to communicate with the Postmaster-General with a view to having the licence extended to include helping both shipowners and mariners in reporting the arrival of vessels, and also in communicating with steamers during fog, and giving them directions. It was stated that, owing to an invention by Mr. D. Alan Stevenson with synchronised clocks, the installation would be under the estimated cost of £700.

United States.—NEW RADIOGRAM RELAY STATION.—That history repeats itself is once again emphasised by the fact that two decades ago Marconi chose the Newfoundland coast as the best site for the reception of signals originating in England; more recently, transoceanic traffic has been handled from the north shore of Long Island, far to the south. Hence the Belfast, Maine, receiving station of the Radio Corporation of America marks the return of transoceanic radio reception to the north-eastern coast of America. It appears that extensive tests proved that the reception of European signals was much better at Belfast than at Riverhead, on Long Island, where the main receiving station is located. A survey of thunderstorms during the past decade by the United States Weather Bureau indicates that there are twice as many thunderstorms at Riverhead as at Belfast, and so the reception at the former point is more affected; also, while Belfast is nearly north of Riverhead, it lies almost directly on the great circle route from Riverhead to Europe, and is 300 miles nearer the distant transmitters than is Riverhead; for this reason the European radio signals are at least 30 per cent. stronger at Belfast. The new station at present houses 12 complete long-wave receiving sets, operating on wave-lengths from 8,000 to 23,000 metres, in addition to battery and motor-generator equipment, oil heating and steam plant, and has its own water supply. The function of the new station is to pick up radio-telegraph signals from European stations on a uni-directional triple antenna, consisting of three antennas, each nine miles long and spaced six miles apart throughout their parallel spans. It is highly directional, covering only a small angle and capable of receiving signals from Norway to the north and sweeping down to Italy on the south. It is the invention of Mr. H. H. Beverage, and is only 20 feet high itself, strung along on poles very much after the fashion of a rural telephone line. A multiplicity of receiving sets are worked on one Beverage wave antenna, each set being provided with a wave trap and filters so that signals from the desired transmitter are taken off the antenna and then built up by radio-frequency amplification for subsequent detection and audio amplification, and are automatically relayed over leased telegraph lines to the central office in New York City, where they are automatically recorded on high-speed recorders, while the inked paper tape with its wave-line passes by the operator seated before a typewriter on which the dots and dashes are transcribed into complete radiograms.

Radio Notes.

Belgium.—NEW BROADCASTING COMPANY.—The *Financial News* reports that there is a proposal to form a national broadcasting company in Belgium, with a capital of three million francs, to continue for ten years, with the right to extension for a further five years. The present company's equipment and clientele would be taken over, and the State would be interested to the extent of 60 per cent. of the receipts. The board of directors is to consist of 11 members, of whom the Minister of Posts and Telegraphs will appoint the chairman and five other members, and the rest will be appointed by the general meeting. The State will reserve the right to use all the company's equipment for communications of public interest.

Canada.—LICENCES.—Wireless receiving licence revenue in Canada during the 11 months ended February last totalled 207,328 dollars at one dollar each, an increase of 77,462 dollars over the revenue during the corresponding 11 months of the previous fiscal year. Ontario led the provinces in the number of licences issued with 97,851.—*Reuter* (Ottawa).

NEW STATION.—The Winnipeg Grain Exchange will this summer operate a 500-watt broadcasting station, to be erected at a cost of 25,000 dollars; its call letters will be "CJCW."—*Reuter* (Winnipeg).

Colombia.—NEW BROADCASTING STATION.—The Government has concluded a contract with a foreign corporation for the installation of a complete broadcasting station, with a range of 300 km., at Bogotà. The international call letters assigned are HJH-HKZ. The recently completed stations at Caracas (Venezuela) and Balbóa (Panamá) are expected to make the development of radio easier for Colombia. A wireless telegraphic station will also be installed, establishing communication with the remotest provinces.—*Reuter's Trade Service* (Bogotá).

Short-wave Experiments.—RECEPTION TESTS.—During two recent week-ends 24-hour broadcasting tests were carried out by the two short-wave "annexes" to the American station at Schenectady (WGY) uninterruptedly: 2XAF used 32.77 metres and 2XAD 26.8 metres in order to enable distant reception effects to be observed. According to the wireless correspondent of the London *Evening News*, the charts drawn by B.B.C. engineers to illustrate the reception in England of those test transmissions are not encouraging to those who believe in the immediate establishment of world-wide relaying of programmes. Throughout the whole 48 hours of the tests engineers were listening at the B.B.C.'s listening-post at Keston, using special short-wave super-heterodyne sets, and from about 10 p.m. till 4 a.m. the signals were at their best, strong and clear enough to be successfully relayed, there being during this period practically no difference between the 32-metre, 26-metre, and 22-metre wave-lengths. At other times, except for short "freak patches," signals were weak, badly distorted and subject to violent fading.

Teaching by Wireless.—That 372 new schools had come on the B.B.C. register this term, and that there were 3,000 schools now in wireless communication with London and Daventry, was the statement made by Mr. J. C. Stobart (B.B.C. Director of Education) on Saturday at a distribution of prizes at the B.B.C. Studio, Savoy Hill, to 19 children successful in examinations dictated by wireless. Captain Ian Fraser, M.P., made the distribution, and said that though, perhaps, the schools would not be superseded in the future, there could be no doubt that teaching by wireless would be of great value to education. The service had gone beyond the experimental stage. Captain Revel, the headmaster of an elementary school, said Captain Fraser had been instrumental in providing more than 3,000 free licences for blind hearers.—*Daily Telegraph.*

The Eclipse of the Sun.—RADIO TESTS.—The British Broadcasting Corporation's stations at London, Daventry, Manchester, Birmingham, and Newcastle-upon-Tyne are to assist observers of the sun during its eclipse on the morning of June 29th. They will transmit a programme of time signals in accordance with the suggestions of the Astronomer-Royal; Mr. F. Hope-Jones is the B.B.C.'s time expert. They will also radiate for the benefit of observers who will attempt to ascertain the effect of the eclipse on radio transmission itself a continuous wave, unmodulated, but swinging continually over a wave-band 10 metres broad, 5 metres on each side of the station's normal wave-length, not merely on June 29th, but in the early mornings of June 27th, 28th, and 30th, and July 1st. This wave will only be interrupted by the time signals. As for short-wave tests during the eclipse, transmissions are being arranged by the Radio Research Board in conjunction with the Radio Society of Great Britain on 90 metres, 45 metres, and 22 metres.

Turkey.—NEW STATION.—At present there is only one station at Osmanié, 16 miles outside Constantinople, which has a wave-length of 1,200 metres; its call is "Radio Stamboul." On June 15th, however, a new station, which has cost over £100,000, was to be opened at Angora, and, says *The Times*, will be the most powerful in the Near East. The control of wireless telegraphy in Turkey is in the hands of a limited company in which the Post Office, the official Anatolian News Agency, and the Banque d'Affaires are interested. Any one can purchase a licence by paying £T14 (30s.), and a heavy fine is imposed on persons who listen without possessing a licence.

Wave-lengths Abandoned. — KILOCYCLE NOTATION. — The British Broadcasting Corporation proposes to adopt forthwith the principle of stating the kilocycle figure instead of the wave-length for all stations. This means that the measurements will be stated in terms of frequency. Support for this step is furnished by the fact by the Union Internationale de Radiophonie, Geneva, has throughout based its system of measurement on frequencies and not on wave-lengths.

Contract Information.

When "Contracts Open" are advertised in our "Official Notice" pages, the date of the ELECTRICAL REVIEW containing the advertisement is given in parentheses below.

Contracts Open.

Adwick-le-Street.—June 21st. Urban District Council. Cables, boxes, pillars, &c. (June 10th.)

Australia.—MELBOURNE.—August 15th. Postmaster-General's Department. One 55-ton 3-motor-type electrically operated overhead travelling crane. (A.X. 4727.)*

August 16th. Automatic telephone exchange equipment. (B.X. 3566.)

November 14th. State Electricity Commission of Victoria. Two 10,000-kW back-pressure turbo-generators and accessory plant.

SYDNEY.—July 18th. Municipal Council. Boiler-house equipment for the Bunnerong power station. (B.X. 3531.)*

August 15th. Generator neutral earthing resistance. (B.X. 3550.)*

Cheadle and Gatley.—June 28th. Electricity Department. Static transformer, e.h.p. switch cubicle, and transformer switch and distributor kiosk. (June 10th.)

Dundee.—June 24th. Electricity Department. Three 200-kVA outdoor-type transformers and two sets of 750-kW rotary convertors. (June 10th.)

Egypt.—Egyptian State Railways, Telegraphs and Telephones. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, S.W.1. Telegraph and telephone materials; wire, porcelain insulators, enamelled cable, copper binders and tapes, £E4,000 to £E4,300.

Halifax.—June 25th. T.C. Wiring 118 houses, Albert Road, for electric light; borough engineer. (Returnable deposit of £2 2s.)

Harrogate. — June 27th. Electricity Department. Transformers, meters, house-service fuse boxes. (See this issue.)

Hazel Grove and Bramhall.—June 28th. Urban District Council. 2,800 yd. .06 3-phase, 6,600-V cables, including laying and accessories. (See this issue.)

Inverness.—June 18th. Town Council. Electric lighting work at 30 blocks of houses. Schedules from Mr. J. Hinton Gall, Lombard Street, and Mr. John G. Chisholm, Union Street, Inverness.

Kirkcaldy.—July 2nd. Electricity Department. L.p. a.c. distribution, l.p. and e.h.p. cables, boxes, and roadwork. (June 10th.)

London.—STEPNEY.—July 11th. Electricity Supply Department. Boilers and boiler-house accessories, turbo-alternator, condenser, accessories, and switchgear. (June 3rd.)

METROPOLITAN WATER BOARD. June 23rd. Six and twelve months' supply of electric lamps. Chief Engineer, 173, Rosebery Avenue, E.C.1.

LEWISHAM.—July 4th. Board of Guardians. Steam and electric steriliser plant for the operating theatre. Mr. G. W. Martin, consulting engineer, 33, Arran Road, Catford, S.E.

Manchester.—June 21st. Electricity Committee. Twelve months' supply of time switches. Mr. H. C. Lamb, chief engineer and manager, Electricity Department, Town Hall.

New Zealand.—WELLINGTON.—August 9th. Public Works Department. 1,500 suspension insulator strings and 470 strain insulator strings. (B.X. 3533.)*

Nottingham. — June 21st. Electricity Department. General stores for 12 months. (June 3rd.)

Smethwick.—June 25th. Smethwick and Oldbury Joint Hospital Committee. Electric lighting installation at the Holly Lane Hospital. Mr. F. Chapman, clerk.

South Africa.—CAPE TOWN.—June 30th. South African Railways and Harbours Board. Gasfilled and vacuum lamps for 12 months. (B.X. 3518.)* Telegraph material. (B.X. 3519.)*

Southend-on-Sea.—July 6th. Light Railways and Electricity Department. L.p. and e.h.p. cables for 12 months. (June 3rd.)

July 5th. 3,000 meter boards. (See this issue.)

Whitehaven.—July 1st. Rural District Council. Laying two miles of overhead cable and erection of fittings, &c., in connection with the electric lighting of streets at Moresby Park Village. Mr. W. J. Goode, engineer and surveyor, Union Hall, Whitehaven.

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Contracts Closed.

Bradford.—Electricity Committee. Accepted:—

Erection of steel chimney.—Newton Chambers & Co., Ltd.

Switchgear for Low Estate sub-station and Haworth Road, Toller Lane, Ormond Road, and Great Horton Road transformer chambers.—A. Reyrolle & Co., Ltd.

Buxton.—Borough Council. Accepted:—

Diesel engine and gas engine oil for the electricity works for the ensuing twelve months.—C. C. Wakefield, Ltd.

Chesterfield.—Electricity Committee. Accepted:—

100-kVA transformer (£127).—Hackbridge Electric Construction Co., Ltd.

Tramways Committee. Accepted:—

Two reduction gears, shafting, &c., for the Thronfield depôt (£134).—Crofts (Engineers), Ltd.

Dartford.—Electricity Committee. Recommended:—

Supplying and laying 1,062 yd. of cable from electricity works to West Hill (£1,092).—Johnson & Phillips, Ltd.

Dewsbury.—Town Council. Accepted:—

4,500 yd. cable (£1,207).—Deutsche Kabelwerke A.G.

Douglas (I.o.M.).—Electricity Committee. Accepted:—

One h.p. truck-type switchboard to control one 50-kW and one 500-kW motor-alternators and one h.p. feeder, as well as l.p. panels (£1,439).—Kartret Switchgear Co., Ltd.

Mercury rectifier and equipment for sub-station (£3,415).—Hewittic Electric Co., Ltd.

Motor alternators (£2,345).—Electric Construction Co., Ltd.

Dumfries.—Dumfries and Galloway Joint Sanatorium Board. Accepted:—

Extension and repair of the existing fire alarm and telephone installation at the Sanatorium and Lochmaben Combination Hospital (£295).—A. Baird & Sons.

Glasgow.—Electricity Committee. Recommended:—

Cables, &c., for 1927-28:—

Telephone cables.—Callender's Cable and Construction Co., Ltd.

L.p. cables.—Enfield Cable Works, Ltd.; W. T. Glover and Co., Ltd.; Callender's Cable and Construction Co., Ltd.

H.p. cables.—Callender's Cable and Construction Co., Ltd.; W. T. Glover & Co., Ltd.

Rubber-insulated cables.—Craigpark Cable Co., Ltd.

Flexibles.—Craigpark Cable Co., Ltd.

Meters.—Chamberlain & Hookham, Ltd.; Edison Swan Electric Co., Ltd.; Ferranti, Ltd.; Metropolitan-Vickers Electrical Co., Ltd.

Arc lamp carbons.—General Electric Co., Ltd.

Cast-iron boxes, section pillars, &c.—Carron Company; Falkirk Iron Co., Ltd.; Lion Foundry Co.; McDowall, Steven & Co., Ltd.; Walter Macfarlane and Co., Ltd.; Sykes & Dyson, Ltd.; Robert Taylor and Co., Ltd.

Malleable iron tube and fittings.—Stewarts & Lloyds, Ltd.

Cleansing Committee. Recommended:—

Construction of the garage for electric vehicles at the new refuse destructor works, Govan (£12,627).—Melville, Dundas & Whitson.

Tramways Committee. Recommended:—

Lead-covered cable.—Standard Telephones and Cables, Ltd.

Welding plant.—British Brown, Boveri, Ltd.

India.—BOMBAY.—Corporation Standing Committee. Accepted:—

Electric lamps.—Allen Electric Co.; Spence & Co., Ltd.; Turner, Hoare & Co., Ltd.

Electric accessories.—Allen Electric Co.; Greaves, Cotton and Co., Ltd.

Liverpool.—Tramways and Electric Power and Lighting Committee. Recommended:—

Special steelwork for tramway junctions (£2,538).—Titan Trackwork Co., Ltd.

Repairs to four Worthington cooling towers at Lister Drive power station (£5,180).—W. Griffiths, Sons and Cromwell, Ltd.

London.—Admiralty. Accepted:—
Rotary switches.—Edison Swan Electric Co., Ltd.

Portrush.—Urban District Council.
Repair and extension of the battery of the electric supply works:—
Premier Accumulator Co. (1921), Ltd., less allowance for old material £505
Tudor Accumulator Co., Ltd., less allowance for old material £490
Forshaw & Bradshaw, less allowance for old material £470
T. May. (Accepted.) **£461**
—*Irish Builder and Engineer.*

Seaham.—Durham County Council. Accepted:—
Installation of electric light at Seaham Hall (£351).—Reid, Ferens & Co.

Southport.—Electricity Committee. Accepted:—
One 150,000-gallon-per-hour water-cooling tower (£2,465).—Peter Brotherhood, Ltd.
One 7,000-kW turbo-alternator and accessories (£22,700).—Brush Electrical Engineering Co., Ltd.

Stevenage.—Urban Council. Accepted:—
Supply of electrical plant and a motor for the sewage disposal works pumping plant (£127).—Electric Light and Power Co., Ltd.

Swansea.—Electricity Committee. Accepted:—
Six Bailey boiler meters, steam and air flow (£708).—Industrial Combustion Engineers, Ltd.
One steam flow meter recorder (£118).—Electroflo Meter Co., Ltd.

Education Committee. Accepted:—
Installation of electric lighting at schools.—R. G. Buckland (Glais School); D. O. Williams & Co. (Graig School); G. L. Ward & Co. (Morriston Boys'); G. L. Ward & Co. (Peniel Green Mixed); Cole & Day (Peniel Green Infants'); P. J. Davies (Pentrechwyth School).

Thanet.—Isle of Thanet Joint Hospital Board. Accepted:—
Maintenance, &c., of bells, telephones, &c., at the hospital for 12 months.—E. Coveney (Ramsgate).

Torquay.—Electricity Committee. Accepted:—
Two switchgear panels (£688).—Metropolitan-Vickers Electrical Co., Ltd.

Forthcoming Events.

Institution of Heating and Ventilating Engineers.—June 20th to 22nd. Bournemouth. Summer meeting.

Electrical Contractors' Association.—June 22nd to 25th. Scarborough. Annual conference.

Institution of Welding Engineers.—Wednesday, June 22nd. Engineers' Club, W. 8 p.m. "The Red-Shortness of Weld Metal," by Mr. A. H. Goodyear.

Physical Society.—Friday, June 24th. Imperial College of Science, South Kensington, S.W. 5 p.m. Ordinary meeting.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

Water dimmers.
England-Richards fluid-free cell.

Notes.

Fatality.

Whilst removing a portable electric saw bench at Messrs. Reichwald's timber yard at South Harbour, Blyth, two employés and Benjamin Jennings, a hawker, of Bedlington Bank Top, received severe electric shocks. Artificial respiration was applied, and the two employés recovered, but in the case of Jennings, the shock proved fatal.

An inquest was held on Friday last, when William Wells, a sawyer, said that he and another were operating an electrically driven saw-bench in the timber yard; Jennings was present collecting sawdust. About five o'clock witness and his companion commenced to shift the saw-bench. Witness put his hand on to it to knock off some dust from the wheel, and received a shock. Victor Lillie, the yard foreman, said he noticed after the accident that the trailing cable, which was attached to the table by means of a plug, had become wrapped round the wheel of the bench. There was nothing to indicate how the deceased got a shock. Dr. W. I. Gordon gave the cause of Jennings's death as heart failure, the result of an electric shock. There were not, however, any burns on the body; Jennings might have died from heart failure on seeing what had occurred. The opinion expressed by Mr. A. J. McCoggan, from the Home Office, was that the fouling of the cable had subjected the connecting plug on the table to a great strain, which had drawn it from its normal position and brought a small portion of unprotected cable into contact with the ironwork, thereby electrifying the bench. The jury returned a verdict of "Death from heart failure consequent upon electric shock accidentally received."

Electrolytic Disinfecting Fluid.

The report for 1926 of the medical officer of health to the borough of Poplar (Dr. F. W. Alexander) states that 65,317 gallons of electrolytic disinfectant fluid were manufactured during 1926 and broken down to 130,635 gallons for distribution. The total cost for materials and electricity was £345, of which £168 was for electrical energy. Since the installation of the plant, a period of 21 years, 957,181 gallons of fluid have been manufactured at a cost of £1,585 for electricity and of £1,898 for materials.

B.E.S.A. Publications.

Recently-issued British Standard Specifications by the British Engineering Standards Association include Nos. 174 to 184 for overhead line materials for telegraph and telephone purposes. These are revisions of the 1923 editions and are issued in two volumes, the first volume comprising specifications Nos. 174-181, and dealing with non-ferrous materials, the second volume comprising Nos. 182-184, and dealing with galvanised iron and steel wire. The following are the chief features in which these specifications differ from the 1923 editions:—Specifications for cadmium-copper wire, tapes, binders and jointing sleeves have been included in specifications Nos. 175, 178, and 181, the only material recognised in the corresponding old specifications being bronze. A new class of material has been introduced into specifications 182-184, this being designated "high-purity iron." This is given as an alternative to the ordinary low-carbon steel, which, of course, is still retained. As the result of experience in working to the original specifications for galvanised line wire, it was found that the data given in the tables were in certain cases inconsistent as between the diameter and weight per mile of the wire. The tables have been fully revised, and are now perfectly consistent amongst themselves. Certain amendments which have been made to the galvanising tests are described in specifications 182-184. Copies of these specifications may be obtained from the Publications Department, British Engineering Standards Association, 28, Victoria Street, S.W.1, price 2s. per volume, or 2s. 2d. post free.

Royal Air Force Display.

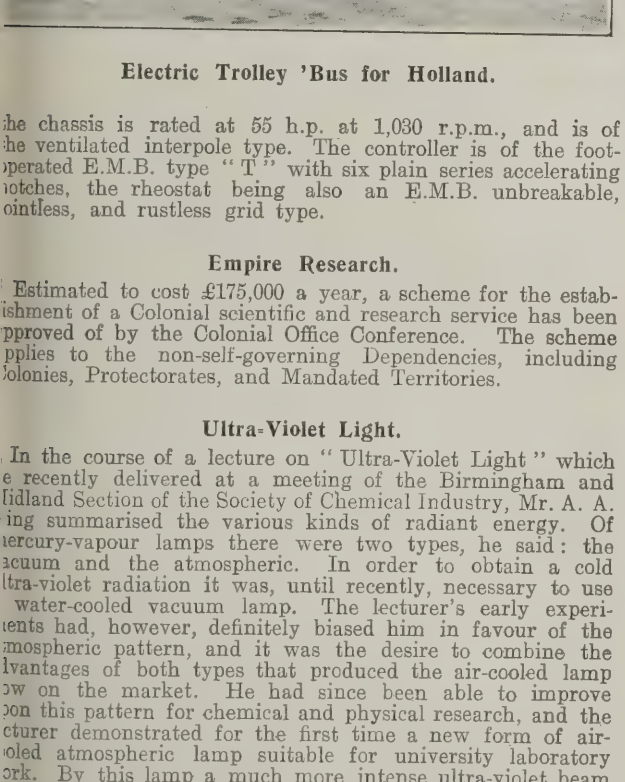
Air-Marshal Sir John Salmond, Air Officer Commanding-in-Chief, Air Defences of Great Britain, who is also chairman of the R.A.F. Display Committee, will deliver a broadcast address about the display from Savoy Hill to-morrow (Saturday) evening. Arrangements have also been made with the British Broadcasting Corporation for a broadcast of about an hour of three of the principal events. These are the destruction by aeroplanes of an observation kite balloon, the air battle for London in which 30 aircraft will take part, and the air rescue of the European population besieged in an Eastern town. It is specially urged that early booking should take place. Tickets are now obtainable at the usual agencies, and from the Secretary, R.A.F. Display, Uxbridge.

Legal.

Marconi's Wireless Telegraph Co., Ltd.—On Tuesday last Mr. W. Greene, K.C., applied to the Court for a fortnight's adjournment of the company's petition for the confirmation of its reduction of capital. He said that the petition was opposed by shareholders, and a long affidavit had to be answered. Notice had been given to cross-examine Senatore Marconi and Sir Gilbert Garnsey, who had made affidavits in support of the petition.

Mr. Justice Eve granted the adjournment required.

Appointments Vacant.



Showroom salesman (£4), stores clerk (£3), for the Radcliffe Urban District Council Electricity Department. Charge engineer for the Peterborough Corporation Electricity Department. Meter mechanic (68s.) for the Bexhill Corporation Electricity Works. Assistant engineer (temporary) and draughtsman (temporary) for the Dublin Corporation Electricity Department. Assistant engineer for the Inverness Corporation Electricity Department. Electrical engineer for the Public Works Department of the Government of Bihar and Orissa. Borough surveyor (£500) for the County Borough of Waterford. (See our advertisement pages to-day.)

Electrical Association for Women.

The Glasgow Branch of the Electrical Association for Women has arranged an outing to the Corporation waterworks at Loch Katrine, where electricity plays a prominent part, on June 20th next.

Holland Adopts Trolley 'Buses.

The first trolley 'bus system in Holland has just been inaugurated by the Municipality of Groningen, which has acquired two Associated Daimler vehicles, to be followed later by a further number if the venture proves satisfactory. The bodies, built by Vickers, Ltd., are of the one-man operated type and provide seating accommodation for 24 passengers; the small seating capacity is explained by the fact that ample room is available for standing. The lowness of the entrance step, which is a feature of these vehicles, has been rendered possible by the low loading height of the "Model 604" chassis frame. Pneumatic tires, size 34 in. by 7 in., are fitted, and a spare is carried underneath the frame behind the rear axle. The "Bull" motor carried in the centre of

Electric Trolley 'Bus for Holland.

he chassis is rated at 55 h.p. at 1,030 r.p.m., and is of he ventilated interpole type. The controller is of the foot-perated E.M.B. type "T" with six plain series accelerating notches, the rheostat being also an E.M.B. unbreakable, ointless, and rustless grid type.

Empire Research.

Estimated to cost £175,000 a year, a scheme for the establishment of a Colonial scientific and research service has been pproved of by the Colonial Office Conference. The scheme pplies to the non-self-governing Dependencies, including olonies, Protectorates, and Mandated Territories.

Ultra-Violet Light.

In the course of a lecture on "Ultra-Violet Light" which e recently delivered at a meeting of the Birmingham and lidland Section of the Society of Chemical Industry, Mr. A. A. ing summarised the various kinds of radiant energy. Of iercury-vapour lamps there were two types, he said: the acuum and the atmospheric. In order to obtain a cold ltra-violet radiation it was, until recently, necessary to use water-cooled vacuum lamp. The lecturer's early experi-ients had, however, definitely biased him in favour of the mospheric pattern, and it was the desire to combine the lvantages of both types that produced the air-cooled lamp ow on the market. He had since been able to improve on this pattern for chemical and physical research, and the cturer demonstrated for the first time a new form of air-oled atmospheric lamp suitable for university laboratory ork. By this lamp a much more intense ultra-violet beam uld be produced by means of a forced draught of air, the cessive heat being removed without the absorption effect tendant upon heat removal by water. The lamp also lent self to the application of a sterilised, ozone charged, air eam for therapeutic purposes, and was much more robust handle than any vacuum mercury-vapour lamp. The model own comprised the fluorescent cabinet, the open lamp for n baths, and the medical lamp adapted for applicator work. ntinuing, the lecturer said that an important new applica-on of ultra-violet rays lay in the distinction between the orescence of pure and impure substances, in which cate-ry might be included many true and imitation gems and cious stones. The presence of minute amounts of impurity uld be detected and identified by subsequent analysis. Some v months ago he had occasion to ascertain with the aid the utmost refinement of the then known methods the sence of minute quantities of arsenic in foodstuffs. The tzeit method of mercury-arsenic stain was selected for ther examination, and an attempt to intensify the stain th monochromatic light served a useful purpose, but when stains were examined in ultra-violet light the making of a new method was found for the detection and quantitative examination of minute quantities of arsenic quite impossible by previous methods. The absorption of ultra-violet rays by the mercury-arsenic stain gave it an intensely black appearance, and stains which were quite invisible to the naked eye in ordinary light flashed up black upon a phosphorescent background when placed in ultra-violet rays. He had been able to detect with certainty 0.00000005 gramme of arsenious oxide, which meant that this arsenic test was approximately 100 times more sensitive than any other method known. Of the commercial applications of ultra-violet rays there were many in the experimental stage, and a few seemed to have become permanent successes; among the latter were the various cabinets used for testing the fastness of colours, and detecting mildew in wool. The use of such rays for the sterilisation of liquids, particularly water, was a promising line of development.

Electricity in Swiss Industries.

A return lately issued by the Swiss Union of Electricity Consumers shows that the association now comprises 109 firms connected with the textile industry, 51 with the food supply trade, 25 with the chemical industry, 22 with the paper, leather, and timber trades, and 144 with the engineering and metallurgical industries. In addition, there are 120 other miscellaneous members, as well as eight electric railway undertakings. The whole of the members are responsible for an annual consumption of purchased electric power of 650 million kWh, in addition to a private output of 100 million kWh. It is estimated that the consumption of electricity in Switzerland now amounts to 980 kWh per year per head of the population.

The Heaviside Layer.

In a recent lecture before the Royal Institution on "Wireless Transmission and the Upper Atmosphere," Prof. E. V. Appleton is reported by *The Times* to have explained that recent intensive study of the shorter waves had shown that the effects of the Heaviside layer could be detected only a few miles away from the transmitter. As the effects increased with increased distance, they became of importance to broadcast listeners, whose receivers were 100 to 150 miles from the transmitting station. The signal fading they experienced was due to the arrival of two sets of waves at the receiver, one travelling along the ground and the other from the upper atmosphere after reflection at the Heaviside layer, the height of which was about 70 kilometres in the day-time, and after sunset gradually rose often to 120 kilometres, only to fall to its day-time value at sunrise. The layer was found to reflect broadcast waves copiously at night, but in the day-time there was practically no reflection, and only ground waves were received. Listeners situated a long way from the transmitting station who were only able to receive during the dark hours often complained of the uncertain intensity and bad quality of their signals, but they should remember that the day-time signal was the one to which they were really entitled. The night-time signal they received was merely a gift from the upper atmosphere, and they must not complain if the gift was a somewhat variable quantity. With decreasing wave-length the amount of bending the atmosphere would accomplish became less, so that with very short waves penetration of the Heaviside layer became feasible, especially at night, when the amount of electricity in the upper atmosphere was least. It had been said that communication with Mars was impossible because the Heaviside layer would present an impenetrable barrier to wireless waves, but from calculations it appeared as if waves of the order of one metre would penetrate it at night and thus be of no use for long-distance communication. A surprising result had recently been found in the effects of magnetic storms on wireless transmission. Such storms interfered very seriously with long-distance short-wave transmission, and yet with very long waves the signals were stronger than usual. If it was assumed that a magnetic storm increased the electricity in the layer, short waves, which had to penetrate the layer to be bent gradually back to the ground, were more strongly absorbed because they now returned at lower levels, where the friction experienced by the electricity was larger. On the other hand, long waves were truly reflected by the layer at its surface, and an increase in the amount of electricity in the layer increased the amount of this reflection.

Electrical Prospecting for Minerals.

We learn that the electrical process of prospecting for mineral deposits is to be thoroughly tested on a large scale in the Kamiscotia copper area of Northern Ontario. The Hollinger Consolidated holds a large area under option which is heavily overburdened with sand and muskegs, rock outcrops being few in number. Prospecting by the ordinary methods would entail much expense, and an arrangement has been entered into between the company and the Government under which the latter agrees to accept the electrical survey of the claims in lieu of the first year's assessment, on condition that the indications of the survey are to be followed up by diamond drilling. As the company undertakes to make a thorough electrical survey of the whole area covered by its claims this will be a more comprehensive and conclusive test of the value of the process than has hitherto been made in Ontario.

The Effect of High Voltages on Tantalum Anodes.

During some recent work with high voltages upon metal electrodes, Mr. E. N. Dunham has found that tantalum exhibits some very unusual phenomena when used as a positive electrode in certain electrolytes. Very brilliantly coloured films are formed on the metal in the following order: violet, reddish purple, indigo, light blue, green gold, light yellow and finally gray. The colours were produced in succession by increasing the voltage, so that any one of the above colours may be obtained by shutting off the current at the proper time. The films form just before the electrode begins to emit light, and the highly-coloured ones disappear when tiny scintillating sparks appear on the surface of the film. The gray film mentioned above is the final product after the breakdown voltage is exceeded. The films are apparently permanent, and the colours give no evidence of being formed by interference. Mr. Dunham has been unable to reproduce them by heating or other means, and is withholding any possible explanation of the phenomena until further data are available.—*Science.*

Chief Technical Assistants' Association.

On June 9th last the above Association entertained Mr. A. P. MacAlister to a complimentary dinner at the Holborn Restaurant, London, in honour of his being appointed borough electrical engineer of Islington. Mr. A. Murdoch, chairman of the Association, presided. After the loyal toast, the chairman proposed the toast of the guest of the evening, and mentioned that the Association was brought into being mainly by the efforts of Mr. MacAlister. He reviewed the events which led up to its formation in February, 1915, when certain Electricity Supply Bills were before Parliament. The chairman referred to the very high esteem in which the guest was held both in their Association and in the supply industry generally, and heartily congratulated him upon his well-deserved appointment. Other members spoke of their appreciation of Mr. MacAlister's many virtues, and the whole Association joined in wishing him a long, happy, and prosperous career in his new position. On behalf of the members, the chairman presented him with a pair of entrée dishes. Mr. MacAlister, in reply, referred to the various conferences held during the earlier days, and to the work of the late Mr. C. H. Wordingham in the cause of the staff engineer.

Electricity in Agriculture.

In a lecture delivered by Dr. E. A. White, Director of the Committee on Relation of Electricity to Agriculture, at a meeting of the National Electrical Manufacturers' Association at Hot Springs, Virginia, U.S.A., it is stated that the possibility of securing three million new customers—farm customers—is not out of range. According to statistics recently released by the Rural Electric Service Committee of the National Electric Light Association, California, with its great irrigation pumping load, heads the list with 62,000 farms connected, 45.4 per cent. of the total. Then follows New York with 35,600, 18.9 per cent., while Washington, with 20,000 and 27.4 per cent. is next. This report shows 227,422 farms served in 27 States, which would indicate a figure between 300,000 and 350,000 in the United States. According to statistics recently released by the Bureau of Agricultural Economics, U.S. Department of Agriculture, the farm population was 27,892,000 on January 1st, 1927, as compared with 28,541,000 on January 1st, 1926, a decrease of 699,000. Evidently there is something wrong with agriculture. As in other industries, the use of power brings with it at least two distinct possibilities; increased production per worker and improved living standards. Agriculture needs both of these. Agriculture is in a state of transition, with every promise of using more power in the future than it has done in the past.

There is a potential electrical load on the farm of sufficient size to ensure reasonable rates in the more important agricultural regions. The farm-house needs electricity for cooking, refrigeration, lights, water pumping, and numerous conveniences. Studies show a load ranging from 200 to 500 kWh per month per farm. With three farms per mile this would give 9,000 kWh per year per mile of line, solely for household uses. The load on the farm, outside of the household, will vary with the type of farming and future developments in the art of applying electricity to agricultural operations. On the dairy farm it will be large, ranging up to 500 kWh per cow per year. Poultry farming produces a good load. Vegetable gardening is most promising. The general live-stock farmer can use electricity to advantage. In fact, it is only on the grain or cotton farm that the use of electricity has to be confined to the household. Considering the territory most promising for the development of rural electric service during the next five years, it is conservative to say that there are possibilities for the use of up to 18,000 kWh of electricity per mile of line per year. Contrasted with this, 4,000 kWh per mile per year is considered good in non-irrigated regions.

To bring such a development about will require equipment. In New Hampshire the average cost of equipment and installations on seven farms above the average was $2,256.65. In 1926 these seven farms used an average of 4,253 kWh per farm. This was experimental, but it shows the possibilities. In 1926 100,000 rural customers were added to electric service lines. If it cost only an average of $200 to reach each customer and only $50 per home was spent for wiring this represents $25,000,000 for labour and materials. The present volume of business is bigger than most people realise, for these figures are certainly conservative. There is a market for electrical equipment in rural districts to-day and it will increase.

Although the progress of the past five years has been great only 5 per cent. of the farmers of the country are to-day reached by the copper wire. The use of electricity on the farms served, excluding irrigation pumping, is far below the possibilities. Generally speaking, these possibilities are as new to farmers as they are to engineers. The use of electricity on the farm will bring a big readjustment problem to agriculture. It is better that this readjustment should come gradually, with as few mistakes as possible. The farmer needs reliable information as to electrical uses on the farm; so do the manufacturers, and so do the electric light and power companies. The big problem is to take the equipment that we now have and that which will be developed and fit it into farm requirements, or fit farm requirements to it. Instead of educating the farmer, as is so often attempted, and so seldom realised, the farmer should be given a chance to educate himself. Speeches, articles, and pamphlets will have an important place, but the groundwork will be the demonstration.

E.L.M.A. at Teachers' Conference.

At the annual conference of the Association of Teachers in Technical Institutes, held recently at Plymouth, a scientific exhibition was organised and a series of lectures given for the benefit of the general public. Mr. H. Lingard, of the E.L.M.A. Lighting Service Bureau, London, gave a special lecture to the delegates and four lectures to the public on the subject of electric lighting, and displayed some demonstration cabinets. Three cabinets were employed, one of eight sections showing the history of artificial lighting, a four-section one illustrating the effect of the colour of different electric light sources on coloured ribbons, and a special "What-reflectors-will-do" cabinet depicting good and bad shop-window lighting. These cabinets were installed in a small darkened room for the period of the exhibition and created considerable public interest. The keen appreciation shown by the audiences at the lectures indicated the growing interest of the public in the "electric lighting art."

Institution Notes.

Institute of Wireless Technology.

The annual general meeting of the Institute took place on May 25th. The chairman announced the result of the election of officers for the ensuing year, and briefly reported on the progress of the Institute during the past year. This has been very satisfactory; ordinary meetings have been held monthly at the Engineers' Club, at which papers have been read and discussed. A first number of the *Journal* has been published, and an enlarged and improved number is now in the press. The Institute is receiving a good measure of support, and the membership is steadily increasing. The next session of ordinary meetings will open in October, and it is anticipated that sufficient support will be forthcoming to hold informal meetings monthly for discussions on problems of special interest. Those desiring further particulars of the activities of the Institute are invited to address themselves to the hon. secretary at 71, Kingsway, London W.C.2.

Diesel Engine Users' Association.

At the meeting held on June 10th a paper by Mr. Arthur F. Evans, M.I.A.E., M.I.Mar.E., entitled "Consumers' Oil Tests," was read and discussed. The author said that such tests as did exist and were generally recognised by the oil suppliers fell short of the actual requirements of oil users for the following reasons:—(*a*) They were not universally adopted by oil suppliers; (*b*) they did not give all the required particulars; (*c*) they were too difficult for the ordinary engineering firm to carry out. He recognised that it was almost impossible even in a laboratory to test all the properties of a lubricating oil. For instance, there did not yet exist an apparatus for accurately determining the actual lubricating values of oil under the varied circumstances and conditions of an engine. Neither was there a means of accurately ascertaining the comparative amount of carbon which the oil would deposit in the combustion chamber, the closest approach being the "bomb" test, which at its best was but an approximation. The greater part of the lubricating oil purchased was bought by name and reputation. Where the purchaser was in any case departing from some known brand the selection was made, apart from commercial considerations by colour and comparative viscosity at room temperature. After many years' experience in purchasing oils, he commenced testing samples of oil which had been submitted to him. He dealt in detail with the tests which he suggested should be carried out, and gave interesting information regarding the apparatus which was necessary and the method of using it. Copies of the paper, together with an account of the discussion thereon, can be obtained from Mr. Percy Still, joint honorary secretary of the Association.

Our Personal Column.

Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements

Following upon the resignation, after nearly 30 years' service, of Mr. F. C. McQUOWN, joint manager and secretary of the County of London Electric Supply Co., Ltd., Mr. H. W. SPRUNT, M.I.E.E., M.I.Mech.E., has been appointed commercial manager, and Mr. JOHN C. DALTON has been appointed secretary of the company.

The *Western Mail* states that Mr. E. MILLWARD, A.M.I.E.E., aged 23, at present employed with Messrs. Bertram Thomas, of Manchester, has been appointed assistant engineer to the Sudan Railways and Steamers. The *Mail* adds that Mr. Millward leaves for the Sudan in a few weeks' time, and he will have sole control of "a new power station to be erected in the lower regions of Southern Egypt, where an electric railroad is being laid."

SENATORE MARCONI was married to the Countess Marie Bezzi-Scali at Rome on Sunday last.

Mr. HAROLD PEACE, of the Dewsbury Corporation electricity works staff, has been presented by his colleagues with an oak clock and a bedroom clock on the occasion of his marriage.

On June 7th, Mr. A. J. B. GOSLING was presented with a set of oxidised copper fire-irons by members of the Electrical Staff of the London, Midland, and Scottish Railway, upon the occasion of his marriage.

The marriage took place on June 6th of Mr. WILLIAM ALEXANDER BLACK, an electrical engineer, at the Tees Station at the Newcastle-upon-Tyne Electric Supply Co., Ltd., and Miss D. MORTON, of Whitby.

Mr. D. MAXWELL BUISH, personal assistant to the Hull Corporation electrical engineer, has been appointed chief electrical engineer to the Synthetic Ammonia and Nitrates, Ltd., of Billingham.

Mr. FRED. W. DAVIES has relinquished the position of manager to Messrs. T. W. Broadbent, Ltd., of Huddersfield, which he has held for more than 20 years, and has established a business under his own name at Electrical Maintenance Works, Colne Road, Huddersfield. He has no manufacturing interests and will carry on a general consulting practice and electrical maintenance and repair business. He has long specialised in the design of a.c. and d.c. generators and motors, and his workshop is equipped for the repair of such machinery.

Obituary.—MR. H. CHILDS.—The death took place on June 8th, at the age of 60 years, of Mr. Henry Childs, electrician at Whipp's Cross Hospital, Walthamstow.

MR. J. C. CRAWSHAW.—Mr. John Charlesworth Crawshaw, who after the war was associated with the English Electric Co., Ltd., at the Bradford works, and latterly was general manager of Crawshaw & Warburton, Ltd., colliery-owners, of Dewsbury, died suddenly while playing tennis on Saturday last. He was 42 years of age.

MR. W. J. NEWBIGIN.—Reports just to hand from Australia state that Mr. William Johnstone Newbigin passed away in April at Sydney, at the age of 53 years. He went to Australia on behalf of Messrs. C. A. Parsons & Co. about 30 years ago. Subsequently he joined the staff of William Adams & Co., Ltd., and during the past four years was managing director. He was a member of the Commonwealth Council for Scientific and Industrial Research, a past-president of the Institute of Engineers of Australia, and a member of the main committee of the Australian Engineering Standards Association.

MR. G. M. TAYLOR.—We regret to record the death, which occurred on June 11th at Kensington, of Mr. G. Midgley Taylor, M.Inst.C.E., at the age of 65 years.

Wills.—The late Sir JOHN TURNEY, of Nottingham, left £172,410 gross and £158,598 net personalty.

Mr. ARCHIBALD CAMPBELL, M.I.E.E., left £3,068 gross and £3,035 net personalty.

The late Captain REGINALD J. WALLIS-JONES left £2,160 gross personalty (net personalty nil).

Financial Section.

New Companies, Returns of Share Capital, Debenture Changes, Reports of Electrical Companies, Dividend Results, Transactions in Stocks and Shares.

New Companies Registered.

Reid Process, Ltd.—Private company. Registered June 'th. Capital, £100 in 1s. shares. Objects:—To carry on the usiness of a financial, commercial, electrical manufacturing, ontracting, promoting, mercantile, developing association, specially electrical matters; to seek for openings for the rofitable employment of capital, &c. The subscribers (each ith one share) are:—T. H. Higgins, 25, Duke's Avenue, Muswell Hill, printer; R. Elliott, 23, Cranley Gardens, N.10, ompany secretary. The first directors (to number not less han 2 nor more than 7) are:—Lt.-Col. the Hon. H. Scott Davey, C.M.G., and Major A. H. Woodhouse. Remunera- ion, £100 per annum (chairman £150). Secretary: R. Elliott. Registered office: 30, St. Swithin's Lane, E.C.4.

Miller's Radio Products, Ltd.—Private company. Regis- ered June 7th. Capital, £100 in 1s. shares. Objects:—To cquire the business formerly carried on by J. W. Miller s wireless components engineer and manufacturer, at 68, arringdon Street, E.C.4. The subscribers (each with one nare) are:—E. C. Goman, 44, Leghorn Road, Harlesden, lectrical engineer; A. Secretan, 44, Montgomery Road, hiswick, W.4, clerk. The first directors are not named. ecretary: F. B. Weller. Registered office: 64, Mill Hill oad, Acton, W.3.

Airships Electric Advertising Co., Ltd.—Private com- any. Registered June 9th. Capital, £350 in 340 preference nares of £1 each and 2,500 deferred shares of 1d. each. bjects:—To deal in airships, aircraft, balloons and captive rships, and electrical appliances; to act as advertising agents nd contractors, &c. The first directors are:—Capt. P. W. eigh-Pemberton, "Southmead," Newbury; Mrs. J. M. ord, 21, Collingham Gardens, South Kensington, S.W.5. ualification, 10 shares. Secretary: John Ford. Registered ffice: 24, Queen Victoria Street, E.C.4.

Frank Raworth, Ltd.—Private company. Registered me 8th. Capital, £3,000 in £1 shares. Objects:—To quire the business of electrical engineers and contractors rried on by the executors of Frank Raworth at 36, Spring rdens, Buxton. The first directors are:—H. Le Mare ckson, 51, King Street, Manchester, accountant; F. Thomp- n, 36, Spring Gardens, Buxton, electrical engineer.

Official Returns of Electrical Companies.

Neutron, Ltd.—R. S. Andrews, C.A., of 448, Strand, W.C.2, ceased to act as receiver on May 30th, 1927.

Dulverton Electric Lighting Co., Ltd.—Satisfaction to the extent of £950 on May 31st, 1927, of debentures dated March 12th, 1907, securing £2,000.

Norton Wireless Co., Ltd.—B. A. Nichols, of 54, St. John's Road, Hoxton, N.1, was appointed receiver on May 26th under powers contained in debenture dated March 14th, 1927.

Hazeltine Neutrodyne Radio Sets, Ltd.—Capital, £5,000 in £1 shares. Return dated December 23rd, 1926. 4,900 shares taken up. Nil called up. Mortgages and charges, nil.

Lacy Induction Coil Co., Ltd.—Capital, £26,725 in 25,500 ordinary shares of £1 each and 24,500 founders' shares of 1s. each. Return dated December 29th, 1926 (filed January 20th, 1927). 14,552 ordinary and 12,250 founders' shares taken up. £14,552 paid. £612 10s. considered as paid. Mortgages and charges, nil.

Townlea Electrical Co., Ltd.—Capital, £1,000 in 300 preference and 700 ordinary shares of £1 each. Return dated January 11th, 1927. All shares taken up. £500 considered as paid. Mortgages and charges, nil.

Nox Electric Lamp Co., Ltd.—Return dated January 21st, 1927. Capital at date of return, £2,000 in £1 shares (increased March 16th, 1927, to £15,000 in £1 shares). 502 shares taken up. £2 paid. £500 considered as paid. Mortgages and charges at date of return, £662 13s. 4d. (paid off March 1st, 1927). Since registered: £6,000 debentures (part of a series of £15,000 authorised February 24th, 1927).

Kent Bros. Electric Wire Co. & E. H. Phillips, Ltd.—Capital, £15,000 in £1 shares. Return dated December 31st, 1926. 11,500 shares taken up. £500 paid. £11,000 considered as paid. Mortgages and charges, £15,500.

John Armstrong & Co. (Manchester), Ltd.—Capital, £2,500 in £1 shares. Return dated March 18th, 1927. 1,493 shares taken up. £849 paid. £644 considered as paid. Mortgages and charges, nil.

City Notes.

Sir W. G. Armstrong, Whitworth & Co., Ltd.

The annual meeting was held on June 9th. Lord Southborough, the chairman, was prevented by illness from presiding, and the vice-chairman (Mr. J. F. Taylor) took his place. Mr. Taylor first made reference to the arrangement made in December last for a five years' moratorium (*vide* ELEC. REV., December 17th, 1926, p. 1006), and referred to the losses occasioned by the coal strike. He had been advised that it was necessary to write down the value of the plant and properties by a substantial amount, and the same remarks applied generally to investments. He proceeded to deal with the more important of the last. Adverse circumstances had arisen in the case of the Newfoundland Power and Paper Co., Ltd., and in view of the outlook they had come to the conclusion that further commitments should not be entered into. They had therefore assented to the Newfoundland Company entering into negotiations with the International Paper Co., of New York, which provided for the latter's acquiring the undertaking and assuming responsibility for the further financing of the business. The company had nearly £1,400,000 invested in the Italian company, S. A. Armstrong di Pozzuoli, which had been put into voluntary liquidation. Their investment in the Pearson and Knowles group of companies was also causing them anxiety; to ease the situation a moratorium had been declared in respect of the payment of interest, &c. It was hoped that there would be a recovery in that group. Where other investments had proved a drag upon the company, they were being drastically dealt with, but with an eye all the time to the best possible outcome for the company. Against those adverse circumstances there were important offsets. They had disposed to very good advantage of their investments in the Armstrong Siddeley Companies and in Messrs. Walmsleys, of Bury. The armament business was wholly inadequate. All the civil engineering contracts had been finished, with the exception of those in New Zealand, which could not possibly be completed until 1928 at the earliest. They had claims in respect of several contracts. A small profit had been realised in the construction of the Hermitage Dam in Jamaica, and they had been commended for their work. New lines were not easy to find, and they were examining possibilities which were close to hand. Included in those were closer working arrangements with Vickers, Ltd.; conversations to that end were taking place. When the board was reconstructed a complete scheme of management would be put into operation. In conclusion, Mr. Taylor said that the time was approaching when a revaluation of assets and a considerable writing down of capital would have to be considered.

Electric Construction Co., Ltd.

The annual meeting was held on June 9th, Mr. P. E. Beachcroft (chairman) presiding. In presenting the report (*vide* our last issue, p. 941), the chairman said that the year under review opened with fairly favourable prospects, and their order book showed an improvement. Those prospects, however, were not fulfilled owing to the prolonged coal strike, which caused comparative stagnation in many industries. Such contracts and orders, therefore, as could be procured were subjected to increased costs and severe competition. So intense had competition become in overseas markets that selling prices showed a small surplus only over the cost of labour and materials. They refused to take any order which did not carry a fair share of establishment charges. Although that policy had resulted in a reduced turnover, their position would have been worse if they had not adopted that course. The company was in an exceptionally favourable position to take advantage of any general improvement in trade, of which there was some slight indication. Little or nothing had been done to relax the burden of taxation, which bore so heavily upon industry. On the contrary, they were threatened with more bureaucratic interference in the form of "safety supervisors," who were to undertake duties which were at present admirably discharged by factory inspectors. He hoped that the proposal would be more fully ventilated than it had been before the new officers were appointed. Reviewing the accounts, Mr. Beachcroft said that they felt that, during the present troublous times, at any rate, they could reduce the amount for depreciation. The directors were disappointed that for the first time in the past ten years they were unable to recommend payment of the bonus of 2½ per cent. on the ordinary shares. The present outlook was somewhat obscure, and the indications of a general improvement in trade were still unconvincing, but there was little doubt that when the new Electricity Act was in full operation there would be a greatly increased demand for electrical plant and apparatus.

Kalgoorlie Electric Power and Lighting Corporation, Ltd.

Speaking at the annual meeting on June 9th, the chairman (Mr. G. C. Howard) said that during the year the income debenture stock had been reduced by £10,100 and now stood at £102,800. Although the average receipts per kWh were lower and the expenses had increased, they were able to show better results on account of the fairly steady and full output. They hoped to be able to produce satisfactory figures at the end of the current year. The chairman then referred to the report of the Commission appointed by the Western Australian Government to make recommendations with a view to prolonging the life of the Kalgoorlie mining industry. He said that the Federal Government had since appointed a technical committee to examine the position. That committee recommended an amalgamation of mining interests, co-operation between the management and the workers, and the introduction of capital. They had now to wait to see what the mining companies would do and what measure of financial support would be afforded by the Federal Government. Any practical suggestions would have the full support of the company.

Lisbon Electric Tramways, Ltd.

The net profit for 1926 was £230,826, as compared with £166,624 for 1925. A balance of £9,122 brought forward was added, making £239,948. From this £100,000 is transferred to general reserve, £7,000 to the staff benefit fund, and £10,000 to exchange reserve. A final dividend of 3 per cent. is recommended, making 6 per cent. for the year, and £8,307 is carried forward. £155,756 standing at the credit of the depreciation account has been released and transferred to the general reserve, making £320,756. It is proposed to capitalise £317,013 of this and distribute it in the form of £1 ordinary shares to existing shareholders in the proportion of one new share for each two held. Proposals for giving this effect will be placed before an extraordinary meeting which is to be held after the annual meeting on June 22nd.

India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.

The company, under date June 13th, informed its shareholders, with much regret, that the improving conditions of a year ago, which were interrupted by the coal dispute and the general strike, had not, so far, been re-established. The reduction in the company's turnover during the half-year under review was serious in many directions, although, on the other hand, there were considerable increases in some sections. The announcement reads:—"It is hoped that the second half of the year may, in some measure, compensate for the loss of trade in the earlier months. Your directors fully recognise the imperative need for increased business and to this end all energies are being directed. In these circumstances they cannot recommend the payment of an interim dividend to the holders of ordinary shares, but the half-yearly dividend on the preference shares will be paid as usual on 1st proximo." The directors add that "there is no truth in the rumours recently circulated as to the possible disposal of this company's business or any portion of it."

Westinghouse Electric and Manufacturing Co.

The sales of this company during 1926 reached the record total of $185,500,000, exceeding those of the previous year by $20,000,000. The net income was $16,138,442, and both preferred and common stock received an 8 per cent. dividend. The current assets are put at $120,000,000, while the current liabilities are only $18,000,000. The value of uncompleted orders at the close of the year was $55,300,000. Mr. Guy E. Tripp (chairman), in his report, says:—"The sales billed for the year reflect the improvement in operations due to the more efficient use of the manufacturing facilities added during the past two years. The cost of sales reflects the keenness of competition and slightly lowered prices. The volume of sales for export increased over the previous year. Competition for export business continued to be keen, but certain affiliations in the foreign field effected during the year should assist in securing a substantial volume of new business."

Cuba Submarine Telegraph Co., Ltd.

The receipts for 1926 were £58,603, as compared with £63,400 in 1925, while the expenses increased from £25,970 to £31,250. After a smaller provision for cable repairs, the balance is £20,481, as against £25,350 (after allowing £3,903 for taxation) in the preceding year. The ordinary shares received an interim dividend of 2½ per cent., free of tax, but after providing for the dividend on the 10 per cent. preference shares, the balance of £18,372 (including £7,891 brought in) is carried forward. The ordinary dividend for the three preceding years was 5 per cent., tax free. The Direct West India Cable Co. Ltd., in March last, offered £10 each for the company's preference shares and £7 for the ordinary shares.

W. T. Henley's Telegraph Works Co., Ltd.

The directors recommend a final dividend on the ordinary shares of 2s. 6d. per share, making 4s. per share for the year. They also recommend a cash bonus of 1s. per share. After placing £50,000 to general reserve as last year, and paying the above dividend and bonus, the amount carried forward to next year will be £506,202, which is an increase of £2,423 on the amount carried forward last year. It is not considered necessary to further increase the carry forward, for which reason the directors are able to recommend the payment of the cash bonus.

Mexican Light and Power Co.

The Canadian Courts have approved the arrangement for dealing with the arrears of dividend on the 7 per cent. cumulative preference shares by the issue of fully-paid 4 per cent. cumulative redeemable second preference shares, and allotment is to be made after the end of this month.

United River Plate Telephone Co., Ltd.

The company reports a total revenue of £2,247,169 for 1926 and a balance on working of £454,955, from which is deducted £13,500, debenture interest, making £441,455. After meeting the preference dividend, it is proposed to pay a final dividend of 5 per cent. on the old ordinary shares, making 8 per cent., free of tax, for the year and a dividend of 5s. per share, free of tax, on the new ordinary shares. This leaves a balance of £28,655, which is added to the amount brought in, making a total of £136,586 to be carried forward. In order to cope with the demand heavy capital commitments have been and will be necessary. It is therefore proposed to increase the capital from £6,000,000 to £7,000,000 by the creation of 200,000 £5 shares; these will not be issued immediately. The report records the death of the deputy-chairman, Sir Frederick Green. His place has been taken by Major E. C. Quilter, and Mr. W. Howard Williams has been appointed to the board. Meeting: June 21st.

A Joint Authority Issue.

The list was to close on or before to-day (Friday) in an issue by the West Midlands Joint Electricity Authority of £2,000,000 5 per cent stock at the price of £98 per cent. The prospectus stated that £500,000 of the proceeds would be used in discharge of a portion of the purchase consideration for the generating stations and other property to be acquired. The plant referred to is at present the property of the Corporations of Shrewsbury, Wolverhampton, Walsall and West Bromwich and the Midland Electric Corporation for Power Distribution, Ltd. The total purchase price is put at £1,329,000.

Whitehall Electric Investments, Ltd.

The gross income for the year ended March 31st last was £712,482, as compared with £708,522 in 1925-26; the net income increased from £456,102 to £468,655. After deducting the preference dividend and one of 2½ per cent. on the ordinary shares, there remains £156,155, which is to be applied in reduction of discount on debenture stock. The meeting was to be held yesterday (Thursday).

Newcastle-upon-Tyne Electric Supply Co., Ltd.

This week the preference and ordinary shareholders were offered 770,000 ordinary shares of £1 each at par in the proportion of one to each five shares at present held. The new shares will participate *pari passu* with the existing shares as from the due dates of the instalments (July 1st and October 1st).

Altrincham Electric Supply, Ltd.

After meeting expenses, including debenture interest, the net profit for 1926 was £27,567 (against £29,181 in 1925). To this is added £927 brought forward, making £28,494. A dividend of 7½ per cent. is recommended on the ordinary shares and £3,500 is allocated to the deferred shares, leaving £1,758 to be carried forward, subject to directors' fees.

Barcelona Traction, Light and Power Co.

An interim dividend of 50 cents per share has been declared on the ordinary stock and one of 1¾ per cent. on the 7 per cent. non-cumulative participating preference stock. The latter stock also receives an additional dividend of 1 per cent., corresponding with that on the ordinary stock.

Richard Johnson, Clapham & Morris, Ltd.

The net profit for 1926-27 was £20,077, and the addition of the balance brought forward gives £28,276. The ordinary dividend is 3¾ per cent. (against *nil* for 1925-26), and a balance of £13,824 is carried forward.

Seaton (Devon) and District Electric Light Co., Ltd.

An increase in revenue of £836 was reported at the recent annual meeting. The balance carried to the net revenue account was £782, as compared with £43 in the previous year.

Globe Telegraph and Trust Co., Ltd.

A final dividend of 5s. per share net is recommended on the ordinary shares, making 10 per cent. net for the year as usual.

Cape Electric Tramways, Ltd.

The directors have declared an interim dividend of 3 per cent., free of tax, as last year.

Chiswick Electricity Supply Corporation, Ltd.

An interim dividend of 7½ per cent. (against 5 per cent.) has been declared.

Mackay Companies.

A quarterly dividend of 1¾ per cent. has been declared on the common stock.

Yorkshire (West Riding) Electric Tramways Co., Ltd.

An interim dividend of 3 per cent. has been declared on the 6 per cent. cumulative preference shares.

Canadian General Electric Co.

A dividend of 1¾ per cent. has been declared in respect of the current quarter.

German Company.

The *Land and Sea Cable Works Company*, Cologne-Nippes, reports that business improved in the second half of 1926 and a further revival has taken place in the current year. After providing for depreciation, the accounts show net profits of 327,000 marks for 1926, as compared with 337,000 marks, the dividend remaining at 10 per cent.

French Companies.

The *Société le Matériel Isolant* reports net profits of 245,000 fr. for 1926; the dividend is 55 fr. per share.

The *Société l'Appareillage Electro-Industriel* earned net profits of 770,000 fr. in 1926, and is paying a dividend of 20 fr. per share.

The *Société le Moteur Electrique* reports a net profit of 107,000 fr.; the dividend is 30 fr. per share.

The 1926 accounts of the *Société la Radiotechnique* show net profits of 1,000,000 fr., and a dividend of 75 fr. per share has been declared.

The *Compagnie Française de Radiophonie* states that its net profit for 1926 was 155,000 fr., which has been carried forward.

The *Société des Accumulateurs Fixés et de Traction* records profits and balance forward amounting to 2,401,000 fr. for 1926; the dividend is 15.625 fr. per share.

The *Compagnie Générale de Télégraphie Sans Fil* reports net profits of 8,507,000 fr. for 1926, as against 7,308,000 fr. in the previous year. It is proposed to increase the dividend from 45 in 1925 to 50 fr. per share.

Swedish Companies.

Aktiebolaget Elektrolux has decided to increase its share capital by a maximum of kr. 25,000,000 nominal, issuing shares giving the right of 1/1,000th part of a vote at meetings. The new capital will be used for the purchase of shares in Aktiebolaget Lux and other companies collaborating with Aktiebolaget Elektrolux.—*Reuter's Trade Service* (Stockholm).

L. M. Ericsson Co.—The net profit for 1926 was 4,410,000 kr., as compared with 4,150,000 kr. for 1925. A dividend of 3 per cent. has been declared.

Swiss Companies.

The report of *Gebruder Sulzer*, Winterthur, for last year shows a net profit of £57,600 as compared with £40,800 in 1925. A dividend of 6 per cent. is again being declared.

The *Alioth Elektrizitäts Gesellschaft*, Basle, reports a net profit of £14,010 for 1926, as against £13,880 in the preceding year, out of which a dividend of 5 per cent. is being paid.

Stocks and Shares.

MONDAY EVENING.

BRAZILIAN Tractions stand out with pre-eminent strength amongst the active securities of the Stock Exchange markets. The appetite of the buyers appears to be insatiable, and the price has gained a further 15 points at 175. The preferred advanced 12 to 146. Reference was made here last week to the favourable comment upon the position of Brazil as reported in an interview with the President of the Brazilian Traction Company, Sir Alexander MacKenzie. There seems to be some odd affinity between the market in these shares and that in American Celanese, the price of which has been rising in meteoric manner, though what connection there can be between Brazilian traction and American artificial silk it is indeed hard to see.

Henley's Telegraph shares are a good deal to the fore by reason of the directors' proposals to pay a 5 per cent. bonus on top of the 20 per cent. dividend. The company is doing very well. In addition to the £300,000 contract obtained from the G.I.P. Railway, Henley's have received a big order from the Eastern Telegraph Company. The price of the shares has risen 3/16ths to 95s., making 6s. 3d. in a fortnight. No other changes of consequence have occurred in this section. Telephone Manufacturing Company shares went back to nearly 5s. 9d. before the price recovered to 6s. 6d. The report is regarded as poor. In 1925 there was a loss of £21,200; for last year the company made a profit of £5,400. After setting aside various allocations, a balance of £1,332 remains, and this it is proposed to carry forward. The meeting is to be held on the Friday in this week. Siemens 4½ per cent. debenture is 2 higher at 91.

The Cuba Submarine Telegraph Company made £20,500 last year, showing a decline of nearly £5,000, as compared with the previous twelve months. No final dividend is to be declared; the company paid an interim of 2½ per cent., tax free, six months ago. It may be recalled that we took Cuba Submarines out of our price list some months ago because, the Direct West India Cable Company having made offers for the Cuba Submarine ordinary and preference (of £7 and £10, respectively), public interest in them became reduced to a minimum. The nominal price is £7, and the last-recorded bargain in the shares was at 6½, early in March. United River Plate Telephones maintain their gain at 9¾. In spite of the fact that nothing has yet transpired to account for the remarkable advance in the quotation, the character of the recent buying is considered sufficient justification for the advice that holders should not part with, at any rate, all their interest. A further advance may easily take place. Indo-European Telegraphs have shed £1. The Eastern quartette holds its previously-acquired strength.

Whitehall Electric Investments, a company interested mainly in Mexican and Chilean utility concerns, has done better, making an extra £11,000 profit, at £468,600. The 7½ per cent. preference shares stand at 20s. 6d., and are a reasonable speculative purchase at that price. It is pointed out in the report that the income received from companies operating in Mexico shows a small reduction, but that the progress in Chile has been well maintained. Unsettled conditions in the country are debited with the decline of the company's earnings in Mexico. The Canadian Courts, having approved the scheme of the Mexican Light and Power Company for satisfaction of the accumulated dividends on the 7 per cent. preference shares, letters of allotment are to be issued in respect of the new 4 per cent. "cumulative redeemable second preference shares." The allotment will be made to those who are registered in the company's books on the last day of this month. Mexican Utility descriptions remain almost unchanged, a fall of 1 in the Light and Power common shares being the only noticeable movement.

British Electric Traction ordinary is 2 higher at 151 in response to the publication of an excellent report for the year ended March 31st, 1927. As already announced, the company proposes to pay 8 per cent. on the preference and the ordinary, with the addition of a 10 per cent. bonus, in deferred stock, to holders of the ordinary. This new deferred stock is likely to become a popular investment, and the opening of a market in it will be awaited with no little interest.

Home Railway stocks have few friends, and investors refuse to put much money into an industry so menaced from without by motor competition and, from within, by never-ending talk of labour troubles. We have previously remarked that the underground systems stand in a class different from that of the steam railways, for the Tubes, to quote the description applied to them by a director, are glorified trams, carrying London to work and home again, goods traffic being of nearly negligible proportions. But the Underground group moves to some extent in sympathy with the others, and falls are marked this week in Metropolitans, Districts and Underground £1 shares.

Twenty-one months ago a director of one of these companies wagered a level £50 that Districts, then many points below Metropolitans, would stand higher than the latter in two years' time. The cheque changed hands last week, the winner laughingly observing that he had come home comfortably, with three months in hand.

Barcelona Tractions remain at 51½. The company is paying an interim dividend of 1 per cent. on the common shares, which gives the 7 per cent. preferred an extra 1 per cent. in their quarterly dividend, under the participating rights that the preferred enjoy. Shawinigan Water and Power is several dollars higher, at 93½. Sidros are 15½, and somewhat neglected. Anglo-Argentine Tramways first preference have hardened a trifle. Cape Electric Trams are unchanged at 23s. on declaration of the interim dividend of 3 per cent., tax free. Rangoon Electric 4½ per cent. debenture at 99½ is a couple of points higher. Revived talk of a bonus on Bournemouth and Poole Electricity shares served to raise the price 2s. 3d. to £3, a fair number of transactions taking place up to 61s. An official announcement is expected to be made immediately. Edmundsons are a strong market, with a rise to 28s. 3d. Charing Cross shares rose 6d. to 25s. 6d. County of London new debenture reacted to 1⅛ premium by reason of the duller tendency in gilt-edged stocks. London Power 5 per cent. debenture is 98 ex dividend, but the scrip, recently-issued, can be bought at 99¼, carrying a coupon of 25s. per cent., now payable. As there is no Government stamp on the scrip, the buyer will save money, of course, in taking this, rather than the old registered stock. The two classes are identical in point of security. Electrical Finance preference are again better at 1s. 3d. premium, and the debenture keeps hard at 2 premium. The new Buenos Aires Lacroze debenture at 5s. premium has gone back a few shillings.

Marconis continue to attract lively attention, though greater interest is, perhaps, being paid to Canadians, in which an active market prevails. The price is better on the week at 5s. 6d., and speculation prophesies a higher level than this. Some people hint that the Radio Corporation is accumulating the shares. Marconi 6½ per cent. debenture has risen to 102. In other wireless shares there is no particular animation. The engineering group is dull, but Armstrongs put on a few pence, to 4s., on the chairman's statement at last week's meeting, that "conversations" are proceeding between Armstrongs and Vickers. At 52s. 6d. Babcocks show no alteration.

Disappointment is felt at the India Rubber, Gutta Percha Company's announcement that no interim dividend will be paid on the ordinary shares, although the preference are to receive their half-yearly dividend on July 1st. No interim was paid a year ago on the ordinary, but shareholders had 5 per cent., tax free, last December. The directors contradict the rumour of a possible disposal of the company's business or any part of it. The price of the shares is 22s. 6d. International Telephones have lost a few pence at 39s. 6d. Newcastle Electric Supply at 22s. 6d. are ex the right to apply for the new issue, the offer of 770,000 ordinary shares at £1 each at par. The proportion is one new share for every complete multiple of 5 shares, ordinary and preference alike. This constitutes a useful little bonus. Rubber shares are weak in consequence of another fall in the price of the raw material.

The Incorporated Municipal Electrical Association.—IV.

Annual Convention at Buxton.

On Thursday, June 2nd, Mr. H. H. Berry's paper on "Electrified Homes of Great Britain" gave rise to a lively discussion; members of the Electrical Association for Women were specially invited to be present, and acquitted themselves with distinction, the remarks of the women who spoke being highly practical and to the point. Afterwards the E.A.W. members and others interested in electrical development lunched together at Ashwood Park Hotel. The afternoon was

Assembling at the Opera House.

devoted to separate meetings of Committee representatives and engineer members; but members of the E.A.W. and other ladies attending the Convention were invited by Dr. and Mrs. Ferranti to visit Baslow Hall, at Baslow, Dr. Ferranti's all-electric house, of which particulars follow; a large party, numbering some 400,

The E.A.W. starting for BaslowH lla .

and including many men, took advantage of this unique privilege, and inspected the installation with keen interest and appreciation. The visitors were entertained to tea, and a hearty vote of thanks was moved by Lady Snell and seconded by Mrs. Ll. B. Atkinson, to which Dr. Ferranti briefly responded. The weather on this and the following day was delightful, fully compensating for the shortcomings of the earlier part of the week.

On Thursday evening the annual dinner of the Association was held in the Pavilion; the President occupied the chair, and there were present some 450 members and ladies.

Friday morning was devoted to the annual meeting. In the afternoon a motor tour to Matlock was thoroughly enjoyed by a large number of the visitors; this was the concluding item of the official programme, but those who stayed at Buxton for the week-end were invited to take part in visits to the electricity works of the Buxton, Macclesfield, and Manchester Corporations, the works

The "Electricar" under Inspection.

of the D.P. Battery Co., Messrs. Hopkinson, Ltd., Ley's Malleable Casting Co., and Mirrlees, Bickerton and Day, Ltd., and the experimental station of the Safety in Mines Research Board at Harpur Hill.

The arrangements for the Convention, which were in the hands of the Hon. Secretary, Mr. A. C. Cramb, the secretary, Miss B. J. Lanfear, and her staff, were carried out on the usual high level of efficiency which

Some well-known members.

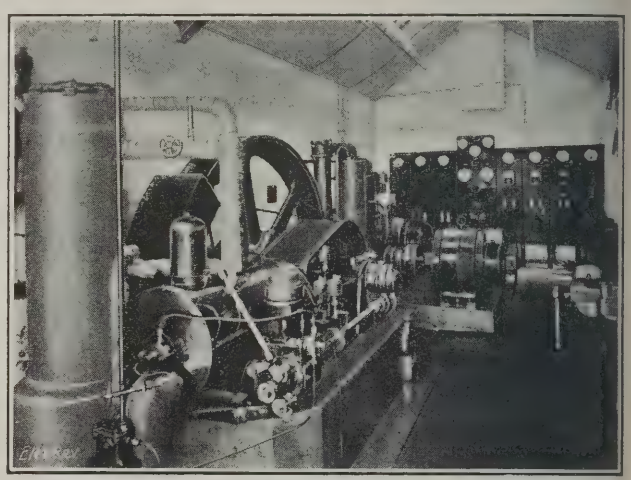
has long characterised these meetings of the I.M.E.A., and which has called forth expressions of keen approval on the part of the members; the programme was conducted without a hitch, and the Convention, the largest recorded in the annals of the Association, was also one of the most successful.

The Electrical Equipment of Baslow Hall.

Electric light, electric cooking, and a few electric fires were installed at the Hall a number of years ago; it was only, however, two years ago that complete electrification was achieved. Since then every requirement of heat, light, and power has been filled electrically, the fundamental feature underlying the installation being the storage of heat in water.

In the discussion on Professor S. Parker Smith's I.E.E. paper on "An All-Electric House," Dr. S. Z. de Ferranti explained the system which he had adopted at the Hall. Remarking that our great handicap in

Baslow Hall.

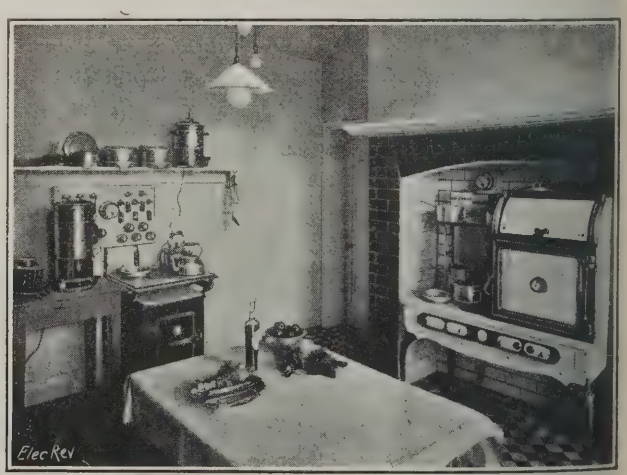


electrical work was that we had no efficient means of storing electricity, he pointed out that hot water was a very cheap form of energy storage, and the provision of a large water tank enabled electricity to be taken at a time when it had practically no value. In his own house he burnt no coal or coke, and used no gas; he burnt crude oil in a 25-h.p. engine, the maximum load being 18 kW (at a time when the battery was assisting the engine). A very large portion of the heat of the jacket water and of the exhaust was used to supply the hot-water storage in the house. He had a

Dining Room.

storage battery containing about 2 tons of lead, and a hot-water storage tank in the basement 6 ft. in diameter, 6½ ft. long, with about 6 in. of heat insulation, holding about 6 tons of hot water. All the principal rooms had invisible panels in the ceilings, consisting of pipes embedded in the plaster below the surface. The general heating was therefore taken care of by radiation at low temperature from the ceilings of all the principal rooms, and not by heating the air by convectors, which were wrongly called radiators. The reason for placing the panels in the ceiling was that they should not heat up the air; the idea was to have in the top of every room a layer of stagnant hot air which kept the surface of the ceiling reasonably warm. The heating was produced by radiation at low temperature from the warm surfaces. The temperature at the surface of the ceiling was 110-120 deg. F. The high-grade radiant heat was produced by electric radiators; every room had one or more of these. The heat efficiency of the whole installation was extremely high; something over 75 per cent. of the heat in the oil was usefully employed.

In the house there are four bathrooms, ten lavatory basins, and five sinks, so that the demand for hot water is considerable. This is obtained from a tank contained inside the large storage tank previously described. Electric lighting is amply provided for. In the cellar there is an electric washer, a motor-driven electric ironer, and a large drying and airing cupboard. There is also an electrically-driven cream

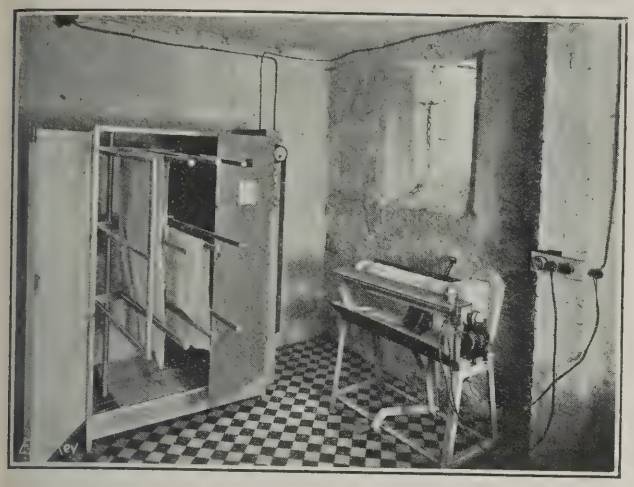


Oil-Engine Generating Plant

separator in the dairy, and an electric fan to keep the air moving in the cellar and the dairy.

The kitchen is provided with a complete cooking range, and an old electric oven made in the early days of electric cooking is still in use and perfectly effective. There are also a number of cooking appliances with self-contained heater elements for which a special table and switch and plug board is provided.

In the main bedrooms the fireplaces have been taken out, and wardrobes have been let into the spaces normally occupied by the grates and chimneys. An air inlet has been arranged which passes underneath the wardrobe to the back of the chimney, so preserving the ventilation obtained before. If the chimney requires cleaning, the wardrobe can be



Kitchen.

removed by unscrewing two thumb screws, and lifting it out as a unit. All unnecessary furniture has been deleted, and as the bedrooms are abnormally large, coke-breeze partitions have been erected. By this means a large hanging closet and bathroom have been added to each of the main bedrooms. The closet has been arranged on the American system, in which a light is lit when the door is opened, and is fitted with boot racks, clothes hangers, &c. The bathrooms are fitted with sunk baths and appliances, adjustable mirrors, electric radiators, &c.

In the smaller bedrooms the fireplaces have been taken out and the recesses arranged for an adjustable looking-glass and washing basin. The air outlet is still preserved, but in this instance, as the basin is a fixture and cannot be removed, a special catch trap has been designed by Dr. Ferranti to fit

into a circular aperture above the basin. This traps dirt in the air and allows filtered air to pass into the room. This aperture is also used for cleaning the chimney.

The towel racks in the bathrooms are above the heating apparatus, thereby allowing hot air to circulate through the damp material instead of hanging the towels on hot pipes.

Ironer and Drying Cupboard.

The cow house is fitted with an electric chaff cutter, a food cutter, and other apparatus. The floor of the garage is heated by means of the exhaust gases taken in piping through the floor prior to their being discharged into the atmosphere.

A large electric lawn mower is used for mowing the lawn. Power plugs are connected at different points in the garden, for the electric lawn mower, and at the tennis courts, for teas.

All dirt has been eradicated by the installation of electricity, and the space that was once used for coal and coke and the heating boiler has now been adapted for electric washing.

It has been estimated that by introducing a complete electrical system nearly 50 per cent. has been added to the accommodation of the house, and it is significant to note that where it was necessary, before the installation was complete, to employ five maids to work and keep the house clean, the whole of the work is now being done by two helpers. It will be seen, therefore, that electrical equipment materially lightens the work, reduces the labour costs, and increases the floor space available for useful work.

Electrified Homes.

The Domestic Heating Problem.

By HERBERT H. BERRY. (*Abstract.*)

The author accepts the "All-Electric Home" as a high standard to be attained and achieved under certain circumstances, and at the same time desires to point out that those circumstances only arise in a percentage of the total number of cases which need diagnosis at the hands of the skilled adviser.

The ultimate solution of the domestic-heating problem lies, not in the adoption of any one particular system as at present, but in a scientific combination of two or even more selected systems which may vary with the local and other conditions. The author desires to draw special attention to a combined system for supplying heat energy for domestic purposes, about which, as far as he knows, little has been said, and no established data published. He will refer to it as the "Colectric System." It represents a combination in modified form of two well-known systems—heat energy generated in the immediate vicinity of the home direct from fuel, plus heat energy generated remotely and distributed in the home in the form of electricity. It is capable of very wide and diverse application, the field including almost every kind of building.

The application in the home is not always the same, but the facts underlying the several principles are more or less identical. In the majority of homes a constant supply of hot water is desirable throughout the day and year, and the principal living rooms, excluding bedrooms, need to be kept warm during the six winter months.
